</tbody>
</table>

**Usage Information**

The following describes the `show ip route all` command in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(undefined)</td>
<td>Identifies the type of route:</td>
</tr>
</tbody>
</table>
Field

Description

• C = connected
• S = static
• R = RIP
• B = BGP
• IN = internal BGP
• EX = external BGP
• LO = Locally Originated
• O = OSPF
• IA = OSPF inter area
• N1 = OSPF NSSA external type 1
• N2 = OSPF NSSA external type 2
• E1 = OSPF external type 1
• E2 = OSPF external type 2
• i = IS-IS
• L1 = IS-IS level-1
• L2 = IS-IS level-2
• IA = IS-IS inter area
• * = candidate default
• > = non-active route
• + = summary routes

The weight for weighted ECMP route calculations is displayed for each path in the route in the `show ip route` command. The ECMP weight is displayed only if weighted ECMP is enabled using the `ip ecmp weighted` command is enabled.

If weighted ECMP is disabled, the `show ip route` command does not show the weighted ECMP route information.

<table>
<thead>
<tr>
<th>Destination</th>
<th>Gateway</th>

Gateway of last resort is not set.
### Example (Summary)

**DellEMC# show ip route summary**

<table>
<thead>
<tr>
<th>Route Source</th>
<th>Active Routes</th>
<th>Non-active Routes</th>
</tr>
</thead>
<tbody>
<tr>
<td>connected</td>
<td>2</td>
<td>0</td>
</tr>
<tr>
<td>static</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>Total</td>
<td>3</td>
<td>0</td>
</tr>
</tbody>
</table>

Total 3 active route(s) using 612 bytes

### Example (vrf)

**DellEMC# show ip route vrf test1**

Codes: C - connected, S - static, R - RIP, B - BGP, IN - internal BGP, EX - external BGP, LO - Locally Originated, O - OSPF, IA - OSPF inter area, N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2, E1 - OSPF external type 1, E2 - OSPF external type 2, i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, IA - IS-IS inter area, * - candidate default, > - non-active route, + - summary route

Gateway of last resort is not set

### Example (Weighted ECMP Enabled)

**DellEMC(conf)# ip route 1.1.1.0/24 6.6.6.2 weight 100**

**DellEMC(conf)# ip route 1.1.1.0/24 6.6.6.2 weight 200**

**DellEMC(conf)# do show ip route**

Codes: C - connected, S - static, R - RIP, B - BGP, IN - internal BGP, EX - external BGP, LO - Locally Originated, O - OSPF, IA - OSPF inter area, N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2, E1 - OSPF external type 1, E2 - OSPF external type 2, i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, IA - IS-IS inter area, * - candidate default, > - non-active route, + - summary route

Gateway of last resort is not set

### Example (Weighted ECMP Disabled)

**DellEMC(conf)# ip route 1.1.1.0/24 6.6.6.2 weight 100**

**DellEMC(conf)# ip route 1.1.1.0/24 6.6.6.2 weight 200**

**DellEMC(conf)# do show ip route**
show ip route list

Display IP routes in an IP prefix list.

Syntax

```
show ip route [vrf vrf-name] list prefix-list
```

Parameters

- **prefix-list**: Enter the name of a configured prefix list.
- **vrf vrf-name**: Enter the keyword vrf followed by the name of the VRF to display IP routes in an IP prefix list corresponding to that VRF.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Related Commands**
- `ip prefix-list` — enter CONFIGURATION-IP PREFIX-LIST mode and configure a prefix list.
- `show ip prefix-list summary` — display a summary of the configured prefix lists.

**show ip route summary**

View a table summarizing the IP routes in the switch.

**Syntax**

```
show ip route [vrf vrf-name] [summary]
```

**Parameters**
- **vrf vrf-name**
  - Enter the keyword vrf followed by the name of the VRF to view information on the IP routes corresponding to that VRF.

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**

**Usage Information**
The following describes the `show ip route summary` shown in the following example.

<table>
<thead>
<tr>
<th>Column Heading</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Route Source</td>
<td>Identifies how the route is configured in Dell EMC Networking OS.</td>
</tr>
<tr>
<td>Active Routes</td>
<td>Identifies the best route if a route is learned from two protocol sources.</td>
</tr>
<tr>
<td>Non-active Routes</td>
<td>Identifies the back-up routes when a route is learned by two different protocols. If the best route or active route goes down, the non-active route becomes the best route.</td>
</tr>
<tr>
<td>ospf 100</td>
<td>If routing protocols (OSPF, RIP) are configured and routes are advertised, then information on those routes is displayed.</td>
</tr>
<tr>
<td>Total 1388 active...</td>
<td>Displays the number of active and non-active routes and the memory usage of those routes. If there are no routes configured in the Dell EMC Networking OS, this line does not appear.</td>
</tr>
</tbody>
</table>

**Example**

```
DellEMC> show ip route summary

Route Source  Active Routes  Non-active Routes
connected      17            0
static         3             0
ospf 100       1368           2
Intra-area: 762 Inter-area: 1 External-1: 600 External-2: 5
Total           1388          2
Total 1388 active route(s) using 222440 bytes
Total 2 non-active route(s) using 128 bytes
DellEMC>
```
show ip traffic

View IP, ICMP, UDP, TCP and ARP traffic statistics.

Syntax
show ip traffic [all | cp | rp1 | rp2]

Parameters
- **all** (OPTIONAL) Enter the keyword all to view statistics from all processors. If you do not enter a keyword, you also view all statistics from all processors.
- **cp** (OPTIONAL) Enter the keyword cp to view only statistics from the Control Processor.
- **rp1** (OPTIONAL) Enter the keyword rp1 to view only the statistics from Route Processor 1.
- **rp2** (OPTIONAL) Enter the keyword rp2 to view only the statistics from Route Processor 2.

Command Modes
- EXEC Privilege

Command History

7.5.1.0 Introduced on the C-Series.
Version | Description
---|---
6.5.1.0 | F10 Monitoring MIB available for the `ip traffic statistics` command.
pre-6.1.1.0 | Introduced on the E-Series.

Usage Information
The following describes the `show ip traffic summary` shown in the following example.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>unknown protocol...</td>
<td>No receiver for these packets. Counts packets whose protocol type field is not recognized by Dell EMC Networking OS.</td>
</tr>
<tr>
<td>not a gateway...</td>
<td>Packets can not be routed; the host/network is unreachable.</td>
</tr>
<tr>
<td>security failures...</td>
<td>Counts the number of received unicast/multicast packets that could not be forwarded due to:</td>
</tr>
<tr>
<td>• route not found for unicast/multicast; ingress interfaces do not belong to the destination multicast group</td>
<td></td>
</tr>
<tr>
<td>• destination IP address belongs to reserved prefixes; the host/network is unreachable</td>
<td></td>
</tr>
<tr>
<td>bad options...</td>
<td>Unrecognized IP option on a received packet.</td>
</tr>
<tr>
<td>Frags:</td>
<td>IP fragments received.</td>
</tr>
<tr>
<td>... reassembled</td>
<td>Number of IP fragments that were reassembled.</td>
</tr>
<tr>
<td>... timeouts</td>
<td>Number of times a timer expired on a reassembled queue.</td>
</tr>
<tr>
<td>... too big</td>
<td>Number of invalid IP fragments received.</td>
</tr>
<tr>
<td>... couldn’t fragment</td>
<td>Number of packets that could not be fragmented and forwarded.</td>
</tr>
<tr>
<td>...encapsulation failed</td>
<td>Counts packets which could not be forwarded due to ARP resolution failure. Dell EMC Networking OS sends an arp request prior to forwarding an IP packet. If a reply is not received, Dell EMC Networking OS repeats the request three times. These packets are counted in encapsulation failed.</td>
</tr>
<tr>
<td>Rcvd:</td>
<td></td>
</tr>
<tr>
<td>...short packets</td>
<td>The number of bytes in the packet are too small.</td>
</tr>
<tr>
<td>...bad length</td>
<td>The length of the packet was not correct.</td>
</tr>
<tr>
<td>...no port broadcasts</td>
<td>The incoming broadcast/multicast packet did not have any listener.</td>
</tr>
<tr>
<td>...socket full</td>
<td>The applications buffer is full and the incoming packet are dropped.</td>
</tr>
</tbody>
</table>

The Dell Monitoring MIB provides access to the following statistics.

- **IP Statistics: Bcast: Received**: Object = f10BcastPktRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.1
- **IP Statistics: Bcast: Sent**: Object = f10BcastPktSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.2
- **IP Statistics: Mcast: Received**: Object = f10McastPktRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.3
- **IP Statistics: Mcast: Sent**: Object = f10McastPktSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.1.4
- **ARP Statistics: Rcvd: Request**: Object = f10ArpReqRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.1
- **ARP Statistics: Rcvd: Replies**: Object = f10ArpReplyRecv, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.2
- **ARP Statistics: Sent: Request**: Object = f10ArpReqSent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.3
- **ARP Statistics: Sent: Replies**: Object = f10ArpReplySent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.4
- **ARP Statistics: Sent: Proxy**: Object = f10ArpProxySent, OIDs = 1.3.6.1.4.1.6027.3.3.5.2.5
Example

DellEMC# show ip traffic
Control Processor IP Traffic:

   IP statistics:
   Rcvd: 23857 total, 23829 local destination
       0 format errors, 0 checksum errors, 0 bad hop count
       0 unknown protocol, 0 not a gateway
       0 security failures, 0 bad options
   Frags: 0 reassembled, 0 timeouts, 0 too big
       0 fragmented, 0 couldn't fragment
   Bcast: 20 received, 0 sent; Mcast: 0 received, 0 sent
   Sent: 16048 generated, 0 forwarded
       21 encapsulation failed, 0 no route

   ICMP statistics:
   Rcvd: 0 format errors, 0 checksum errors, 0 redirects, 0 unreachable
       0 echo, 0 echo reply, 0 mask requests, 0 mask replies, 0 quench
       0 parameter, 0 timestamp, 0 info request, 0 other
   Sent: 0 redirects, 0 unreachable, 0 echo, 0 echo reply
       0 mask requests, 0 mask replies, 0 quench, 0 timestamp
       0 info reply, 0 time exceeded, 0 parameter problem

   UDP statistics:
   Rcvd: 0 total, 0 checksum errors, 0 no port
       0 short packets, 0 bad length, 0 no port broadcasts, 0 socket full
   Sent: 0 total, 0 forwarded broadcasts

   TCP statistics:
   Rcvd: 23829 total, 0 checksum errors, 0 no port
   Sent: 16048 total

   ARP statistics:
   Rcvd: 156 requests, 11 replies
   Sent: 21 requests, 10 replies (0 proxy)

Routing Processor1 IP Traffic:

show tcp statistics

View information on TCP traffic through the switch.

Syntax

show tcp statistics {all | cp}

Parameters

all

Enter the keyword all to view all TCP information.

cp

Enter the keyword cp to view only TCP information from the Control Processor.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
### Version | Description
---|---
9.8(2.0) | Introduced on the S3100 series.  
9.8(1.0) | Introduced on the Z9100-ON.  
9.8(0.0P5) | Introduced on the S4048-ON.  
9.8(0.0P2) | Introduced on the S3048-ON.  
9.2(1.0) | Introduced on the Z9500.  
9.0.2.0 | Introduced on the S6000.  
8.3.19.0 | Introduced on the S4820T.  
8.3.11.1 | Introduced on the Z9000.  
8.3.7.0 | Introduced on the S4810.  
8.1.1.0 | Introduced on the E-Series.  
6.4.1.0 | Introduced

**Usage Information**

The following describes the `show tcp statistics cp` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Rcvd:** | Displays the number and types of TCP packets received by the switch.  
- Total = total packets received  
- no port = number of packets received with no designated port |
| **0 checksum error...** | Displays the number of packets received with the following:  
- checksum errors  
- bad offset to data  
- too short |
| **329 packets...** | Displays the number of packets and bytes received in sequence.  
- 17 dup... | Displays the number of duplicate packets and bytes received.  
- 0 partially... | Displays the number of partially duplicated packets and bytes received.  
- 7 out-of-order... | Displays the number of packets and bytes received out of order.  
- 0 packets with data after window | Displays the number of packets and bytes received that exceed the switch’s window size.  
- 0 packets after close | Displays the number of packet received after the TCP connection was closed.  
- 0 window probe packets... | Displays the number of window probe and update packets received.  
- 41 dup ack... | Displays the number of duplicate acknowledgement packets and acknowledgement packets with data received.  
- 10184 ack... | Displays the number of acknowledgement packets and bytes received.  
- Sent: | Displays the total number of TCP packets sent and the number of urgent packets sent.  
- 25 control packets... | Displays the number of control packets sent and the number retransmitted.  

IPv4 Routing
### Field Description

- **11603 data packets...** Displays the number of data packets sent.
- **24 data packets retransmitted** Displays the number of data packets resent.
- **355 ack...** Displays the number of acknowledgement packets sent and the number of packet delayed.
- **0 window probe...** Displays the number of window probe and update packets sent.
- **7 Connections initiated...** Displays the number of TCP connections initiated, accepted, and established.
- **14 Connections closed...** Displays the number of TCP connections closed, dropped.
- **20 Total rxmt...** Displays the number of times the switch tried to re-send data and the number of connections dropped during the TCP retransmit timeout period.
- **0 Keepalive...** Lists the number of keepalive packets in timeout, the number keepalive probes and the number of TCP connections dropped during keepalive.

### Example

```sh
dellEMC# show tcp stat cp
Control Processor TCP:
Rcvd: 10585 Total, 0 no port
  0 checksum error, 0 bad offset, 0 too short
  329 packets (1263 bytes) in sequence
  17 dup packets (6 bytes)
  0 partially dup packets (0 bytes)
  7 out-of-order packets (0 bytes)
  0 packets ( 0 bytes) with data after window
  0 packets after close
  0 window probe packets, 41 window update packets
  41 dup ack packets, 0 ack packets with unsend data
  10184 ack packets (12439508 bytes)
Sent: 12007 Total, 0 urgent packets
  25 control packets (including 24 retransmitted)
  11603 data packets (12439677 bytes)
  24 data packets (7638 bytes) retransmitted
  355 ack only packets (41 delayed)
  0 window probe packets, 0 window update packets
  7 Connections initiated, 8 connections accepted, 15 connections established
  14 Connections closed (including 0 dropped, 0 embryonic dropped)
  20 Total rxmt timeout, 0 connections dropped in rxmt timeout
  0 Keepalive timeout, 0 keepalive probe, 0 Connections dropped in keepalive
```
IPv6 Access Control Lists (IPv6 ACLs)

IPv6 ACLs and IPv6 Route Map commands are supported on Dell EMC Networking OS.

NOTE: For IPv4 ACL commands, see Access Control Lists (ACL).

Important Points to Remember

- Certain platforms require manual CAM usage space allotment. For more information, see `cam-acl`.
- Egress IPv6 ACL and IPv6 ACL on the Loopback interface is not supported.
- Reference to an empty ACL permits any traffic.
- ACLs are not applied to self-originated traffic (for example, Control Protocol traffic not affected by IPv6 ACL because the routed bit is not set for Control Protocol traffic and for egress ACLs the routed bit must be set).
- You can use the same access list name for both IPv4 and IPv6 ACLs.
- You can apply both IPv4 and IPv6 ACLs on an interface at the same time.
- You can apply IPv6 ACLs on physical interfaces and a logical interfaces (Port-channel/VLAN).
- Non-contiguous masks are not supported in source or destination addresses in IPv6 ACL entries.
- Because the prefix mask is specified in /x format in IPv6 ACLs, inverse mask is not supported.

Topics:

- show cam-acl-egress
- show cam-acl
- permit icmp
- permit
- ipv6 control-plane egress-filter
- ipv6 access-list
- cam-acl-egress
- cam-acl

show cam-acl-egress

Show information on FP groups allocated for egress ACLs.

Syntax

```
show cam-acl-egress
```

Command Modes

- EXEC
- EXEC Privilege
Command History

Related Commands
- `cam-acl` — configure CAM profiles to support IPv6 ACLs.

**permit icmp**

To allow all or specific internet control message protocol (ICMP) messages, configure a filter.

**Syntax**

```
permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} [message-type] [count [byte]] | [log] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.
Parameters

**source address**
Enter the IPv6 address of the network or host from which the packets were sent in the x:x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128. The :: notation specifies successive hexadecimal fields of zero.

**mask**
Enter a network mask in /prefix format (/x).

**host ipv6-address**
Enter the keyword host then the IPv6 address of the host in the x:x:x:x::x format. The :: notation specifies successive hexadecimal fields of zero.

**destination address**
Enter the IPv6 address of the network or host to which the packets are sent in the x:x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128. The :: notation specifies successive hexadecimal fields of zero.

**count**
(Optional) Enter the keyword count to count packets the filter processes.

**byte**
(Optional) Enter the keyword byte to count bytes the filter processes.

**log**
(Optional) Enter the keyword log to have the information kept in an ACL log file.

**monitor**
(Optional) Enter the keyword monitor to monitor traffic on the monitoring interface specified in the flow-based monitoring session along with the filter operation.

Defaults
Not configured.

</tbody>
</table>
To configure a filter that matches the filter criteria, select an IPv6 protocol number, ICMP, IPv6, TCP, or UDP.

### Syntax

`permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter’s sequence number
- Use the `no permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

### Parameters

</table>

ipv6 access-list

Configure an access list based on IPv6 addresses or protocols.

**Syntax**

ipv6 access-list access-list-name cpu-qos

To delete an access list, use the no ipv6 access-list access-list-name command.

**Parameters**

- **access-list-name**
  - Enter the access list name as a string, up to 140 characters.
- **cpu-qos**
  - Enter the keyword cpu-qos to assign this ACL to control plane traffic only (CoPP).
- **permit**
  - Enter the keyword permit to configure a filter to forward packets meeting this condition.
deny Enter the keyword deny to configure a filter to drop packets meeting this condition.

ospfv3 Specify that this ACL is for OSPFv3 control plane traffic

**Defaults**

All access lists contain an implicit "deny any"; that is, if no match occurs, the packet is dropped.

**Command Modes**

CONFIGURATION

**Command History**

</tr>
<tr>
<td>7.4.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

The number of entries allowed per ACL is hardware-dependent. For detailed specification on entries allowed per ACL, refer to your line card documentation. You can create an IPv6 ACL for control-plane traffic policering for OSPFv3, in addition to the CoPP support for VRRP, BGP, and ICMP.
Allocate space for IPv6 egress ACLs.

Syntax

```plaintext
cam-acl-egress {default | l2acl 1-4 ipv4acl 1-4 ipv6acl 0-4}
```

Parameters

- **default**: Use the default CAM profile settings, and set the CAM as follows:
  - L2 ACL (l2acl): 1
  - L3 ACL (ipv4acl): 1
  - IPv6 L3 ACL (ipv6acl): 2

- **l2acl 1-4 ipv4acl 1-4 ipv6acl 0-4**: Allocate space to support IPv6 ACLs. Enter all of the profiles and a range. Enter the CAM profile name then the amount to be allotted. The total space allocated must equal 4. The ipv6acl range must be a factor of 2.

Command Modes

- **CONFIGURATION**

Command History

<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.8.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>
**Usage Information**

For the new settings to take effect, save the new CAM settings to the startup-config (write-mem or copy run start), then reload the system.

The total amount of space allowed is 4 FP Blocks.

**Example**

```
DellEMC# configure
DellEMC(conf)# cam-acl-egress ?
default  Reset Egress CAM ACL entries to default setting
l2acl    Set L2-ACL entries
DellEMC(conf)# cam-acl-egress l2acl ?
<1-4>    Number of FP blocks for l2acl
DellEMC(conf)# cam-acl-egress l2acl 1 ?
ipv4acl  Set IPV4-ACL entries
DellEMC(conf)# cam-acl-egress l2acl 1 ipv4acl ?
ipv6acl  Set IPV6-ACL entries
DellEMC(conf)# cam-acl-egress l2acl 1 ipv4acl 1 ?
ipv6acl  <0-4>    Number of FP blocks for IPV6 (multiples of 2)
DellEMC(conf)# cam-acl-egress l2acl 1 ipv4acl 1 ipv6acl 2
DellEMC(conf)#
```

---

**cam-acl**

Allocate space for IPv6 ACLs.

**Syntax**

```
cam-acl {default | l2acl 1-10 ipv4acl 1-10 ipv6acl 0-10 ipv4qos 1-10 l2qos 1-10}
```

**Parameters**

- **default**
  - Use the default CAM profile settings, and set the CAM as follows:
    - L3 ACL (ipv4acl): 6
    - L2 ACL(l2acl): 5
    - IPv6 L3 ACL (ipv6acl): 0
    - L3 QoS (ipv4qos): 1
    - L2 QoS (l2qos): 1

- **l2acl 1-10 ipv4acl 1-10 ipv6acl 0-10 ipv4qos 1-10 l2qos 1-10**
  - Allocate space to support IPv6 ACLs. Enter all of the profiles and a range. Enter the CAM profile name then the amount to be allotted. The total space allocated must equal 13. The `ipv6acl` range must be a factor of 2 (2, 4, 6, 8, 10).

<tr>
<td>8.2.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.8.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

For the new settings to take effect, save the new CAM settings to the startup-config (write-mem or copy run start) then reload the system.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks and these blocks cannot be reallocated. The `ipv4acl` profile range is from 1 to 4.

When configuring space for IPv6 ACLs, the total number of Blocks must equal 13.

Ranges for the CAM profiles are from 1 to 10, except for the `ipv6acl` profile which is from 0 to 10. The `ipv6acl` allocation must be a factor of 2 (2, 4, 6, 8, 10).
IPv6 Basics

IPv6 basic commands are supported on the Dell EMC Networking OS.

NOTE: For information about the Dell EMC Networking OS version and platform that supports IPv6 in each software feature, see the IPv6 Addressing section in the Dell EMC Networking OS Configuration Guide.

cam-ipv6 extended-prefix

Enable LPM partitioning to support IPv6 /65 to /128 route prefixes to be stored in Partition 1.

Syntax
cam-ipv6 extended-prefix <Max-IPv6-prefixes>

To remove LPM partitioning configuration, use no cam-ipv6 extended-prefix.

Parameters
Max-IPv6-Prefix Maximum number of IPv6 prefixes in the mask length of /65 to /128. The possible values are 1024, 2048, and 3072.

Defaults
LPM is not partitioned with Partition 1 and therefore /65 to /128 prefixes are not converted to /64 prefixes and are installed and saved in LPM. All the packets for those routes traverse through the default route path.

Command Modes
CONFIGURATION

Command History
Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S6100-ON.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.3(0.0) Introduced on the S6000.

Usage Information
You can partition the LPM table to store IPv6 prefixes greater than /64 mask length. Requires reboot of the switch to take effect as the SDK handles this only during its initialization.

clear ipv6 fib

Clear (refresh) all forwarding information base (FIB) entries on a stack unit.

Syntax
clear ipv6 fib [vrf vrf-name] stack-unit unit-number

Parameters
vrf vrf-name (Optional) Enter the keyword vrf followed by the name of the VRF to clear the neighbor corresponding to that VRF.
NOTE: If you do not specify this option, neighbors corresponding to the default VRF are cleared.

**slot**
Enter the slot number to clear the FIB.

**unit-number**
Enter the stack member number. The range is from 1 to 6.

**clear ipv6 route**
Clear (refresh) all or a specific route from the IPv6 routing table.

**Syntax**
clear ipv6 route [vrf vrf-name] { * | ipv6-address prefix-length }

**Parameters**
- **vrf vrf-name** (Optional) Enter the keyword vrf followed by the name of the VRF to clear the IPv6 routes corresponding to that VRF.
- *****
Enter the * to clear (refresh) all routes from the IPv6 routing table.
- **ipv6-address prefix-length** Enter the IPv6 address in the x::x::x format then the prefix length in the /x format. The range is from /0 to /128.

**NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**Command Modes**
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**
- 9.8(0.0P5)
- Introduced on the S4048-ON.
- 9.8(0.0P2)

maximum dynamic-routes-ipv6

Specify the maximum number of dynamic (protocol) IPv6 routes a VRF can have.

Syntax

```
maximum dynamic-routes-ipv6 limit {warn-threshold threshold-value | warning-only}
```

To remove the limit on the maximum number of IPv6 routes used, use the no maximum dynamic-routes-ipv6 command.

Parameters

- **limit**: Maximum number of IPv6 routes allowed in a VRF. Valid range is from 1 to 8000 (or maximum allowable for that platform if smaller value).
- **warn-threshold**: Warning threshold value is expressed as a percentage of the limit value. When the number of IPv6 routes reaches the specified percentage of the limit, a warning message is generated. Valid range is 1 to 100. When warn-threshold is used, once the limit is reached, additional routes will not be allowed into the RTM (route table manager) itself.
- **warning-only**: When the warning-only option is used, a syslog message will be thrown when maximum number of dynamic IPv6 routes reaches the limit. Additional dynamic IPv6 routes will still be allowed.

Defaults

No limit is set on the maximum number of dynamic IPv6 routes for a VRF.

Command Modes

- CONFIGURATION-VRF

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500.</td>
</tr>
</tbody>
</table>

Usage Information

If the maximum IPv6 route limit is not specified for a VRF (valid range is from 1 to 8000), then it has unlimited space that extends to the maximum number of entries allowed for the system. This command is not applicable to the default and management VRFs.
ipv6 address autoconfig

Configure IPv6 address auto-configuration for the management interface.

Syntax

ipv6 address autoconfig

To disable the address autoconfig operation on the management interface, use the no ipv6 address autoconfig command.

Default

Disabled

Command Modes

INTERFACE (management interface only)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

Usage Information

- SAA can configure up to two addresses. If any preferred prefix or valid timers time out, the corresponding address are deprecated or removed. If an address is removed due to a time-out, an address from the current unused prefix is used to create a new address. If there are no remaining prefixes, the software waits to receive a new prefix from the RA.
- If auto-configuration is enabled, all IPv6 addresses on that management interface are auto-configured. Manual and auto-configurations are not supported on a single management interface.
- Removing auto-configuration removes all auto-configured IPv6 addresses and the link-local IPv6 address from that management interface.
- IPv6 addresses on a single management interface cannot be members of the same subnet.
- IPv6 secondary addresses on management interfaces across a platform must be members of the same subnet.
- IPv6 secondary addresses on management interfaces should not match the virtual IP address and should not be in the same subnet as the virtual IP.

ipv6 address

Configure an IPv6 address to an interface.

Syntax

ipv6 address {ipv6-address prefix-length}

To remove the IPv6 address, use the no ipv6 address {ipv6-address prefix-length} command.
Parameters

ipv6-address prefix-length

- Enter the IPv6 address in the x:x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128.

NOTE: The :: notation specifies successive hexadecimal fields of zeros.

Defaults

None

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
9.1(0.0) Updated Usage Information.
9.0.0.0 Introduced on the Z9000.
8.3.19.0 Introduced on the S4820T.
8.3.7.0 Introduced on the S4810.
8.4.1.0 Added support on the management Ethernet port.
8.2.1.0 Introduced on the E-Series.
7.8.1.0 Introduced on the C-Series and S-Series.
7.4.1.0 Introduced on the E-Series.

Usage Information

- If two addresses are configured, delete an existing address before configuring a new address.
- If the last manually-configured global IPv6 address is removed using the “no” form of the command, the link-local IPv6 address is removed automatically.
- IPv6 addresses on a single management interface cannot be members of the same subnet.
- IPv6 secondary addresses on management interfaces across platform must be members of the same subnet.
- IPv6 secondary addresses on management interfaces should not match the virtual IP address and should not be in the same subnet as the virtual IP.

NOTE: Do not use the /128 prefix length on physical or port channel interfaces. You can use the /128 prefix length on loopback interfaces.

Example

DellEMC(conf)# interface tengigabitethernet 1/2
DellEMC(conf-if-te-1/2)# ipv6 address ?
X:X:X:X:x IPv6 address
DellEMC(conf-if-te-1/2)# ipv6 address 2002:1:2::3 ?
<0-128> Prefix length in bits
DellEMC(conf-if-te-1/2)# ipv6 address 2002:1:2::3 /96 ?
<cr>
DellEMC(conf-if-te-1/2)# ipv6 address 2002:1:2::3 /96
DellEMC(conf-if-te-1/2)# show config
ipv6 address eui64

Configure IPv6 EUI64 address configuration on the interface.

Syntax

```
ipv6 address {ipv6-address prefix-length} eui64
```

To disable IPv6 EUI64 address autoconfiguration, use the `no ipv6 address {ipv6-address prefix-length} eui64` command.

Parameters

- `ipv6-address prefix-length` Enter the IPv6 prefix in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.

  **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

Defaults

None

Command Modes

<td>Introduced on the Z9500.</td>
</tr>
<tr>
<td>9.2(0.2)</td>
<td>Introduced.</td>
</tr>
</tbody>
</table>

Usage Information

This command allows you to create an EUI64 address based on the specified prefix and MAC address only. Prefixes may be configured on the interface using the `ipv6 nd prefix` command without creating an EUI64 address.

Example

```
DellEMC(conf)# int ten 1/4
DellEMC(conf-if-te-1/4)# ipv6 address 200:1::/64 eui64
DellEMC(conf)# int ten 1/6
DellEMC(conf-if-te-1/6)# ipv6 address 801:10::/64 eui64
```
**ipv6 control-plane icmp error-rate-limit**

Configure the maximum number of ICMP error packets per second that can be sent per second.

**Syntax**

```
ipv6 control-plane icmp error-rate-limit {1-200}
```

To restore the default value, use the `no ipv6 control-plane icmp error-rate-limit` command.

**Parameters**

- **pps**
  
  Enter the maximum number of error packets generated per second. The range is from 1 to 200, where 0 disables the rate-limiting.

**Default**

100 pps

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**ipv6 flowlabel-zero**

Configure system to set the flow label field in the packets to zero.

**Syntax**

```
ipv6 flowlabel-zero
```

To disable the 0 from being set in the field and allow the protocol operations to fill the field, use the `no ipv6 flowlabel-zero` command.

**Default**

Disabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Version Description
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.

Usage Information
If the flowlabel value is already set for BGP or SSH, the system defaults to the already configured value. All packets on the same connection are considered part of the same flow by the system. For new connections, set the new flowlabel to zero.

**ipv6 host**

Assign a name and IPv6 address the host-to-IPv6 address mapping table uses.

**Syntax**

```
ipv6 host name ipv6-address
```

To remove an IP host, use the `no ipv6 host name {ipv6-address}`.

**Parameters**

- **name**
  - Enter a text string to associate with one IP address.
- **ipv6-address**
  - Enter the IPv6 address (X::X::X::X) to be mapped to the name.

**Defaults**
Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
**ipv6 name-server**

Enter up to six IPv6 addresses of name servers. The order you enter the addresses determines the order of their use.

**Syntax**

