Integrated Dell Remote Access Controller With Lifecycle Controller

The Integrated Dell Remote Access Controller (iDRAC) is designed to enhance the productivity of server administrators and improve the overall availability of Dell servers. iDRAC achieves this by alerting administrators about the server problems, enabling remote server management, and reducing the need for an administrator to physically visit the server.

iDRAC with Lifecycle Controller allows administrators to deploy, update, monitor and manage Dell servers from any location without the use of agents in a one-to-one or one-to-many method. This out-of-band management allows the updates to be sent from Dell or appropriate third-party consoles directly to iDRAC with Lifecycle Controller on a Dell PowerEdge server, regardless of the operating system that may or may not be running.

- The Lifecycle Controller console provides local one-to-one deployment for operating system installation, updates, configuration, and for performing diagnostics on single local servers. This eliminates the need for multiple option ROMs for hardware configuration.
- The Lifecycle Controller Remote Services further enables remote systems management in a one-to-many method. Remote Services is accessible over the network using the secure Web services interface and can be programmatically utilized by applications and scripts. Remote services enable management consoles to perform one-to-many bare-metal server provisioning. The combination of the Auto-discovery feature to identify and authenticate the attached Dell system to the network and integration with one-to-many management consoles reduces the manual steps required for server setup and management. The interface is aimed at simplifying many tasks, some of which include remotely deploying an operating system, remote update and inventory, and remotely automating the
setup and configuration of new and already-deployed Dell systems. Developed on the industry standard Unified Extensible Firmware Interface (UEFI) platform and Web Services for Management (WSMAN) interfaces, Lifecycle Controller provides an open environment for console integration that also allows custom scripting for Lifecycle Controller.

iDRAC with Lifecycle Controller provides the following benefits:

- **Increase Availability** — Early notification of potential or actual failures can help prevent a server failure or reduce recovery time in the case of a failure.
- **Improve Productivity and Lower Total Cost of Ownership** — Extending the reach of administrators to larger numbers of distant servers can make IT staff more productive while reducing the operational costs such as travel.
- **Secured Connectivity** — By providing secure access to remote servers, administrators can carry out business-critical functions, while maintaining server and network security.
- **Simplified Management through Automation** — Lifecycle Controller provides local or remote automation through the Lifecycle Controller GUI and WS-Management, reducing overall steps and providing a repeatable process for systems management.

You can perform the following:

- The Dell servers (through iDRAC) can automatically check and update the latest firmware for various components from the network repository or directly from dell.com based on a recurring schedule. You can perform all the updates in a single reboot. It can establish firmware baselines for server groups.
- Automatically perform regular backups of the server configuration and firmware based on a recurring schedule.
- Automatically configure components in a server or multiple servers using DHCP provisioning and XML configuration files that iDRAC accesses from a network share.
- Automatically configure iDRAC to use the dedicated Network Interface Card (NIC) if a link is detected on the iDRAC dedicated NIC.

iDRAC shares Lifecycle Controller features such as firmware update, backup and restore, lifecycle log, and hardware inventory export. For complete information, see *iDRAC7 User’s Guide*, *iDRAC8 User’s Guide*, *Lifecycle Controller Graphical User Interface User’s Guide*, and *Lifecycle Controller Remote Services Quick Start Guide*.

**Dell Chassis Management Controller for Servers**

The Dell Chassis Management Controller is an embedded systems management hardware and software solution for managing multiple servers, IO modules, and shared power or cooling using either the Web interface or the command line interface. It provides a secure interface that enables an administrator to inventory, perform configuration, and monitor tasks, remotely turn on or turn off servers, and enable alerts for events on servers and components in the servers. The CMC leverages the iDRAC with Lifecycle Controller technology to update BIOS or component firmware and configure BIOS settings in a one-to-many operation.

