Version 3.0 User's Guide
Notes, Cautions, and Warnings

NOTE: A NOTE indicates important information that helps you make better use of your computer.

CAUTION: A CAUTION indicates either potential damage to hardware or loss of data and tells you how to avoid the problem.

WARNING: A WARNING indicates a potential for property damage, personal injury, or death.

Introduction

Dell Command | Configure (Command | Configure) is a packaged software that provides configuration capability to business client systems. You can configure the client systems using a Graphical User Interface (GUI) or a Command Line Interface (CLI).

For more information on CLI, see Dell Command | Configure Command Line Interface Reference Guide available at dell.com/clientsystemsmanagement. You can use Command | Configure in Red Hat Enterprise Linux environments and Microsoft Windows Preinstallation Environment (Windows PE), and on the Microsoft Windows Vista, Windows 7, Windows 8, and Windows 8.1 operating systems.

NOTE: Dell Command | Configure was formerly Dell Client Configuration Toolkit (CCTK). After the CCTK version 2.2.1, CCTK is rebranded as Dell Command | Configure.

What’s new in this release

The new features for this release include:

- Dell Client Configuration Toolkit (CCTK) is rebranded to Dell Command | Configure.
- Support for Red Hat Enterprise Linux 7.0 operating system.
- Support for Advanced System Management (ASM) 2.0 for setting the non-critical upper threshold values for cooling probes.
- Support for configuring the internal GPS radio using the gpsradio option.
- Support for configuring the keyboard backlight when the system is running on AC power using the keyboardbacklightonacpower option.
- Support for configuring the back camera using the backcamera option.
- Support for additional arguments medium_high and medium_low for configuring the fan speed using the fanspeed option.
- Support for configuring the behavior of the dual-function keys, when <Fn> key is pressed using the fnlock option.
- Support for configuring the behavior of the dual-function keys (F1 — F12), when <Fn> key is pressed and when it is not using the fnlockmode option.
- Support for configuring the state of the onboard unmanaged Network Interface Card (NIC) using the unmanagednic option.
- Support for configuring the USB ports available at the back of the system using the rearusb option.
- Support for configuring the USB ports available on the side of the system using the sideusb option.

NOTE: For more details on the CLI options, see Dell Command | Configure Command Line Interface Reference Guide available at dell.com/clientsystemsmanagement.
Supported systems and operating systems

For the list of Dell client systems and operating systems, see the Release notes available in the Command | Configure installation files or at dell.com/clientsystemsmanagement.

Other documents you may need

In addition to this guide, you can access the following guides available at dell.com/clientsystemsmanagement.

- The Dell Command | Configure Installation Guide provides information about installing Command | Configure on supported client systems. The guide is available as part of the Command | Configure download.
- The Dell Command | Configure Command Line Interface Reference Guide provides information about configuring the Basic Input Output System (BIOS) options on supported Dell client systems.

Additionally, the Release Notes file, which is available as part of the Command | Configure download and at dell.com/clientsystemsmanagement, provides the latest available information for the installation and operation of Command | Configure.

Accessing documents from Dell support site

You can access the required documents in one of the following ways:

- Using the following links:
  - For all Enterprise Systems Management documents — dell.com/softwaresecuritymanuals
  - For Enterprise Systems Management documents — dell.com/openmanagemanuals
  - For Remote Enterprise Systems Management documents — dell.com/esmmanuals
  - For OpenManage Connections Enterprise Systems Management documents — dell.com/OMConnectionsEnterpriseSystemsManagement
  - For Serviceability Tools documents — dell.com/serviceabilitytools
  - For Client Systems Management documents — dell.com/clientsystemsmanagement
  - For OpenManage Connections Client Systems Management documents — dell.com/connectionsclientsystemsmanagement
- From the Dell Support site:
  a. Go to dell.com/support/home.
  c. In the Software & Security group box, click the required link from the following:
     - Enterprise Systems Management
     - Remote Enterprise Systems Management
     - Serviceability Tools
     - Client Systems Management
     - Connections Client Systems Management
  d. To view a document, click the required product version.
• Using search engines:
  – Type the name and version of the document in the search box.
Command | Configure graphical user interface

Dell Command | Configure Graphical User Interface (Command | Configure GUI) displays all BIOS configurations supported by Command | Configure. Using the Command | Configure GUI, you can do the following:

- Create BIOS configuration for client systems. For more information, see Creating a BIOS package using GUI.
- Validate the BIOS configuration against the BIOS configuration of the host system. For more information, see BIOS option validation.
- Export the customized BIOS configurations as a configuration file (INI or CCTK), Self-Contained Executable (SCE), shell script, or report. For more information, see Exporting the BIOS configuration.