```
ipv6 name-server ipv6-address [ipv6-address2... ipv6-address6]
```

To remove a name server, use the `no ipv6 name-server ipv6-address` command.

**Parameters**

- `ipv6-address` Enter the IPv6 address (X::X::X) of the name server to be used.
  
  Note: The :: notation specifics successive hexadecimal fields of zeros.

- `ipv6-address2... ipv6-address6` (OPTIONAL) Enter up to five more IPv6 addresses, in the x:x:x:x::x format, of name servers to be used. Separate the IPv6 addresses with a space.

**Defaults**

None

**Command Modes**

CONFIGURATION

</tr>
</tbody>
</table>

**Usage Information**

You can separately configure both IPv4 and IPv6 domain name servers.

In a dual stack setup, the system sends both A (request for IPv4 — RFC 1035) and AAAA (request for IPv6 — RFC 3596) record requests to a DNS server even if only the `ip name-server` command is configured.

**ipv6 nd dad attempts**

To perform duplicate address detection (DAD) on an interface, configure the number of neighbor solicitation messages that are sent.

**Syntax**

```
ipv6 nd dad attempts {number of attempts}
```
To restore the default value, use the `no ipv6 nd dad attempts` command.

**Parameters**

`number of attempts` Enter the number of attempts to be made to detect a duplicate address. The range is from 0 to 15. Setting the value to 0 disables DAD on the interface.

**Default**

3 attempts

**Command Modes**

INTERFACE (management interface only)

**Command History**

</tr>
</tbody>
</table>

### ipv6 nd dns-server

Configures Recursive DNS Server (RDNSS) addresses to be distributed via IPv6 router advertisements to an IPv6 device.

**Syntax**

```
ipv6 nd dns-server {ipv6-RDNSS-address} {lifetime | infinite}
```

To remove the IPv6 RDNS configuration, use `no ipv6 nd dns-server {ipv6-RDNSS-address} {lifetime | infinite}`
### Parameters

- **ipv6-RDNSS-address**
  - Enter the IPv6 Recursive DNS Server’s (RDNSS) address. You can specify up to 4 IPv6 RDNSS server addresses.

- **lifetime**
  - Enter the lifetime in seconds. The amount of time the IPv6 host can use the IPv6 RDNSS address for name resolution. The range is 0 to 4294967295 seconds. When you specify the maximum lifetime value of 4294967295 or `infinite`, the lifetime does not expire. A value of 0 indicates to the host that the RDNSS address should not be used. You must specify a lifetime using the `lifetime` or `infinite` parameter.

- **infinite**
  - Enter the keyword `infinite` to specify that the RDNSS lifetime does not expire.

### Defaults

- Not configured

### Command Modes

- INTERFACE CONFIG

### Command History

</tr>
<tr>
<td>9.5(0.0)</td>
<td>Introduced on the Z9000, S6000, S4810, S4820T, and MXL..</td>
</tr>
</tbody>
</table>

### Usage Information

Use this command to add, edit, or delete an IPv6 RDNSS address and lifetime value. You can configure up to four IPv6 RDNSS addresses. You must specify a lifetime using the `lifetime` or `infinite` parameter.

### Example

```
DellEMC(conf-if-te-1/1)# ipv6 nd dns-server 1000::1 1
```

### ipv6 nd prefix

Specify which IPv6 prefixes are included in Neighbor Advertisements.

- **Syntax**
  ```
  ipv6 nd prefix {ipv6-prefix | prefix-length | default} [no-advertise] | [no-autoconfig] [no-rtr-address] [off-link] [lifetime {valid | infinite} {preferred | infinite}]
  ```

- **Parameters**
  - **ipv6-prefix**
    - Enter an IPv6 prefix.
  - **prefix-length**
    - Enter the prefix then the prefix length. The length range is from 0 to 128.
Enter the keyword `default` to set default parameters for all prefixes.

Enter the keyword `no-advertise` to prevent the specified prefix from being advertised.

Enter the keywords `no-autoconfig` to disable Stateless Address Autoconfiguration.

Enter the keyword `no-rtr-address` to exclude the full router address from router advertisements (the R bit is not set).

Enter the keywords `off-link` to advertise the prefix without stating to recipients that the prefix is either on-link or off-link.

Enter the amount of time that the prefix is advertised, or enter `infinite` for an unlimited amount of time. The range is from 0 to 4294967295. The default is 2592000. The maximum value means that the preferred lifetime does not expire for the valid-lifetime parameter.

Enter the amount of time that the prefix is preferred, or enter `infinite` for an unlimited amount of time. The range is from 0 to 4294967295. The default is 604800. The maximum value means that the preferred lifetime and does not expire.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.3.2.0 Introduced on the E-Series, C-Series, and S-Series.

**Usage Information**

By default, all prefixes configured as addresses on the interface are advertised. This command allows control over the individual parameters per prefix; you can use the `default` keyword to use the default parameters for all prefixes. If a prefix has been configured with lifetime parameter values, the default values cannot be applied using the `ipv6 nd prefix default no-autoconfig` command.

### ipv6 nd reachable-time

Configure the amount of time before an IPv6 neighbor is considered unreachable.

**Syntax**

```
ipv6 nd reachable-time reachable-time
```

To restore to default, use the `no ipv6 nd reachable-time` command.

**Parameters**

- `reachable-time` Enter the reachable time in milliseconds. The value is from 0 to 3600000. The default value is 0.
Default: Disabled

Command Modes: INTERFACE

Command History: This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Legacy version</td>
<td>Introduced on the S series and Z series.</td>
</tr>
</tbody>
</table>

**ipv6 route**

Establish a static IPv6 route.

**Syntax**

```
ipv6 route [vrf vrf-name] ipv6-address prefix-length [ipv6-address | interface | interface ipv6-address] [distance] [tag value] [permanent] [weight weight-value]
```

To remove the IPv6 route, use the `no ipv6 route` command.

**Parameters**

- **vrf vrf-name** (Optional) Enter the keyword vrf followed by the name of the VRF to install IPv6 routes in that VRF.
- **ipv6-address prefix-length** Enter the IPv6 address in the x::x::x format then the prefix length in the /x format. The range is from /0 to /128.
  
  **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

- **interface** (OPTIONAL) Enter the following keywords and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a Null interface, enter the keyword null then the Null interface number.
  - For a tunnel interface, enter the keyword tunnel then the tunnel interface number. The range is from 1 to 16383.
  - For a VLAN interface, enter the keyword VLAN then the vlan number. The range is from 1 to 4094.

If you configure a static IPv6 route using an egress interface and enter the `ping` command to reach the destination IPv6 address, the `ping` operation may not work. Configure the IPv6 route using a next-hop IPv6 address in order for the `ping` command to detect the destination address.
ipv6-address  (OPTIONAL) Enter the forwarding router IPv6 address in the x:x:x:x::x format.

NOTE: The :: notation specifies successive hexadecimal fields of zeros.

distance  (OPTIONAL) Enter a number as the metric distance assigned to the route. The range is from 1 to 255.

tag-value  (OPTIONAL) Enter the keyword tag then a tag value number. The range is from 1 to 4294967295.

permanent  (OPTIONAL) Enter the keyword permanent to specify that the route is not to be removed, even if the interface assigned to that route goes down.

NOTE: If you disable the interface with an IPv6 address associated with the keyword permanent, the route disappears from the routing table.

weight weight-value  Enter the keyword weight followed by a weight value. The range is from 0 to 255.

NOTE: Weight for a static route can be added only for the destination address and not for the route pointing to destination a interface.

Defaults  None

Command Modes  CONFIGURATION

Command History  This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version   Description
9.10(0.1)   Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)   Introduced on the S3148.
9.10(0.0)   Introduced on the S6100-ON.
9.8(2.0)    Introduced on the S3100 series.
9.8(1.0)    Introduced on the Z9100-ON.
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)    Added support for VRF. Also included the weight parameter to support weighted ECMP feature. Introduced on the S6000-ON.
9.2(1.0)    Introduced on the Z9500.
9.0.0.0      Introduced on the Z9000.
8.3.19.0     Introduced on the S4820T.
8.3.7.0      Introduced on the S4810.
8.5.1.0      Added support for 4-port 40G line cards on the E-Series.
8.2.1.0      Introduced on the E-Series.
7.8.1.0      Introduced on the C-Series and S-Series.
7.4.1.0      Introduced on the E-Series.
Usage Information

When the interface goes down, Dell EMC Networking OS withdraws the route. The route is re-installed, by Dell EMC Networking OS, when the interface comes back up. When a recursive resolution is “broken,” Dell EMC Networking OS withdraws the route. The route is re-installed, by Dell EMC Networking OS, when the recursive resolution is satisfied.

After an IPv6 static route interface is created, if an IP address is not assigned to a peer interface, the peer must be manually pinged to resolve the neighbor information.

You can specify a weight for an IPv4 or IPv6 static route. If the weight value of a path is 0, then that path is not used for forwarding when weighted ECMP is in effect. Also, if a path corresponding to a static route (destination) has a non-zero weight assigned to it and other paths do not have any weight configured, then regular ECMP is used for forwarding.

You can specify the weight value only to destination address and not on the egress port.

A route is considered for weighted ECMP calculations only if each paths corresponding to that route is configured with a weight.

Example

```
DellEMC(conf)# ipv6 route 44::/64 33::1 weight 100
DellEMC(conf)# ipv6 route 44::/64 33::2 weight 200
DellEMC(conf)# do show running-config | grep ipv6 route
DellEMC(conf)# ipv6 route vrf vrf_test 44::/64 33::1 weight 100
DellEMC(conf)# ipv6 route vrf vrf_test 44::/64 33::2 weight 200
DellEMC(conf)# do show running-config | grep ipv6 route vrf
```

Related Commands

- `show ipv6 route` — view the IPv6 configured routes.

**ipv6 unicast-routing**

Enable IPv6 unicast routing on the device.

```
Syntax
ipv6 unicast-routing

To disable unicast routing, use the `no ipv6 unicast-routing` command.
```

### Version Description

- **8.3.19.0**: Introduced on the S4820T.
- **8.3.7.0**: Introduced on the S4810.
- **8.4.2.1**: Introduced on the S-Series.
- **8.2.1.0**: Introduced on the E-Series.
- **7.8.1.0**: Introduced on the C-Series.
- **7.4.1.0**: Introduced on the E-Series.

#### Usage Information

Because this command is enabled by default, it does not appear in the running configuration. When you disable unicast routing, the `no ipv6 unicast-routing` command is included in the running configuration. Whenever unicast routing is disabled or re-enabled, DellEMC Networking OS generates a syslog message indicating the action.

Disabling unicast routing on an E-Series chassis causes the following behavior:

- static and protocol learned routes are removed from RTM and from the CAM; packet forwarding to these routes is terminated
- connected routes and resolved neighbors remain in the CAM and new IPv6 neighbors are still discoverable
- additional protocol adjacencies (OSPFv3 and BGP4) are brought down and no new adjacencies are formed
- the IPv6 address family configuration (under router bgp) is deleted
- IPv6 Multicast traffic continues to flow unhindered

---

### show ipv6 cam stack-unit

Displays the IPv6 CAM entries for the specified stack-unit.

#### Syntax

```plaintext
show ipv6 cam [vrf vrf-name] stack-unit unit-number port-set {0-1} [summary | index | ipv6-address]
```

#### Parameters

- **vrf vrf-name** (Optional) Enter the keyword `vrf` followed by the name of the VRF to display IPv6 CAM entries corresponding to that VRF.

  **NOTE:** If you do not specify this option, IPv6 CAM entries corresponding to the default VRF are displayed.

- **unit-number** Enter the stack unit's ID number.
- **port-set** Enter the keyword `Port Set`.
- **summary** (OPTIONAL) Enter the keyword `summary` to display a table listing network prefixes and the total number prefixes which can be entered into the IPv6 CAM.
- **index** (OPTIONAL) Enter the index in the IPv6 CAM.
- **ipv6-address** Enter the IPv6 address in the `x:x:x:x/x` format to display networks that have more specific prefixes. The range is from `/0` to `/128`. 
NOTE: The :: notation specifies successive hexadecimal fields of zeros.

Defaults
None

Command Modes
- EXEC
- EXEC Privilege

Command History

</tr>
</tbody>
</table>

Usage Information
NOTE: If a route has a mask greater than 64, no output is displayed and no output is displayed for show ipv6 cam stack-unit unit-number port-set {0-1} ipv6-address, but an equivalent /64 entry would be listed in the show ipv6 cam stack-unit unit-number port-set {0-1} output. Similarly, if there is more than one ECMP object with a destination route that has a mask greater than 64, if the first 64 bits in the destination routes of the ECMP objects are the same, only one route is installed in CAM even though multiple ECMP path entries exist.

NOTE: The self address is displayed in the neighbor portion for the show ipv6 cam stack-unit unit-number port-set command.

show ipv6 control-plane icmp
Displays the status of the icmp control-plane setting for the error eate limit setting.

Syntax
show ipv6 control-plane icmp

Default
100

show ipv6 fib stack-unit

View all FIB entries.

Syntax

show ipv6 fib [vrf vrf-name] stack-unit unit-number [summary | ipv6-address]

Parameters

vrf vrf-name
(Optional) Enter the keyword vrf followed by the name of the VRF to display neighbors corresponding to that VRF.

slot-number
Enter the number of the stack unit.

summary
(Optional) Enter the keyword summary to view a summary of entries in IPv6 cam.

ipv6-address
Enter the IPv6 address in the x:x:x:x::x/n format to display networks that have more specific prefixes. The range is from /0 to /128.

NOTE: The :: notation specifies successive hexadecimal fields of zeros.

show ipv6 interface

Display the status of interfaces configured for IPv6.

Syntax

show ipv6 interface interface {slot | slot/port[/subport]} [brief] [configured] [stack-unit id]

Parameters

interface (OPTIONAL) Enter the following keywords and slot/port or number information:
- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
- For a port channel interface, enter the keywords port-channel then a number.
- For a Null interface, enter the keyword null then the Null interface number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.
- For stacking, enter the keywords `stack-unit` then the stack-unit ID.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel ID.

**brief**
(Optional) View a summary of IPv6 interfaces.

**configured**
(Optional) View information on all IPv6 configured interfaces.

**managementethernet slot/port**
(Optional) View information on an IPv6 Management port. Enter the slot number (0-1) and port number zero (0).

**loopback**
(Optional) View information for IPv6 Loopback interfaces.

**port-channel**
(Optional) View information for IPv6 port channels.

**tengigabitethernet**
(Optional) View information for an IPv6 tengigabitethernet interface.

**fortyGigE**
(Optional) View information for an IPv6 fortygigabitethernet interface.

**stack-unit id**
(Optional) View information for stacking.

**tunnel tunnel-id**
(Optional) View information for a tunnel interface.

**vlan**
(Optional) View information for IPv6 VLANs.

ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 198 to 600 seconds
ND router advertisements live for 1800 seconds
ND advertised hop limit is 64
IPv6 hop limit for originated packets is 64
IPv6 unicast RPF check is not supported

Example (Brief)
DellEMC# show ipv6 interface brief
TenGigabitEthernet 1/2            [administratively down/down]
  fe80::201:e8ff:fea7:497e
  2002::1:::3/96
TenGigabitEthernet 1/12          [up/up]
  fe80::201:e8ff:fea7:497e
  100::2/64
ManagementEthernet 1/1           [up/up]
  fe80::201:e8ff:fea7:497e
  300::1/64

Example (Tunnel)
DellEMC# show ipv6 interface tunnel 1
Tunnel 1 is up, line protocol is up
IPv6 is enabled
Link Local address: fe80::201:e8ff:fea7:497e
Global Unicast address(es):
  400::1, subnet is 400::/64 (MANUAL)
  Remaining lifetime: infinite
Global Anycast address(es):
Joined Group address(es):
  ff02::1
  ff02::2
  ff02::1:ff00:1
  ff02::1:fffa7:497e
ND MTU is 0
ICMP redirects are not sent
DAD is enabled, number of DAD attempts: 3
ND reachable time is 20410 milliseconds
show ipv6 mld_host

Display the IPv6 MLD host counters.

Syntax
show ipv6 mld_host

Command Modes
EXEC

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.

Usage Information
The following describes the show ipv6 mld-host command shown in the following example.

Field Description
Valid MLD Packets The total number of packets received and sent from the last time the elapsed time was cleared.
Reports The total number of reports (queries and unsolicited reports generated from joins or leaves) that have been received or sent.
Leaves The number of Multicast leaves that have been sent.
MLDv1 queries The number of MLDv1 queries that have been received.
MLDv2 queries The number of MLDv2 queries that have been received.
Malformed Packets The number of MLDv1 and MLDv2 packets that do not match the requirement for a valid MLD packet.

Example
MLD Host Traffic Counters
Elapsed time since counters cleared: 0028:33:52
Received  Sent
Valid MLD Packets 97962  18036
show ipv6 route

Displays the IPv6 routes.

Syntax

show ipv6 route [ipv6-address prefix-length] [vrf vrf-name] [hostname] [all] [bgp as number] [connected] [isis tag] [list prefix-list name] [ospf process-id] [rip] [static] [summary]

Parameters

ipv6-address prefix-length (OPTIONAL) Enter the IPv6 address in the x:x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128.

NOTE: The :: notation specifies successive hexadecimal fields of zeros.

vrf vrf-name (Optional) Enter the keyword vrf followed by the name of the VRF to display IPv6 routes corresponding to that VRF.

NOTE: If you do not specify this option, routes corresponding to the default VRF are displayed.

hostname (OPTIONAL) View information for this IPv6 routes with Host Name.

all (OPTIONAL) View information for all IPv6 routes.

bgp (OPTIONAL) View information for all IPv6 BGP routes.

connected (OPTIONAL) View only the directly connected IPv6 routes.

isis (OPTIONAL) View information for all IPv6 IS-IS routes.

list (OPTIONAL) View the IPv6 prefix list.

ospf (OPTIONAL) View information for all IPv6 OSPF routes.

rip (OPTIONAL for E-Series only) View information for all IPv6 RIP routes.

static (OPTIONAL) View only routes configured by the ipv6 route command.

summary (OPTIONAL) View a brief list of the configured IPv6 routes.

Defaults

none

Command Modes

• EXEC
• EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

**Example (S-Series)**

```text
DellEMC# show ipv6 route

Codes:  C - connected,  L - local,  S - static,  R - RIP,  
        B - BGP,  IN - internal BGP,  EX - external BGP,  LO - Locally Originated,  
        O - OSPF,  IA - OSPF inter area,  N1 - OSPF NSSA external type 1,  
        N2 - OSPF NSSA external type 2,  E1 - OSPF external type 1,  
        E2 - OSPF external type 2,  i - IS-IS,  L1 - IS-IS level-1,  
        L2 - IS-IS level-2,  IA - IS-IS inter area,  * - candidate default,  
Gateway of last resort is not set

Destination    Dist/Metric,      Gateway,   Last Change
-------------------------------------------------------------
C    100::/64 [0/0]                  Direct, Te 1/12/1, 20:00:18
C    400::/64 [0/0]                  Direct, Tu 1, 00:09:02
S    800::/64 [1/0]                  via 100::1, Te 1/12/1, 00:00:50
        via 100::1, Te 1/12/1, 00:00:50
L    fe80::/10 [0/0]                  Direct, Nu 0, 20:00:18
DellEMC#
```

**Example (Summary)**

```text
show ipv6 route summary:

DellEMC# show ipv6 route summary

Route Source     Active Routes   Non-active Routes
connected         3              0
static            1              0
Total             4              0
Total 4 active route(s) using 928 bytes
DellEMC#
```

**trust ipv6-diffserv**

Allows the dynamic classification of IPv6 DSCP.

**Syntax**

```
trust ipv6-diffserv
```

To remove the definition, use the `no trust ipv6-diffserv` command.

**Defaults**

None

**Command Modes**

CONFIGURATION-POLICY-MAP-IN
**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>8.3.19.0</td>

<tr>
<td>8.2.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
<tr>
<td>7.4.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

When you configure trust IPv6 diffserv, matched bytes/packets counters are not incremented in the `show qos statistics` command.

Trust diffserv (IPv4) can co-exist with trust ipv6-diffserv in an Input Policy Map. Dynamic classification happens based on the mapping as shown:

<table>
<thead>
<tr>
<th>IPv6 Service Class Field</th>

</tr>
</tbody>
</table>
Internet small computer system interface (iSCSI) optimization enables quality-of-service (QoS) treatment for iSCSI storage traffic on Dell EMC Networking OS platforms.

To configure and verify the iSCSI optimization feature, use the following Dell EMC Networking OS commands.

Topics:

- advertise dcbx-app-tlv
- iscsi aging time
- iscsi cos
- iscsi enable
- iscsi priority-bits
- iscsi profile-compellant
- iscsi target port
- show iscsi
- show iscsi session
- show iscsi session detailed
- show run iscsi

advertise dcbx-app-tlv

Configure DCBX to send iSCSI TLV advertisements.

Syntax

advertise dcbx-app-tlv iscsi

To disable DCBX iSCSI TLV advertisements, use the no advertise dcbx-app-tlv iscsi command.

Defaults
Disabled.

Command Modes
PROTOCOL LLDP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>

</tr>
</tbody>
</table>
**iscsi aging time**

Set the aging time for iSCSI sessions.

**Syntax**

```plaintext
iscsi aging time time
```

To remove the iSCSI session aging time, use the `no iscsi aging time` command.

**Parameters**

- `time`: Enter the aging time for the iSCSI session. The range is from 5 to 43,200 minutes.

**Defaults**

- `10 minutes`

**Command Modes**

- `CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>

</tr>
</tbody>
</table>

**iscsi cos**

Set the QoS policy that is applied to the iSCSI flows.

**Syntax**

```plaintext
iscsi cos {enable | disable | dot1p vlan-priority-value [remark] | dscp dscp-value [remark]}
```

To disable the QoS policy, use the `no iscsi cos` command.

**Parameters**

- `enable`: Enter the keyword `enable` to allow the application of preferential QoS treatment to iSCSI traffic so that the iSCSI packets are scheduled in the switch with a dot1p priority 4 regardless of the VLAN priority tag in the packet. The default is: the iSCSI packets are handled with dotp1 priority 4 without remark.
**disable**
Enter the keyword `disable` to disable the application of preferential GoS treatment to iSCSI frames.

**dot1p vlan-priority-value**
Enter the dot1p value of the VLAN priority tag assigned to the incoming packets in an iSCSI session. The range is from 0 to 7. The default is the dot1p value in ingress iSCSI frames is not changed and is the same priority is used in iSCSI TLV advertisements if you did not enter the `iscsi priority-bits` command.

**dscp dscp-value**
Enter the DSCP value assigned to the incoming packets in an iSCSI session. The valid range is from 0 to 63. The default is: the DSCP value in ingress packets is not changed.

**remark**
Marks the incoming iSCSI packets with the configured dot1p or DSCP value when they egress to the switch. The default is: the dot1and DSCP values in egress packets are not changed.

**Defaults**
Disabled.

**Command Modes**
CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>8.3.16.0</td>
<td>Introduced on MXL 10/40GbE Switch IO Module.</td>
</tr>
</tbody>
</table>

**Usage Information**
By default, iSCSI flows are assigned to dot1p priority 4.

---

**iscsi enable**

Globally enable iSCSI optimization.

**Syntax**

```
iscsi enable
```

To disable iSCSI optimization, use the `no iscsi enable` command.

**Parameters**

- **enable**
  Enter the keyword `enable` to enable the iSCSI optimization feature.

**Defaults**
Disabled.

**Command Modes**
CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
**iscsi priority-bits**

Configure the priority bitmap that advertises in the iSCSI application TLVs.

**Syntax**

```plaintext
iscsi priority-bits
```

To remove the configured priority bitmap, use the no iscsi priority-bits command.

**Defaults**

4 (0x10 in the bitmap)

**Command Modes**

PROTOCOL LLDP (only on the global, not on the interface)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**iscsi profile-compellant**

Configure the auto-detection of Dell Compellent arrays on a port.

**Syntax**

```plaintext
iscsi profile-compellant
```

**Defaults**

Dell Compellent disk arrays are not detected.

**Command Modes**

INTERFACE
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

### iscsi target port

Configure the iSCSI target ports and optionally, the IP addresses on which iSCSI communication is monitored.

**Syntax**

```
iscsi target port 
```

To remove the configured iSCSI target ports or IP addresses, use the `no iscsi target port` command.

**Parameters**

- `tcp-port-2...tcp-port-16`  
  - Enter the tcp-port number of the iSCSI target ports. The `tcp-port-n` is the TCP port number or a list of TCP port numbers on which the iSCSI target listens to requests. Separate port numbers with a comma. The default is `860, 3260`.

- `ip-address`  
  - Enter the ip-address that the iSCSI monitors. The ip-address specifies the IP address of the iSCSI target. (Optional)

**Defaults**

`860, 3260`  

**Command Modes**

`CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>

<tr>
<td>8.3.12.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.16.0</td>
<td>Introduced on MXL 10/40GbE Switch IO Module.</td>
</tr>
</tbody>
</table>
Usage Information

You can configure up to 16 target TCP ports on the switch in one command or multiple commands.

When you use the `no iscsi target port` command and the TCP port you wish to delete is one bound to a specific IP address, the IP address value must be included in the command.

show iscsi

Display the currently configured iSCSI settings.

Syntax

show iscsi

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Example

```
DellEMC# show iscsi
iSCSI is enabled
iSCSI session monitoring is disabled
iSCSI COS : dot1p is 4 no-remark
Session aging time: 10
Maximum number of connections is 256
------------------------------------------------
iSCSI Targets and TCP Ports:
-----------------------------------------------
TCP Port Target IP Address
3260
860
```

Related Commands

- `show iscsi session` — display information about active iSCSI sessions on the switch.
- `show iscsi session detailed` — display detailed information about active iSCSI sessions on the switch.
- `show run iscsi` — show run iscsi.
show iscsi session

Display information about active iSCSI sessions on the switch.

Syntax

    show iscsi session

Command Modes

    • EXEC
    • EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

Example

DellEMC# show iscsi session
Session 0:
---------------------------------------------
Target: iqn.2001-05.com.equallogic:0-8a0906-0e70c2002-10a0018426a48c94-iom010
Initiator: iqn.1991-05.com.microsoft:win-x9l8v27yajg
ISID: 400001370000

Session 1:
---------------------------------------------
Target: iqn.2001-05.com.equallogic:0-8a0906-0f60c2002-0360018428d48c94-iom011
Initiator: iqn.1991-05.com.microsoft:win-x9l8v27yajg
ISID: 400001370000.

Usage Information

Only sessions the switch observes are learned; sessions flowing through an adjacent switch are not learned.

After the switch is reloaded, any information exchanged during the initial handshake is not available. If the switch picks up the communication after reloading, it would detect a session was in progress but could not obtain complete information for it. Any incomplete information of this type would not be available in the show commands.

Related Commands

    • show iscsi — display the currently configured iSCSI settings.
    • show iscsi session detailed — display detailed information about active iSCSI sessions on the switch.
    • show run iscsi — show run iscsi.
Show iSCSI session detailed

Display detailed information on active iSCSI sessions on the switch.

Syntax

```
show iscsi session detailed [session isid]
```

Parameters

- **isid**: Enter the session's iSCSI ID to display detailed information about the specified iSCSI session.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

- `show iscsi session detailed` — display detailed information on active iSCSI sessions on the switch.
Intermediate System to Intermediate System (IS-IS)

IS-IS is an interior gateway protocol that uses shortest-path-first algorithm. IS-IS facilitates the communication between open systems, supporting routers passing through both IP and OSI traffic.

A router is considered as an intermediate system. Networks are partitioned into manageable routing domains called areas. Intermediate systems send, receive, and forward packets to other routers within their area (Level 1 and Level 1-2 devices). Only Level 1-2 and Level 2 devices communicate with other areas.

IS-IS protocol standards are listed in the Standard Compliance chapter in the Dell EMC Networking OS Configuration Guide.

NOTE: The fundamental mechanisms of IS-IS are the same for IPv4 and IPv6. However some command modes might vary when applied to IPv4 and IPv6. These variations have been explicitly explained for such commands. If the variation is not mentioned, then the information applies to both the protocol versions.

- graceful-restart t3
adjacency-check

Verify that the “protocols supported” field of the IS-IS neighbor contains matching values to this router.

Syntax  adjacency-check
To disable adjacency check, use the `no adjacency-check` command.

**Defaults**

Enabled.

**Command Modes**

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

To perform protocol-support consistency checks on hello packets, use this command. The adjacency-check is enabled by default.

If a BFD session goes down indicating that IPv4 or IPv6 connectivity to its neighbor is lost, it does not imply that the adjacency is lost altogether. The hello adjacency runs over Layer 2, and does not require IP connectivity. However, if IPv4 connectivity is lost to a neighbor, then when the next SPF calculation is performed, the system ensures that it does not calculate any IPv4 or IPv6 routes through that neighbor.

**advertise**

Leak routes between levels (distribute IP prefixes between Level 1 and Level 2 and vice versa).

**Syntax**

```text
advertise {level1-into-level2 | level2-into-level1} prefix-list-name
```

To return to the default, use the `no advertise {level1-into-level2 | level2-into-level1} [prefix-list-name]` command.

**Parameters**

- `level1-into-level2`: Enter the keywords `level1-into-level2` to advertise Level 1 routes into Level 2 LSPs. This setting is the default.
level2-into-level1  Enter the keywords level2-into-level1 to advertise Level 2 inter-area routes into Level 1 LSPs. This behavior is described in RFC 2966.

prefix-list-name Enter the name of a configured IP prefix list. Routes meeting the criteria of the IP Prefix list are leaked.

Defaults
- level1-into-level2 (Level 1 to Level 2 leaking is enabled.)
- level2-into-level1 (Level 2 to Level 1) leaking is disabled.

Command Modes
- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the S6100-ON.
9.8(2.0)   Introduced on the S3100 series.
9.8(1.0)   Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0)   Introduced on the S6000-ON.
9.5(0.1)   Introduced on the Z9500.
9.0.2.0     Introduced on the S6000.
8.3.19.0    Introduced on the S4820T.
8.3.12.0    Introduced on the S4810.
8.3.11.1    Introduced on the Z9000.
7.5.1.0     Added IPv6 ISIS support.
6.3.1.0     Version 6.3.1.0 Introduced

Usage Information
You cannot disable leaking from Level 1 to Level 2. Also, you cannot enable leaking from Level 2 to Level 1. However, you can regulate the rate flow from one level to another using an IP Prefix list. If you do not configure the IP Prefix list, all Level 1 routes are leaked.

You can find more information in IETF RFC 2966, Domain-wide Prefix Distribution with Two-Level IS-IS.

area-password

Configure a hash message authentication code (HMAC) password for an area.

Syntax
area-password [hmac-md5 | encryption-type] password
To delete a password, use the `no area-password` command.

**Parameters**

- **hmac-md5**
  (OPTIONAL) Enter the keywords `hmac-md5` to encrypt the password.

- **encryption-type**
  (OPTIONAL) Enter 7 to encrypt the password using DES.

- **password**
  Enter a 1 to 16-character length alphanumeric string to prevent unauthorized access or incorrect routing information corrupting the link state database. The password is processed as plain text, which only provides limited security.

**Defaults**

- Not configured.

**Command Modes**

- ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

To prevent the link state database from receiving incorrect routing information from unauthorized routers, use the `area-password` command on routers within an area.

The configured password injects into Level 1 LSPs, CSNPs, and PSNPs.

**Related Commands**

- `domain-password` — set the authentication password for a routing domain.
- `isis password` — configure an authentication password for an interface.

### clear config

Clear IS-IS configurations that display under the `router isis` heading of the `show running-config` command output.

**Syntax**