CMC is available for the following chassis:

- Dell PowerEdge M1000e - This chassis is Dell’s first blade server solution. It provides the infrastructure (industry-leading power and cooling, networking, and blade manageability) for companies who choose to deploy blade-based server solutions. A single Chassis Management Controller interface with multi-chassis management capability can manage and see up to nine chassis, 288 servers, 54 power supplies, and 81 fans with no additional cabling. The chassis has slots for two, redundant CMC modules, so that administrators can connect to the chassis even if one Chassis Management Controller module is not working.
• Dell PowerEdge VRTX - The chassis is a revolutionary, easy-to-manage, remote and office-optimized platform that converge servers, storage and networking into a compact package. One of the key features is that it provides shared storage across multiple server nodes and the on-board RAID controller. It can hold up to four server nodes, up to 48 TB of integrated, shared storage, and network switching. The Dell PowerEdge VRTX offers the ability to use PCIe slots that no other blade server solution provides. By combining the density of blade servers with the flexibility of rack server I/O options with PowerEdge VRTX, Dell gives you the flexibility to use less expensive PCIe cards while still being managed through shared chassis management.

For complete information on CMC, see the following documents based on the chassis:

• Dell Chassis Management Controller for PowerEdge M1000e User’s Guide
• Dell Chassis Management Controller for PowerEdge VRTX User’s Guide

Dell OpenManage Server Administrator

The Dell OpenManage Server Administrator provides a comprehensive one-to-one systems management solution for both local and remote servers and their storage controllers and Direct Attached Storage (DAS). Server Administrator helps to:

• Simplify single-server-monitoring with a secure command line or Web-based management.
• View system configuration, health, and performance.
• View information about systems that are operating normally, systems that are having problems, and systems that require remote recovery operations.
• Shut down and restart the server.
• Perform functions for all the supported RAID and non-RAID controllers and enclosures from a single GUI, without using the Option ROM utilities.
• Send unique system identifiers such as system service tag, chassis service tag, and system FQDN and Enhanced Error Message Initiative (EEMI) messages (Message ID) with the SNMP trap varbinds.

To enable storage management through Server Administrator, the storage management service must be installed. This helps to:

• Configure a system’s locally-attached RAID and non-RAID disk storage using enhanced features.
• Configure data-redundancy, assign hot spares, import foreign disk configuration, or rebuild the failed physical disks to protect data.
• Generate Physical Disk firmware reports.

For complete information, see the Dell OpenManage Server Administrator User’s Guide and Dell OpenManage Server Administrator Storage Management User’s Guide available at dell.com/openmanagemanuals.

iDRAC Service Module

The iDRAC Service Module is a software application that is recommended to be installed on the server (it is not installed by default). This module complements iDRAC with monitoring information from the operating system. It does not have an interface but complements iDRAC by providing additional data to work with iDRAC interfaces such as the Web interface, RACADM, and WSMAN. You can configure the features monitored by the iDRAC Service Module to control the CPU and memory consumed on the server’s operating system.

The iDRAC Service Module provides the following monitoring features:

• Operating System information
- Replicate Lifecycle Controller logs to operating system logs
- Automatic system recovery options
- Populating Windows Management Instrumentation (WMI) information
- Integration with Technical Support Report. This is applicable only if iDRAC Service Module Version 2.0 or later is installed.
- Integration with NVMe Management for Prepare to Remove operation on a NVMe class PCIe SSD.

For more information, see the iDRAC User’s Guide available at dell.com/emsmanuals.

**Baseboard Management Controller Management Utilities**

The Basic Management monitors the system for critical events by communicating with various sensors on the system board and sends alerts and logs, events, when certain parameters exceed their preset thresholds. The Baseboard Management Controller supports the industry-standard Intelligent Platform Management Interface (IPMI) specification, enabling you to remotely configure, monitor, and recover systems.

For complete information, see the Dell Baseboard Management Controller Management Utilities User’s Guide available at dell.com/emsmanuals.

**OpenManage Client Instrumentation**

Client Instrumentation refers to software applications that enable remote management of a client system. The Dell OpenManage Client Instrumentation (OMCI) software enables remote management application programs to access the Dell Enterprise Client system information, monitor the status, or change the state of the system such as remotely shutting down the system. OMCI uses key system parameters through standard interfaces allowing administrators to manage inventory, monitor system health, and gather information of deployed Dell Enterprise client systems. For more information on OMCI, see the OpenManage Client Instrumentation User’s Guide available at dell.com/OMConnectionsClient.