**NOTE:** To apply the configuration using the Command | Configure Command Line Interface (CLI), run the required file (INI or CCTK or SCE).

Accessing Command | Configure from Microsoft Windows system

Click Start → All Programs → Dell → Command | Configure → Command Configure Command Prompt.

Accessing Command | Configure from Linux

Browse to /opt/Dell/toolkit/bin directory.

Files and folders of Command | Configure

The following table displays the files and folders of Command | Configure on systems running the Windows operating system.

<table>
<thead>
<tr>
<th>Files/Folders</th>

**Accessing the Command | Configure GUI**

**NOTE:** Command | Configure GUI is supported only on systems running the Windows operating system.

To access the GUI, click Start → All Programs → Dell → Command Configure → Configuration Wizard or double-click Dell Configuration Wizard on the desktop.

**Creating a BIOS package using GUI**

Using Command | Configure GUI, you can create a BIOS package containing valid settings to apply to the target client systems.

To create a BIOS package:

1. Access the Configuration wizard.
   For more information, see Accessing Command | Configure GUI.

   The **Create Multiplatform Package** section is displayed with the following configuration options.
   - **Create Multiplatform Package** — Click to view the BIOS settings that are supported on all possible client systems. Configure, validate, and export the settings as INI, CCTK, EXE, shell script, or HTML file.
   - **Create Local System Package** — Click to view the BIOS settings of the host system. Configure, validate, and export the settings as INI, CCTK, EXE, or HTML file. The file displays the supported and unsupported BIOS options for the system.
   - **Open a Saved Package** — Click to import a saved configuration file. Configure, validate, and export the settings as INI, CCTK, EXE, shell script, or HTML file.

   **NOTE:** To open a saved package, click Open a Saved Package, browse to the file location and then click Open.

2. Click the required option.

   All the options supported for configuration are displayed. For more information, see Configuration options.

3. Click Edit or double-click the option.

4. From the **Value to Set** drop-down list, select the values of the required option.

   The **Apply Settings** check box of the edited options are displayed as selected.

5. Select the required export option to export the edited options.

   For more information, see Exporting the BIOS configuration.

   **NOTE:** If you do not want to export an option, then clear the **Apply Settings** check box.

- Configuring auto on option
Configuration options

You can customize the BIOS settings and create a configuration package using the available configuration options in the following table.

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
</table>
| View/Change   | Click to view or change the selected configuration and load a new configuration. When you click **View/Change** to load a new configuration, the configuration screen is displayed. After you have made the preferred modifications, click **Save** to save the changes, or click **Cancel** to return to the previous configuration.  

NOTE: If you try to load a new configuration without exporting the configured BIOS options, then a screen is displayed. Click **Discard Changes** to discard the configured values or click **Cancel** to continue with the same configuration. |
| Edit          | Click to edit the loaded configuration.                                      |
| Advanced view | Click to view the configuration details such as command line options, possible values that you can set for the option, current value of the option, options to apply settings, and the description of the option.  

NOTE: You can view the current value of an option if you have loaded the settings of the host system. |
| Basic view    | Click to view the configuration details such as category to which the option belongs, name of the option, possible values that you can set for the option, current value of the option, options to apply settings, and the description of the option.  

NOTE: You can view the current value of an option if you have loaded the settings of the host system. |
| Validate      | Click to validate the loaded configuration against the configuration of the host system. For more information, see **BIOS option validation**. |
| Search        | Search a text in the table. Type the text in the search box and the first occurrence of the text in the table is highlighted. |
| Category      | Click to select the required categories from the drop-down list.  

NOTE: You can view this option only in **Basic View**. |
| Name          | Displays the name of the options.  