```
clear config
```
clear isis

Restart the IS-IS process. All IS-IS data is cleared.

clear isis [vrf vrf-name] [tag] {* | database | traffic}

Parameters

vrf vrf-name
  (Optional) Enter the keyword vrf followed by the name of the VRF to restart the IS-IS process corresponding to that VRF.

tag
  (Optional) Enter an alphanumeric string to specify the IS-IS routing tag area.
  *
  Enter the keyword * to clear all IS-IS information and restart the IS-IS process. This command removes IS-IS neighbor information and IS-IS LSP database information and the full SPF calculation is done.

database
  Clears IS-IS LSP database information.

traffic
  Clears IS-IS counters.
clns host

Define a name-to-network service mapping point (NSAP) that you use with commands that require NSAPs and system IDs.

Syntax

```
clns host name nsap
```

Parameters

- **name**: Enter an alphanumeric string to identify the name-to-NSAP mapping.
- **nsap**: Enter a specific NSAP address that is associated with the name parameter.

Defaults

Not configured.

Command Modes

- ROUTER ISIS

### debug isis

Enable debugging for all IS-IS operations.

**Syntax**

```plaintext
debug isis
```

To disable debugging of IS-IS, use the `no debug isis` command.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>

**Usage Information**

Entering `debug isis` enables all debugging parameters.
To display all debugging information in one output, use this command. To turn off debugging, you normally enter separate no forms of each command. To disable all debug messages for IS-IS at once, enter the no debug isis command.

**debug isis adj-packets**

Enable debugging on adjacency-related activity such as hello packets that are sent and received on IS-IS adjacencies.

**Syntax**

debug isis [vrf vrf-name] adj-packets [interface]

To turn off debugging, use the no debug isis [vrf vrf-name]adj-packets [interface] command.

**Parameters**

- **vrf vrf-name** (Optional) Enter the keyword vrf followed by the name of the VRF to enable the debug information on IS-IS for an adjacency tied to that VRF. This command displays the IIH related debug details.

- **interface** (OPTIONAL) Identifies the interface type and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**Command Modes**

- EXEC Privilege

**Command History**

debug isis local-updates

To debug IS-IS local update packets, enable debugging on a specific interface and provides diagnostic information.

Syntax
debug isis [vrf vrf-name] local-updates [interface]

To turn off debugging, use the no debug isis [vrf vrf-name] updates [interface] command.

Parameters
- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable the debugging information on IS-IS corresponding to that VRF. This information contains local updates tied to the VRF that you specify. This command displays the local LSP debugging details of the current unit.
- **interface** (OPTIONAL) Identifies the interface type as one of the following:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Command Modes

**debug isis snp-packets**

To debug IS-IS complete sequence number PDU (CSNP) and partial sequence number PDU (PSNP) packets, enable debugging on a specific interface and provides diagnostic information.

**Syntax**
```
debug isis [vrf vrf-name] snp-packets [interface]
```

To turn off debugging, use the `no debug isis [vrf vrf-name] snp-packets [interface]` command.

**Parameters**
- **vrf vrf-name** (Optional) Enter the keyword vrf followed by the name of the VRF to enable debugging information on ISIS for CSNP/PSNP packets tied to that VRF. The command displays the SNP (CSNP/PSNP) related debugging information.
- **interface** (OPTIONAL) Identifies the interface type as one of the following:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.

### debug isis spf-triggers

Enable debugging on the events that triggered IS-IS shortest path first (SPF) events for debugging purposes.

**Syntax**

```
depth isis [vrf vrf-name] spf-triggers
```

To turn off debugging, use the `no debug isis [vrf vrf-name] spf-triggers` command.

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to enable debugging information on IS-IS corresponding to that VRF. This information contains SPF trigger detail tied to the VRF that you specify. When SPF is triggered, this debugging information is displayed.

**Command Modes**

EXEC Privilege

**debug isis update-packets**

Enable debugging on link state PDUs (LSPs) that a router detects.

**Syntax**

d debug isis [vrf vrf-name] update-packets [interface]

To turn off debugging, use the no debug isis update-packets [interface] command.

**Parameters**

vrf vrf-name  
(Optional) Enter the keyword vrf followed by the name of the VRF to enable the debugging information on IS-IS. This information contains updates from neighbors tied to the VRF that you specify. This command displays the debugging details of the received LSPs from the neighbors.

interface  
(Optional) Identifies the interface type and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

9.5(0.1) Introduced on the Z9500.
default-information originate

Generates a default route into an IS-IS routing domain and controls the distribution of default information.

Syntax
default-information originate [always] [metric metric] [route-map map-name]

To disable the generation of a default route into the specified IS-IS routing domain, use the no default-information originate [always] [metric metric] [route-map map-name] command.

Parameters
- **always** (OPTIONAL) Enter the keyword always to have the default route always advertised.
- **metric** metric (OPTIONAL) Enter the keyword metric then a number to assign to the route. The range is from 0 to 16777215.
- **route-map** map-name (OPTIONAL) A default route the routing process generates if the route map is satisfied.

Defaults
Not configured.

Command Modes
- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information

When you use this command to redistribute routes into a routing domain, the router becomes an autonomous system (AS) boundary router. An AS boundary router does not always generate a default route into a routing domain. The router still requires its own default route before it can generate one.

How a metric value assigned to a default route advertises depends on the `metric-style` command configuration. If the `metric-style` command is set for Narrow mode and the metric value in the `default-information originate` command is set to a number higher than 63, the metric value advertised in the LSPs is 63. If the `metric-style` command is set for Wide mode, the metric value in the `default-information originate` command is advertised.

Related Commands

- `redistribute` — redistribute routes from one routing domain to another routing domain.

### description

Enter a description of the IS-IS routing protocol.

**Syntax**

```
description {description}
```

To remove the description, use the `no description {description}` command.

**Parameters**

- `description` Enter a description to identify the IS-IS protocol (80 characters maximum).

**Defaults**

None

**Command Modes**

ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
## distance

Define the administrative distance for learned routes.

### Syntax

```
distance weight [ip-address mask [prefix-list]]
```

To return to the default values, use the `no distance weight` command.

### Parameters

- **weight**
  
  The administrative distance value indicates the reliability of a routing information source. The range is from 1 to 255. (A higher relative value indicates lower reliability. Routes with smaller values are given preference.) The default is 115.

- **ip-address mask** (OPTIONAL) Enter the next-hop address in dotted decimal format and enter a mask in either dotted decimal or /prefix format.

- **prefix-list** (OPTIONAL) Enter the name of a prefix list name.

### Defaults

- weight = 115

### Command Modes

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Version

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S6010-ON and S4048T-ON.</td>

<td>Introduced on the S6000-ON.</td>
</tr>
<tr>
<td>9.5(0.1)</td>
<td>Introduced on the Z9500.</td>
</tr>
</tbody>
</table>
**Usage Information**

The administrative distance indicates the trust value of incoming packets. A low administrative distance indicates a high trust rate. A high value indicates a lower trust rate. For example, a weight of 255 is interpreted that the routing information source is not trustworthy and should be ignored.

**distribute-list in**

Filter network prefixes received in updates.

**Syntax**

distribute-list prefix-list-name in [interface]

To return to the default values, use the no distribute-list prefix-list-name in [interface] command.

**Parameters**

- **prefix-list-name**
  - Specify the prefix list to filter prefixes in routing updates.

- **interface** (OPTIONAL)
  - Identifies the interface type and the interface following:
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport/subport information.
    - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
    - For a port channel interface, enter the keywords port-channel then a number.
    - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

## distribute-list out

Suppress network prefixes from being advertised in outbound updates.

### Syntax

```
distribute-list prefix-list-name out [connected | bgp as number | ospf process-id | rip | static]
```

To return to the default values, use the `no distribute-list prefix-list-name out [bgp as number connected | ospf process-id | rip | static]` command.

### Parameters

- **prefix-list-name**: Specify the prefix list to filter prefixes in routing updates.
- **connected**: (OPTIONAL) Enter the keyword `connected` for directly connected routing process.
- **ospf process-id**: (OPTIONAL) Enter the keyword `ospf` then the OSPF process-ID number. The range is from 1 to 65535.
- **bgp as number**: (OPTIONAL) Enter the BGP then the AS Number. The range is from 1 to 65535.
- **rip**: (OPTIONAL) Enter the keyword `rip` for RIP routes.
- **static**: (OPTIONAL) Enter the keyword `static` for user-configured routing process.

### Defaults
Not configured.

### Command Modes
- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
You can assign a name to a routing process so a prefix list IS applied to only the routes derived from the specified routing process.

**Related Commands**

- **distribute-list in** — filter the networks received in updates.
- **redistribute** — redistribute routes from one routing domain to another routing domain.

### distribute-list redistributed-override

Suppress flapping of routes when the same route is redistributed into IS-IS from multiple routers in the network.

**Syntax**

```
distribute-list redistributed-override in
```

To return to the default, use the `no distribute-list redistributed-override in` command.

**Defaults**

none

**Command Modes**

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>7.8.1.0</td>
<td>Added IPv6 ISIS support.</td>
</tr>
<tr>
<td>6.3.1.0</td>
<td>Introduced.</td>
</tr>
</tbody>
</table>

### Usage Information
When you execute this command, IS-IS does not download the route to the routing table if the same route was redistributed into IS-IS routing protocol on the same router.

### domain-password
Set the authentication password for a routing domain.

**Syntax**
```
domain-password [hmac-md5 | encryption-type] password
```

To disable the password, use the `no domain-password` command.

**Parameters**
- `hmac-md5` (OPTIONAL) Enter the keywords `hmac-md5` to encrypt the password using MD5.
- `encryption-type` (OPTIONAL) Enter `7` to encrypt the password using DES.
- `password` Enter an alphanumeric string up to 16 characters long. If you do not specify an encryption type or `hmac-md5` keywords, the password is processed as plain text which provides limited security.

**Defaults**
No default password.

**Command Modes**
ROUTER ISIS

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

### graceful-restart ietf

Enable graceful restart on an IS-IS router.

**Syntax**

```
graceful-restart ietf
```

To return to the default, use the `no graceful-restart ietf` command.

**Parameters**

- `ietf` Enter `ietf` to enable graceful restart on the IS-IS router.

**Defaults**

Graceful restart disabled.

**Command Modes**

- ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

#### Version Description

- **9.10(0.1)**
  - Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)**
  - Introduced on the S3148.
- **9.10(0.0)**
  - Introduced on the S6100-ON.
- **9.8(2.0)**
  - Introduced on the S3100 series.
- **9.8(1.0)**
  - Introduced on the Z9100-ON.
- **9.8(0.0P6)**
  - Introduced on the S4048-ON.
- **9.8(0.0P2)**
  - Introduced on the S3048-ON.
- **9.7(0.0)**
  - Introduced on the S6000-ON.
- **9.5(0.1)**
  - Introduced on the Z9500.

---

**Usage Information**

The domain password is inserted in Level 2 link state PDUs (LSPs), complete sequence number PDUs (CSNPs), and partial sequence number PDUs (PSNPs).

**Related Commands**

- `area-password` — configure an IS-IS area authentication password.
- `isis priority` — configure the authentication password for an interface.
Every graceful restart enabled router's HELLO PDUs includes a restart TLV. This restart enables (re)starting as well as the existing ISIS peers to detect the GR capability of the routers on the connected network. A flag in the Restart TLV contains restart request (RR), restart acknowledge (RA) and suppress adjacency advertisement (SA) bit flags.

The ISIS graceful restart-enabled router can co-exist in mixed topologies where some routers are graceful restart-enabled and others are not. For neighbors that are not graceful restart-enabled, the restarting router brings up the adjacency per the usual methods.

**graceful-restart interval**

Set the graceful restart grace period, the time during that all graceful restart attempts are prevented.

**Syntax**

```
graceful-restart interval minutes
```

To return to the default, use the `no graceful-restart interval` command.

**Parameters**

- `minutes` Enter the graceful-restart interval minutes. The range is from 1 to 20 minutes. The default is **5 minutes**.

**Defaults**

**5 minutes**

**Command Modes**

ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>
graceful-restart restart-wait

Enable the graceful restart maximum wait time before a restarting peer comes up.

**Syntax**

```plaintext
NOTE: Set the t3 timer to adjacency on the restarting router when implementing this command.

graceful-restart restart-wait seconds

To return to the default, use the no graceful-restart restart-wait command.
```

**Parameters**

- `seconds` Enter the graceful restart time in seconds. The range is from 5 to 300 seconds. The default is **30 seconds**.

**Defaults**

- **30 seconds**

**Command Modes**

- ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.

8.3.11.1 | Introduced on the Z9000.
8.3.1.0 | Introduced on the E-Series.
Related Commands

- `graceful-restart t3` — configure the overall wait time before graceful restart completes.

**graceful-restart t1**

Set the graceful restart wait time before unacknowledged restart requests are generated. This wait time is the interval before the system sends a restart request (an IIH with RR bit set in Restart TLV) until the CSNP is received from the helping router.

**Syntax**

```
graceful-restart t1 {interval seconds | retry-times value}
```

To return to the default, use the `no graceful-restart t1` command.

**Parameters**

- `interval`:
  
  Enter the keyword `interval` to set the wait time. The range is from 5 to 120 seconds. The default is 5 seconds.

- `retry-times`:
  
  Enter the keywords `retry-times` to set the number of times the request interval is extended until a CSNP is received from the helping router. The range is from 1 to 10 attempts. The default is 1.

**Defaults**

See Parameters.

**Command Modes**

- `ROUTER ISIS`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>
**graceful-restart t2**

Configure the wait time for the graceful restart timer T2 that a restarting router uses as the wait time for each database to synchronize.

**Syntax**

```
graceful-restart t2 {level-1 | level-2} seconds
```

To return to the default, use the `no graceful-restart t2` command.

**Parameters**

- `level-1, level-2` Enter the keywords `level-1` or `level-2` to identify the database instance type to which the wait interval applies.
- `seconds` Enter the `graceful-restart t2` time in seconds. The range is from 5 to 120 seconds. The default is **30 seconds**.

**Defaults**

- **30 seconds**

**Command Modes**

- ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>

**graceful-restart t3**

Configure the overall wait time before graceful restart completes.

**Syntax**

```
graceful-restart t3 {adjacency | manual} seconds
```

To return to the default, use the `no graceful-restart t3` command.
adjacency

Enter the keyword adjacency so that the restarting router receives the remaining time value from its peer and adjusts its T3 value so if you have configured this option.

manual

Enter the keyword manual to specify a time value that the restarting router uses. The range is from 50 to 120 seconds. The default is 30 seconds.

Defaults

manual, 30 seconds

Command Modes

ROUTER ISIS

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100--ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100--ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
8.3.1.0 Introduced on the E-Series.

Usage Information

The running router sets the remaining time value to the current adjacency hold time. You can override this setting by implementing this command.

Override the default restart-wait time by entering the no graceful-restart restart-wait command. When you disable restart-wait, the current adjacency hold time is used.

Set the t3 timer to adjacency on the restarting router when implementing this command. The restarting router gets the remaining time value from its peer and adjusts its T3 value so only when you have configured graceful-restart t3 adjacency.

Related Commands

- graceful-restart restart-wait — enable the graceful restart maximum wait time before a restarting peer comes up.
**hello padding**

Use to turn ON or OFF padding for LAN and point-to-point hello PDUs or to selectively turn padding ON or OFF for LAN or point-to-point hello PDUs.

**Syntax**

```
hello padding [multi-point | point-to-point]
```

To return to the default, use the `no hello padding [multi-point | point-to-point]` command.

**Parameters**

- **multi-point** *(OPTIONAL)* Enter the keywords `multi-point` to pad only LAN hello PDUs.
- **point-to-point** *(OPTIONAL)* Enter the keywords `point-to-point` to pad only point-to-point PDUs.

**Defaults**

Both LAN and point-to-point hello PDUs are padded.

**Command Modes**

`ROUTER ISIS`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

</tbody>
</table>

**Usage Information**

IS-IS hellos are padded to the full maximum transmission unit (MTU) size. Padding IS-IS Hellos (IIHS) to the full MTU provides early error detection of large frame transmission problems or mismatched MTUs on adjacent interfaces.

**Related Commands**

- `isis hello padding` — turn ON or OFF hello padding on an interface basis.
hostname dynamic

Enables dynamic learning of hostnames from routers in the domain and allows the routers to advertise the hostname in LSPs.

Syntax

```
hostname dynamic
```

To disable this command, use the `no hostname dynamic` command.

Defaults

Enabled.

Command Modes

ROUTER ISIS

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

Usage Information

To build name-to-systemID mapping tables through the protocol, use this command. All `show` commands that display systems also display the hostname.

Related Commands

- `clns host` — define a name-to-NSAP mapping.

ignore-lsp-errors

Ignore LSPs with bad checksums instead of purging those LSPs.

Syntax

```
ignore-lsp-errors
```

To return to the default values, use the `no ignore-lsp-errors` command.

Defaults

In IS-IS, the default deletes LSPs with internal checksum errors (`no ignore-lsp-errors`).

Command Modes

ROUTER ISIS
Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

Usage Information

IS-IS normally purges LSPs with an incorrect data link checksum causing the LSP source to regenerate the message. A cycle of purging and regenerating LSPs can occur when a network link continues to deliver accurate LSPs even though there is a link causing data corruption. This process could cause disruption to your system operation.

ip router isis

Configure IS-IS routing processes on an interface and attach an area tag name to the routing process.

Syntax

```
ip router isis [tag]
```

To disable IS-IS on an interface, use the `no ip router isis [tag]` command.

Parameters

tag (OPTIONAL) The tag you specify identifies a specific area routing process. If you do not specify a tag, a null tag is assigned.

Defaults

No processes are configured.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Version Description

- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100-ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Introduced on the S6000-ON.
- **9.5(0.1)**: Introduced on the Z9500.
- **9.0.2.0**: Introduced on the S6000.
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.12.0**: Introduced on the S4810.
- **8.3.11.1**: Introduced on the Z9000.
- **7.5.1.0**: Introduced.

### Usage Information

To assign a network entity title to enable IS-IS, use the `net` command.

This command accepts even if an IP address is not configured. This command is cached in the L3 Manager till the IP address is configured. When the IP address configuration reaches the L3Manager, the circuit add message is sent to IS-IS.

**NOTE:** IP address is not mandatory for forming IS-IS adjacency.

### Related Commands

- `net` — configure an IS-IS network entity title (NET) for the routing process.
- `router isis` — enable the IS-IS routing protocol.

### ipv6 router isis

Enable the IPv6 IS-IS routing protocol and specify an IPv6 IS-IS process.

**Syntax**

```
ipv6 router isis [tag]
```

To disable IS-IS routing, use the `no router isis [tag]` command.

**Parameters**

- `tag`  
  (OPTIONAL) This parameter is a unique name for a routing process. A null tag is assumed if the tag option is not specified. The tag name must be unique for all IP router processes for a given router.

**Defaults**

Not configured.

**Command Modes**

- `ROUTER ISIS`

**Command History**

- **Version**
  - **9.10(0.1)**: Introduced on the S6010-ON and S4048T-ON.
  - **9.10(0.0)**: Introduced on the S3148.
  - **9.10(0.0)**: Introduced on the S6100-ON.

<td>7.5.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Configure a network entity title (the `net` command) to specify the area address and the router system ID.

To establish adjacencies and establish dynamic routing, enable routing on one or more interfaces.

You can configure only one IS-IS routing process to perform Level 2 routing. A `level-1-2` designation performs Level 1 and Level 2 routing at the same time.

**Related Commands**

- `net` — configure an IS-IS network entity title (NET) for the routing process.
- `is-type` — assign a type for a given area.

**isis circuit-type**

Configure the adjacency type on interfaces.

**Syntax**

```
isis circuit-type {level-1 | level-1-2 | level-2-only}
```

To return to the default values, use the `no isis circuit-type` command.

**Parameters**

- `level-1`

  You can form a Level 1 adjacency if there is at least one common area address between this system and neighbors. You cannot form Level 2 adjacencies on this interface.

- `level-1-2`

  You can form a Level 1 and Level 2 adjacencies when the neighbor is also configured as Level-1-2 and there is at least one common area, if not, a Level 2 adjacency is established. This setting is the default.

- `level-2-only`

  You can form a Level 2 adjacencies when other Level 2 or Level 1-2 routers and their interfaces are configured for Level 1-2 or Level 2. Level 1 adjacencies cannot be established on this interface.

**Defaults**

`level-1-2`

**Command Modes**

`INTERFACE`
is is csnp-interval

Configure the IS-IS complete sequence number PDU (CSNP) interval on an interface.

Syntax

```
isis csnp-interval seconds [level-1 | level-2]
```

To return to the default values, use the `no isis csnp-interval [seconds] [level-1 | level-2]` command.

Parameters

- **seconds**: Interval of transmission time between CSNPs on multi-access networks for the designated intermediate system. The range is from 0 to 65535. The default is 10.
- **level-1**: (OPTIONAL) Independently configures the interval of time between transmission of CSNPs for Level 1.
- **level-2**: (OPTIONAL) Independently configures the interval of time between transmission of CSNPs for Level 2.

Defaults

- `seconds = 10`: **level-1** (if not otherwise specified)

Command Modes

- INTERFACE
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

Usage Information

The default values of this command are typically satisfactory transmission times for a specific interface on a designated intermediate system. To maintain database synchronization, the designated routers send CSNPs.

You can configure Level 1 and Level 2 CSNP intervals independently.

**isis hello-interval**

Specify the length of time between hello packets sent.

**Syntax**

```
isis hello-interval seconds [level-1 | level-2]
```

To return to the default values, use the `no isis hello-interval [seconds] [level-1 | level-2]` command.

**Parameters**

- **seconds**
  - Allows you to set the length of time between hello packet transmissions. The range is from 1 to 65535. The default is 10.
- **level-1**
  - (OPTIONAL) Select this value to configure the hello interval for Level 1. This value is the default.
- **level-2**
  - (OPTIONAL) Select this value to configure the hello interval for Level 2.

**Defaults**

- `seconds = 10`
- `level-1` (if not otherwise specified)

**Command Modes**

- INTERFACE

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Usage Information

Hello packets are held for a length of three times the value of the hello interval. To conserve bandwidth and CPU usage, use a high hello interval seconds. Use a low hello interval seconds for faster convergence (but uses more bandwidth and CPU resources).

Related Commands

- `isis hello-multiplier` — specify the number of IS-IS hello packets a neighbor must miss before the router declares the adjacency as down.

**isis hello-multiplier**

Specify the number of IS-IS hello packets a neighbor must miss before the router declares the adjacency down.

**Syntax**

```plaintext
isis hello-multiplier 
```

To return to the default values, use the `no isis hello-multiplier` command.

**Parameters**

- `multiplier` Specifies an integer that sets the multiplier for the hello holding time. Never configure a hello-multiplier lower than the default (3). The range is from 3 to 1000. The default is 3.
- `level-1` (OPTIONAL) Select this value to configure the hello multiplier independently for Level 1 adjacencies. This value is the default.
- `level-2` (OPTIONAL) Select this value to configure the hello multiplier independently for Level 2 adjacencies.

**Defaults**

- `multiplier` = 3.
- `level-1` (if not otherwise specified)

**Command Modes**

- INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Usage Information

The holdtime (the product of the hello-multiplier multiplied by the hello-interval) determines how long a neighbor waits for a hello packet before declaring the neighbor is down so routes can be recalculated.

Related Commands

- `isis hello-interval` — specify the length of time between hello packets.

**isis hello padding**

Turn ON or OFF padding of hello PDUs from INTERFACE mode.

Syntax

```
isis hello padding

To return to the default, use the no isis hello padding command.
```

Defaults

Padding of hello PDUs is enabled (ON).

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version | Description
---|---
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5(0.1) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.12.0 | Introduced on the S4810.
8.3.11.1 | Introduced on the Z9000.

Usage Information
Hello PDUs are “padded” only when both the global and interface padding options are ON. Turning either one OFF disables padding for the corresponding interface.

Related Commands
• hello padding — turn ON or OFF padding for LAN and point-to-point hello PDUs.

**isis ipv6 metric**

Assign metric to an interface for use with IPv6 information.

**Syntax**

```plaintext
isis ipv6 metric default-metric [level-1 | level-2]
```

To return to the default values, use the `no ipv6 isis metric [default-metric] [level-1 | level-2]` command.

**Parameters**

- `default-metric` Metric assigned to the link and used to calculate the cost from each other router via the links in the network to other destinations. You can configure this metric for Level 1 or Level 2 routing. The range is from 0 to 16777215. The default is 10.
- `level-1` (OPTIONAL) Enter the keywords `level-1` to configure the shortest path first (SPF) calculation for Level 1 (intra-area) routing. This value is the default.
- `level-2` (OPTIONAL) Enter the keywords `level-2` to configure the SPF calculation for Level 2 (inter-area) routing.

**Defaults**

default-metric = 10; level-1 (if not otherwise specified)

**Command Modes**

`INTERFACE`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
---|---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
### isis metric

Assign a metric to an interface.

#### Syntax

```
isis metric default-metric [level-1 | level-2]
```

To return to the default values, use the `no isis metric [default-metric] [level-1 | level-2]` command.

#### Parameters

- **default-metric**: Metric assigned to the link and used to calculate the cost from each other router via the links in the network to other destinations. You can configure this metric for Level 1 or Level 2 routing. The range is from 0 to 16777215 irrespective of the metric style. The default is **10**.
  - If metric value is configured to more than 63, system throws the following warning: `Warning: for metrics greater than 63, 'metric-style wide' should be configured on level-1-2, or it will be capped at 63.`
  - If the metric style is WIDE, the metric values that are greater than 63 are only effective.

- **level-1**: (OPTIONAL) Enter the keywords `level-1` to configure the shortest path first (SPF) calculation for Level 1 (intra-area) routing. This setting is the default.

- **level-2**: (OPTIONAL) Enter the keywords `level-2` to configure the SPF calculation for Level 2 (inter-area) routing.

#### Defaults

- `default-metric = 10`
- `level-1` (if not otherwise specified)

#### Command Modes

- INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Usage Information

Dell EMC Networking recommends configuring metrics on all interfaces. Without configuring this command, the IS-IS metrics are similar to hop-count metrics.

**isis network point-to-point**

Enable the software to treat a broadcast interface as a point-to-point interface.

**Syntax**

```
isis network point-to-point
To disable the feature, use the no isis network point-to-point command.
```

**Defaults**

Not enabled.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
### isis password

Configure an authentication password for an interface.

**Syntax**

```plaintext
isis password [hmac-md5] password [level-1 | level-2]
```

To delete a password, use the `no isis password [password] [level-1 | level-2]` command.

**Parameters**

- `encryption-type`
  - (OPTIONAL) Enter 7 to encrypt the password using DES.
- `hmac-md5`
  - (OPTIONAL) Enter the keywords `hmac-md5` to encrypt the password using MD5.
- `password`
  - Assign the interface authentication password.
- `level-1`
  - (OPTIONAL) Independently configures the authentication password for Level 1. The router acts as a station router for Level 1 routing. This setting is the default.
- `level-2`
  - (OPTIONAL) Independently configures the authentication password for Level 2. The router acts as an area router for Level 2 routing.

**Defaults**

No default password. `level-1` (if not otherwise specified).

**Command Modes**

- INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

isis priority

Set the priority of the designated router you select.

Syntax

```
isis priority value [level-1 | level-2]
```

To return to the default values, use the `no isis priority [value] [level-1 | level-2]` command.

Parameters

- **value**: This value sets the router priority. The higher the value, the higher the priority. The range is from 0 to 127. The default is 64.
- **level-1** (OPTIONAL): Specify the priority for Level 1. This setting is the default.
- **level-2** (OPTIONAL): Specify the priority for Level 2.

Defaults

```
value = 64; level-1 (if not otherwise specified).
```

Command Modes

```
INTERFACE
```

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

- 9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
- 9.10(0.0) Introduced on the S3148.
- 9.10(0.0) Introduced on the S6100-ON.
- 9.8(2.0) Introduced on the S3100 series.
- 9.8(1.0) Introduced on the Z9100-ON.
- 9.8(0.0P5) Introduced on the S4048-ON.
- 9.8(0.0P2) Introduced on the S3048-ON.
- 9.7(0.0) Introduced on the S6000-ON.
- 9.5(0.1) Introduced on the Z9500.
- 9.0.2.0 Introduced on the S6000.

</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**

You can configure priorities independently for Level 1 and Level 2. Priorities determine which router on a LAN is the designated router. Priorities are advertised within hellos. The router with the highest priority becomes the designated intermediate system (DIS).

**NOTE:** Routers with a priority of 0 cannot be a designated router.

Setting the priority to 0 lowers the chance of this system becoming the DIS, but does not prevent it. If all the routers have priority 0, one with highest MAC address becomes DIS even though its priority is 0.

### is-type

Configure IS-IS operating level for a router.

**Syntax**

```plaintext
is-type {level-1 | level-1-2 | level-2-only}
```

To return to the default values, use the `no is-type` command.

**Parameters**

- **level-1**
  - Allows a router to act as a Level 1 router.

- **level-1-2**
  - Allows a router to act as both a Level 1 and Level 2 router. This setting is the default.

- **level-2-only**
  - Allows a router to act as a Level 2 router.

**Defaults**

`level-1-2`

**Command Modes**

ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

This command allows you to monitor adjacency state changes, which are useful when you monitor large networks. Messages are logged in the system’s error message facility.
**lsp-gen-interval**

Set the minimum interval between successive generations of link-state packets (LSPs).

**Syntax**

```
lsp-gen-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]
```

To restore default values, use the `no lsp-gen-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]` command.

**Parameters**

- **level-l** (OPTIONAL) Enter the keywords level-1 to apply the configuration to generation of Level-1 LSPs.
- **level-2** (OPTIONAL) Enter the keywords level-2 to apply the configuration to generation of Level-2 LSPs.
- **interval seconds** Enter the maximum number of seconds between LSP generations. The range is from 0 to 120 seconds. The default is **5 seconds**.
- **initial_wait_interval seconds** (OPTIONAL) Enter the initial wait time, in seconds, before running the first LSP generation. The range is from 0 to 120 seconds. The default is **1 second**.
- **second_wait_interval seconds** (OPTIONAL) Enter the wait interval, in seconds, between the first and second LSP generation. The range is from 0 to 120 seconds. The default is **5 seconds**.

**Defaults**

See Parameters.

**Command Modes**

ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5(0.1) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.12.0 | Introduced on the S4810.
8.3.11.1 | Introduced on the Z9000.
7.5.1.0 | Added support for LSP Throttling Enhancement.
LSP throttling slows down the frequency at which LSPs are generated during network instability. Even though throttling LSP generations slows down network convergence, no throttling can result in a network not functioning as expected. If network topology is unstable, throttling slows down the scheduling of LSP generations until the topology regains its stability.

The first generation is controlled by the initial wait interval and the second generation is controlled by the second wait interval. Each subsequent wait interval is twice as long as the previous one until the wait interval reaches the maximum wait time specified (interval seconds). After the network calms down and there are no triggers for two times the maximum interval, fast behavior is restored (the initial wait time).

**Isp-mtu**

Set the maximum transmission unit (MTU) of IS-IS link-state packets (LSPs). This command only limits the size of LSPs this router generates.

**Syntax**