OpenManage Essentials is a Dell hardware element management solution that is optimized for managing the Dell hardware infrastructure. It can be integrated to other point solutions to provide end-to-end IT infrastructure management. Hereafter, OpenManage Essentials replaces the legacy Dell IT Assistant.

For complete information, see the Dell OpenManage Essentials User’s Guide available at dell.com/openmanagemanuals.

Dell OpenManage Mobile

OpenManage Mobile is a software application that enables you to remotely and securely perform a subset of datacenter monitoring and server remediation tasks from your Android handheld device. OpenManage Mobile connects to your datacenter through the Dell OpenManage Essentials management console. This allows you to monitor all systems managed by OpenManage Essentials such as Dell servers, storage, networking, and Firewall appliances and any other supported third party appliance from your android mobile device.

OpenManage Mobile can also connect to a server directly through the iDRAC interface. Once connected, a user can perform several basic management functions directly on the server.

Key Features of OpenManage Mobile:

- Connect to multiple OpenManage Essentials installed servers from a single mobile device.
- Connect to multiple 12th and 13th generation servers individually through the iDRAC interface.
- Receive critical alert notification on your mobile device as they arrive into your OpenManage Essentials management console.
- Acknowledge, forward, and delete alerts from your mobile device.
- Browse through device details, firmware inventory, and event logs of individual systems.
- Perform several server management functions such as power on, power cycle, reboot, and shutdown from the mobile application.
Dell Remote Access Configuration Tool

Dell Remote Access Configuration Tool is a one-to-many application that discovers and configures iDRACs from a single console. It helps to:

- Discover or import iDRAC IP addresses on the network.
- Update firmware for the selected iDRACs.
- Configure standard or extended schema-based Active Directory settings for selected iDRACs.
- Create iDRAC objects on the Active Directory server for extended schema-based Active Directory.

For complete information, see Dell Remote Access Configuration Tool User’s Guide available at dell.com/esmmanuals.

Dell OpenManage Power Center

Dell OpenManage Power Center is a one-to-many application that can read power usage information from Dell servers, Power Distribution Units (PDU), and Uninterruptible Power Supplies (UPS). It can aggregate this information into rack, row, and room-level views. Additionally, for servers with the iDRAC Enterprise version, you can cap or throttle the amount of power consumed. This is done in response to a need to reduce consumption due to external events such as brownout and failure of data center cooling devices. Capping can also be used to safely increase the number of servers in a rack to match the power that has been provisioned to that rack. It helps to:

- Track power and thermal at rack, row, and room level
- Rack-level power capping
- Risk mitigation with predefined policies

For complete information, see Dell OpenManage Power Center User’s Guide available at dell.com/openmanagemanuals.

Dell Active System Manager

### Dell Repository Manager

The Dell Repository Manager is a standalone Windows-based application that helps simplify the process of managing downloads and baseline component configurations, firmware, and driver updates. Dell Repository Manager can compare differences between two repositories at the bundle and component level. It allows you to create deployment tools using a custom repository. The tool can create and manage repositories for servers, select PowerVault and EqualLogic storage, and Dell Optiplex/Dell Latitude/Dell Precision client systems.

Dell Repository Manager primarily utilizes the catalogs located on the Dell FTP site, but also provides the capability to search for newer files that are located on the Dell Support site. Additionally, Dell Repository Manager allows you to schedule searches for newer updates.

The Dell Repository Manager provides advanced integration capabilities with Dell OpenManage Essentials, Dell PowerEdge M1000e chassis, Dell OpenManage Integration for VMware vCenter that allows these programs to work with DRM to provide optimized repositories for accessing component updates.