NOTE: You can view this option only in **Basic View**. |
### Options

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value to set</td>
<td>Displays the value of the option. Double-click the row or click <strong>Edit</strong> to change the values.</td>
</tr>
<tr>
<td>Present Value</td>
<td>Displays the current value of the option.</td>
</tr>
<tr>
<td>Apply settings</td>
<td>Select the check box to export the option. By default, all the options having a value in the <strong>Value to set</strong> column are selected.</td>
</tr>
<tr>
<td>Description</td>
<td>Displays a short description of the option.</td>
</tr>
<tr>
<td>Command Line Options</td>
<td>Displays the command line representation of the options.</td>
</tr>
<tr>
<td>Status</td>
<td>Displays the status of the options of the loaded configuration.</td>
</tr>
</tbody>
</table>

**NOTE:** You can view this option only in **Advance View**.

**NOTE:** The **Status** column is displayed only when you validate.

### Configuring the setuppwd and syspwd passwords

You can set or change the setup password (**setuppwd**) and the system password (**syspwd**).

To edit the setup or system password:

1. In the **Edit** mode, click the **Value to Set** text box of the required option. The corresponding password screen is displayed.

   **NOTE:** To display the password as clear text, select **Display password in clear text**. When you select **Display password in clear text**, then the **Confirm Password** text box is not displayed. Type the password in the **Password** text box.

   **NOTE:** The password must contain a minimum of four characters.

2. Type the same password in the **Confirm Password** text box to confirm the password. If both the entries match, then a green color check mark is displayed next to the **Confirm Password** text box, else a red X mark is displayed.

3. Click **Save**.

### Clearing setup and system passwords

You can clear the configured setup and system passwords.

To clear the passwords:

1. In the **Edit** mode, click the **Value to Set** text box of the required option. The corresponding password screen is displayed.

   **NOTE:** To display the password as clear text, select **Display password in clear text**. If you select **Display password in clear text**, then the **Confirm Password** text box is not displayed.

2. Enter a blank space in the **Password** text box.
3. Enter a blank space in the **Confirm Password** text box to confirm the password.
   If both the entries match, the a green check mark is displayed next to the **Confirm Password** text box, else, a red X mark is displayed.

4. Click **Save**.

**BIOS setup or system password screen**

Perform the following steps to export the BIOS configuration:

1. Click the **EXPORT.EXE** option to export the BIOS configuration as a an EXE file.
2. The **BIOS Setup** or **System Password** screen is displayed prompting you to type a password.
3. If the target system has a setup or system password, then select the **Use the password information below** option and type the same setup or system password in the **BIOS Setup** or **System Password** screen.
4. If the target system does not have a setup or system password, then select **No password is required**.

**Password protection screen**

While exporting a file or report with system or setup password, a password protection screen is displayed. To export the file with the password as clear text, click **Continue**. To export the file without the password, click **Mask**.

**Configuring the autoon option**

You can configure the days on which the system has to automatically turn on using the **autoon** option from the **Power and Performance Management** category.

To configure the days:

1. Click the required option:
   - **Create Multiplatform Package**
   - **Create Local System Package**
   - **Open a Saved Package**

   **NOTE**: To open a saved package, click **Open a Saved Package**, browse to the file location and then click **Open**.

2. Click **Edit** or double-click the option.
3. In the **autoon** option row, click **View/Change** in the **Value to set** column.
   The auto on screen is displayed.

4. Select one of the following options from **Dell Command | Configure** - **Auto On** screen.
   - **Disabled** — Select this option to turn off the feature.
   - **Weekdays** — Select this option to turn on the target system automatically only on weekdays.
   - **Every Day** — Select this option to turn on the target system automatically everyday.
   - **Selected Days** — Select this option to choose the days on which the target system has to turn on automatically.

5. Click **Save**.
Configuring the bootorder option

You can configure the boot order of a client system using the `bootorder` option from the Boot Management category. You can add, remove, enable, disable, or change the boot order of the legacy and Unified Extensible Firmware Interface (UEFI) boot items.

To configure the boot order:

1. Click the required option:
   - Create Multiplatform Package
   - Create Local System Package
   - Open a Saved Package

   **NOTE:** To open a saved package, click Open a Saved Package, browse to the file location and then click Open.

2. Click Edit or double-click the option.

3. In the bootorder option row, click View/Change in the Value to set column.
   The boot order screen is displayed with the current boot order type and boot order options. For more information, see Configure boot order.