```
lsp-mtu size
```

To return to the default values, use the `no lsp-mtu` command.

**Parameters**

- `size`: The maximum LSP size, in bytes. The range is from 512 to 16000 for Non-Jumbo mode and from 128 to 9195 for Jumbo mode. The default is 1497.

**Defaults**

1497 bytes.

**Command Modes**

ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5(0.1) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.12.0 | Introduced on the S4810.
8.3.11.1 | Introduced on the Z9000.
Usage Information

The link MTU and the LSP MTU size must be the same. Because each device can generate a maximum of 255 LSPs, consider carefully whether you use the `lsp-mtu` command.

### lsp-refresh-interval

Set the link state PDU (LSP) refresh interval. LSPs must be refreshed before they expire. When the LSPs are not refreshed after a refresh interval, they are kept in a database until their `max-lsp-lifetime` reaches zero and then LSPs is purged.

**Syntax**

```
lsp-refresh-interval seconds
```

To restore the default refresh interval, use the `no lsp-refresh-interval` command.

**Parameters**

- `seconds`: The LSP refresh interval, in seconds. This value must be 300 seconds less than the value specified in the `max-lsp-lifetime` command. The range is from 1 to 65535 seconds. The default is **900**.

**Defaults**

- **900** seconds

**Command Modes**

- ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
Usage Information

The refresh interval determines the rate at which route topology information is transmitted preventing the information from becoming obsolete.

The refresh interval must be less than the LSP lifetime specified with the max-lsp-lifetime command. A low value reduces the amount of time that undetected link state database corruption can persist at the cost of increased link utilization. A higher value reduces the link utilization the flooding of refreshed packets causes.

Related Commands

- `max-lsp-lifetime` — set the maximum interval that LSPs persist without being refreshed.

max-area-addresses

Configure manual area addresses.

Syntax

```
max-area-addresses number
```

Parameters

- `number` — Set the maximum number of manual area addresses. The range is from 3 to 6. The default is 3.

Defaults

3 addresses

Command Modes

ROUTER ISIS

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
To configure the number of area addresses on router, use this command. This value must be consistent with routers in the same area, otherwise the router forms only Level 2 adjacencies. The value must be same among all the routers to form Level 1 adjacencies.

max-lsp-lifetime

Set the maximum time that link-state packets (LSPs) exist without being refreshed.

Syntax
max-lsp-lifetime seconds

To restore the default time, use the no max-lsp-lifetime command.

Parameters
seconds The maximum lifetime of LSP in seconds. This value must be greater than the lsp-refresh-interval command. The higher the value the longer the LSPs are kept. The range is from 1 to 65535. The default is 1200.

Defaults
1200 seconds

Command Modes
ROUTER ISIS

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.

Usage Information
Change the maximum LSP lifetime with this command. The maximum LSP lifetime must always be greater than the LSP refresh interval.

The seconds parameter enables the router to keep LSPs for the specified length of time. If the value is higher, the overhead is reduced on slower-speed links.

Related Commands
-  lsp-refresh-interval — set the link-state packet (LSP) refresh interval.
maximum-paths

Allows you to configure the maximum number of equal cost paths allowed in a routing table.

NOTE: Enables you to configure a single system wide value that is common for both IPv4 and IPv6 addresses.

Syntax

maximum-paths number

To return to the default values, use the no maximum-paths command.

Parameters

number Enter a number as the maximum number of parallel paths an IP routing installs in a routing table. The range is from 1 to 64. The default is 4.

Defaults

4

Command Modes

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100--ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100--ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
7.8.1.0 Added support for multi-topology ISIS.
6.3.1.0 Introduced.
metric-style

To generate and accept old-style, new-style, or both styles of type, length, and values (TLV), configure a router.

Syntax

```
metric-style {narrow [transition] | transition | wide [transition]} [level-1 | level-2]
```

To return to the default values, use the `no metric-style {narrow [transition] | transition | wide [transition]} [level-1 | level-2]` command.

Parameters

- **narrow**: Allows you to generate and accept old-style TLVs. The metric range is from 0 to 63.
- **transition**: Allows you to generate both old-style and new-style TLVs. The metric range is from 0 to 63.
- **wide**: Allows you to generate and accept only new-style TLVs. The metric range is from 0 to 16777215.
- **level-1**: Enables the metric style on Level 1.
- **level-2**: Enables the metric style on Level 2.

Defaults

```
narrow; if no Level is specified, Level-1 and Level-2 are configured.
```

Command Modes

```
ROUTER ISIS
```

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Usage Information

If you enter the `metric-style wide` command, the Dell EMC Networking OS generates and accepts only new-style TLVs. The router uses less memory and other resources rather than generating both old-style and new-style TLVs.
The new-style TLVs have wider metric fields than old-style TLVs.

When wide transition is configured, narrow metric is sent for the narrow metric TLV and the actual wide metric is sent in wide metric TLV. The receiver can choose to use the metric that is requires.

Related Commands

- `isis metric` — configure a metric for an interface.

**multi-topology**

Enables multi-topology IS-IS. It also allows enabling/disabling of old and new style TLVs for IP prefix information in the LSPs.

**Syntax**

```
multi-topology [transition]
```

To return to a single topology configuration, use the `no multi-topology [transition]` command.

**Parameters**

- `transition`

**Defaults**

Disabled

**Command Modes**

CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6

**Command History**

To configure an IS-IS network entity title (NET) for a routing process, use this mandatory command. If you did not configure a NET, the IS-IS process does not start.

**Syntax**
```
net network-entity-title
```
To remove a net, use the `no net network-entity-title` command.

**Parameters**
- `network-entity-title`: Specify the area address and system ID for an IS-IS routing process. The first 1 to 13 bytes identify the area address. The next 6 bytes identify the system ID. The last 1 byte is the selector byte, always identified as zero zero (00). This argument can be applied to an address or a name.

**Defaults**
Not configured.

**Command Modes**
ROUTER ISIS

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**passive-interface**

Suppress routing updates on an interface. This command stops the router from sending updates on that interface.

**Syntax**
```
passive-interface interface
```
To delete a passive interface configuration, use the `no passive-interface interface` command.

**Parameters**
- `interface`: Enter the following keywords and the interface information:
For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport/subport information.

For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.

For a port channel interface, enter the keywords port-channel then a number.

For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

- **Defaults**
  - Not configured.

- **Command Modes**
  - ROUTER ISIS

- **Command History**
  - This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

- **Usage Information**
  - Although the passive interface does not send nor receive routing updates, the network on that interface is still included in the IS-IS updates sent using other interfaces.

### redistribute

Redistribute routes from one routing domain to another routing domain.

**Syntax**

```
redistribute {static | connected | rip} [level-1 | level-1-2 | level-2] [metric metric-value] [metric-type {external | internal}] [route-map map-name]
```

**Parameters**

- `connected`
  - Enter the keyword `connected` to redistribute active routes into IS-IS.

  * To end redistribution or disable any of the specified keywords, use the `no redistribute {static | connected | rip} [metric metric-value] [metric-type {external | internal}] [level-1 | level-1-2 | level-2] [route-map map-name]` command.
Enter the keyword rip to redistribute RIP routes into IS-IS.

Enter the keyword static to redistribute user-configured routes into IS-IS.

**metric metric-value** *(OPTIONAL)* Assign a value to the redistributed route. The range is from 0 to 16777215. The default is 0. Use a value that is consistent with the destination protocol.

**metric-type (external | internal)** *(OPTIONAL)* The external link type associated with the default route advertised into a routing domain. Specify one of the following:

- external
- internal

**level-1** *(OPTIONAL)* Routes are independently redistributed into IS-IS as Level 1 routes.

**level-1-2** *(OPTIONAL)* Routes are independently redistributed into IS-IS as Level-1-2 routes.

**level-2** *(OPTIONAL)* Routes are independently redistributed into IS-IS as Level 2 routes. This setting is the default.

**route-map map-name** *(OPTIONAL)* If you do not enter the route-map argument, all routes are redistributed. If a map-name value is not specified, no routes are imported.

**Defaults**

- **metric metric-value** = 0
- **metric-type** = internal; level-2

**Command Modes**

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** 6.3.1.0  
**Description** Introduced.

### Usage Information

To redistribute a default route (0.0.0.0/0), configure the `default-information originate` command.

Changing or disabling a keyword in this command does not affect the state of the other command keywords.

When an LSP with an internal metric is received, the Dell EMC Networking OS considers the route cost while considering the advertised cost to reach the destination.

Redistributed routing information is filtered with the `distribute-list out` command to ensure that the routes are properly passed to the receiving routing protocol.

How a metric value assigned to a redistributed route is advertised depends on how on the configuration of the `metric-style` command. If the `metric-style` command is set for Narrow or Transition mode and the metric value in the redistribute command is set to a number higher than 63, the metric value advertised in LSPs is 63. If the `metric-style` command is set for Wide mode, the metric value in the redistribute command is advertised.

### Related Commands

- `default-information originate` — generate a default route for the IS-IS domain.
- `distribute-list out` — suppress networks from being advertised in updates. This command filters redistributed routing information.

### redistribute bgp

Redistribute routing information from a BGP process.

**Syntax**

```plaintext
redistribute bgp AS number [level-1 | level-1-2 | level-2] [metric metric-value] [metric-type {external | internal}] [route-map map-name]
```

To return to the default values, use the `no redistribute bgp` command with the appropriate parameters.

**Parameters**

- **AS number**  
  Enter a number that corresponds to the autonomous system number. The range is from 1 to 65535.

- **level-1**  
  (OPTIONAL) Routes are independently redistributed into IS-IS Level 1 routes only.

- **level-1-2**  
  (OPTIONAL) Routes are independently redistributed into IS-IS Level 1 and Level 2 routes.

- **level-2**  
  (OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes only. This setting is the default.

- **metric metric-value**  
  (OPTIONAL) The value used for the redistributed route. Use a metric value that is consistent with the destination protocol. The range is from 0 to 16777215. The default is 0.

- **metric-type**  
  (OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are:

  - `external`
  - `internal`
route-map name

map-name is an identifier for a configured route map. The route map filters imported routes from the source routing protocol to the current routing protocol.
If you do not specify a map-name, all routes are redistributed. If you specify a keyword, but fail to list route map tags, no routes are imported.

Defaults IS-IS Level 2 routes only

Command Modes
- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information
BGP to IS-IS redistribution supports “match” options using route maps. You can set the metric value, level, and metric-type of redistributed routes by the redistribution command. You can “set” more advanced options using route maps.

Example
DellEMC(conf)# router is
DellEMC(conf-router_isis)# redistribute bgp 1 level-1 metric 32 metric-type external route-map rmap-isis-to-bgp
DellEMC(conf-router_bgp)# show running-config isis
  !
  router isis
  redistribute bgp 1 level-1 metric 32 metric-type external route-map rmap-isis-to-bgp
redistribute ospf

Redistribute routing information from an OSPF process.

Syntax

redistribute ospf process-id [level-1| level-1-2 | level-2] [match {internal | external}] [metric metric-value] [metric-type {external | internal}] [route-map map-name]

To return to the default values, use the no redistribute ospf process-id [level-1| level-1-2 | level-2] [match {internal | external}] [metric metric-value][metric-type {external | internal}] [route-map map-name] command.

Parameters

- **process-id**: Enter a number that corresponds to the OSPF process ID to be redistributed. The range is from 1 to 65535.
- **metric metric-value**: (OPTIONAL) The value used for the redistributed route. Use a metric value that is consistent with the destination protocol. The range is from 0 to 16777215. The default is 0.
- **metric-type {external | internal}**: (OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are:
  - external
  - internal
- **level-1**: (OPTIONAL) Routes are independently redistributed into IS-IS as Level 1 routes.
- **level-1-2**: (OPTIONAL) Routes are independently redistributed into IS-IS as Level-1-2 routes.
- **level-2**: (OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes. This setting is the default.
- **match {external | internal}**: (OPTIONAL) The command used for OSPF to route and redistribute into other routing domains. The values are
  - internal
  - external
- **route-map map-name**: map-name is an identifier for a configured route map. The route map should filter imported routes from the source routing protocol to the current routing protocol. If you do not specify a map-name, all routes are redistributed. If you specify a keyword, but fail to list route map tags, no routes are imported.

Defaults

See Parameters.

Command Modes

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced.</td>
</tr>
</tbody>
</table>

### Usage Information

How a metric value assigned to a redistributed route is advertised depends on how on the configuration of the `metric-style` command. If the `metric-style` command is set for Narrow mode and the metric value in the `redistribute ospf` command is set to a number higher than 63, the metric value advertised in LSPs is 63. If the `metric-style` command is set for wide mode, the metric value in the `redistribute ospf` command is advertised.

### router isis

Allows you to enable the IS-IS routing protocol and to specify an IP IS-IS process.

**Syntax**

`router isis [vrf vrf-name] [tag]

To disable IS-IS routing, use the `no router isis [tag]` command.

**Parameters**

- **vrf vrf-name**  
  Enter the keyword `vrf` followed by the name of the VRF to enable the IS-IS routing protocol and to specify an IP IS-IS process on that VRF.

- **tag**  
  (OPTIONAL) This is a unique name for a routing process. A null tag is assumed if the `tag` option is not specified. The tag name must be unique for all IP router processes for a given router.

**Defaults**

Not configured.

**Command Modes**

<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

### Usage Information

Configure a network entity title (the `net` command) to specify the area address and the router system ID.

Enable routing on one or more interfaces to establish adjacencies and establish dynamic routing.

You can configure only one IS-IS routing process to perform Level 2 routing. A `level-1-2` designation performs Level 1 and Level 2 routing at the same time.

### Related Commands

- `ip router isis` — configure IS-IS routing processes for IP on interfaces and attaches an area designator to the routing process.
- `net` — configure an IS-IS network entity title (NET) for a routing process.
- `is-type` — assign a type for a given area.

## set-overload-bit

To set the overload bit in zeroth fragment of non-pseudonode LSPs on the router, configure the router. This setting prevents other routers from using it as an intermediate hop in their shortest path first (SPF) calculations.

### Syntax

```
set-overload-bit
```

To return to the default values, use the `no set-overload-bit` command.

### Defaults

Not set.

### Command Modes

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Usage Information
Set the overload bit when a router experiences problems, such as a memory shortage due to an incomplete link state database which can result in an incomplete or inaccurate routing table. If you set the overload bit in its LSPs, other routers ignore the unreliable router in their SPF calculations until the router has recovered.

**NOTE:** Enables you to configure a single system wide value that is common for both IPv4 and IPv6 address.

**show config**

Display the changes you made to the IS-IS configuration. Default values are not shown.

**Syntax**

```
show config
```

**Command Modes**

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Example (Router-Isis)**

The bold section identifies that Multi-Topology IS-IS is enabled in Transition mode.

DellEMC(conf-router_isis)# show config
```
!router isis
clns host ISIS 49.0000.0001.F100.E120.0013.00
log-adjacency-changes
net 49.0000.0001.F100.E120.0013.00
!address-family ipv6 unicast
multi-topology transition
set-overload-bit
spf-interval level-1 100 15 20
spf-interval level-2 120 20 25
exit-address-family
```

**Example (Address-Family_IPv6)**

The bold section identifies that Multi-Topology IS-IS is enabled in Transition mode.

DellEMC(conf-router_isis-af_ipv6)# show config
```
!address-family ipv6 unicast
multi-topology transition
set-overload-bit
spf-interval level-1 100 15 20
spf-interval level-2 120 20 25
exit-address-family
```

**show isis database**

Display the IS-IS link state database.

**Syntax**

```
show isis [vrf vrf-name] database [level-1 | level-2] [local] [detail | summary] [system-id] [lspid]
```

**Parameters**

- **vrf vrf-name** (Optional) Enter the keyword vrf followed by the name of the VRF to display IS-IS link state database corresponding to that VRF.
NOTE: If you do not specify this option, the IS-IS link state database corresponding to the default VRF are displayed.

level-1 (OPTIONAL) Displays the Level 1 IS-IS link-state database.
level-2 (OPTIONAL) Displays the Level 2 IS-IS link-state database.
local (OPTIONAL) Displays local link-state database information.
detail (OPTIONAL) Displays the detailed link-state database information of each LSP when specified. If not specified, a summary displays.

summary (OPTIONAL) Displays the summary of link-state database information when specified.
lspid (OPTIONAL) Display only the specified LSP.
system-id (OPTIONAL) Displays the link-state database for system-id.

Command Modes
• EXEC
• EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Added supported for VRF. Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.2(0.2) Introduced on the Z9000.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.7.1 Introduced on the S4810.

Usage Information
The following describes the show isis database command shown in the following example.

Field Description
IS-IS Level-1/Level-2 Link State Database Displays the IS-IS link state database for Level 1 or Level 2.

LSPID Displays the LSP identifier.

The first six octets are the System ID of the originating router.
### Field Description

The first six octets are the System ID of the originating router. The next octet is the pseudonode ID. If this byte is not zero, the LSP describes system links. If this byte is zero (0), the LSP describes the state of the originating router.

The designated router for a LAN creates and floods a pseudonode LSP and describes the attached systems.

The last octet is the LSP number. An LSP is divided into multiple LSP fragments if there is more data than cannot fit in a single LSP. Each fragment has a unique LSP number.

An * after the LSPID indicates that the system originates an LSP where this command was issued.

### LSP Seq Num

This value is the sequence number for the LSP that allows other systems to determine if they have received the latest information from the source.

### LSP Checksum

This is the checksum of the entire LSP packet.

### LSP Holdtime

This value is the amount of time, in seconds, that the LSP remains valid. A zero holdtime indicates that this is a purged LSP and is being removed from the link state database. A value between brackets indicates the duration that the purged LSP stays in the database before being removed.

### ATT

This value represents the Attach bit. This value indicates that the router is a Level 1-2 router and can reach other areas. Level 1-only routers and Level 1-2 routers that have lost connection to other Level 1-2 routers use the Attach bit to find the closest Level 1-2 router. They install a default route to the closest Level 1-2 router.

### P

This value represents the P bit. This bit is always set to zero as Dell EMC Networking does not support area partition repair.

### OL

This value represents the overload bit, determining congestion. If the overload bit is set, other routers do not use this system as a transit router when calculating routes.

### Example

The bold sections identify that MultiTopology IS-IS is enabled.

```text
DellEMC# show isis database

```
show isis graceful-restart detail

Display detailed IS-IS graceful restart related settings.

Syntax

    show isis [vrf vrf-name] graceful-restart detail

Command Modes

• EXEC
• EXEC Privilege

Parameters

vrf vrf-name  (Optional) Enter the keyword vrf followed by the name if the VRF to display IS-IS graceful restart details corresponding to that VRF.

Note: If you do not specify this option, the IS-IS graceful restart details corresponding to the default VRF are displayed.

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version  
9.10(0.1)  
Introduced on the S6010-ON and S4048T-ON.
show isis hostname

Display IS-IS host names configured or learned on the switch.

Syntax

```
show isis [vrf vrf-name] hostname
```

Parameters

- **vrf vrf-name**
  - Enter the keyword vrf followed by the name of the VRF to display IS-IS host names corresponding to that VRF.
Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

DellEMC#

show isis interface

Display detailed IS-IS interface status and configuration information.

Syntax

show isis [vrf vrf-name] interface [interface]

Parameters

vrf vrf-name  (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display IS-IS interface status information corresponding to that VRF.

interface    (OPTIONAL) Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes**
- EXEC
- EXEC Privilege

```
show isis neighbors

Display information about neighboring (adjacent) routers.

Syntax

```
show isis [vrf vrf-name] neighbors [level-1 | level-2] [detail] [interface]
```

Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display adjacent router information corresponding to that VRF.
- **level-1** (OPTIONAL) Displays information about Level 1 IS-IS neighbors.
- **level-2** (OPTIONAL) Displays information about Level 2 IS-IS neighbors.
- **detail** (OPTIONAL) Displays detailed information about neighbors.
- **interface** (OPTIONAL) Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Command Modes

- EXEC
- EXEC Privilege

Command History

</tbody>
</table>
Usage Information

Use this command to confirm that the neighbor adjacencies are operating correctly. If you suspect that they are not, you can verify the specified area addresses of the routers by using the `show isis neighbors` command.

The following describes the `show isis neighbors` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Id</td>
<td>The value that identifies a system in an area.</td>
</tr>
<tr>
<td>Interface</td>
<td>The interface, slot, and port in which the router was discovered.</td>
</tr>
<tr>
<td>State</td>
<td>The value providing status about the adjacency state. The range is Up and Init.</td>
</tr>
<tr>
<td>Type</td>
<td>This value displays the adjacency type (Layer 2, Layer 2 or both).</td>
</tr>
<tr>
<td>Priority</td>
<td>IS-IS priority the neighbor advertises. The neighbor with highest priority becomes the designated router for the interface.</td>
</tr>
<tr>
<td>Uptime</td>
<td>Displays the interfaces uptime.</td>
</tr>
<tr>
<td>Circuit Id</td>
<td>The neighbor’s interpretation of the designated router for the interface.</td>
</tr>
</tbody>
</table>

Example

The bold sections below identify that Multi-Topology IS-IS is enabled. This command displays only one IP address per line.

DellEMC# show isis neighbors
System Id Interface State Type Priority Uptime Circuit Id
TEST Te 7/1 Up L1L2(M) 127 09:28:01 TEST.02
!
DellEMC# show isis neighbors detail
System Id Interface State Type Priority Uptime Circuit Id
TEST Te 7/1 Up L1L2(M) 127 09:28:04 TEST.02 Area Address(es):
49.0000.0001
  IP Address(es): 25.1.1.3*
  MAC Address: 0000.0000.0000
  Hold Time: 28
  Link Local Address: fe80::201:e8ff:fe00:492c
  Topology: IPv4 IPv6 , Common (IPv4 IPv6 )
  Adjacency being used for MTs: IPv4 IPv6
DellEMC#

**show isis protocol**

Display IS-IS routing information.

**Syntax**

```
show isis [vrf vrf-name] protocol
```
Parameters

vrf vrf-name  (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display IS-IS routing information corresponding to that VRF.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version  Description

9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the S6100--ON.
9.8(2.0)   Introduced on the S3100 series.
9.8(1.0)   Introduced on the Z9100--ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0)   Added support for VRF. Introduced on the S6000-ON.
9.5(0.1)   Introduced on the Z9500.
9.2(0.2)   Introduced on the Z9000.
9.0.2.0     Introduced on the S6000.
8.3.19.0    Introduced on the S4820T.
8.3.12.0    Introduced on the S4810.

Example

The bold section identifies that Multi-Topology IS-IS is enabled.

DellEMC# show isis protocol
IS-IS Router: <Null Tag>
    System Id: F100.E120.0013 IS-Type: level-1-2
    Manual area address(es):
        49.0000.0001
    Routing for area address(es):
        49.0000.0001
    Interfaces supported by IS-IS:
        TenGigabitEthernet 1/1 - IP - IPv6
        TenGigabitEthernet 1/2 - IP - IPv6
        TenGigabitEthernet 1/10 - IP - IPv6
        Loopback 0 - IP - IPv6
    Redistributing:
    Distance: 115
    Generate narrow metrics: level-1-2
    Accept narrow metrics:  level-1-2
    Generate wide metrics:  none
    Accept wide metrics:    none
    Multi Topology Routing is enabled in transition mode.
DellEMC#
**show isis traffic**

This command allows you to display IS-IS traffic interface information.

**Syntax**

```
show isis [vrf vrf-name] traffic [interface]
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display IS-IS traffic interface information corresponding to that VRF.
- `interface` (OPTIONAL) Identifies the interface type and the interface following:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

  IS-IS: Level-1 DR Elections : 4
  IS-IS: Level-2 DR Elections : 4
  IS-IS: Level-1 SPF Calculations : 0
  IS-IS: Level-2 SPF Calculations : 389
  IS-IS: LSP checksum errors received : 0
  IS-IS: LSP authentication failures : 0
DellEMC#
```
**spf-interval**

Specify the minimum interval between shortest path first (SPF) calculations.

**Syntax**

```plaintext
spf-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]
```

To restore default values, use the `no spf-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]` command.

**Parameters**

- `level-l` (OPTIONAL) Enter the keyword `level-1` to apply the configuration to Level-1 SPF calculations.
- `level-2` (OPTIONAL) Enter the keyword `level-2` to apply the configuration to Level-2 SPF calculations.
- `interval seconds` Enter the maximum number of seconds between SPF calculations. The range is from 0 to 120 seconds. The default is 10 seconds.
- `initial_wait_interval seconds` (OPTIONAL) Enter the initial wait time, in seconds, before running the first SPF calculations. The range is from 0 to 120 seconds. The default is 5 seconds.
- `second_wait_interval seconds` (OPTIONAL) Enter the wait interval, in seconds, between the first and second SPF calculations. The range is from 0 to 120 seconds. The default is 5 seconds.

**Defaults**

See Parameters.

**Command Modes**

- ROUTER ISIS (for IPv4)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (for IPv6)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tbody>
<tr>
<td>7.8.1.0</td>
<td>Added support for multi-topology ISIS.</td>
</tr>
<tr>
<td>7.5.1.0</td>
<td>Added support for SPF Throttling Enhancement.</td>
</tr>
</tbody>
</table>

Usage Information

This command `spf-interval` in `CONFIG-ROUTER-ISIS-AF-IPV6` mode is used for IPv6 Multi-Topology route computation only. If using Single Topology mode, use the `spf-interval` command in `CONFIG-ROUTER-ISIS` mode for both IPv4 and IPv6 route computations.

SPF throttling slows down the frequency at which route calculations are performed during network instability. Even though throttling route calculations slows down network convergence, not throttling can result in a network not functioning as expected. If network topology is unstable, throttling slows down the scheduling of route calculations until the topology regains its stability.

The first route calculation is controlled by the initial wait interval and the second calculation is controlled by the second wait interval. Each subsequent wait interval is twice as long as the previous one until the wait interval reaches the maximum wait time specified (`interval seconds`). After the network calms down and there are no triggers for two times the maximum interval, fast behavior is restored (the initial wait time).
Link Aggregation Control Protocol (LACP)

This section contains commands for Dell EMC Networks’ implementation of the link aggregation control protocol (LACP) for creating dynamic link aggregation groups (LAGs) — known as “port-channels” in the Dell EMC Networking OS.

**NOTE:** For static LAG commands based on the standards specified in the IEEE 802.3 Carrier sense multiple access with collision detection (CSMA/CD) access method and physical layer specifications, see Port Channel Commands.

Topics:
- clear lacp counters
- debug lacp
- lacp fast-switchover
- lacp long-timeout
- lacp port-priority
- lacp system-priority
- port-channel-protocol lacp
- show lacp

### clear lacp counters

Clear port channel counters.

**Syntax**

```
clear lacp port-channel-number counters
```

**Parameters**

- `port-channel-number` Enter a port-channel number. The range is from 1 to 128.

**Defaults**

Without a Port Channel specified, the command clears all Port Channel counters.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
6.2.1.1 | Introduced on the E-Series.

Related Commands
- `show lacp` — display the LACP configuration.

**debug lacp**

Debug LACP (configuration, events, and so on).

**Syntax**
```
debug lacp [config | events | pdu [interface-type [in | out]]]
```
To disable LACP debugging, use the `no [config | events | pdu [interface-type [in | out]]]` command.

**Parameters**
- **config** (OPTIONAL) Enter the keyword `config` to debug the LACP configuration.
- **events** (OPTIONAL) Enter the keyword `events` to debug the LACP event information.
- **pdu** (OPTIONAL) Enter the keyword `pdu` to debug the LACP Protocol Data Unit information.
- **interface-type in | out** (OPTIONAL) Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

Optionally, enter an `in` or `out` parameter:
- `Receive` enter `in`
lacp fast-switchover

Cause the physical ports to be aggregated faster by configuring this capability in a port-channel on both the nodes that are members of a port-channel.

Syntax

```
lacp fast-switchover
```

To disable the capability of faster aggregation of the member ports of a LAG or a port-channel bundle, use the no version of this command.

Defaults

Not configured

Command Modes

INTERFACE (conf-if-po-number)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.

9.10(0.0)  Introduced on the S3148.

9.10(0.0)  Introduced on the S6100–ON.

9.8(2.0)   Introduced on the S3100 series.

9.8(1.0)   Introduced on the Z9100–ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0)   Introduced on the S6000–ON.

9.2(1.0)   Introduced on the Z9500.

9.0.2.0     Introduced on the S6000.

8.3(19.0)  Introduced on the S4820T.

8.3(11.1)  Introduced on the Z9000.

8.3.1.0    Added support for 4-port 40G line cards on the E-Series.

8.3.7.0    Introduced on the S4810.

7.6.1.0    Introduced on the S-Series.

7.5.1.0    Introduced on the C-Series.

6.2.1.1    Introduced on the E-Series.

</tbody>
</table>

**Usage Information**

You can configure the optimal switchover functionality for LACP even if you do not enable the fast boot mode on the system. You must configure the long timeout mechanism for the LACP session to enable the fast boot capability to operate properly. This command applies to dynamic port-channel interfaces only. When applied on a static port-channel, this command has no effect.

If you configure the optimized booting-time capability and perform a reload of the system, the LACP application sends PDUs across all the active LACP links immediately.

**Related Commands**

- `show lacp` — displays the LACP configuration.

---

**lACP long-timeout**

Configure a long timeout period (30 seconds) for an LACP session.

**Syntax**

```
lACP long-timeout
```

To reset the timeout period to a short timeout (1 second), use the `no lACP long-timeout` command.

**Defaults**

1 second

Usage Information

This command applies to dynamic port-channel interfaces only. When applied on a static port-channel, this command has no effect.

Related Commands

- `show lacp` — display the LACP configuration.

**lacp port-priority**

To influence which ports will be put in Standby mode when there is a hardware limitation that prevents all compatible ports from aggregating, configure the port priority.

**Syntax**

```
lacp port-priority priority-value
```

To return to the default setting, use the `no lacp port-priority priority-value` command.

**Parameters**

- `priority-value`  
  Enter the port-priority value. The higher the value number, the lower the priority. The range is from 1 to 65535. The default is **32768**.

**Defaults**

**32768**

6.2.1.1 Introduced on the E-Series.

Related Commands

-  `show lacp` — display the LACP information.
-  `show interfaces port-channel` — display information on configured Port Channel groups.
show lacp

Display the LACP matrix.