The Dell Repository Manager supports the following features:
- User Query — Define filters for searching for the required updates.
- Custom Baseline — Define custom baseline configurations.
- Flexible Output — Get multiple output options to simplify BIOS and firmware updates, and driver provisioning during operating system deployment and post Operating system updates.
- Custom Repository — Define and manage a custom local repository that contains only the required updates.
- Search Latest Updates — Manually search the Dell support site for the latest updates or schedule operating system task to search the Dell support site.
- Manage a local repository — Compare a local repository with another repository (Dell online repository), check the differences, and then update the local repository.
- Jobs Queue services — Run time-consuming tasks at the background.
- Centralized Data Management — For customized repositories.
- Search Dell Support Site — Find updates that are newer than the versions available in the FTP Catalog.
- Scheduled Search for new updates — Set up a recurring search that discovers new updates when they are released

Dell Repository Manager can create the following:
- Custom Server Update Utility
- Light weight deployment pack
- Raw Data packs (INI files)

For complete information, see Dell Repository Manager User’s Guide available at dell.com/support/manuals.

Dell Update Packages

The Dell Update Package is a self-contained executable in a standard package format that updates an application or component firmware on a server.

DUPs are available for components such as system BIOS, Embedded Systems Management (ESM) firmware, iDRAC firmware, network firmware and drivers, Remote Access Controller firmware, RAID controller firmware and device drivers, NIC firmware, OpenManage application, and so on.

You can use DUPs to:
- Apply an individual update to a system by using an interactive command line interface (CLI).
- Install device drivers in interactive and non-interactive modes.
• Execute multiple updates on the system by using a script comprised of non-interactive commands that you write using the CLI feature.
• Leverage the scheduling of your operating system and software distribution utilities to apply updates remotely to any number of systems.

You can apply the updates using the operating system, iDRAC Web interface, RACADM CLI, or WSMAN interface.

For complete information, see Dell Update Package User’s Guide available at dell.com/openmanagemanuals.

Dell OpenManage Server Update Utility

The Dell Server Update Utility (SUU) is an application (available in both DVD or .iso format) for identifying and applying updates to your system. You can use this utility to update managed system or to view the updates available for systems that it supports. The application compares the versions of components currently installed on the system with the available updates for those components. You can download SUU from dell.com/support/manuals or order it as part of the OpenManage Subscription Kit. Additionally, use Dell Repository Manager to create a customized SUU that contains only the updates available for the systems that are managed.

For complete information, see Dell Server Update Utility User’s Guide available at dell.com/support/manuals.

Yellowdog Updater, Modified

The Yellowdog Updater, Modified repository provides updates for Red Hat and SuSE operating systems in the RPM Package Manager format that is utilized by the Open source YUM Tool.

Dell OpenManage System Build and Update Utility

The Dell System Build and Update Utility provides one-to-one and one-to-many deployment and single-server update capabilities in the pre-operating system environment. It:

• Provides quick and easy configuration of multiple servers from operating system installation to application setup.
• Simplifies single server updates with the latest system software features, including inventories, reports and prerequisite checks.
• Applies updates, manages reboot, and generates a final report.

For complete information, see the Dell OpenManage Systems Build and Update Utility User’s Guide available at dell.com/openmanagemanuals

NOTE: Dell Server Build and Update Utility (SBUU) will not be available in the releases following OpenManage 7.4. Dell recommends using Dell Lifecycle Controller 2 as replacement for SBUU.

Dell OpenManage Deployment Toolkit

The Dell OpenManage Deployment Toolkit includes a set of utilities for configuring and deploying Dell PowerEdge systems. It is designed for customers who want to build scripted installations to deploy large numbers of servers without making many changes to their current deployment process.
In addition to the command-line utilities used to configure various system features, the Deployment Toolkit also provides sample scripts and configuration files to perform common deployment tasks. These files and scripts describe the use of Deployment Toolkit in Microsoft Windows Pre-installation Environment (Windows PE), and embedded Linux environments. It helps to:

- Provide the tools necessary to automate the pre-operating system configuration tasks and the unattended operating system installation tasks when deploying PowerEdge systems.
- Scale to support one-to-many system deployment efforts.
- Facilitate consistent system configurations across multiple systems.
- Provide diverse and useful deployment tools that can be utilized in different ways.
- Manage RAID configuration.