   - To create a multiplatform package, you can add devices.
     **NOTE:** The multiplatform package supports only the legacy boot order.

   - To create a local system package and to open a saved package, you can add devices and edit the existing boot order, if present.
     **NOTE:** Use the arrow buttons at the bottom of the Dell Command | Configure - Boot Order screen to change the boot order of the devices.

   - Click Save to save the configuration, or click Cancel to discard the changes and close the Dell Command | Configure - Boot Order screen.

Related Links:

- Adding a new device to the boot order
- Boot order type

Boot order screen

The following table displays the available options on the Dell Command | Configure - Boot Order screen.

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device Type</td>
<td>Displays the type of device.</td>
</tr>
<tr>
<td>Device Instance</td>
<td>Displays a unique number to identify the device on the system.</td>
</tr>
<tr>
<td>Shortform</td>
<td>Displays the short form of the device name. If the system has many devices of the similar device type, then the short form of the device is displayed with a <code>&lt;number&gt;</code> notation. For example, if the system has an internal HDD, eSATA HDD, and eSATA Dock HDD, then the short forms are displayed as hdd.1, hdd.2, and hdd.3 respectively.</td>
</tr>
</tbody>
</table>
### Options

<table>
<thead>
<tr>
<th>Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Displays a short description for the device.</td>
</tr>
<tr>
<td>Status</td>
<td>Displays if the device is turned on or off.</td>
</tr>
<tr>
<td>Delete</td>
<td>Removes the device from the boot order. Click X to remove a device.</td>
</tr>
</tbody>
</table>

**NOTE:** You can view this option if the boot order screen is in **Edit** mode.

---

### Adding a new device to the boot order

To add a new device to the boot order:

1. Click **Add Device** on the Dell Command | Configure - Boot Order screen.
2. Select the device from the **Device Type** drop-down list. The **Shortform**, **Description**, and **Status** fields are automatically populated. By default, the **Status** of the device is displayed as **On**.
3. Select an instance for the device from the **Device Instance** drop-down list.
4. Click **Save**.

### Boot order type

The boot order type displays the type of the loaded configuration. The two types of boot orders are Legacy and UEFI. If the host system file is loaded, then it displays the currently active boot order type. If a saved file is loaded, then it displays the boot order type saved in the file.

The common scenarios for boot order type are:

- If boot order type is not specified in the file and if any UEFI devices are present on the system, then the system displays the boot order type as UEFI.
- If the boot order type is not specified in the file and if any legacy devices (other than hdd) are present on the system, then the system displays the boot order type as Legacy.
- If the boot order type is not specified and the loaded configuration file has only hdd items, then the system prompts the user to select the boot order type.
- If the boot order type is not specified for a legacy system and if both UEFI and legacy devices are present, then the system displays a warning message and removes the legacy or UEFI devices depending on the order of occurrence of the device.

### Configuring the primarybatterycfg option

You can configure the primary battery charging mode using the **primarybatterycfg** option from the **Power and Performance Management** category.

To configure the primary battery charging:

1. Click the required option:
   - **Create Multiplatform Package**
   - **Create Local System Package**
   - **Open a Saved Package**
NOTE: To open a saved package click **Open a Saved Package**, browse to the file location and then click **Open**.

2. Click **Edit** or double-click the option.

3. In the `primarybatterycfg` option row, click **View/Change** in the **Value to set** column.
   The primary battery screen is displayed.

4. Select the mode to charge the battery in the **Dell Command | Configure - Primary Battery Charging** screen.
   
   **NOTE:** If you have selected **Custom Charge**, then specify the **Start Charging (50 – 95 %)** and **Stop Charging (55 – 100 %)** values.

5. Click **OK**.

**Configuring the advbatterychargecfg option**

You can configure the advanced battery charging mode using the `advbatterychargecfg` option from the **Power and Performance Management** category. Advanced Battery charge mode uses standard charging algorithm and other methods during non-working hours to maximize battery health. During working hours, express charge is used to charge the batteries faster. You can configure the days and the work period during which the battery has to be charged. To enable advanced battery charging, provide the day, start time, and the duration of charging (optimal usage duration).