Syntax

show lacp port-channel-number [sys-id | counters]

Parameters

- **port-channel-number**: Enter a port-channel number. The range is from 1 to 128.
- **sys-id**: (OPTIONAL) Enter the keywords `sys-id` and the value that identifies a system.
- **counters**: (OPTIONAL) Enter the keyword `counters` to display the LACP counters.

Defaults

Without a Port Channel specified, the command clears all Port Channel counters.

Command Modes

- EXEC
- EXEC Privilege

MAC Addressing Commands

The following commands are related to configuring, managing, and viewing MAC addresses.

clear mac-address-table

Clear the MAC address table of all MAC address learned dynamically.

**Syntax**

```plaintext
clear mac-address-table {dynamic | sticky }{address mac-address | all | interface interface | vlan vlan-id}
```

**Parameters**

- `dynamic` Enter the keyword `dynamic` to specify dynamically-learned MAC addresses.
- `sticky` Enter the keyword `sticky` to specify sticky MAC addresses.
- `address mac-address` Enter the keyword `address` then a MAC address in `nn:nn:nn:nn:nn:nn` format.
- `all` Enter the keyword `all` to delete all MAC address entries in the MAC address table.
- `interface interface` Enter the following keywords and slot/port or number information:
  - For a Port Channel interface, enter the keywords `port-channel` then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- `vlan vlan-id` Enter the keyword `vlan` then a VLAN ID number from 1 to 4094.

**Command Modes**

EXEC Privilege

**Command History**

</table>
mac-address-table aging-time

Specify an aging time for MAC addresses to remove from the MAC address table.

Syntax

mac-address-table aging-time seconds

Parameters

seconds Enter either zero (0) or a number as the number of seconds before MAC addresses are relearned. To disable aging of the MAC address table, enter 0. The range is from 10 to 1000000. The default is 1800 seconds.

Defaults 1800 seconds

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
Version Description
8.3.7.0 Introduced on the S4810.
8.3.1.0 On the E-Series, available in INTERFACE VLAN context, reduced the minimum aging time in the INTERFACE VLAN context from 10 seconds to 1 second.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
pre-6.2.1.1 Introduced on the E-Series.

Related Commands
- `mac learning-limit` — set the MAC address learning limits for a selected interface.
- `show mac-address-table aging-time` — display the MAC aging time.

**mac-address-table disable-learning**

Disable MAC address learning from LACP or LLDP BPDUs.

**Syntax**
```
mac-address-table disable-learning [lacp | lldp]
```

**Parameters**
- `lacp`: Enter `lacp` to disable MAC address learning from LACP BPDUs.
- `lldp`: Enter `lldp` to disable MAC address learning from LLDP BPDUs.

**Defaults**
Disabled

**Command Modes**
CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** Description
9.10(0.0) Introduced on the S3048–ON, S3100 series, S4048–ON, S4810, S4820T, S5000, S6000, S6000–ON, Z9100–ON, and Z9500.

**Usage Information**
If you use the `mac-address-table disable-learning` command without specifying any option, the system does not learn source MAC addresses from LACP or LLDP BPDUs.

**mac-address-table static**

Associate specific MAC or hardware addresses to an interface and VLANs.

**Syntax**
```
mac-address-table static mac-address {multicast vlan vlan-id output-range interface}{output interface vlan vlan-id}
```
To remove a MAC address, use the `no mac-address-table static mac-address output interface vlan vlan-id` command.

**Parameters**

`mac-address`  
Enter the 48-bit hexadecimal address in `nn:nn:nn:nn:nn:nn` format.

`multicast`  
Enter a vlan port to where L2 multicast MAC traffic is forwarded.

**NOTE:** Use this option if you want multicast functionality in an L2 VLAN without IGMP protocols.

`output interface`  
For a unicast MAC address, enter the keyword `output` then one of the following interfaces for which traffic is forwarded:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/{subport}] information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

`output-range interface`  
For a multicast MAC address, enter the keyword `output-range` then one of the following interfaces to indicate a range of ports for which traffic is forwarded:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/{subport}] information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

`vlan vlan-id`  
Enter the keyword `vlan` then a VLAN ID number from 1 to 4094.

**Defaults**  
Not configured.

**Command Modes**  
CONFIGURATION

**Command History**  
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**  
**Description**

9.10(0.1)  
Introduced on the S6010-ON and S4048T-ON.

9.10(0.0)  
Introduced on the S3148.

9.8(2.0)  
Introduced on the S3100 series.

9.8(0.0P5)  
Introduced on the S4048-ON.

9.8(0.0P2)  
Introduced on the S3048-ON.

9.7(0.0)  
Introduced on the S6000-ON.

9.2(1.0)  
Introduced on the Z9500.

9.0.2.0  
Introduced on the S6000.

9.1(0.0)  
Added support for output range parameter for S4810 and Z9000.

8.3.19.0  
Introduced on the S4820T.

8.3.11.1  
Introduced on the Z9000.
**mac-address-table station-move threshold**

Change the frequency with which the MAC address station-move trap is sent after a MAC address changes in a VLAN. A trap is sent if a station move is detected above a threshold number of times in a given interval.

**Syntax**

```
[no] mac-address-table station-move threshold number interval count
```

**Parameters**

- `threshold number`: Enter the keyword `threshold` then the number of times MAC addresses in VLANs can change before an SNMP trap is sent. The range is from 1 to 10.
- `interval seconds`: Enter the keyword `interval` then the number of seconds. The range is from 5 to 60.

**Defaults**

- Not configured.

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

**Version**

- 9.8(0.0) Introduced on the S3048-ON and S4048-ON.
- 8.3.19.0 Introduced on the S4820T.
- 8.3.7.0 Introduced on the S4810.
- 7.5.1.0 Introduced on the C-Series.
- pre-6.2.1.1 Introduced on the E-Series.

**Usage Information**

For information about the specific trap sent and the corresponding Syslog, see SNMP Traps.
mac-address-table station-move refresh-arp

Ensure that address resolution protocol (ARP) refreshes the egress interface when a station move occurs due to a topology change.

Syntax

mac-address-table station-move refresh-arp

To disable the ARP refresh feature, use the no mac-address-table station-move refresh-arp command.

Defaults

Enabled

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.9(0.0) Modified the default option from none to Enabled.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.

7.4.1.0 Introduced on the E-Series.
8.3.7.0 Introduced on the S4810.
7.7.1.0 Introduced on the S-Series.

Usage Information

For more information about using this command, see NIC Teaming in the Layer 2 section of the Dell EMC Networking OS Configuration Guide.
**mac learning-limit**

Limit the maximum number of MAC addresses (static + dynamic) learned on a selected interface.

**Syntax**

```plaintext
mac learning-limit address_limit [vlan vlan-id] [station-move-violation [dynamic]] [dynamic [no-station-move| station-move]]
```

**Parameters**

- **address_limit**: Enter the maximum number of MAC addresses that can be learned on the interface. The range is from 1 to 1000000.
- **vlan vlan-id**: Enter the keyword then the VLAN ID. The range is from 1 to 4094.
- **dynamic**: (OPTIONAL) Enter the keyword dynamic to allow aging of MACs even though a learning limit is configured.
- **station-move-violation**: (OPTIONAL) Enter the keywords station-move to allow a station move on learned MAC addresses.

**Defaults**

- On S-Series, the default behavior is dynamic.

**NOTE**: “Static” means manually entered addresses, which do not age.

**Command Modes**: INTERFACE

</table>
Version | Description
---|---
8.3.1.0 | Added the `vlan` option on the E-Series.
8.2.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series. Added the `station-move` option.
6.5.1.0 | Added support for MAC Learning-Limit on the LAG.

Usage Information
This command and its options are supported on physical interfaces, static LAGs, LACP LAGs, and VLANs.

If you do not specify the `vlan` option, the MAC address counters are not VLAN-based. That is, the sum of the addresses learned on all VLANs (not having any learning limit configuration) is counted against the MAC learning limit.

MAC Learning Limit violation logs and actions are not available on a per-VLAN basis.

With the keyword `no-station-move` option, MAC addresses learned through this feature on the selected interface persist on a per-VLAN basis, even if received on another interface. Enabling or disabling this option has no effect on already learned MAC addresses.

After the MAC address learning limit is reached, the MAC addresses do not age out unless you add the `dynamic` option. To clear statistics on MAC address learning, use the `clear counters` command with the `learning-limit` parameter.

**NOTE:** If you configure this command on an interface in a routed VLAN, and after the MAC addresses learned reaches the limit set in the `mac learning-limit` command, IP protocols are affected. For example, VRRP sets multiple VRRP Masters and OSPF may not come up.

When a channel member is added to a port-channel and there is not enough ACL CAM space, the MAC limit functionality on that port-channel is undefined. When this occurs, un-configure the existing configuration first and then reapply the limit with a lower value.

Related Commands
- `mac learning-limit mac-address-sticky` — replace deprecated `no-station-move` parameter.
- `show mac learning-limit` — display MAC learning-limit configuration.

mac learning-limit learn-limit-violation

Configure an action for a MAC address learning-limit violation.

**Syntax**
```
mac learning-limit learn-limit-violation {log | shutdown}
```

To return to the default, use the `no mac learning-limit learn-limit-violation {log | shutdown}` command.

**Parameters**
- `log` Enter the keyword `log` to generate a syslog message on a learning-limit violation.
- `shutdown` Enter the keyword `shutdown` to shut down the port on a learning-limit violation.
Defaults
None

Usage Information
This command is supported on physical interfaces, static LAGs, and LACP LAGs.

Related Commands
- show mac learning-limit — display details of the mac learning-limit.

mac learning-limit mac-address-sticky
Maintain the dynamically learned mac addresses as sticky MAC addresses on the selected port.

Syntax
mac learning-limit mac-address-sticky

Parameters
- mac-address-sticky Configures the dynamic MAC addresses as sticky on an interface.

Defaults
None
Command Modes

INTERFACE

<tr>
<td>8.3.12.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

Usage Information

If you configure `mac-learning-limit` and the sticky MAC feature is enabled, dynamically learned MAC addresses are converted to sticky for that port. Any new MAC address that is learned also becomes sticky for that port.

Related Commands

- `show mac learning-limit` — display the details of the mac learning-limit.

mac learning-limit station-move-violation

Specify the actions for a station move violation.

Syntax

```
mac learning-limit station-move-violation {log | shutdown-both | shutdown-offending | shutdown-original}
```

To disable a configuration, use the `no mac learning-limit station-move-violation` command, then the configured keyword.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>log</code></td>
<td>Enter the keyword <code>log</code> to generate a syslog message on a station move violation.</td>
</tr>
<tr>
<td><code>shutdown-both</code></td>
<td>Enter the keyword <code>shutdown</code> to shut down both the original and offending interface and generate a syslog message.</td>
</tr>
<tr>
<td><code>shutdown-offending</code></td>
<td>Enter the keywords <code>shutdown-offending</code> to shut down the offending interface and generate a syslog message.</td>
</tr>
</tbody>
</table>
**shutdown-original**

Enter the keywords `shutdown-original` to shut down the original interface and generate a syslog message.

**Defaults**

None

**Usage Information**

This command is supported on physical interfaces, static LAGs, and LACP LAGs.

**Related Commands**

- `show mac learning-limit` — display details of the mac learning-limit.

### mac learning-limit reset

Reset the MAC address learning-limit error-disabled state.

**Syntax**

`mac learning-limit reset`

**Defaults**

none

**Command Modes**

- EXEC
show cam mac linecard (count)

Display the content addressable memory (CAM) size and the portions allocated for MAC addresses and for MAC ACLs.

Syntax

```
show cam mac linecard slot port-set port-pipe count [vlan vlan-id] [interface interface]
```

Parameters

- `linecard slot` (REQUIRED) Enter the keyword linecard then a slot number to select the linecard for which to gather information.
- `port-set port-pipe` (REQUIRED) Enter the keywords port-set then a Port-Pipe number to select the Port-Pipe for which to gather information.
- `count` (REQUIRED) Enter the keyword count to display CAM usage by interface type.
- `interface interface` (OPTIONAL) Enter the keyword interface then the interface type, slot and port information:
  - For a port channel interface, enter the keywords port-channel then a number.

Command History

### show cam mac linecard (dynamic or static)

Display the CAM size and the portions allocated for MAC addresses and for MAC ACLs.

**Syntax**

```
show cam mac linecard slot port-set port-pipe [address mac_addr | dynamic | interface interface | static | vlan vlan-id]
```

**Parameters**

- **linecard slot** (REQUIRED) Enter the keyword linecard then a slot number to select the linecard for which to gather information.
- **port-set port-pipe** (REQUIRED) Enter the keywords port then a Port-Pipe number to select the Port-Pipe for which to gather information. The range is from 0 or 1.
- **address mac_addr** (OPTIONAL) Enter the keyword address then a MAC address in the nn:nn:nn:nn:nn:nn format to display information on that MAC address.
- **dynamic** (OPTIONAL) Enter the keyword dynamic to display only those MAC addresses the switch dynamically learns.
- **interface interface** (OPTIONAL) Enter the keyword interface then the interface type, slot and port information:
  - For a port channel interface, enter the keywords port-channel then a number.
• For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.

• For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

static (OPTIONAL) Enter the keyword static to display only those MAC addresses specifically configured on the switch.

vlan vlan-id (OPTIONAL) Enter the keyword vlan then the VLAN ID to display the MAC address assigned to the VLAN. The range is 1 to 4094.

Command Modes

• EXEC
• EXEC Privilege

Dell#
**show mac-address-table**

Display the MAC address table.

**Syntax**

```
show mac-address-table [address mac-address | interface interface | vlan vlan-id] [aging-time] [dynamic | static] [count [vlan vlan-id] [interface interface-type [slot [/port[/subport]]]]]
```

**Parameters**

- **address mac-address** (OPTIONAL) Enter the keyword address then a MAC address in the nn:nn:nn:nn:nn:nn format to display information on that MAC address.
- **dynamic** (OPTIONAL) Enter the keyword dynamic to display only those MAC addresses the switch dynamically learns. Optionally, you can also add one of these combinations: address/mac-address, interface/interface, or vlan vlan-id.
- **static** (OPTIONAL) Enter the keyword static to display only those MAC addresses specifically configured on the switch. Optionally, you can also add one of these combinations: address/mac-address, interface/interface, or vlan vlan-id.
- **aging-time** Enter the keyword aging-time to display only aging-time information.
- **interface interface** (OPTIONAL) Enter the keyword interface and the interface information:
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- **interface interface-type** (OPTIONAL) Instead of entering the keyword interface then the interface type, slot/port/subport information, as above, you can enter the interface type, then just a slot number.
- **vlan vlan-id** (OPTIONAL) Enter the keyword vlan then the VLAN ID to display the MAC address assigned to the VLAN. The range is 1 to 4094.
- **count** (OPTIONAL) Enter the keyword count, then optionally, by an interface or VLAN ID, to display total or interface-specific static addresses, dynamic addresses, and MAC addresses in use.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
### Version Description

**9.10(0.0)**
Introduced on the S3148.

**9.10(0.0)**
Introduced on the S6100-ON.

**9.8(2.0)**
Introduced on the S3100 series.

**9.8(1.0)**
Introduced on the Z9100-ON.

**9.8(0.0P5)**
Introduced on the S4048-ON.

**9.8(0.0P2)**
Introduced on the S3048-ON.

**9.7(0.0)**
Introduced on the S6000-ON.

**9.2(1.0)**
Introduced on the Z9500.

**9.0.2.0**
Introduced on the S6000.

**8.3.19.0**
Introduced on the S4820T.

**8.3.11.1**
Introduced on the Z9000.

**8.3.12.0**
Updated the output.

**8.5.1.0**
Added support for 4-port 40G line cards on the E-Series.

**8.3.7.0**
Introduced on the S4810.

**7.6.1.0**
Introduced on the S-Series.

**7.5.1.0**
Introduced on the C-Series.

**pre-6.2.1.1**
Introduced on the E-Series.

### Usage Information

The following describes the `show mac-address-table` command shown in the following example.

#### Column Heading | Description

<table>
<thead>
<tr>
<th>VlanId</th>
<th>Displays the VLAN ID number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Lists whether the MAC address was manually configured (Static), learned dynamically (Dynamic), or associated with a specific port (Sticky).</td>
</tr>
</tbody>
</table>
| Interface | Displays the interface type and slot/port[/subport] information. The following abbreviations describe the interface types:  
  - Po = port channel  
  - Te = ten-gigabit Ethernet  
  - Fo = forty-gigabit Ethernet |
| State | Lists if the MAC address is in use (Active) or not in use (Inactive). |

### Example

```bash
DellEMC(conf)# do show mac-address-table
Codes: *N - VLT Peer Synced MAC

<table>
<thead>
<tr>
<th>VlanId</th>
<th>Mac Address</th>
<th>Type</th>
<th>Interface</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>00:00:00:00:00:01</td>
<td>Dynamic (N)</td>
<td>Po 128</td>
<td>Active</td>
</tr>
<tr>
<td>2</td>
<td>00:00:00:00:00:02</td>
<td>Dynamic (N)</td>
<td>Po 10</td>
<td>Active</td>
</tr>
<tr>
<td>2</td>
<td>00:00:00:00:00:03</td>
<td>Dynamic</td>
<td>Po 100</td>
<td>Active</td>
</tr>
<tr>
<td>2</td>
<td>00:00:00:00:00:04</td>
<td>Dynamic</td>
<td>Po 10</td>
<td>Active</td>
</tr>
</tbody>
</table>
```

### Usage Information

The following describes the `show mac-address-table count` command shown in the following example.
**Line Beginning With** | **Description**
---|---
MAC Entries... | Displays the number of MAC entries learned per VLAN.
Dynamic Address... | Lists the number of dynamically learned MAC addresses.
Static Address... | Lists the number of user-defined MAC addresses.
Total MAC... | Lists the total number of MAC addresses the switch uses.

**Example (Count)**

```
DellEMC# show mac-address-table count
MAC Entries for all vlans :
Dynamic Address Count :               110
Static Address (User-defined) Count : 0
Sticky Address Count :                0
Total Synced Mac from Peer (N):        100
Total MAC Addresses in Use:           110
DellEMC#
```

**Related Commands**
- `show mac-address-table aging-time` — display MAC aging time.

### show mac-address-table aging-time

Display the aging times assigned to the MAC addresses on the switch.

**Syntax**

```
show mac-address-table aging-time [vlan vlan-id]
```

**Parameters**

- `vlan vlan-id` (OPTIONAL) Enter the keyword `vlan` then the VLAN ID to display the MAC address assigned to the VLAN. The range is from 1 to 4094.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

**Version** | **Description**
---|---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
show mac accounting destination

Display destination counters for Layer 2 traffic (available on physical interfaces only).

Syntax

```
show mac accounting destination [mac-address vlan vlan-id] [interface interface [mac-address vlan vlan-id] [vlan vlan-id]] [vlan vlan-id]
```

Parameters

- **mac-address**  
  (OPTIONAL) Enter the MAC address in the nn:nn:nn:nn:nn:nn format to display information on that MAC address.

- **interface interface**  
  (OPTIONAL) Enter the keyword interface then the interface type, slot and port information:

  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

- **vlan vlan-id**  
  (OPTIONAL) Enter the keyword vlan then the VLAN ID to display the MAC address assigned to the VLAN. The range is from 1 to 4094.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### show mac accounting destination interface tengigabitethernet 2/1

<table>
<thead>
<tr>

<td>5120000</td>
</tr>
</tbody>
</table>

**Related Commands**

- `show mac accounting access-list` — display the MAC access list configurations and counters (if configured).

### show mac learning-limit

Display MAC address learning limits set for various interfaces.

**Syntax**

```
show mac learning-limit [violate-action] [detail] [interface interface]
```

**Parameters**

- **violate-action** (OPTIONAL) Enter the keywords `violate-action` to display the MAC learning limit violation status.
- **detail** (OPTIONAL) Enter the keyword `detail` to display the MAC learning limit in detail.
- **interface interface** (OPTIONAL) Enter the keyword `interface` with the following keywords and the interface information:
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
For a 40-Gigabit Ethernet interface, enter the keyword **fortyGigE** then the slot/port information.

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Te 1/1      10         0          0          0
```
Virtual LAN (VLAN) Commands

The following commands configure and monitor virtual LANs (VLANs). VLANs are a virtual interface and use many of the same commands as physical interfaces.

You can configure an IP address and Layer 3 protocols on a VLAN called Inter-VLAN routing. FTP, TFTP, ACLs and SNMP are not supported on a VLAN.

Occasionally, while sending broadcast traffic over multiple Layer 3 VLANs, the VRRP state of a VLAN interface may continually switch between Master and Backup.

NOTE: For more information, refer to VLAN Stacking and VLAN-related commands, such as portmode hybrid in the Interfaces chapter.

default vlan-id

Specify a VLAN as the Default VLAN.

Syntax

    default vlan-id vlan-id

Parameters

    vlan-id  

Enter the VLAN ID number of the VLAN to become the new Default VLAN. The range is from 1 to 4094. The default is 1.

Defaults

Default VLAN is VLAN 1.

**Example**

```
DellEMC(conf-if-vl-100)# show config
!
interface Vlan 100
```
show vlan

Display the current VLAN configurations on the switch.

Syntax

```
show vlan [brief | id vlan-id | name vlan-name]
```

Parameters

- **brief**
  (OPTIONAL) Enter the keyword brief to display the following information:
  - VLAN ID
  - VLAN name (left blank if none is configured)
  - Spanning Tree Group ID
  - MAC address aging time
  - IP address

- **id vlan-id**
  (OPTIONAL) Enter the keyword id then a number from 1 to 4094. Only information on the VLAN specified is displayed.

- **name vlan-name**
  (OPTIONAL) Enter the keyword name then the name configured for the VLAN. Only information on the VLAN named is displayed.

Command Modes

- EXEC
- EXEC Privilege

  3  Active  T P020(Te 1/6)
          T Te 1/7
          U Te 1/1

  4  Active  U P02(Te 1/2)
          T P020(Te 1/6)
          T Te 1/7

  5  Active  T P020(Te 1/6)
          T Te 1/7
          U Te 1/3

  6  Active  U P03(Te 1/4)
          T P020(Te 1/6)
          T Te 1/7

  7  Active  T P020(Te 1/6)
          T Te 1/7
          U Te 1/5

P  100  Active  T P01(Te 1/1)
          T Te 1/2

C  101  Inactive  T Te 1/3
I  102  Inactive  T Te 1/4

DellEMC#

Example (VLAN ID)

DellEMC# show vlan id 40

Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
x - Dot1x untagged, X - Dot1x tagged
G - GVRP tagged, M - Vlan-stack

NUM  Status  Description  Q Ports
  40  Active  M Te 1/47

DellEMC# show vlan id 41

Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
x - Dot1x untagged, X - Dot1x tagged
G - GVRP tagged, M - Vlan-stack

NUM  Status  Description  Q Ports
  41  Active  T Te 1/47

DellEMC# show vlan id 42

Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
x - Dot1x untagged, X - Dot1x tagged
G - GVRP tagged, M - Vlan-stack

NUM  Status  Description  Q Ports
  42  Active  U Te 1/47

DellEMC#

Example (Brief)

DellEMC# show vlan br

VLAN  Name  STG  MAC Aging  IP Address
---- ------------------------------------
  1             0    1800        unassigned
  2             0    1800        2.2.2.2/24
Example (Name)

```plaintext
Dellconf)# interface vlan 222
DellEMC(conf-if-vl-222)#name test
DellEMC(conf-if-vl-222)#do show vlan name test
```

```plaintext
Codes: * - Default VLAN, G - GVRP VLANs
Q: U - Untagged, T - Tagged
x - Dot1x untagged, X - Dot1x tagged
G - GVRP tagged, M - Vlan-stack

<td>Inactive</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>12</td>
<td>Inactive</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>O Te 1/10</td>
</tr>
</tbody>
</table>
```

Related Commands

- `vlan-stack compatible` — enable the Stackable VLAN feature on the selected VLAN.
- `interface vlan` — configure a VLAN.

**tagged**

Add a Layer 2 interface to a VLAN as a tagged interface.

**Syntax**

```
tagged interface
```

To remove a tagged interface from a VLAN, use the `no tagged interface` command.

**Parameters**

- `interface`

  Enter the following keywords and the interface information:

  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults**

All interfaces in Layer 2 mode are untagged.

**Command Modes**

INTERFACE VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
### Version Description
- **9.10(0.0)** Introduced on the S3148.
- **9.10(0.0)** Introduced on the S6100-ON.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100-ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.5.1.0** Added support for 4-port 40G line cards on the E-Series.
- **8.3.7.0** Introduced on the S4810.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **pre-6.2.1.1** Introduced on the E-Series.

### Usage Information
When you use the no tagged command, the interface is automatically placed in the Default VLAN as an untagged interface unless the interface is a member of another VLAN. If the interface belongs to several VLANs, remove it from all VLANs to change it to an untagged interface.

Tagged interfaces can belong to multiple VLANs, while untagged interfaces can only belong to one VLAN at a time.

### Related Commands
- `interface vlan` — configure a VLAN.
- `untagged` — specify which interfaces in a VLAN are untagged.

### track ip
Track the Layer 3 operational state of a Layer 3 VLAN, using a subset of the VLAN member interfaces.

### Syntax
```
track ip interface
```
To remove the tracking feature from the VLAN, use the no track ip interface command.

### Parameters
- **interface**
  - Enter the following keywords and the interface information:
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
• For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
• For a port channel interface, enter the keywords `port-channel` then a number.

**Defaults**
Not configured.

**Command Modes**
INTERFACE VLAN

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**
When this command is configured, the VLAN is operationally UP if any of the interfaces specified in the `track ip` command are operationally UP, and the VLAN is operationally DOWN if none of the tracking interfaces are operationally UP.

If the `track ip` command is not configured, the VLAN's Layer 3 operational state depends on all the members of the VLAN.

The Layer 2 state of the VLAN, and the Layer 2 traffic, is not affected by the `track ip` command configuration.

**Related Commands**
• `interface vlan` — configure a VLAN.
• `tagged` — specify which interfaces in a VLAN are tagged.
Add a Layer 2 interface to a VLAN as an untagged interface.

Syntax
untagged interface

To remove an untagged interface from a VLAN, use the no untagged interface command.

Parameters

- interface
  - Enter the following keywords and the interface information:
    - For a port channel interface, enter the keywords port-channel then a number.
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport/subport information.
    - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

Defaults
All interfaces in Layer 2 mode are untagged.

Command Modes
INTERFACE VLAN

</tbody>
</table>
Untagged interfaces can only belong to one VLAN.

In the Default VLAN, you cannot use the no untagged interface command. To remove an untagged interface from all VLANs, including the Default VLAN, enter INTERFACE mode and use the no switchport command.

Related Commands

- interface vlan — configure a VLAN.
- tagged — specify which interfaces in a VLAN are tagged.

Far-End Failure Detection (FEFD)

The Dell EMC Networking operating software supports far-end failure detection (FEFD) on the Ethernet interfaces of the platform. The FEFD feature detects and reports far-end link failures.

- FEFD is not supported on the Management interface.
- During an RPM failover, FEFD is operationally disabled for approximately 8 to 10 seconds.
- By default, FEFD is disabled.

debug fefd

Enable debugging of FEFD.

Syntax

debug fefd {events | packets} [interface]

To disable debugging of FEFD, use the no debug fefd {events | packets} [interface] command.

Parameters

- events
- packets
- interface (OPTIONAL) Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
fefd

Enable Far-End Failure Detection on an interface, set the FEFD interval, or select the FEFD mode.

Syntax

fefd {disable|interval|mode {aggressive|normal}}

Parameters

- **disable**
  - Enter the keyword disable to disable FEFD for the specified interface.

- **interval**
  - Enter the keyword interval, followed by a value to specify the FEFD interval in seconds. Range is from 3 to 300. Default is 15.

- **mode**
  - Enter the keyword mode followed by the mode type to specify the FEFD mode.
    - **normal**: Change the link state to “unknown” when a far-end failure is detected by the software on that interface. When the interface is placed in an “unknown” state, the software brings down the line protocol.
    - **aggressive**: Change the link state to “error-disabled” when a far-end failure is detected by the software on that interface. When an interface is placed in an “error-disabled” state, you must enter the fefd reset command to reset the interface state. Range is normal or aggressive. Default is normal.

Defaults

Disabled.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
**Version** | **Description**
---|---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.12.0 | Introduced on the S4810.

**Usage Information**
When you enter `no fefd` for an interface and `fefd-global`, FEFD is enabled on the interface because the `no fefd` command is not retained in the configuration file. To keep the interface FEFD disabled when the global configuration changes, use the `fefd reset` command.

**Related Commands**
- `fefd disable` — disable far-end failure detection on an interface.
- `fefd reset` — enable FEFD globally on the system.
- `fefd mode` — change FEFD mode on an interface.

### fefd disable

Disable FEFD on an interface only. This command overrides the `fefd reset` command for the interface.

**Syntax**

```
fefd disable
```

To re-enable FEFD on an interface, use the `no fefd disable` command.

**Defaults**
Not configured.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**

</tr>
<tr>
<td>9.7(0.0)</td>
<td>Introduced on the S6000-ON.</td>
</tr>
</tbody>
</table>

Legacy E-Series command.

Usage Information

FEFD disable command on the interface prevents the interface from running FEFD when FEFD is enabled globally.

Related Commands

- `fefd reset` — clear an interface in Err-disabled state. It doesn’t work until the interface is in err-disabled state.
- `fefd mode` — change FEFD mode on an interface.

### fefd interval

Set an interval between control packets.

**Syntax**

```
fefd interval seconds
```

To return to the default value, use the `no fefd interval` command.

**Parameters**

- `seconds` Enter a number as the time between FEFD control packets. The range is from 3 to 255 seconds. The default is **15 seconds**.

**Defaults**

**15 seconds**

**Command Modes**

INTERFACE

**Command History**

8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
Legacy E-Series command.

Usage Information
You can set up the interval between control packets using the fefd interval command.

Related Commands
- fefd — enable far-end failure detection.

**fefd mode**

Change the FEFD mode on an interface.

**Syntax**

```
fefd mode {normal | aggressive}
```

To return the FEFD mode to the default of normal, use the `no fefd mode` command.

**Parameters**

- **normal** (OPTIONAL) Enter the keyword `normal` to change the link state to "unknown" when a far-end failure the software detects on that interface. When the interface is placed in "unknown" state, the software brings down the line protocol.
- **aggressive** (OPTIONAL) Enter the keyword `aggressive` to change the link state to "error-disabled" when a far-end failure the software detects on that interface. When an interface is placed in "error-disabled" state, enter the `fefd reset` command to reset the interface state.

**Defaults**

Normal

Legacy E-Series command.

Related Commands

  • `fefd` — enable far-end failure detection.
  • `fefd-global` — enable FEFD globally on the system.
**fefd-global**

Enable FEFD globally on the system.

**Syntax**