For complete information, see the Dell Deployment Toolkit User’s Guide available at dell.com/support/manuals.

Remote Access Controller Administration

The RACADM command-line utility provides a scriptable interface that allows you to locally or remotely configure iDRAC. The RACADM utility runs on the management station and the managed system.

You must install DRAC Tool to use RACADM. For complete information, see the RACADM Command Line Reference Guide for iDRAC and CMC available at dell.com/support/manuals.

WSMAN Profiles

iDRAC with Lifecycle Controller implements Dell Common Information Model (DCIM) profiles that provide data and methods for multiple hardware subsystems. These profiles are provided through the WS-Management interface, which can be accessed remotely through several industry standard tools. For more information on the data available through DCIM profiles and the tools available for WS-MAN, see delltechcenter.com/lc.

Dell IPMITool

The Dell IPMITool are scriptable-console-application programs used to control and manage remote systems using the IPMI version 2.0 protocol.

For complete information, see the Dell Baseboard Management Controller Management Utilities User’s Guide available at dell.com/esmmanuals.

OpenManage Server Administrator Command Line Interface

Dell OpenManage Server Administrator provides a comprehensive, one-to-one systems management solution by using a command line interface (CLI). Server Administrator CLI has the following primary commands:

- omconfig — Allows you to configure the system’s hardware and direct attached storage.
- omhelp — Displays short text help for CLI commands.
- omreport — Displays reports of the management information of a system.

For complete information, see OpenManage Server Administrator Command Line Interface User’s Guide available at dell.com/support/manuals.

Dell Lifecycle Controller Integration (DLCI) for System Center Virtual Machine Manager

Dell Lifecycle Controller Integration (DLCI) for Microsoft System Center Virtual Machine Manager provides an embedded deployment solution to simplify and improve the operating system deployment on Dell Servers using remote deployment feature of the iDRAC with Lifecycle Controller. You can do the following:

• Check for server compliance — make sure that the Dell servers are compliant.
• Auto discover unassigned Dell servers — connect the factory delivered Dell servers to the network, power on the servers, and enter the provisioning server details for DLCI appliance to automatically discover the Servers. Servers discovered by appliance are known as unassigned servers and these servers are available for operating system deployment.
• Manually discover unassigned Dell servers — discover Dell servers 12th and 13th generation and deploy the servers into a virtual environment.
• View inventory of discovered servers — view key inventory details about the Dell Servers you want to deploy into a virtual environment.
• Prepare an ideal server configuration, also known as Golden Configuration — prepare a server with the required golden configuration and replicate this configuration on the servers that are deployed into the virtual environment.
• Edit and modify the golden configuration for boot order and BIOS.
• Create and maintain profiles and templates.
• Customize Microsoft Windows Pre-installation Environment (WinPE) — prepare customized WinPE images with the latest Dell OpenManage Deployment Toolkit (DTK) drivers.
• Deploy hypervisors with or without Lifecycle Controller (LC) Driver injection — from the DLCI appliance, perform hypervisor deployment based on the golden server configuration; replicating BIOS, RAID, and Boot Order settings. Leverage LC Driver Injection feature for the latest factory delivered servers, these servers are shipped with the latest driver packs.
• Install operating systems remotely on servers.
• Launch iDRAC Console from the DLCI Console to view inventory information and do troubleshooting.
• View information on jobs — view information logged for various jobs and tasks that are performed in the DLCI appliance.

Dell Server Management Operations

Dell's approach to systems management is centered on the server lifecycle – Deploy, Update, Monitor, and Maintain. To manage an infrastructure properly and efficiently, you must perform these functions easily and quickly. This allows you to invest more time and energy on business improvements, and less on maintenance.

The figure illustrates the various operations that can be performed during a server's lifecycle.

Figure 2. Server Lifecycle

The following table lists the products that are recommended for one-to-one and one-to-many operations, and when they are used in the server's lifecycle. However, you can use the one-to-many tools for one-to-one, and some of the one-to-one tools can be automated for one-to-many.