To configure the advanced battery charging:

1. Click the required option:
   - Create Multiplatform Package
   - Create Local System Package
   - Open a Saved Package

   **NOTE:** To open a saved package, click **Open a Saved Package**, browse to the file location and then click **Open**.

2. Click **Edit** or double-click the option.

3. In the `advbatterychargecfg` option row, click **View/Change** in the **Value to set** column.
   The **Dell Command | Configure - Advanced Battery Charge Configuration** screen is displayed.

4. Enable advanced battery charge.
   
   **NOTE:** If advanced battery charge mode is enabled in the **BIOS Setup** screen, the **Enable Advanced Battery Charge** is selected by default.

5. In the **Beginning Of Day** drop-down list, select the time at which the advanced charging has to start.

6. In the **Work Period** drop-down list, select the duration of advanced charging.

7. Click **OK**.

**Configuring the peakshiftcfg option**

You can configure the Peak Shift battery charging mode using the `peakshiftcfg` option from the **Power and Performance Management** category. Using Peak Shift configuration, you can minimize the consumption of AC power during the peak power usage period of the day. You can set a start and end time for the Peak Shift period. During this period, the system runs on battery, if the battery charge is above the set battery threshold value. After the Peak Shift period, the system runs on AC power without charging the battery. The system functions normally by using AC power and recharging the battery at the specified Charge Start Time.
To configure the peak shift battery charging:

1. Click the required option:
   - Create Multiplatform Package
   - Create Local System Package
   - Open a Saved Package

   **NOTE:** To open a saved package, click Open a Saved Package, browse to the file location and click Open.

2. Click Edit or double-click the option.

3. In the peakshiftcfg option row, click View/Change in the Value to set column.
   The Dell Command | Configure - Peak Shift Battery Settings screen is displayed.

4. Enable the peak shift settings option.

5. Select the day of the week.

   **NOTE:** To apply the same settings to all the days select the Apply these settings to other days check box.

6. From the Operate only on battery drop-down list, select the time from when you want the system to operate only on battery.

7. From the Operate only on AC drop-down list, select the time from when you want the system to operate only on AC.

8. From the Resume normal power/charge drop-down list, select the time from when the system has to start using the AC power and recharging the battery.

   **NOTE:** The system adjusts the value in the drop-down list to meet the following criteria:
   - Operate only on battery time should be less than or equal to the time specified for Operate only on AC.
   - Operate only on battery time and Operate only on AC time should be less than or greater than the Resume normal power/charge time.

9. Click OK.

   **NOTE:** Select Apply these settings to other days check box to apply the same settings for all days of the week.

**Advanced System Management**

Advanced System Management (ASM) is a feature supported on Dell Precision R7610, T5810, T7810, T7910 and later workstations. The feature displays information about voltage, temperature, current, cooling device, and power supply probes. The feature also allows you to set the non-critical upper threshold values of voltage, current, cooling, and temperature probes.

**Setting the noncritical threshold values**

**NOTE:** You can set the critical and non-critical upper threshold values only for voltage, current, cooling and temperature probes.

To set the non-critical threshold values for the probes:

1. Click the required option:
   - Create Multiplatform Package
- Create Local System Package
- Open a Saved Package

NOTE: To open a saved package, click Open a Saved Package, browse to the file location and then click Open.

2. Click Edit or double-click the option.
3. In the advsm option row, click View/Change in the Value to set column.

The Dell Command | Configure - Advanced System Management screen is displayed.

NOTE:
- If you are setting the non-critical threshold values for Create Local System Package, the columns displayed are: Description, Type, Index, Location, Minimum, Maximum, Critical Upper Threshold, NonCritical Upper Threshold, and Delete. The system displays the details of the available probes. You cannot edit the Type and Index fields of the listed probes.
- If you are setting the non-critical threshold values for Create Multiplatform System Package, the columns displayed are: Type, Index, NonCritical Upper Threshold, and Delete. The system does not display any values for the probes. You have to set the values for Index, and NonCritical Upper Threshold fields for each of the selected probes. Set the value of Index depending on the number of instances of the probes running on the system. The value of NonCritical Upper Threshold must be within the critical upper threshold range.

4. To set the non-critical threshold values for a new probe, click Add Probe, and then type the values in the required fields.
5. To set the non-critical threshold value for the listed probes, provide the value in the respective column.
6. To delete a probe, click X.
7. Click OK.