```
fefd-global [interval seconds][mode {normal | aggressive}]
```

To disable FEFD globally, use the `no fefd-global [mode {normal | aggressive}]` command.

**Parameters**

- **interval seconds**
  - Enter the keyword `interval` followed by the number of seconds to wait between FEFD control packets. Range is from 3 to 300 seconds. Default is 15 seconds.
- **normal**
  - (OPTIONAL) Enter the keywords `mode normal` to change the link state to “unknown” when a far-end failure the software detects on that interface. When the interface is placed in “unknown” state, the software brings down the line protocol. The default is **Normal mode**.
- **aggressive**
  - (OPTIONAL) Enter the keywords `mode aggressive` to change the link state to “error-disabled” when a far-end failure the software detects on that interface. When an interface is placed in “error-disabled” state, enter the `fefd reset` command to reset the interface state.

**Defaults**

Disabled.

</tbody>
</table>

**Legacy E-Series command.**

**Usage Information**

If you enter only the `fefd-global` syntax, the mode is normal and the default interval is 15 seconds.
If you disable FEFD globally (no fefd-global), the system does not remove the FEFD interface configuration.

**Related Commands**

- `fefd` — enable far-end failure detection.
- `fefd-global interval` — configure an interval between FEFD control packets.
- `show fefd` — display the FEFD command output.

### show fefd

View FEFD status globally or on a specific interface.

**Syntax**

```
show fefd [interface]
```

**Parameters**

- `interface`  
  (OPTIONAL) Enter the following keywords and the interface information:
  
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

### Related Commands

- `fefd` — enable far-end failure detection.
- `fefd disable` — disable FEFD on an interface only.
- `fefd-global` — enable FEFD globally on the system.
- `fefd reset` — reset all interfaces or a single interface that was in “error-disabled” mode.
The link layer discovery protocol (LLDP) advertises connectivity and management from the local station to the adjacent stations on an IEEE 802 LAN.

LLDP facilitates multi-vendor interoperability by using standard management tools to discover and make available a physical topology for network management. The Dell EMC Networking operating software implementation of LLDP is based on IEEE standard 801.1ab.

The starting point for using LLDP is invoking LLDP with the `protocol lldp` command in either `CONFIGURATION` or `INTERFACE` mode.

The information LLDP distributes is stored by its recipients in a standard management information base (MIB). You can access the information by a network management system through a management protocol such as simple network management protocol (SNMP).

### Topics:
- LLDP Commands
- LLDP-MED Commands

### LLDP Commands

The following are LLDP commands.

#### advertise dot1-tlv

Advertise dot1 TLVs (Type, Length, Value).

**Syntax**

```
advertise dot1-tlv {port-protocol-vlan-id | port-vlan-id | vlan-name}
```

To remove advertised dot1-tlv, use the `no advertise dot1-tlv {port-protocol-vlan-id | port-vlan-id | vlan-name}` command.

**Parameters**

- `port-protocol-vlan-id` Enter the keywords `port-protocol-vlan-id` to advertise the port protocol VLAN identification TLV.
- `port-vlan-id` Enter the keywords `port-vlan-id` to advertise the port VLAN identification TLV.
- `vlan-name` Enter the keywords `vlan-name` to advertise the vlan-name TLV. This keyword is only supported on the C-Series and S-Series.

**Defaults**

Disabled.

**Command Modes**

`CONFIGURATION` (conf-lldp) and `INTERFACE` (conf-if-interface-lldp)
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Related Commands

- `protocol lldp (Configuration)` — enable LLDP globally.
- `debug lldp interface` — debug LLDP.
- `show lldp neighbors` — display the LLDP neighbors.

**advertise dot3-tlv**

Advertise dot3 TLVs (Type, Length, Value).

**Syntax**

`advertise dot3-tlv {max-frame-size}`

To remove advertised dot3-tlv, use the no `advertise dot3-tlv {max-frame-size}` command.

**Parameters**

- `max-frame-size` Enter the keywords max-frame-size to advertise the dot3 maximum frame size TLV.

**Defaults**

None

**Command Modes**

CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)
advertise interface-port-desc

Advertise port descriptor.

Syntax

advertise interface-port-desc {description | port-id}

To remove the advertised port descriptor, use the no advertise interface-port-desc {description | port-id} command.

Parameters

description Enter the keyword description then the interface description.

port-id Enter the keyword port-id then the port-id. The range is from 0 to 7.

Defaults

None

Command Modes

CONFIGURATION (conf-lldp)

INTERFACE (conf-if-interface-lldp)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Version Description  
9.11(2.0P1) Introduced the description and port-id options.

Usage Information If you do not specify the option, by default the port-id takes higher precedence and sends the port-id in the LLDP packets.

advertise management-tlv

Advertise management TLVs (Type, Length, Value).

Syntax
advertise management-tlv {management-address | system-capabilities | system-description | system-name}
To remove advertised management TLVs, use the no advertise management-tlv {management-address | system-capabilities | system-description | system-name} command.

Parameters

management-address Enter the keyword management-address to advertise the management IP address TLVs to the LLDP peer.

system-capabilities Enter the keywords system-capabilities to advertise the system capabilities TLVs to the LLDP peer.

system-description Enter the keywords system-description to advertise the system description TLVs to the LLDP peer.

system-name Enter the keywords system-name to advertise the system name TLVs to the LLDP peer.

Defaults
None

Command Modes
CONFIGURATION (conf-lldp)

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
9.1(0.0) Modified to support management-address parameter.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.7.1.0 Introduced on the S-Series.
7.6.1.0 Introduced on the C-Series.
advertise management-tlv (Interface)

Advertise management type, length, values (TLVs) to the specified interface.

Syntax
advertise management-tlv {management-address | system-capabilities | system-description | system-name}

To remove advertised management TLVs, use the no advertise management-tlv {management-address | system-capabilities | system-description | system-name} command.

Parameters
management-address
Enter the keywords management-address to advertise the management IP address TLVs to the specified interface.

system-capabilities
Enter the keywords system-capabilities to advertise the system capabilities TLVs to the specified interface.

system-description
Enter the keywords system-description to advertise the system description TLVs to the specified interface.

system-name
Enter the keywords system-name to advertise the system name TLVs to the specified interface.

Defaults
None

Command Modes
INTERFACE (conf-interface-lldp)

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
9.1(0.0) Introduced on the Z9000 and S4810.
8.3.19.0 Introduced on the S4820T.

Usage Information
The command options management-address, system-capabilities, system-description, and system-name can be invoked individually or together, in any sequence.
clear lldp counters

Clear LLDP transmitting and receiving counters for all physical interfaces or a specific physical interface.

Syntax

```
clear lldp counters [interface interface]
```

Parameters

- `interface interface` (OPTIONAL) Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

Defaults

None

Command Modes

EXEC Privilege

Command History

**clear lldp neighbors**

Clear LLDP neighbor information for all interfaces or a specific interface.

**Syntax**

```
clear lldp neighbors [interface interface]
```

**Parameters**

- `interface interface` (OPTIONAL) Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults**

None

**Command Modes**

EXEC Privilege

**Command History**

debug lldp interface

To display timer events, neighbor additions or deletions, and other information about incoming and outgoing packets, enable LLDP debugging.

**Syntax**

```
debug lldp interface {interface | all}{events | packet {brief | detail} {tx | rx | both}}
```

To disable debugging, use the `no debug lldp [interface {interface | all}{events} {packet {brief | detail} {tx | rx | both}}]` command.

**Parameters**

- `interface` Enter the following keywords and slot/port[/subport] or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

- `all` Enter the keyword `all` to display information on all interfaces.

- `events` Enter the keyword `events` to display major events such as timer events.

- `packet` Enter the keyword `packet` to display information regarding packets coming in or going out.

- `brief` Enter the keyword `brief` to display brief packet information.

- `detail` Enter the keyword `detail` to display detailed packet information.

- `tx` Enter the keyword `tx` to display transmit-only packet information.

- `rx` Enter the keyword `rx` to display receive-only packet information.

- `both` Enter the keyword `both` to display both receive and transmit packet information.

**Defaults**

None

**Command Modes**

EXEC Privilege

**Command History**

```

### disable

Enable or disable LLDP.

**Syntax**

`disable`

To enable LLDP, use the `no disable` command.

**Defaults**

Enabled — no disable.

**Command Modes**

- CONFIGURATION (conf-lldp)
- INTERFACE (conf-if-interface-lldp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### hello

Configure the rate at which the LLDP control packets are sent to its peer.

**Syntax**

```
hello seconds
```

To revert to the default, use the `no hello seconds` command.

**Parameters**

- **seconds**
  
  Enter the rate, in seconds, at which the control packets are sent to its peer. The rate is from 5 to 180 seconds. The default is `30 seconds`.

**Defaults**

- `30 seconds`

**Command Modes**

- CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
management-interface

Enable and configure LLDP protocol parameters on the management interface.

Syntax
management-interface
To remove LLDP configuration on a management interface, use the no management-interface command.

Command Modes LLDP (conf-lldp)

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.11.0 Introduced on the C-Series.
8.3.19.0 Introduced on the S4820T.
8.2.1.0 Introduced on the S4810.
7.7.1.0 Introduced on the S-Series.
7.6.1.0 Introduced on the Z-Series.
7.4.1.0 Introduced on the E-Series.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
To enable LLDP on the management interface, use the `no disable` command in LLDP-MANAGEMENT-INTERFACE mode (conf-lldp-mgmtif).

**mode**

To receive or transmit, set LLDP.

**Syntax**

```
mode {tx | rx}
```

To return to the default, use the `no mode` command.

**Parameters**

- `tx` Enter the keyword `tx` to set the mode to transmit.
- `rx` Enter the keyword `rx` to set the mode to receive.

**Defaults**

Both `transmit` and `receive`.

**Command Modes**

CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Related Commands

- `protocol lldp (Configuration)` — enable LLDP globally.
- `show lldp neighbors` — display the LLDP neighbors.

**multiplier**

Set the multiple of the hello timer before LLDP declares the interface dead.

**Syntax**

```
multiplier number
```

To return to the default, use the `no multiplier` command.

**Parameters**

- `integer` Enter the number of consecutive misses before the LLDP declares the interface dead. The range is from 2 to 10.

**Defaults**

4

**Command Modes**

CONFIGURATION (conf-lldp) and INTERFACE (conf-if-interface-lldp)

**Command History**

protocol lldp (Configuration)

Enable the LLDP globally on the switch.

Syntax

```plaintext
protocol lldp
```

To disable LLDP globally on the chassis, use the `no protocol lldp` command.

Defaults

Enabled.

Command Modes

- **CONFIGURATION (conf-lldp)**

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**protocol lldp (Interface)**

Enter the LLDP protocol in INTERFACE mode.

**Syntax**

[no] protocol lldp

To return to the global LLDP configuration mode, use the no protocol lldp command from Interface mode.

**Defaults**

LLDP is not enabled on the interface.

**Command Modes**

INTERFACE (conf-if-interface-lldp)

**Command History**

**Usage Information**

Before LLDP can be configured on an interface, it must be enabled globally from CONFIGURATION mode. This command places you in LLDP mode on the interface; it does not enable the protocol.

When you enter the LLDP protocol in the Interface context, it overrides global configurations. When you execute the no protocol lldp from INTERFACE mode, interfaces begin to inherit the configuration from global LLDP CONFIGURATION mode.
show lldp neighbors

Display LLDP neighbor information for all interfaces or a specified interface.

Syntax

show lldp neighbors [interface interface] [detail]

Parameters

interface interface  (OPTIONAL) Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

detail  (OPTIONAL) Enter the keyword detail to display all the TLV information, remote management IP addresses, timers, and LLDP tx and rx counters.

Defaults

None

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version  Description

9.13.0.0  Enhanced to display organizational specific unrecognized LLDP TLVs.

9.11.2.5  Enhanced to display unrecognized TLVs.

9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.

9.10(0.0)  Introduced on the S3148.

9.10(0.0)  Introduced on the S6100–ON.

9.8(2.0)  Introduced on the S3100 series.

9.8(1.0)  Introduced on the Z9100–ON.

9.8(0.0P5)  Introduced on the S4048-ON.

9.8(0.0P2)  Introduced on the S3048-ON.

9.7(0.0)  Introduced on the S6000-ON.

9.2(1.0)  Introduced on the Z9500.

9.0.2.0  Introduced on the S6000.

9.1.(0.0)  Modified output of detail parameter to display remote management IP addresses.

8.3.(0.0)  Introduced on the S4820T.

8.3.11.1  Introduced on the Z9000.

8.5.1.0  Added support for 4-port 40G line cards on the E-Series.

8.3.7.0  Introduced on the S4810.
Version | Description
--- | ---
7.7.1.0 | Introduced on the S-Series.
7.6.1.0 | Introduced on the C-Series.
7.4.1.0 | Introduced on the E-Series.

Usage Information

Omitting the keyword `detail` displays only the remote chassis ID, Port ID, and Dead Interval.

Example

DellEMC(conf-if-te-1/31)# do show lldp neighbors
Loc PortID Rem Host Name       Rem     Port Id Rem Chassis Id
--------------------------------------------------------------
Te   1/21    R2  TenGigabitEthernet  2/11   00:01:e8:06:95:3e
Te   1/31    R3  TenGigabitEthernet  3/11   00:01:e8:09:c2:4a

Example (Detail)

DellEMC(conf)# do show lldp neighbors detail

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.11(2.5) Enhanced to display total number of suppressed traps on the, S3048–ON, S4048-ON, S4048T-ON, S6010–ON and Z9100–ON.

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the S6100–ON.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100–ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000-ON.

9.2(1.0) Introduced on the Z9500.

9.0.2.0 Introduced on the S6000.

8.3.11.1 Introduced on the S9000.

8.3.7.0 Introduced on the S4810.

7.7.1.0 Introduced on the S-Series.

7.6.1.0 Introduced on the C-Series.

7.4.1.0 Introduced on the E-Series.

Example

DellEMC# show lldp statistics

show running-config lldp

Display the current global LLDP configuration.

Syntax

    show running-config lldp

Defaults

None

Command Modes

    EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.7(0.0)</td>
<td>Introduced on the S6000-ON.</td>

<td>Introduced on the Z9500.</td>
</tr>
<tr>
<td>9.0.2.0</td>
<td>Introduced on the S6000.</td>
</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S8420T.</td>
</tr>
</tbody>
</table>
**Version** | **Description**
--- | ---
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.7.1.0 | Introduced on the S-Series.
7.6.1.0 | Introduced on the C-Series.
7.4.1.0 | Introduced on the E-Series.

**Example**
```
DellEMC# show running-config lldp
!
protocol lldp
  advertise dot1-tlv port-protocol-vlan-id port-vlan-id
  advertise dot3-tlv max-frame-size
  advertise management-tlv system-capabilities system-description
  hello 15
  multiplier 3
  no disable
DellEMC#
```

**snmp-notification-interval**

Used to configure the value for the lldp notification interval, to throttle lldp notification messages.

**Syntax**
```
[no] snmp-notification-interval [seconds]
```

**Parameters**
- `seconds`: Enter a value from 5 to 3600 seconds.

**Defaults**
5 seconds

**Command Modes**
CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.11(2.5) | Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6010-ON and Z9100-ON

**Usage Information**
SNMP notification for the changes in the lldp remote entry table is throttled by 5 seconds (default), or the configured time set using this command. If more than one notification message is generated within the configured time, only the first one will be sent and the remaining messages are suppressed.

**LLDP-MED Commands**

The following are the LLDP-MED (Media Endpoint Discovery) commands.

Dell EMC Networking OS LLDP-MED commands are an extension of the set of LLDP TLV advertisement commands.
As defined by ANSI/TIA-1057, LLDP-MED provides organizationally specific TLVs (Type Length Value), so that endpoint devices and network connectivity devices can advertise their characteristics and configuration information. The Organizational Unique Identifier (OUI) for the Telecommunications Industry Association (TIA) is 00-12-BB.

- LLDP-MED Endpoint Device — any device that is on an IEEE 802 LAN network edge, can communicate using IP, and uses the LLDP-MED framework.
- LLDP-MED Network Connectivity Device — any device that provides access to an IEEE 802 LAN to an LLDP-MED endpoint device, and supports IEEE 802.1AB (LLDP) and TIA-1057 (LLDP-MED). The Dell EMC Networking system is an LLDP-MED network connectivity device.

Regarding connected endpoint devices, LLDP-MED provides network connectivity devices with the ability to:

- manage inventory
- identify physical location
- identify network policy

advertise med guest-voice

To advertise a separate limited voice service for a guest user with their own IP telephony handset or other appliances that support interactive voice services, configure the system.

Syntax

```
advertise med guest-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}
```

To return to the default, use the

```
no advertise med guest-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}
```

Parameters

- **vlan-id**
  - Enter the VLAN ID. The range is from 1 to 4094.
- **layer2_priority**
  - Enter the Layer 2 priority. The range is from 0 to 7.
- **DSCP_value**
  - Enter the DSCP value. The range is from 0 to 63.
- **priority-tagged number**
  - Enter the keywords priority-tagged, the Layer 2 priority, and then the DSCP value.

Defaults

- Unconfigured.

Command Modes

- CONFIGURATION (conf-lldp)

Command History

- Introduced on the S6010-ON and S4048T-ON.
- Introduced on the S3148.
- Introduced on the S6100-ON.
- Introduced on the S3100 series.
- Introduced on the Z9100-ON.
- Introduced on the S4048-ON.

This guide is platform-specific. For command information about other platforms, see the relevant **Dell EMC Networking OS Command Line Reference Guide**.
advertise med guest-voice-signaling

To advertise a separate limited voice service for a guest user when the guest voice control packets use a separate network policy than the voice data, configure the system.

Syntax

advertise med guest-voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}

To return to the default, use the no advertise med guest-voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number} command.

Parameters

<table>
<thead>
<tr>

- `show lldp neighbors` — display the LLDP neighbors.

**advertise med location-identification**

To advertise a location identifier, configure the system.

**Syntax**

```
advertise med location-identification {coordinate-based value | civic-based value | ecs-elin value}
```

To return to the default, use the `no advertise med location-identification {coordinate-based value | civic-based value | ecs-elin value}` command.

**Parameters**

- **coordinate-based value**
  - Enter the keywords `coordinate-based` then the coordinated based location in hexadecimal value of 16 bytes.

- **civic-based value**
  - Enter the keywords `civic-based` then the civic based location in hexadecimal format. The range is from 6 to 255 bytes.

- **ecs-elin value**
  - Enter the keywords `ecs-elin` then the Emergency Call Service (ecs) Emergency Location Identification Number (elin) numeric location string. The range is from 10 to 25 characters.

**Defaults**

Unconfigured.

### Usage Information

- **ECS** — Emergency call service such as defined by TIA or the national emergency numbering association (NENA)
- **ELIN** — Emergency location identification number, a valid North America Numbering Plan format telephone number supplied for ECS purposes.

### Related Commands

- `debug lldp interface` — debug LLDP.
- `show lldp neighbors` — display the LLDP neighbors.

---

**advertise med power-via-mdi**

To advertise the Extended Power via MDI TLV, configure the system.

**Syntax**

advertise med power-via-mdi

To return to the default, use the `no advertise med power-via-mdi` command.

**Defaults**

unconfigured.

**Command Modes**

CONFIGURATION (conf-lldp)
advertise med softphone-voice

To advertise softphone to enable IP telephony on a computer so that the computer can be used as a phone, configure the system.

Syntax

advertise med softphone-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}

To return to the default, use the no advertise med softphone-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number} command.

Parameters

- `vlan-id` Enter the VLAN ID. The range is from 1 to 4094.
- `layer2_priority` Enter the Layer 2 priority. The range is from 0 to 7.
- `DSCP_value` Enter the DSCP value. The range is from 0 to 63.
- `priority-tagged number` Enter the keywords priority-tagged, the Layer 2 priority, and then the DSCP value.
advertise med streaming-video

To advertise streaming video services for broadcast or multicast-based video, configure the system. This command does not include video applications that rely on TCP buffering.

Syntax

advertise med streaming-video {vlan-id layer2_priority DSCP_value} | {priority-tagged number}

To return to the default, use the no advertise med streaming-video {vlan-id layer2_priority DSCP_value} | {priority-tagged number} command.

Parameters

- **vlan-id**: Enter the VLAN ID. The range is from 1 to 4094.
- **layer2_priority**: Enter the Layer 2 priority. The range is from 0 to 7.
advertise med video-conferencing

To advertise dedicated video conferencing and other similar appliances that support real-time interactive video, configure the system.

Syntax

```
advertise med video-conferencing {vlan-id layer2_priority DSCP_value} | {priority-tagged number}
```

To return to the default, use the no advertise med video-conferencing {vlan-id layer2_priority DSCP_value} | {priority-tagged number} command.
advertise med video-signaling

To advertise video control packets that use a separate network policy than video data, configure the system.

Syntax

```
advertise med video-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}
```
To return to the default, use the no advertise med video-signaling \{vlan-id layer2_priority DSCP_value\} | \{priority-tagged number\} command.

**Parameters**
- **vlan-id**
  - Enter the VLAN ID. The range is from 1 to 4094.
- **layer2_priority**
  - Enter the Layer 2 priority. The range is from 0 to 7.
- **DSCP_value**
  - Enter the DSCP value. The range is from 0 to 63.
- **priority-tagged number**
  - Enter the keywords priority-tagged, the Layer 2 priority, and then the DSCP value.

**Defaults**
Unconfigured.

- `show lldp neighbors` — display the LLDP neighbors.
Microsoft Network Load Balancing

Network load balancing (NLB) is a clustering functionality that is implemented by Microsoft on Windows 2000 Server and Windows Server 2003 operating systems. Microsoft NLB clustering allows multiple servers running Microsoft Windows to be represented by one MAC and one IP address to provide transparent failover and load-balancing. The Dell EMC Networking OS does not recognize server clusters by default; you must configure NLB functionality on a switch to support server clusters. The maximum NLB entry limit from 8 to 11 is increased and support for more CAM-ACL to increase.

Topics:

- arp (for Multicast MAC Address)
- mac-address-table static (for Multicast MAC Address)
- ip vlan-flooding

arp (for Multicast MAC Address)

To associate an IP address with a multicast MAC address in the switch when you configure multicast mode of network load balancing (NLB), use address resolution protocol (ARP).

Syntax

```
arp ip-address multicast-mac-address interface
```

To remove an ARP address, use the `no arp ip-address` command.

Parameters

- **ip-address**: Enter an IP address in dotted decimal format.
- **multicast-mac-address**: Enter a 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format for the static MAC address to be used to switch multicast traffic.
- **interface**: Enter any of the following keywords and slot/port[/subport] or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - The interface specified here must be one of the interfaces configured using the `output-range | output` interface option with the `mac-address-table static` command.

Defaults

Not configured.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
**Usage Information**

For multicast mode of NLB, to associate an IP address with a multicast MAC address in the switch, use address resolution protocol (ARP) by entering the `arp ip-address multicast-mac-address` command in Global configuration mode. This setting causes the multicast MAC address to be mapped to the cluster IP address for NLB mode of operation of the switch.

**Related Commands**

- `clear arp-cache` — clear dynamic ARP entries from the ARP table.
- `show arp` — display the ARP table.

---

**mac-address-table static (for Multicast MAC Address)**

For multicast mode of network load balancing (NLB), configure a static multicast MAC address, associate the multicast MAC address with the VLAN used to switch Layer 2 multicast traffic, and add output ports that will receive multicast streams on the VLAN. To delete a configured static multicast MAC address from the MAC address table on the router, enter the `no mac-address-table static multicast-mac-address` command.

**Syntax**

```
mac-address-table static multicast-mac-address multicast vlan vlan-id range-output {single-interface | interface-list | interface-range}
```

To remove a MAC address, use the `no mac-address-table static multicast-mac-address output interface vlan vlan-id` command.

**Parameters**

- `multicast` Enter a vlan port to where L2 multicast MAC traffic is forwarded.
- `output interface` For a multicast MAC address, enter the keyword `output` then one of the following interfaces for which traffic is forwarded:

  - For a Port Channel interface, enter the keywords `port-channel` then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/[subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

- `output-range interface` For a multicast MAC address, enter the keyword `output-range` then one of the following interfaces to indicate a range of ports for which traffic is forwarded:

  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/[subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
For a Management interface, enter the keyword managementethernet followed by slot/port numbers.

- For a Port Channel interface, enter the keywords port-channel followed by a number.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

```
  vlan vlan-id
```

Enter the keyword vlan then a VLAN ID number from 1 to 4094.

</tbody>
</table>

**Default**

Disabled

**Usage Information**

By default this command is disabled. There might be some ARP table entries which are resolved through ARP packets which had Ethernet MAC SA different from MAC information inside the ARP packet. This unicast data traffic flooding occurs only for those packets which use these ARP entries.
Multicast Source Discovery Protocol (MSDP)

Multicast source discovery protocol (MSDP) connects multiple PIM sparse-mode (PIM-SM) domains together. MSDP peers connect using TCP port 639. Peers send keepalives every 60 seconds. A peer connection is reset after 75 seconds if no MSDP packets are received. MSDP connections are parallel with MBGP connections.

The Dell EMC Networking OS supports MSDP commands on the S4048-ON platform.

Topics:
- clear ip msdp peer
- clear ip msdp sa-cache
- clear ip msdp statistic
- debug ip msdp
- ip msdp cache-rejected-sa
- ip msdp default-peer
- ip msdp log-adjacency-changes
- ip msdp mesh-group
- ip msdp originator-id
- ip msdp peer
- ip msdp redistribute
- ip msdp sa-filter
- ip msdp sa-limit
- ip msdp shutdown
- ip multicast-msdp
- show ip msdp
- show ip msdp sa-cache rejected-sa

```
clear ip msdp peer
```

Reset the TCP connection to the peer and clear all the peer statistics.

**Syntax**

```
clear ip msdp peer {peer address}
```

**Parameters**

- **peer address**
  
  Enter the peer address in a dotted decimal format (A.B.C.D.)

**Defaults**

Not configured.

**Command Modes**

EXEC Privilege
clear ip msdp sa-cache

Clears the entire source-active cache, the source-active entries of a particular multicast group, rejected, or local source-active entries.

Syntax

```
clear ip msdp sa-cache [group-address | rejected-sa | local]
```

Parameters

- `group-address`: Enter the group IP address in dotted decimal format (A.B.C.D.).
- `rejected-sa`: Enter the keywords `rejected-sa` to clear the cache source-active entries that are rejected because the RPF check failed, an SA filter or limit is configured, the RP or MSDP peer is unreachable, or because of a format error.
- `local`: Enter the keyword `local` to clear out local PIM advertised entries. It applies the redistribute filter (if present) while adding the local PIM SA entries to the SA cache.

Defaults

Without any options, this command clears the entire source-active cache.

Command Modes

- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
clear ip msdp statistic

Clears the entire source-active cache, the source-active entries of a particular multicast group, rejected, or local source-active entries.

Syntax

```plaintext
clear ip msdp statistic peer peer-address
```

Parameters

- **peer**
  - Enter the keyword `peer` to clear the MSDP peer entries.
- **peer-address**
  - Enter the IP address of the MSDP peer.

Defaults

Without any options, this command clears the entire source-active cache.

Command Modes

- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

# debug ip msdp

Turn on MSDP debugging.

## Syntax

```
debug ip msdp {event peer address | packet peer address | pim}
```

To turn debugging off, use the `no debug ip msdp {event peer address | packet peer address | pim}` command.

## Parameters

- **event peer address**
  
  Enter the keyword `event` then the peer address in a dotted decimal format (A.B.C.D).

- **packet peer address**
  
  Enter the keyword `packet` then the peer address in a dotted decimal format (A.B.C.D).

- **pim**
  
  Enter the keyword `pim` to debug advertisement from PIM.

## Defaults

Not configured.

ip msdp cache-rejected-sa

Enable an MSDP cache for the rejected source-active entries.

Syntax

ip msdp cache-rejected-sa {number}

To clear the MSDP rejected source-active entries, use the no ip msdp cache-rejected-sa {number} command then the ip msdp cache-rejected-sa {number} command.

Parameters

number

Enter the number of rejected SA entries to cache. The range is from 0 to 32766.

Defaults

None

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the S9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
**ip msdp default-peer**

Define a default peer from which to accept all source-active (SA) messages.

**Syntax**

```
ip msdp default-peer peer address [list name]
```

To remove the default peer, use the `no ip msdp default-peer {peer address} list name` command.

**Parameters**

- **peer address**: Enter the peer address in a dotted decimal format (A.B.C.D.)
- **list name**: Enter the keywords `list name` and specify a standard access list that contains the RP address that should be treated as the default peer. If no access list is specified, then all SAs from the peer are accepted.

**Defaults**

Not configured.

**Command Modes**

ip msdp mesh-group

To be a member of a mesh group, configure a peer.

Syntax

\[\text{ip msdp mesh-group} \{\text{name} \} \{\text{peer address}\}\]

To remove the peer from a mesh group, use the no \text{ip msdp mesh-group} \{\text{name} \} \{\text{peer address}\} command.

Parameters

- **name**: Enter a string of up to 16 characters long for as the mesh group name.
- **peer address**: Enter the peer address in a dotted decimal format (A.B.C.D.).

Defaults

Not configured.

Usage Information

An MSDP mesh group is a mechanism for reducing SA flooding, typically in an intra-domain setting. When some subset of a domain’s MSDP speakers are fully meshed, they can be configured into a mesh-group. If member X of a mesh-group receives a SA message from an MSDP peer that is also a member of the mesh-group, member X accepts the SA message and forwards it to all of its peers that are not part of the mesh-group. However, member X cannot forward the SA message to other members of the mesh-group.
ip msdp originator-id

Configure the MSDP Originator ID.

Syntax

ip msdp originator-id {interface}

To remove the originator-id, use the no ip msdp originator-id {interface} command.

Parameters

interface

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Defaults

Not configured.

**ip msdp peer**

Configure an MSDP peer.

**Syntax**

```
ip msdp peer peer address [connect-source] [description] [sa-limit number]
```

To remove the MSDP peer, use the no ip msdp peer peer address [connect-source interface] [description name] [sa-limit number] command.

**Parameters**

- **peer address**
  
Enter the peer address in a dotted decimal format (A.B.C.D.).

- **connect-source interface**
  
Enter the keywords connect-source then one of the interfaces and slot/port or number information:
  
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

- **description name**
  
  (OPTIONAL) Enter the keyword description then a description name (maximum 80 characters) to designate a description for the MSDP peer.

- **sa-limit number**
  
  (OPTIONAL) Enter the maximum number of SA entries in SA-cache. The range is from 1 to 100000.

### ip msdp redistribute

Filter local PIM SA entries in the SA cache. SAs which the ACL denies time out and are not refreshed. Until they time out, they continue to reside in the MSDP SA cache.

**Syntax**

```
ip msdp redistribute [list acl-name]
```

**Parameters**

- **list acl-name**
  
  Enter the name of an extended ACL that contains permitted SAs. If you do not use this option, all local entries are blocked.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

### Version Description

9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced

### Usage Information

Modifications to the ACL do not have an immediate effect on the sa-cache.

To apply the redistribute filter to entries already present in the SA cache, use the `clear ip msdp sa-cache local` command.

---

**ip msdp sa-filter**

Permit or deny MSDP source active (SA) messages based on multicast source and/or group from the specified peer.

**Syntax**

```
ip msdp sa-filter {in | out} peer-address list [access-list name]
```

Remove this configuration using the `no ip msdp sa-filter {in | out} peer-address list [access-list name]` command.

**Parameters**

- **in**
  - Enter the keyword `in` to enable incoming SA filtering.
- **out**
  - Enter the keyword `out` to enable outgoing SA filtering.
- **peer-address**
  - Enter the peer address of the MSDP peer in a dotted decimal format (A.B.C.D.).
- **access-list name**
  - Enter the name of an extended ACL that contains permitted SAs. If you do not use this option, all local entries are blocked.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION
ip msdp sa-limit

Configure the upper limit of source-active (SA) entries in SA-cache.

Syntax
ip msdp sa-limit number

To return to the default, use the no ip msdp sa-limit number command.

Parameters

number

Enter the maximum number of SA entries in SA-cache. The range is from 1 to 500000.

Defaults
50000

6.2.1.1 Introduced
show ip msdp

Display the MSDP peer status, SA cache, or peer summary.

Syntax

show ip msdp {peer peer address | sa-cache | summary}

Parameters

peer peer address  Enter the keyword peer then the peer address in a dotted decimal format (A.B.C.D).
sa-cache  Enter the keywords sa-cache to display the Source-Active cache.
summary  Enter the keyword summary to display an MSDP peer summary.

Defaults

Not configured.

Version  Description

9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the S6100–ON.
9.8(2.0)  Introduced on the S3100 series.
9.8(1.0)  Introduced on the Z9100–ON.
9.8(0.0P6)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)  Introduced on the S6000-ON.
9.5(0.1)  Introduced on the Z9500.
9.0.2.0  Introduced on the S6000.
8.3.19.0  Introduced on the S4820T.
show ip msdp sa-cache rejected-sa

Display the rejected SAs in the SA cache.

**Syntax**

```
show ip msdp sa-cache rejected-sa
```

**Defaults**
None

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

```
Dell Networking OS Supports Multicast Listener Discovery (MLD) protocol.

Multicast Listener Discovery (MLD) is a Layer 3 protocol that IPv6 routers use to learn of the multicast receivers that are directly connected to them and the groups in which the receivers are interested. Multicast routing protocols (like PIM) use the information learned from MLD to route multicast traffic to all interested receivers. MLD is analogous to IGMP, which tracks IPv4 multicast receivers.

MLD version 1 is analogous to IGMP version 2. MLD version 3 adds the ability to include and exclude sources and is analogous to IGMP version 3.

### MLD Version 1

Routers use MLD to learn which multicast addresses have listeners on each of their attached links. For each link, the router keeps a list of which multicast addresses have listeners and a timer associated with each of those addresses.

There are three types of MLD messages:

- **Multicast Listener Query** — a message sent by the Querier to learn which multicast groups have listeners.
  - **General Query** — a query to which all listeners should respond.
  - **Multicast-Address-Specific Query** — a query to which only listeners for the specified group should respond.
- **Multicast Listener Report** — a message sent by listeners declaring their multicast group subscriptions.
- **Multicast Listener Done** — a message sent by a listener declaring that it is leaving a multicast group.
- **Maximum Response Delay** — the maximum amount of time that the Querier waits to receive a response to a General or Multicast-Address-Specific Query. The value is zero in reports and Done messages.
- **Multicast Address** — set to zero in General Queries, and set to the relevant multicast address in multicast-address-specific queries and done messages.

MLD Version 1 packets have the following structure:

```
0                   1                   2                   3
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|     Type      |     Code      |          Checksum             |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|     Maximum Response Delay    |          Reserved             |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|                                                               |
|                                                               |
|                                                               |
|                       Multicast Address                       |
|                                                               |
|                                                               |
|                                                               |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

### MLD Querier Router

MLD routers periodically ask connected hosts in which, if any, multicasts groups they are interested. For any subnet, only one router solicits hosts for this information; this router is called the Querier, and all the other routers on the subnet are non-queriers. Initially, each router...
assumes that it is the Querier, and transmits queries. If a router receives a query with a source IP address lower than its own, it stops transmitting queries, and so the router with the lowest IP address is ultimately elected the Querier for the subnet.

### Joining a Multicast Group

The Querier periodically sends a General Query to the all-nodes multicast address FF02::1. A host that wants to join a multicast group responds to the general query with a report that contains the group address; the report is also addressed to the group (in the IPv6 Destination Address field). To avoid duplicate reporting, any host that hears a report from another host for the same group in which it itself is interested cancels its report for that group.

A host does not have to wait for a General Query to join a group. If a host wants to become a member of a group for which the router is not currently forwarding traffic, it should send an unsolicited report.

When a router receives a report for a group, it either creates a new entry in the group membership table, or it updates an existing entry by adding the interface on which the report arrived to the outgoing interface list for the group.

### Leaving a Multicast Group

A receiver that is no longer interested in traffic for a particular group should leave the group by sending a Done message to the link-scope all-routers multicast address, FF02::02.

When a Querier receives a Done message, it sends a Multicast-Address-Specific Query addressed to the relevant multicast group. Hosts still interested in receiving traffic for that group (according to the suppression mechanism) so that the group table entry is maintained. If no reports are received in response to the query, the group membership entry is cleared and the router stops forwarding traffic for that group.

### MLD version 2

MLD version 2 (MLDv2) adds source-filtering capability. A node can report interest in multicast traffic only from specific source addresses or from all sources except for specific source addresses. MLDv2 is backwards compatible with MLD version 1.

**NOTE:** MLDV2 is the default MLD version.

There are two types of MLDv2 messages

- **Multicast Listener Query** — a message sent by the Querier to discover multicast listeners.
  - **General Query** — a query to which all listeners should respond.
  - **Multicast-Address-Specific Query** — a query to which listeners for the specified group should respond to affirm their membership.
  - **Multicast-Address-and-Source-Specific Query** — a query to determine if there are any listeners interested in a group and source pair.
- **Version 2 Multicast Listener Report** — a response to a query indicating listening state or state changes.

Multicast Listener Queries are sent by multicast routers in Querier State to query the multicast listening state of neighboring interfaces. Queries have the following format:

```
0                   1                   2                   3
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|  Type = 130   |      Code     |           Checksum            |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|    Maximum Response Code      |           Reserved            |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|                                                               |
*                                                               *
|                                                               |
*                                                               *
```
Version 2 multicast listener reports are sent by IP nodes to report (to neighboring routers) the current multicast listening state, or changes in the multicast listening state, of their interfaces. Reports have the following format:

```
+---------------------------------+-
| Type = 143 | Reserved   |           Checksum            |
+---------------------------------+-
|           Reserved            |Nr of Mcast Address Records (M) |
+---------------------------------+-
|                               .                               |
+---------------------------------+-
|                               .                               |
+---------------------------------+-
|                               .                               |
+---------------------------------+-
|                               .                               |
+---------------------------------+-
|                               .                               |
+---------------------------------+-
|                               .                               |
+---------------------------------+-
|                               .                               |
+---------------------------------+-
|                               .                               |
+---------------------------------+-
|                               .                               |
+---------------------------------+-
|                               .                               |
+---------------------------------+-
|                               .                               |
+---------------------------------+-
|                               .                               |
+---------------------------------+-
|                               .                               |
+---------------------------------+-
|                               .                               |

Topics:

- MLD timers
- Clearing MLD groups
- Debugging MLD
- Explicit Tracking
- Reducing Leave Latency
- Displaying MLD groups table
- Displaying MLD Interfaces
- MLD Snooping
**MLD timers**

All non-queriers have a timer that is refreshed when it hears a general query. If the timer expires, then the router can assume that the querier is not present, and so it assumes the role of querier. The other querier present interval, or querier timeout interval, is the amount of time that passes before a non-querier router assumes that there is no longer a querier on the link.

To adjust the query interval, use the following command:

```
NOTE: Query interval is the amount of time between general queries sent by the querier.
```

**INTERFACE Mode**

```
ipv6 mld query-interval
```

**Reducing Host Response Burstiness**

General Queries contain a Query Response Interval value, which is the amount of time the host has to respond to a general query. Hosts set a timer to a random number less than the Query Response Interval upon receiving a general query, and send a report when the timer expires. Increasing this value spreads host responses over a greater period of time, and so reduces response burstiness.

To adjust the query response time, use the following command:

**INTERFACE Mode**

```
ipv6 mld query-max-resp-time
```

**Clearing MLD groups**

Clear a specific group or all groups on an interface from the multicast routing table.

To clear MLD groups, use the following command:

**EXEC Privilege**

```
clear ipv6 mld groups
```

**Debugging MLD**

Display Dell Networking OS messages about the MLD process.

To display debugging messages, use the following command:

**EXEC Privilege**

```
debug ipv6 mld
```

**Explicit Tracking**

If the Querier does not receive a response to a Multicast-Address-Specific Query, it sends another. Then, after no response, it removes the group entry from the group membership table. You can configure the system to remove specified groups immediately after receiving a Leave message to reduce leave latency.

To configure the system to remove a group immediately after receiving a Leave message, use the following command:
INTERFACE Mode
ipv6 mld explicit-tracking

Reducing Leave Latency

Leave Latency is the amount of time after the last host leaves the MLD group that the router stops forwarding traffic for that group. Latency is introduced because the router attempts several times to determine if there are any remaining members before stopping traffic for the group. The Querier sends a Multicast-Address-Specific Query upon receiving a Done message to ascertain whether there are any remain receivers for a group. The Last Listener Query Interval is the Maximum Response Delay for a Multicast-Address-Specific Query, and also the amount of time between Multicast-Address-Specific Query retransmissions. Lowering the Last Listener Query Interval reduces the time to detect that there are no remaining receivers for a group, and so can reduce the amount of unnecessarily forwarded traffic.

To adjust the last-member query interval, use the following command:

INTERFACE Mode
ipv6 mld last-member-query-interval

Displaying MLD groups table

Display MLD groups. Group information can be filtered.

To display MLD groups, use the following command:
EXEC Privilege

show ipv6 mld groups

Dell#show ipv6 mld groups
Total Number of Groups: 1
MLD Connected Group Membership
Group Address    Interface    Mode     Uptime    Expires     Last Reporter
Ff08::12         Vlan 10     MLDv2   00:00:12  00:02:05     1::2

Displaying MLD Interfaces

Display MLD interfaces.

To display MLD interfaces, use the following command:
INTERFACE

show ipv6 mld interface vlan 20

Dell#show ipv6 mld interface vlan 20
Vlan 20 is up, line protocol is up
Inbound MLD access group is not set
Internet address is fe80::92b1:1cf:fe04:9b63/64
MLD is enabled on interface
MLD query interval is 60 seconds
MLD querier timeout is 125 seconds
MLD max query response time is 10 seconds
MLD last member query response interval is 1000 ms
MLD immediate-leave is enabled for all groups
MLD activity: 0 joins
MLD Snooping

MLD snooping allows the switch to examine the MLD packets and forwards the decision based on their content. You can configure MLD snooping in subnets that receive MLD queries from either MLD or the MLD snooping querier. MLD snooping limits the IPv6 multicast traffic at Layer 2 by configuring Layer 2 LAN ports and dynamically forwards the IPv6 multicast traffic to the ports that want to receive it. Hosts join IPv6 multicast groups either by sending an unsolicited MLD report or by sending an MLD report in response to a general query from an IPv6 multicast router (the switch forwards general queries from IPv6 multicast routers to all the ports in a VLAN). The switch snoops these reports and in response to a snooped MLD report, the switch creates an entry in its forwarding table for the VLAN on which the report was received. When the other hosts that are interested in this multicast traffic send MLD reports, the switch snoops their report and adds them to the existing forwarding table entry. The switch creates only one entry per VLAN in the forwarding table for each multicast group, for which it snoops an MLD report.

clear ipv6 mld snooping groups

Clear entries from the group cache table.

Syntax

```
clear ipv6 mld snooping groups [interface | group-address]
```

Parameters

- **interface**: Enter the following keywords and slot/port or number information:
  - For a 1-Gigabit Ethernet interface, enter the keyword GigabitEthernet followed by the slot/port information.
  - For a Port Channel interface, enter the keywords port-channel then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a VLAN, enter the keyword vlan followed by a number from 1 to 4094.

- **group-address**: (OPTIONAL) Enter the group address in the following format: x:x:x:x::x. The :: notation specifies successive hexadecimal fields of zero.

Defaults

None.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.14(0.0) Introduced on the S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010.

debug ipv6 mld snooping

Enable debugging on IPv6 MLD snooping packets.

Syntax

```
debug ipv6 mld {group-address | interface}
```
To turn off debugging, use the `no debug ipv6 mld {group-address | interface}` command.

**Parameters**

- **group-address**
  - (OPTIONAL) Enter the multicast group address in the `x:x:x:x::x` format. The :: notation specifies successive hexadecimal fields of zero.

- **interface**
  - Enter the following keywords and slot/port or number information:
    - For a 1-Gigabit Ethernet interface, enter the keyword `GigabitEthernet` followed by the slot/port information.
    - For a Port Channel interface, enter the keywords `port-channel` then a number.
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
    - For a VLAN, enter the keyword `vlan` followed by a number from 1 to 4094.

**Defaults**

- Disabled.

**Command Modes**

- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

### ipv6 mld snooping

Enable MLD snooping on a VLAN.

**Syntax**

```
ipv6 mld snooping
```

To disable MLD snooping, use the `no ipv6 mld snooping` command.

** Defaults**

- Enabled on all VLAN interfaces.

** Command Modes**

- INTERFACE VLAN

** Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

</tr>
</tbody>
</table>
ipv6 mld snooping enable

Enable MLD snooping on the switch globally.

Syntax: ipv6 mld snooping enable

To disable MLD snooping, use the no ipv6 mld snooping enable command.

Defaults: Enabled on all VLAN interfaces.

Command Modes: CONFIGURATION

Command History: This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

ipv6 mld snooping explicit-tracking

Enable explicit MLD snooping tracking on an interface.

Syntax: ipv6 mld snooping explicit-tracking

To disable MLD snooping explicit tracking, use the no ipv6 mld snooping explicit-tracking command.

Defaults: Disabled.

Command Modes: INTERFACE VLAN

Command History: This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

ipv6 mld snooping mrouter

Configure a Layer 2 port as a multicast router port.

Syntax: ipv6 mld snooping mrouter interface {interface interface}

Parameters:
- interface: Enter the keyword interface to indicate the next-hop interface to the multicast router.
- interface: Enter one of the following keywords and the interface information:
For a null interface, enter the keyword null then the slot/port information. The Null interface number is 0.

For the Management interface on the stack-unit, enter the keyword ManagementEthernet then the slot/port information.

For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.

For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.

For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

For a port channel interface, enter the keywords port-channel then a number.

### Defaults
None.

### Command Modes
 INTERFACE VLAN

### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

### ipv6 mld snooping querier

Enable the MLD querier processing for the VLAN interface.

#### Syntax
ipv6 mld snooping querier

To disable the querier feature, use the no ipv6 mld snooping querier command.

#### Defaults
Disabled

#### Command Modes
 INTERFACE VLAN

#### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

### show ipv6 mld snooping groups

Display the IPv6 MLD snooping group information.

#### Syntax
show ipv6 mld snooping groups [group address] [summary] [interface interface [detail]]
Parameters

**group-address** (Optional) Enter the multicast group addresses in the X::X::X::X format. The :: notation specifies successive hexadecimal fields of zero.

**summary** (OPTIONAL) Enter the keyword `summary` to display a summary of groups.

**interface interface** Enter the following keywords and slot/port or number information:

- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN, enter the keyword `vlan` followed by a number from 1 to 4094.

**detail** View detailed group information.

Defaults None.

Command Modes EXEC

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** **Description**

9.14(0.0) Introduced on the S3048–ON, S4048–ON, S4048T-ON, S5048F-ON, S6000–ON, S6010–ON, S6100–ON, Z9100–ON, S3100, and C9010.

Example

```
Dell EMC#show ipv6 mld snooping groups
Total Number of Groups: 1
Channel ::/ff0e::225:1:1:1, interface Vlan 10
    Uptime 11:24:49, Last join time 00:00:15
    Expires in 00:01:54
    Ports : Po 1
Dell EMC#
```

**show ipv6 mld snooping interface**

View the configured MLD snooping interfaces.

**Syntax**

```
show ipv6 mld snooping interface [interface]
```

**Parameters**

**interface interface** Enter the following keywords and slot/port or number information:

- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN, enter the keyword `vlan` followed by a number from 1 to 4094.
Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.14(0.0) Introduced on the S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010.

Example
DellEMC#show ipv6 mld snooping interface vlan 10
Vlan 10 is up, line protocol is up
  Interface address is fe80::3617:ebff:fe30:2482/64
  MLD protocol processing disabled
  Current MLD snooping version is 2
  MLD snooping is enabled on this interface
  MLD snooping querier is disabled and is currently inactive
  MLD snooping last member query response interval is 1000 ms
  MLD snooping explicit tracking is disabled

show ipv6 mld snooping mrouter

Display information on the MLD snooping router.

Syntax
show ipv6 mld snooping mrouter [vlan]

Parameters
VLAN (OPTIONAL) Enter the keyword VLAN then the VLAN number to display the information on that specific VLAN. The VLAN range is from 1 to 4094.

Defaults
None.

Command Modes
EXEC
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.14(0.0) Introduced on the S3048-ON, S4048-ON, S4048T-ON, S5048F-ON, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, S3100, and C9010.

Example
Dell#show ipv6 mld snooping mrouter
Interface Ports (* - Dynamic)
Vlan 2 Gi 1/18
Dell#
Multiple Spanning Tree Protocol (MSTP)

Multiple spanning tree protocol (MSTP), as implemented by the Dell EMC Networking OS, conforms to IEEE 802.1s. This command supports the Dell EMC Networking OS.

Topics:
• debug spanning-tree mstp
• disable
• forward-delay
• hello-time
• max-age
• msti
• name
• protocol spanning-tree mstp
• revision
• show config
• show spanning-tree mst configuration
• show spanning-tree msti
• spanning-tree
• spanning-tree msti
• tc-flush-standard

debug spanning-tree mstp

Enable debugging of the multiple spanning tree protocol and view information on the protocol.

Syntax
debug spanning-tree mstp [all | bpdu interface {in | out} | events]
To disable debugging, enter no debug spanning-tree mstp

Parameters
• all
  (OPTIONAL) Enter the keyword all to debug all spanning tree operations.
• bpdu interface
  (OPTIONAL) Enter the keyword bpdu to debug bridge protocol data units (BPDU).
  (OPTIONAL) Enter the interface keyword along with the type slot/port of the interface you want displayed. Type slot/port options are the following:
  • For a port channel interface, enter the keywords port-channel then a number.
  • For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

Optionally, enter an `in` or `out` parameter with the optional interface:

- For Receive, enter the keyword `in`.
- For Transmit, enter the keyword `out`.

### events

(Optional) Enter the keyword `events` to debug MSTP events.

</table>

**Example**

```
DellEMC# debug spanning-tree mstp bpdu tengigabitethernet 2/1 ?
in Receive (in)
out Transmit (out)
```
disable

Globally disable the multiple spanning tree protocol on the switch.

Syntax

disable

To enable MSTP, enter the no disable command.

Defaults

Disabled.

Command Modes

MULTIPLE SPANNING TREE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3(19.0) Introduced on the S4820T.
8.3(11.1) Introduced on the Z9000.
8.3(7.0) Introduced on the S4810.
7.6(1.0) Introduced on the S-Series.
7.5(1.0) Introduced on the C-Series.
6.2(1.0) Introduced.

Related Commands

- protocol spanning-tree mstp — enter MULTIPLE SPANNING TREE mode.
**forward-delay**

The amount of time the interface waits in the Blocking State and the Learning State before transitioning to the Forwarding State.

### Syntax

```
forward-delay seconds
```

To return to the default setting, use the `no forward-delay` command.

### Parameters

- **seconds**
  - Enter the number of seconds the interface waits in the Blocking State and the Learning State before transiting to the Forwarding State. The range is from 4 to 30. The default is **15 seconds**.

### Defaults

**15 seconds**

### Command Modes

- **MULTIPLE SPANNING TREE**

### Related Commands

- `max-age` — change the wait time before MSTP refreshes protocol configuration information.
- `hello-time` — change the time interval between bridge protocol data units (BPDUs).
**hello-time**

Set the time interval between generation of MSTB bridge protocol data units (BPDUs).

Syntax

```
hello-time seconds
```

To return to the default value, use the `no hello-time` command.

Parameters

- **seconds**
  - Enter a number as the time interval between transmission of BPDUs. The range is from 1 to 10. The default is 2 seconds.

Defaults

- 2 seconds

Command Modes

- MULTIPLE SPANNING TREE

Related Commands

- `forward-delay` — amount of time the interface waits in the Blocking State and the Learning State before transitioning to the Forwarding State.
- `max-age` — change the wait time before MSTP refreshes protocol configuration information.
max-age

To maintain configuration information before refreshing that information, set the time interval for the MSTB.

Syntax

`max-age seconds`

To return to the default values, use the `no max-age` command.

Parameters

- `max-age` Enter a number of seconds the Dell EMC Networking OS waits before refreshing configuration information. The range is from 6 to 40. The default is 20 seconds.

Defaults

20 seconds

Related Commands

- `forward-delay` — amount of time the interface waits in the Blocking State and the Learning State before transitioning to the Forwarding State.
- `hello-time` — change the time interval between BPDUs.
msti

Configure multiple spanning tree instance, bridge priority, and one or multiple VLANs mapped to the MST instance.

Syntax

```plaintext
msti instance {vlan range | bridge-priority priority}
```

To disable mapping or bridge priority, use the no msti instance {vlan range | bridge-priority priority} command.

Parameters

- **msti instance**: Enter the MSTP instance. The range is from zero (0) to 63.
- **vlan range**: Enter the keyword vlan then the identifier range value. The range is from 1 to 4094.
- **bridge-priority priority**: Enter the keywords bridge-priority then a value in increments of 4096 as the bridge priority. The range is from zero (0) to 61440. Valid priority values are: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440. All other values are rejected.

Defaults
default bridge-priority is 32768.

</tbody>
</table>
Usage Information

For two MSTP switches to be within the same MSTP region, the switches must share the same region name (including matching case).

Related Commands

- `msti` — map the VLAN(s) to an MST instance.
- `revision` — assign the revision number to the MST configuration.

**protocol spanning-tree mstp**

To enable and configure the multiple spanning tree group, enter MULTIPLE SPANNING TREE mode.

Syntax

```
protocol spanning-tree mstp
```

To disable the multiple spanning tree group, use the `no protocol spanning-tree mstp` command.

Defaults

Not configured.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Usage Information

MSTP is not enabled when you enter MULTIPLE SPANNING TREE mode. To enable MSTP globally on the switch, enter the `no disable` command while in MULTIPLE SPANNING TREE mode.

For more information about the multiple spanning tree protocol, refer to the Dell EMC Networking OS Configuration Guide.
Example

```bash
DellEMC(conf)# protocol spanning-tree mstp
DellEMC(config-mstp)# no disable
```

Related Commands

- `disable` — disable multiple spanning tree.

---

**revision**

The revision number for the multiple spanning tree configuration.

**Syntax**

```
revision range
```

To return to the default values, use the `no revision` command.

**Parameters**

- `range` Enter the revision number for the MST configuration. The range is from 0 to 65535. The default is 0.

**Defaults**

0

Usage Information

Enable the multiple spanning tree protocol prior to using this command.

Example

```
DellEMC# show spanning-tree mst configuration
MST region name: CustomerSvc
Revision: 2
MSTI VID
  10 101-105
DellEMC#
```
show spanning-tree msti

View the multiple spanning tree instance.

Syntax

```
show spanning-tree msti [instance-number [brief]] [guard]
```

Parameters

- **instance-number** (Optional) Enter the multiple spanning tree instance number. The range is from 0 to 63.
- **brief** (Optional) Enter the keyword `brief` to view a synopsis of the MST instance.
- **guard** (Optional) Enter the keyword `guard` to display the type of guard enabled on an MSTP interface and the current port state.

Command Modes

- EXEC
- EXEC Privilege

Command History

- **Version**
  - 9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
  - 9.10(0.0) Introduced on the S3148.
  - 9.8(2.0) Introduced on the S3100 series.
  - 9.8(0.0P5) Introduced on the S4048-ON.
  - 9.8(0.0P2) Introduced on the S3048-ON.
  - 9.7(0.0) Introduced on the S6000-ON.
  - 9.2(1.0) Introduced on the Z9500.
  - 9.0.2.0 Introduced on the S6000.
  - 8.3(19.0) Introduced on the S4820T.
  - 8.3(11.1) Introduced on the Z9000.
  - 8.4(2.1) Support for the optional keyword `guard` was added on the C-Series, S-Series, and E-Series.
  - 8.3(7.0) Introduced on the S4810.
  - 7.6(1.0) Introduced on the S-Series.
  - 7.5(1.0) Introduced on the C-Series.
  - 6.4(1.0) Expanded to display the port error disable state (EDS) loopback BPDU inconsistency causes.

Usage Information

Enable the multiple spanning tree protocol prior to using this command.
Example

DellEMC# show spanning-tree msti 10
MSTI 10 VLANs mapped 101-105

Bridge Identifier has priority 32768, Address 0001.e802.3506
Configured hello time 2, max age 20, forward delay 15, max hops 5
Current root has priority 16384, Address 0001.e800.0a5c
Number of topology changes 0, last change occurred 3058087

Port 82 (TenGigabitEthernet 2/1) is designated Forwarding
Port path cost 0, Port priority 128, Port Identifier 128.82
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 32768, address 0001.e802.35:06
Designated port id is 128.82, designated path cost
Number of transitions to forwarding state 1
BPDU (Mrecords): sent 1109, received 0
The port is not in the portfast mode

Port 88 (TenGigabitEthernet 2/6) is root Forwarding
Port path cost 0, Port priority 128, Port Identifier 128.88
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 16384, address 0001.e800.0a:5c
Designated port id is 128.88, designated path cost
Number of transitions to forwarding state 4
BPDU (Mrecords): sent 19, received 1103
The port is not in the portfast mode

Port 89 (TenGigabitEthernet 2/7) is alternate Discarding
Port path cost 0, Port priority 128, Port Identifier 128.89
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 16384, address 0001.e800.0a:5c
Designated port id is 128.89, designated path cost
Number of transitions to forwarding state 3
BPDU (Mrecords): sent 7, received 1103
The port is not in the portfast mode

Example (EDS and LBK)

The bold line shows the loopback BPDU inconsistency (LBK_INC).

DellEMC# show spanning-tree msti 0 brief
MSTI 0 VLANs mapped 1-4094

Executing IEEE compatible Spanning Tree Protocol
Root ID Priority 32768, Address 0001.e801.6aa8
Root Bridge hello time 2, max age 20, forward delay 15, max hops 20
Bridge ID Priority 32768, Address 0001.e801.6aa8
We are the root of MSTI 0 (CIST)
Configured hello time 2, max age 20, forward delay 15, max hops 20
CIST regional root ID Priority 32768, Address 0001.e801.6aa8
CIST external path cost 0

The port is not in the Edge port mode

Usage Information
The following describes the show spanning-tree msti 5 guard command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>MSTP interface.</td>
</tr>
<tr>
<td>Instance</td>
<td>MSTP instance.</td>
</tr>
<tr>
<td>Sts</td>
<td>Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), or shut down (EDS Shut).</td>
</tr>
<tr>
<td>Guard Type</td>
<td>Type of STP guard configured (Root, Loop, or BPDU guard).</td>
</tr>
</tbody>
</table>

Example (Guard)

DellEMC# show spanning-tree msti 5 guard
Interface Name Instance Sts Guard Type
---------- --------- ------ ------ --------
Te 1/1  5       INCON(Root) Rootguard
Te 1/2  5       FWD     Loopguard
Te 1/3  5       EDS(Shut) Bpduguard

spanning-tree

Enable the multiple spanning tree protocol on the interface.

Syntax

```plaintext
spanning-tree
```

To disable the multiple spanning tree protocol on the interface, use the `no spanning-tree` command.

Parameters

- **spanning-tree**: Enter the keywords `spanning-tree` to enable the MSTP on the interface.

Defaults

Enable.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>

</tr>
</tbody>
</table>
spanning-tree msti

Configure multiple spanning tree instance cost and priority for an interface.

Syntax

```
spanning-tree msti instance {cost cost | priority priority}
```

Parameters

- **msti instance**: Enter the keyword `msti` and the MST instance number. The range is from zero (0) to 63.
- **cost cost**: (OPTIONAL) Enter the keyword `cost` then the port cost value. The range is from 1 to 200000. The defaults are:
  - 100 Mb/s Ethernet interface = 200000
  - 1-Gigabit Ethernet interface = 20000
  - 10-Gigabit Ethernet interface = 2000
  - Port Channel interface with one 100 Mb/s Ethernet = 200000
  - Port Channel interface with one 1 Gigabit Ethernet = 20000
  - Port Channel interface with one 10 Gigabit Ethernet = 2000
  - Port Channel with two 1 Gigabit Ethernet = 18000
  - Port Channel with two 10 Gigabit Ethernet = 1800
  - Port Channel with two 100 Mbps Ethernet = 180000
priority priority  Enter keyword priority then a value in increments of 16 as the priority. The range is from 0 to 240. The default is 128.

Defaults

- cost = depends on the interface type
- priority = 128

</tbody>
</table>

**Usage Information**

By default, Dell EMC Networking OS implements an optimized flush mechanism for MSTP. This mechanism helps in flushing the MAC addresses only when necessary (and less often) allowing for faster convergence during topology changes. However, if a standards-based flush mechanism is needed, this knob command can be turned on to enable flushing MAC addresses after receiving every topology change notification.
The multicast commands are supported by Dell EMC Networking OS.

### IPv4 Multicast Commands

The following section contains the IPv4 multicast commands.

#### clear ip mroute

Clear learned multicast routes on the multicast forwarding table. To clear the protocol-independent multicast (PIM) tree information base, use the `clear ip pim tib` command.

**Syntax**