**BIOS option validation**

You can validate the options of a BIOS package against the configuration of the host system using the Validate option. You can validate the settings of a multiplatform package, local system package, or a saved package. You can validate all the options except the bootorder, syspwd, and setuppwd options.

**Validating a multiplatform package or saved package**

To validate the options of a multiplatform or saved package:

On the Create Multiplatform Package screen, click Validate.
- If the option and the configured value are supported on the host system, then a green check mark is displayed in the Status column.
- If the option is supported and if the configured value is not supported on the host system, then a red X mark is displayed in the Status column.
- All unsupported options are greyed out and the Status column remains blank.
- All the supported options on the host system are highlighted and the Status column remains blank with the Value to Set field as Not Specified.

**Validating a local system package**

To validate the options of a local system package:

On the Create Local System Package screen, click Validate.
• All the options that are applicable on the host system are highlighted and a green check mark is displayed in the **Status** column.
• All unsupported options are greyed out and the **Status** column remains blank.

**NOTE:** You can configure the supported options on the host system, even after you validate the local system package.

### Exporting the BIOS configuration

You can export a customized configuration to apply the same settings on a target client system. You can export both supported and unsupported options. You can export certain options (*asset* and *propowntag*) without specifying any values.

To export an option:

Select the **Apply Settings** check box of that option and then export in any of the following formats:

- **Self-Contained Executable** — Click **EXPORT.EXE** to export the configuration settings as a SCE (EXE file).
- **Report** — Click **Report** to export the configuration settings as read-only HTML file.
- **Configuration file** — Click **EXPORT CONFIG** to export the configuration settings as a CCTK or INI file.

**NOTE:** To display and configure the options on GUI, double-click the CCTK file.

- **Shell script** — The shell script is generated at the location where the SCE file is exported and contains the same configuration as that of the SCE file. The shell script is used to configure a system running the Linux operating system.

### Exporting the configuration without setting values

To export *asset* and *propowntag* without specifying changes to values:

Select the **Apply Settings** check box of the corresponding option and export.

### Target system configuration

You can apply the exported INI, CCTK, SCE, and shell script files to configure the target client systems.

**Related Links:**

- [Applying a INI or CCTK file](#)
- [Applying a shell script on Linux systems](#)
- [Applying a SCE file](#)

### Applying a INI or CCTK file

The prerequisites for applying a INI file or CCTK file:

- Administrator privileges
- Command | Configure installed on the client system

To apply a INI file or CCTK file, type `cctk -i <filename>`. 

18
Applying a shell script on Linux

1. Copy the script to a system running the Linux operation system.
2. Run dos2unix on the system.
3. Run the script as: sh <filename.sh>

Applying a SCE file

NOTE: You should have Administrator privileges.

To apply SCE on a target system:

Double-click the SCE, or from the command prompt, browse to the directory where SCE is located, and type the name of the SCE file.

For example, C:\Users\SystemName\Documents\"<filename>".

NOTE: You cannot run SCE on Windows PE systems. For more information on applying SCE on target systems running the Windows PE operating systems, see Troubleshooting.

SCE details

The common scenarios of using SCE are as follows:

• When you apply SCE on a target system, it performs a silent installation for the BIOS settings on the target system. When the installation is complete, SCE generates a log file with the SCE name at the same location. The log file contains all the applied options and the status of the SCE file.

  NOTE: To generate the log file in the required location, specify the location of the log file. For example, SCE.exe /l="<folder_path>\log.txt".

• When you apply SCE on a target system from a read-only location, provide the /nolog option to prevent generation of the log file. For example, SCE.exe /nolog. The /nolog option helps the SCE to run successfully and informs that a log file is not created as SCE is in a read-only location.

• If you run SCE from a read-only location without providing /nolog, then SCE fails to run.

• To apply SCE on Windows PE, extract SCE from a system running the Window operating system using the /e option. For example, SCE.exe/e=<folder_path_to extract SCE>.

• If you have configured a setup or system password on the target system, and while exporting SCE, if you have not provided the same password in the Configure | BIOS Setup Password or System Password screen, then you cannot double-click and apply SCE on the target system. However, while applying SCE from the command prompt, you can provide the setup or system password of the target system.

  NOTE: Example of providing setup password: C:\Windows\Command Configure \SCE"<filename>" --valsetuppwd= <password string>

  NOTE: Example of providing system password: C:\Windows\Command Configure \SCE"<filename>" --valsypwd= <password string>

Viewing a log file

Click Package History, on the Command | Configure page.

Deleting log details

On the Package History page, click the Clear Log.
Troubleshooting

Running Command | Configure displays error messages

If you get the following error message, Required BIOS interface not found or HAPI load error, then uninstall and reinstall Hardware Application Programming Interface (HAPI)

Running Command | Configure on 32-bit and 64-bit supported system

Ensure that you are running cctk.exe based on the architecture of the system. If you are running Command | Configure in a 32-bit supported system, in the installation directory, browse to the x86 directory and run Command | Configure commands. If you are running cctk.exe on a 64-bit supported system, then browse to the x86_64 directory, and run Command | Configure commands.

If you are running Command | Configure for 32-bit supported systems on a 64-bit supported system, then an error message is displayed: HAPI Driver Load Error.

If you are running Command | Configure for 64-bit supported systems on a 32-bit supported system, then an error message is displayed: Not a valid Win32 application.

Running Command | Configure on Windows Vista, Windows 7, Windows 8, Or Windows 8.1 when user account control is enabled

To run Command | Configure on systems running Windows Vista or later with User Account Control (UAC) enabled, right-click the Command | Configure Command Prompt and select Run as administrator.

NOTE: On a Windows Vista, Windows 7, Windows 8, or Windows 8.1, if UAC is enabled, then a user with Administrator privileges cannot install or uninstall Command | Configure in silent mode.

Running Command | Configure on Linux

When you install Command | Configure on system running the Linux operating system, the entry, modprobe dcdbas, is added in the /etc/rc.modules file. After uninstalling Command | Configure, this entry is not removed.
TPM activation

Trusted Platform Module (TPM) is an industry standard cryptographic module that provides attestation, integrity metrics and reporting, and a secure key hierarchy. Client systems use TPM to verify if the state of the system has changed between two boot cycles.

To activate and check the TPM activation:

1. If not set, set the BIOS password on the system. Type:
   ```bash
cctk --setuppwd=<new-BIOS-password>
   ```
2. If not enabled, enable TPM. by typing the following command:
   ```bash
cctk --tpm=on
   ```
3. Reboot the system.
4. To activate TPM, type the following command:
   ```bash
cctk --tpmactivation=activate --valsetuppwd=<Setuppwd>
   ```
5. Reboot the system without interruption till the operating system loads.
6. To check the status of TPM, type:
   ```bash
cctk --tpmactivation
   ```
   The status is displayed as **activate**.

SCE failing to run on Windows Preinstallation Environment (Windows PE)

The SCE generated using the Export option on the GUI is failing to run on Windows PE. To configure BIOS using SCE, on the target system running the Windows PE operating systems:

1. On systems running the Windows operating systems, extract the contents of SCE to a folder using the following command:
   ```bash
   Sce.exe /e=<folder_path_to_extract_contents>
   ```
   **NOTE:** For more information on using the command, use `/h` switch.
2. Copy the extracted contents to an accessible location on the system.
3. From the location of the extracted contents, run the following command to apply the configuration:
   ```bash
   applyconfig.bat /logfile <A valid and existing folder with write permission> \<A valid file name>
   ```
   For example, `applyconfig.bat /logfile C:\log.txt`

   To apply the configuration on a system, where setup or system password has been set, run the following command: `applyconfig.bat /logfile <A valid and existing folder with write permission> \<A valid file name> "--valsetuppwd= <setup password>"

   **Example 1:** `applyconfig.bat /logfile C:\log.txt "--valsetuppwd=password"

   **Example 2:** `applyconfig.bat /logfile C:\log.txt "--valsyspwd=password"`
Contacting Dell

NOTE: If you do not have an active Internet connection, you can find contact information on your purchase invoice, packing slip, bill, or Dell product catalog.

Dell provides several online and telephone-based support and service options. Availability varies by country and product, and some services may not be available in your area. To contact Dell for sales, technical support, or customer service issues:

1. Go to dell.com/support.
2. Select your support category.
3. Verify your country or region in the Choose a Country/Region drop-down list at the bottom of the page.
4. Select the appropriate service or support link based on your need.