```plaintext
clear ip mroute [vrf vrf-name] {group-address [source-address] | *}
```

**Parameters**

- **vrf vrf-name**
  - (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.
  - **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **group-address**
  - Enter the multicast group address and source address (if desired), in dotted decimal format, to clear information on a specific group.

- **source-address**
  - Enter * to clear all multicast routes.

**Command Modes**

- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version                     Description
9.2.(0.0)                   Added support for keyword snooping on the Z9000, S4810, and S4820T.
9.0.2.0                     Introduced on the S6000.
8.3.19.0                   Introduced on the S4820T.
8.3.7.0                     Introduced on the S4810.
7.8.1.0                     Introduced on the C-Series.

E-Series legacy command

Related Commands
  • show ip pim tib — show the PIM tree information base.

ip mroute

Assign a static mroute.

Syntax
ip mroute [vrf vrf-name] destination mask {ip-address | null 0| {{bgp| ospf} process-id | isis | rip | static} {ip-address | tag | null 0}} [distance]

To delete a specific static mroute, use the no ip mroute [vrf vrf-name] destination mask {ip-address | null 0| {{bgp| ospf} process-id | isis | rip | static} {ip-address | tag | null 0}} [distance] command.

To delete all mroutes matching a certain mroute, use the no ip mroute [vrf vrf-name]destination mask command.

Parameters
  vrf vrf-name (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to assign a static mroute to that VRF.

  NOTE: Applies to specific VRF if input is provided, else applies to Default VRF.

destination
  Enter the IP address in dotted decimal format of the destination device.

mask
  Enter the mask in slash prefix formation (/x) or in dotted decimal format.

null 0 (OPTIONAL) Enter the keyword null then zero (0).

[protocol [process-id | tag] ip-address] (OPTIONAL) Enter one of the routing protocols:
  • Enter the BGP as-number then the IP address in dotted decimal format of the reverse path forwarding (RPF) neighbor. The range is from 1 to 65535.
  • Enter the OSPF process identification number then the IP address in dotted decimal format of the RPF neighbor. The range is from 1 to 65535.
  • Enter the IS-IS alphanumeric tag string then the IP address in dotted decimal format of the RPF neighbor.
  • Enter the RIP IP address in dotted decimal format of the RPF neighbor.

static ip-address (OPTIONAL) Enter the Static IP address in dotted decimal format of the RPF neighbor.
**ip-address**

(Optional) Enter the IP address in dotted decimal format of the RPF neighbor.

**distance**

(Optional) Enter a number as the distance metric assigned to the mroute. The range is from 0 to 255.

**Defaults**

Not configured.

**ip multicast-limit**

To limit the number of multicast entries on the system, use this feature.

**Syntax**

```plaintext
ip multicast-limit [vrf vrf-name] limit
```

**Parameters**

- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to limit the number of multicast on the VRF.
- **limit** Enter the desired maximum number of multicast entries on the system. The range is from 1 to 16000.

**Defaults**

The default is 4000.

</tbody>
</table>

Usage Information
This feature allows you to limit the number of multicast entries on the system. This number is the total of all the multicast entries on all line cards in the system. On each line card, the multicast module only installs the maximum number of entries, depending on the configured CAM profile.

To store multicast routes, use the IN-L3-McastFib CAM partition. It is a separate hardware limit that exists per port-pipe. This hardware space limitation can supersede any software-configured limit. The opposite is also true, the CAM partition might not be exhausted at the time the system-wide route limit set by the ip multicast-limit command is reached.

Related Commands
- show ip igmp groups — display the IGMP groups.

ip multicast-routing

Enable IP multicast forwarding.

Syntax
ip multicast-routing [vrf vrf-name]

To disable multicast forwarding, use the no ip multicast-routing [vrf vrf-name] command.

Defaults
Disabled.

Parameters
vrf vrf-name (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable IP multicast forwarding on that VRF.

E-Series legacy command

**Usage Information**

After you enable multicast, you can enable IGMP and PIM on an interface. In INTERFACE mode, enter the `ip pim sparse-mode` command to enable IGMP and PIM on the interface.

**Related Commands**

- `ip pim sparse-mode` — enable IGMP and PIM on an interface.

---

**mtrace**

Trace a multicast route from the source to the receiver.

**Syntax**

`mtrace [vrf vrf-name] {source-address/hostname} [destination-address/hostname] [group-address/hostname]`

**Parameters**

- `vrf vrf-name`: Enter the keyword `vrf` followed by the name of the VRF. If VRF name is not mentioned, the default VRF will be used. Mtrace is not supported for management VRF.
- `source-address/hostname`: Enter the source IP address in dotted decimal format (A.B.C.D). This is a unicast address of the beginning of the path to be traced.
- `destination-address/hostname`: Enter the destination (receiver) IP address in dotted decimal format (A.B.C.D). If omitted, the mtrace starts from the system at which the command is typed.
- `group-address/hostname`: Enter the multicast group address in dotted decimal format (A.B.C.D). If group address is not given then software shall invokes a weak mtrace. A weak mtrace is one that follows
the RPF path to the source, regardless of whether any router along the path has multicast routing table state

<tr>
<td>7.4.1.0</td>
<td>Expanded to support the intermediate (transit) router.</td>
</tr>
</tbody>
</table>

Usage Information

Mtrace is an IGMP based protocol that provides a multicast trace route facility and is implemented according to the IETF draft “A trace route facility for IP Multicast” (draft-fenner-traceroute-ipm-01.txt). Dell EMC Networking OS supports the Mtrace client and transit functionality.

As an Mtrace client, Dell EMC Networking OS transmits Mtrace queries, receives, parses, and prints out the details in the response packet received.

A transit or intermediate router, forwards mtrace requests to the RPF neighbor after appending its response block to the packet. In case it is the first hop router, it sends a response.

As an Mtrace transit or intermediate router, Dell EMC Networking OS returns the response to Mtrace queries. After receiving the Mtrace request, Dell EMC Networking OS computes the RPF neighbor for the source, fills in the request and forwards the request to the RPF neighbor.

Example

R1>mtrace 103.103.103.3 1.1.1.1 226.0.0.3
Type Ctrl-C to abort.

Querying reverse path for source 103.103.103.3 to destination 1.1.1.1 via group 226.0.0.3
From source (?) to destination (?)

<table>

<td></td>
</tr>
</tbody>
</table>

The mtrace command traverses the path of the response data block in the reverse direction of the multicast data traffic. The mtrace command traverses the reverse path to the source from the destination. As a result, the tabular output of the mtrace command displays the destination details in the first row, followed by the RPF router details along the path in the consequent rows, and finally the source details in the last row. The tabular output contains the following columns:

- Hop — a hop number (counted negatively to indicate reverse-path)
- OIF IP — outgoing interface address
- Proto — multicast routing protocol
- Forwarding code — error code as present in the response blocks
- Source Network/Mask — source mask
show ip mroute

View the multicast routing table.

Syntax

```
show ip mroute [vrf vrf-name] [static | group-address [source-address] | count | snooping [vlan vlan-id] [group-address [source-address]] | summary | vlt [group-address [source-address] | count]
```

Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **static** (OPTIONAL) Enter the keyword `static` to view static multicast routes.

- **group-address** (OPTIONAL) Enter the multicast group-address to view only routes associated with that group. Enter the source-address to view routes with that group-address and source-address.

- **count** (OPTIONAL) Enter the keyword `count` to view the number of multicast routes and packets.

- **snooping [vlan vlan-id] [group-address [source-address]]** Enter the keyword `snooping` to display information on the multicast routes PIM-SM snooping discovers.

  Enter a VLAN ID to limit the information displayed to the multicast routes PIM-SM snooping discovers on a specified VLAN. The VLAN ID range is from 1 to 4094.

  Enter a multicast group address and, optionally, a source multicast address in dotted decimal format (A.B.C.D) to limit the information displayed to the multicast routes PIM-SM snooping discovers for a specified multicast group and source.

- **summary** (OPTIONAL) Enter the keyword `summary` to view a summary of all routes.

- **vlt** (OPTIONAL) Enter the keyword `vlt` to view multicast routes with a spanned incoming interface. Enter a multicast group address in dotted decimal format (A.B.C.D) to limit the information displayed to the multicast routes for a specified multicast group and optionally a source multicast address in dotted decimal format (A.B.C.D) to limit the information displayed for a specified multicast source. Enter the keyword `count` to display the total number of multicast routes with the spanned IIF.

</tbody>
</table>

**E-Series legacy command**

**Usage Information**

Network administrators use static mroutes to control the reach-ability of the multicast sources. If a PIM-registered multicast source is reachable using static mroute as well as unicast route, the distance of each route is examined and the route with shorter distance is the one the PIM selects for reach-ability.

**NOTE:** The default distance of mroutes is zero (0) and is CLI configurable on a per route basis.

**Example**

```text
DellEMC# show ip rpf
RPF information for 10.10.10.9
  RPF interface: Te 3/4
  RPF neighbor: 165.87.31.4
  RPF route/mask: 10.10.10.9/255.255.255.255
  RPF type: unicast
```
Neighbor Discovery Protocol (NDP)

The neighbor discovery protocol for IPv6 is defined in RFC 2461 as part of the Stateless Address Autoconfiguration protocol. It replaces the Address Resolution Protocol used with IPv4. NDP defines mechanisms for solving the following problems:

- Router discovery — hosts can locate routers residing on a link
- Prefix discovery — hosts can discover address prefixes for the link
- Parameter discovery
- Address autoconfiguration — configuration of addresses for an interface
- Address resolution — mapping from IP address to link-layer address
- Next-hop determination
- Neighbor unreachability detection (NUD) — determine that a neighbor is no longer reachable on the link.
- Duplicate address detection (DAD) — allow a node to check whether a proposed address is already in use.
- Redirect — the router can inform a node about a better first-hop.

NDP uses the following five ICMPv6 packet types in its implementation:

- Router Solicitation
- Router Advertisement
- Neighbor Solicitation
- Neighbor Advertisement
- Redirect

Topics:

- clear ipv6 neighbors
- ipv6 neighbor
- show ipv6 neighbors
- IPv6 Router Advertisement (RA) Guard

clear ipv6 neighbors

Delete all entries in the IPv6 neighbor discovery cache or neighbors of a specific interface. Static entries are not removed using this command.

Syntax

```
clear ipv6 neighbors [vrf vrf-name] [ipv6-address | interface]
```

Parameters

- **vrf vrf-name**

  (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to clear the neighbor corresponding to that VRF.
If you do not specify this option, the neighbors in the default VRF are cleared.

ipv6-address

Enter the IPv6 address of the neighbor in the x:x:x:x::x format to remove a specific IPv6 neighbor.

NOTE: The :: notation specifies successive hexadecimal fields of zero.

interface interface

To remove all neighbor entries learned on a specific interface, enter the keyword interface then the interface type and slot/port or number information of the interface:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Command Modes

- EXEC
- EXEC Privilege

Command History

</table>
ipv6 neighbor

Configure a static entry in the IPv6 neighbor discovery.

Syntax
ipv6 neighbor [vrf vrf-name] {ipv6-address} {interface interface} {hardware_address}

To remove a static IPv6 entry from the IPv6 neighbor discovery, use the no ipv6 neighbor [vrf vrf-name] {ipv6-address} {interface interface} command.

Parameters

vrf vrf-name  (Optional) Enter the keyword vrf followed by the name of the VRF to install IPv6 routes in that VRF.

ipv6-address  Enter the IPv6 address of the neighbor in the x:x:x:x::x format.

NOTE: The :: notation specifies successive hexadecimal fields of zero.

interface interface  Enter the keyword interface then the interface type and slot/port or number information:

• For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport/subport information.
• For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
• For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
• For a port channel interface, enter the keywords port-channel then a number.
• For a Null interface, enter the keyword null then the Null interface number.
• For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.
• For a tunnel interface, enter the keyword tunnel then the tunnel interface number. The range is from 1 to 16383.

hardware_address  Enter a 48-bit hardware MAC address in nn:nn:nn:nn:nn:nn format.

Defaults
None

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.

Neighbor Discovery Protocol (NDP)
**Version** | **Description**
--- | ---
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Added support for VRF. Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.1 | Introduced on the S4810.

**Usage Information**

Neighbor Discovery Protocol for IPv6 is defined in RFC 2461 as part of the Stateless Address Autoconfiguration protocol. It replaces the Address Resolution Protocol used with IPv4. It defines mechanisms for solving problems, such as:

- Router discovery: Hosts can locate routers residing on a link.
- Prefix discovery: Hosts can discover address prefixes for the link.
- Parameter discovery.
- Address autoconfiguration — configuration of addresses for an interface.
- Address resolution — mapping from IP address to link-layer address.
- Next-hop determination.
- Neighbor Unreachability Detection (NUD): Determine that a neighbor is no longer reachable on the link.
- Duplicate Address Detection (DAD): Allow a node to check whether a proposed address is already in use.
- Redirect: The router can inform a node about a better first-hop.

Use the ipv6 neighbor command to manually configure the IPv6 address of a neighbor to be discovered by the switch.

**show ipv6 neighbors**

Display IPv6 discovery information. Entering the command without options shows all IPv6 neighbor addresses stored on the control processor (CP).

**Syntax**

```
show ipv6 neighbors [vrf vrf-name] [ipv6-address| interface interface]
```

**Parameters**

- **vrf vrf-name** *(OPTIONAL)* Enter the keyword vrf and the name of the VRF to display the neighbors corresponding to that VRF.

  **NOTE:** If you do not specify this option, neighbors corresponding to the default VRF are displayed.

- **ipv6-address** Enter the IPv6 address of the neighbor in the x:x:x:x:x format.

  **NOTE:** The :: notation specifies successive hexadecimal fields of zero.

- **interface interface** Enter the keyword interface then the interface type and slot/port or number information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Management interface, enter the keyword `managementethernet` followed by slot/port numbers.
- For a Port Channel interface, enter the keywords `port-channel` followed by a number.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**
None

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**

IPv6 Router Advertisement (RA) Guard

The IPv6 RA guard provides support to perform conditional forwarding or blocking of the router advertisement messages that are received at the network device platform. This functionality analyzes and filters the RAs sent by the devices and compares the configuration information on the layer 2 device with the RA frame. Once the layer 2 device validates the content of the RA frame against the configuration, it forwards the RA to its unicast or multicast destination. On failure to validate the RA frame content, the RA frame is dropped.

The IPv6 RA guard supports two different modes:

- **Host mode** — When a policy with device role as host is applied on an interface, all the RA packets are dropped without validation. You can also configure the host mode policy with VLAN option to drop the RA packets on that specific VLAN and port.

- **Router mode** — When a policy with device role as router is applied on an interface, all the RA packets are validated based on the configuration information in the policy. Similarly, you can also apply this mode over any specific VLAN and the validation is performed only for that particular VLAN RA packets.

To configure the IPv6 RA guard, use the following Dell EMC Networking OS commands.

### debug ipv6 nd ra-guard

Enable debugging for IPv6 RA guard snooping information.

**Syntax**

```
dev ipv6 nd ra-guard [interface_type slot/port | count value]
```

**Parameters**

- **interface_type slot/port**
  - Enter the one of the following interfaces and slot/port information:
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then slot/port information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then slot/port information.
- **count value**
  - Enter the keyword `count` then the number of debug outputs. The range is from 1 to 65534. The default is infinity.

**Defaults**

None

**Command Modes**

EXEC Privilege

**Command History**

device-role

Specify the role of the device attached to the port.

Syntax

device-role {host | router}

To reset the device role, use the no device-role {host | router} command.

Parameters

host

Enter the keyword host to set the device-role as host.

router

Enter the keyword router to set the device-role as router.

Defaults

None

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.11(0.0) Introduced on the C9010.

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the S6100-ON.

9.9(0.0) Introduced on the Z9500.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100-ON.

9.8(0.0P6) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9000 switches.

Related Commands

- ipv6 nd raguard policy policy-name — define the RA guard policy name and enter the RA guard policy configuration mode.
- ipv6 nd ra-guard enable — configure the RA guard related commands.

hop-limit

Enable the verification of the advertised hop count limit. If this command is not configured, the verification process is bypassed.

Syntax

hop-limit {maximum | minimum limit}

To reset the hop count limit, use the no hop-limit {maximum | minimum limit} command.
ipv6 nd ra-guard attach-policy

Apply the IPv6 RA guard to a specific interface.

Syntax:
```
ipv6 nd ra-guard attach-policy policy-name [vlan [vlan 1, vlan 2, vlan 3....]]
```

Parameters:
- **policy policy-name**: Enter the keyword `policy` then the policy name. The policy-name allows a maximum of 140 characters.
- **vlan [vlan 1, vlan 2, vlan 3....]**: Enter the keyword `vlan` then the VLAN range. The VLAN range is from 1 to 4094.

Defaults:
- None

Command Modes:
- INTERFACE

Command History:

match ra

Enable verifying either of the configured source IPv6 address or prefix address or the source MAC address in the inspected messages. If this command is not configured, the verification process is bypassed.

Syntax

```
match ra {ipv6-access-list name | ipv6-prefix-list name | mac-access-list name}
```

To reset the access list, use the `no match ra{ipv6-access-list | ipv6-prefix-list | mac-access-list}command.

Parameters

- **ipv6–access-list name**: Enter the keywords ipv6–access-list then the access-list name. The access-list name allows a maximum of 140 characters.
- **ipv6–prefix-list name**: Enter the keywords ipv6–prefix-list then the prefix-list name. The prefix-list name allows a maximum of 140 characters.
- **ipv6–mac-access-list name**: Enter the keywords ipv6–mac-access-list then the mac-access-list name. The mac-access-list name allows a maximum of 140 characters.

router-preference maximum

Enable the verification of the advertised default router preference (DRP) value. The preference value is lower than or equal to the specified limit. If this command is not configured, the verification process is bypassed.

Syntax

```
router-preference maximum {high | low | medium}
```

To reset the default router preference value, use the `no router-preference maximum {high | low | medium}` command.

Parameters

- **high**: Enter the keyword `high` to set the DRP value as high.
- **low**: Enter the keyword `low` to set the DRP value as low.
- **medium**: Enter the keyword `medium` to set the DRP value as medium.

Defaults

None

**Example**

```plaintext
DellEMC(conf)# ipv6 nd ra-guard policy test
DellEMC(conf-ra.guard_policy_list)#show config
! ipv6 nd ra-guard policy test
device-role router
  hop-limit maximum 251
  mtu 1350
  other-config-flag on
  reachable-time 540
  retrans-timer 101
  router-preference maximum medium
  trusted-port
DellEMC(conf-ra.guard_policy_list)#
```

**Related Commands**

- `ipv6 nd ra-guard enable` — configure the RA guard related commands.
- `ipv6 nd ra-guard policy` — define the RA guard policy name and enter the RA guard policy list configuration mode.
- `device-role` — specify the role of the device attached to the port.
- `hop-limit` — enable the verification of the advertised hop count limit.
- `mtu` — set the maximum transmission unit (MTU) value.
- `other-config-flag` — enable the verification of the advertised other configuration parameter.
- `reachable-time` — set the advertised reachability time.
- `retrans-timer` — set the advertised retransmission time.
- `router-preference maximum` — enable the verification of the advertised default router preference (DRP) value.
show ipv6 nd ra–guard policy

Display the configurations applied on all the RA guard policies or a specific RA guard policy.

Syntax

```
show ipv6 nd ra-guard policy policy-name
```

Parameter

- **policy policy-name**: Enter the keyword policy then the policy name. The policy name allows a maximum of 140 characters.

Command Modes

- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

- 9.11(0.0)
  - Introduced on the C9010.
- 9.10(0.1)
  - Introduced on the S6010-ON and S4048T-ON.
- 9.10(0.0)
  - Introduced on the S3148.
- 9.10(0.0)
  - Introduced on the S6100-ON.
- 9.9(0.0)
  - Introduced on the Z9500.
- 9.8(2.0)
  - Introduced on the S3100 series.
- 9.8(1.0)
  - Introduced on the Z9100-ON.
- 9.8(0.0P6)
  - Introduced on the S4048-ON.
- 9.8(0.0P2)
  - Introduced on the S3048-ON.
- 9.7(0.0)
  - Introduced on the S4810, S4820T, S5000, S6000, Introduced on the S6000–ON, and Z9000 switches.

Example

```
DellEMC# show ipv6 nd ra-guard policy test
ipv6 nd ra-guard policy test
  device-role router
  hop-limit maximum 1
  match ra ipv6-access-list access
  other-config-flag on
  router-preference maximum medium
  trusted-port
  Interfaces:
  Te 1/1
DellEMC#
```

Related Commands

- `ipv6 nd ra-guard enable` — configure the RA guard related commands.
- `ipv6 nd ra-guard policy` — define the RA guard policy name and enter the RA guard policy list configuration mode.
- `device-role` — specify the role of the device attached to the port.
- `hop-limit` — enable the verification of the advertised hop count limit.
- mtu — set the maximum transmission unit (MTU) value.
- other-config-flag — enable the verification of the advertised other configuration parameter.
- reachable-time — set the advertised reachability time.
- retrans-timer — set the advertised retransmission time.
- router-preference maximum — enable the verification of the advertised default router preference (DRP) value.
- trusted-port — apply the policy to trusted ports.
- ipv6 nd raguard attach-policy — apply the IPv6 RA guard to a specific interface.

trusted-port

Allow bypassing the configured RA guard validation and forwards the RA packets received on the interface, which has the trusted port policy attached.

Syntax

```
trusted-port
```

To reset the policy applied to the trusted port, use the `no trusted-port` command.

Defaults

None

Command Modes

Usage Information

Use this command to disable all the RA guard policies.

Related Commands

- ipv6 nd ra-guard enable — configure the RA guard related commands.
- ipv6 nd raguard policy policy-name — define the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.
Object Tracking supports IPv4 and IPv6, and is available on the Dell EMC Networking platforms.

Object tracking allows you to define objects of interest, monitor their state, and report to a client when a change in an object’s state occurs. The following tracked objects are supported:

- Link status of Layer 2 interfaces
- Routing status of Layer 3 interfaces (IPv4 and IPv6)
- Reachability of IPv4 and IPv6 routes
- Metric thresholds of IPv4 and IPv6 routes

You can configure client applications, such as virtual router redundancy protocol (VRRP), to receive a notification when the state of a tracked object changes.

Topics:
- IPv4 Object Tracking Commands
- IPv6 Object Tracking Commands

IPv4 Object Tracking Commands

The following section describes the IPv4 VRRP commands.

debug track

Enables debugging for tracked objects.

Syntax

debug track [all | notifications | object-id]

Parameters

- all: Enables debugging on the state and notifications of all tracked objects.
- notifications: Enables debugging on the notifications of all tracked objects.
- object-id: Enables debugging on the state and notifications of the specified tracked object. The range is 1 to 500.

Defaults

Enable debugging on the state and notifications of all tracked objects (debug track all).

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
## delay

Configure the time delay used before communicating a change in the status of a tracked object to clients.

**Syntax**

```
delay {[up seconds] [down seconds]}
```

To return to the default setting, use the `no delay` command.

**Parameters**

- `seconds`
  - Enter the number of seconds the object tracker waits before sending a notification about the change in the UP and/or DOWN state of a tracked object to clients. The range is 0 to 180. The default is 0 seconds.

**Defaults**

0 seconds

**Command Modes**

OBJECT TRACKING (conf_track_object-id)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>
version
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)    Introduced on the S6000-ON.
8.3.12.0    Introduced on the S4810.
8.4.1.0     Introduced.

Usage Information
You can configure an UP and/or DOWN timer for each tracked object to set the time delay before a change in the state of a tracked object is communicated to clients. The configured time delay starts when the state changes from UP to DOWN or vice-versa.

If the state of an object changes back to its former UP/DOWN state before the timer expires, the timer is cancelled and the client is not notified. For example, if the DOWN timer is running when an interface goes down and comes back up, the DOWN timer is cancelled and the client is not notified of the event.

If the timer expires and an object’s state has changed, a notification is sent to the client. If no delay is configured, a notification is sent immediately after a change in the state of a tracked object is detected. The time delay in communicating a state change is specified in seconds.

Related Commands
• track interface ip routing – configure object tracking on the routing status of an IPv4 Layer 3 interface.
• track interface line-protocol – configure object tracking on the line-protocol state of a Layer 2 interface.
• track ip route metric threshold – configure object tracking on the threshold of an IPv4 route metric.
• track ip route reachability – configure object tracking on the reachability of an IPv4 route.

description
Enter a description of a tracked object.

Syntax
description {text}

To remove the description, use the no description {text} command.

Parameters
text

Enter a description to identify a tracked object (80 characters maximum).

Defaults
None

Command Modes
OBJECT TRACKING (conf_track_object-id)

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the S6100-ON.
9.8(2.0)   Introduced on the S3100 series.
## show running-config track

Display the current configuration of tracked objects.

**Syntax**

```
show running-config track [object-id]
```

**Parameters**

- `object-id` (OPTIONAL) Display information on the specified tracked object. The range is 1 to 500.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Version Description

- 9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
- 9.10(0.0) Introduced on the S3148.
- 9.10(0.0) Introduced on the S6100-ON.
- 9.8(2.0) Introduced on the S3100 series.
- 9.8(1.0) Introduced on the Z9100-ON.
- 9.8(0.0P6) Introduced on the S4048-ON.
- 9.8(0.0P2) Introduced on the S3048-ON.
- 9.7(0.0) Introduced on the S6000-ON.
- 8.3.12.0 Introduced on the S4810.
- 8.4.1.0 Introduced.

**Example**

```
DellEMC# show running-config track
track 1 ip route 23.0.0.0/8 reachability
track 2 ipv6 route 2040::/64 metric threshold
```
delay down 3
delay up 5
threshold metric up 200
track 3 ipv6 route 2050::/64 reachability
track 4 interface TenGigabitEthernet 1/2 ip routing
track 5 ip route 192.168.0.0/24 reachability vrf red
track resolution ip route isis 20
track resolution ip route ospf 10

Example (Object-id)
DellEMC# show running-config track 300
track 300 ip route 10.0.0.0/8 metric threshold
delay down 3
delay up 5
threshold metric up 100

Related Commands
- show track – display information about tracked objects, including configuration, current state, and clients which track the object.
- track interface ip routing – configure object tracking on the routing status of an IPv4 Layer 3 interface.
- track interface line-protocol – configure object tracking on the line-protocol state of a Layer 2 interface.
- track ip route metric threshold – configure object tracking on the threshold of an IPv4 route metric.
- track ip route reachability – configure object tracking on the reachability of an IPv4 route.

show track

Display information about tracked objects, including configuration, current tracked state (UP or DOWN), and the clients which are tracking an object.

Syntax
show track [object-id [brief] | interface [brief] [vrf vrf-name] | ip route [brief] [vrf vrf-name] | resolution | vrf vrf-name [brief] | brief]

Parameters
- object-id (OPTIONAL) Display information on the specified tracked object. The range is 1 to 500.
- interface (OPTIONAL) Display information on all tracked interfaces (Layer 2 and IPv4 Layer 3).
- ip route (OPTIONAL) Display information on all tracked IPv4 routes.
- resolution (OPTIONAL) Display information on the configured resolution values used to scale protocol-specific route metrics. The range is 0 to 255.
- brief (OPTIONAL) Display a single line summary of the tracking information for a specified object, object type, or all tracked objects.
- vrf vrf-name (OPTIONAL) E-Series only: Display information on only the tracked objects that are members of the specified VRF instance. The maximum is 32 characters. If you do not enter a VRF name, information on the tracked objects from all VRFs displays.

Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td><strong>number changes,</strong> last change time</td>
</tr>
<tr>
<td><strong>First hop interface</strong></td>
</tr>
<tr>
<td><strong>Tracked by</strong></td>
</tr>
</tbody>
</table>

**Example**

```
DellEMC# show track

Track 1
 IP route 23.0.0.0/8 reachability
 Reachability is Down (route not in route table)
  2 changes, last change 00:16:08
 Tracked by:

Track 2
 IPv6 route 2040::/64 metric threshold
 Metric threshold is Up (STATIC/0/0)
  5 changes, last change 00:02:16
 Metric threshold down 255 up 254
 First-hop interface is TenGigabitEthernet 1/2
 Tracked by:
   VRRP TenGigabitEthernet 2/3 IPv6 VRID 1

Track 3
 IPv6 route 2050::/64 reachability
 Reachability is Up (STATIC)
  5 changes, last change 00:02:16
 First-hop interface is TenGigabitEthernet 1/2
```
Usage Information
The following describes the `show track brief` command shown in the Example below.

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ResId</td>
<td>Number of the tracked object.</td>
</tr>
<tr>
<td>Resource</td>
<td>Type of tracked object.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Detailed description of the tracked object.</td>
</tr>
<tr>
<td>State</td>
<td>Up or Down state of the tracked object.</td>
</tr>
<tr>
<td>Last Change</td>
<td>Time since the last change in the state of the tracked object.</td>
</tr>
</tbody>
</table>

Example (Brief)
```
DellEMC> show track brief
ResId Resource               Parameter   State LastChange
1     IP route reachability   10.16.0.0/16 Up   00:01:08
2     Interface line-protocol Ethernet0/2 Down 00:05:00
3     Interface ip routing    VLAN100      Up   01:10:05
```

Related Commands
- `show running-config track` — display configuration information about tracked objects.
- `track interface ip routing` — configure object tracking on the routing status of an IPv4 Layer 3 interface.
- `track interface line-protocol` — configure object tracking on the line-protocol state of a Layer 2 interface.
- `track ip route metric threshold` — configure object tracking on the threshold of an IPv4 route metric.
- `track ip route reachability` — configure object tracking on the reachability of an IPv4 route.

### threshold metric

Configure the metric threshold used to determine the UP and/or DOWN state of a tracked IPv4 or IPv6 route.

**Syntax**
```
threshold metric {up number | down number}
```
To return to the default setting, use the `no threshold metric {up number | down number}` command.

**Parameters**
- **up number**
  - Enter a number for the UP threshold to be applied to the scaled metric of an IPv4 or IPv6 route. The default UP threshold is 254. The routing state is UP if the scaled route metric is less than or equal to the UP threshold.
- **down number**
  - Enter a number for the DOWN threshold to be applied to the scaled metric of an IPv4 or IPv6 route. The default DOWN threshold is 255. The routing state is DOWN if the scaled route metric is greater than or equal to the DOWN threshold.

**Defaults**
- None

**Command Modes**
- `OBJECT TRACKING (conf_track_object-id)`

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

8.4.1.0              Introduced.

Usage Information
Use this command to configure the UP and/or DOWN threshold for the scaled metric of a tracked IPv4 or IPv6 route.

Determine the UP/DOWN state of a tracked route by the threshold for the current value of the route metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower value to have priority over a higher value.

The resulting scaled value is compared against the configured threshold values to determine the state of a tracked route as follows:

- If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.
- If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.

Configure the UP and DOWN thresholds for each tracked route with the `threshold metric` command. The default UP threshold is 254; the default DOWN threshold is 255. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.

The tracking process uses a protocol-specific resolution value to convert the actual metric in the routing table to a scaled metric in the range 0 to 255. You can configure the resolution value used to scale route metrics for supported protocols with the `track resolution ip route` and `track resolution ipv6 route` commands.

Related Commands
- `track ip route metric threshold` — configure object tracking on the threshold of an IPv4 route metric.
- `track resolution ip route` — configure the protocol-specific resolution value used to scale an IPv4 route metric.

track interface ip routing

Configure object tracking on the routing status of an IPv4 Layer 3 interface.

Syntax

```
track object-id interface interface ip routing
```

Parameters

- `object-id` Enter the ID number of the tracked object. The range is 1 to 500.

To return to the default setting, use the `no track object-id` command.
**interface**

Enter one of the following values:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a tunnel interface, enter the keyword `tunnel`.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Usage Information**

Use this command to create an object that tracks the routing state of an IPv4 Layer 2 interface:

- The status of the IPv4 interface is UP only if the Layer 2 status of the interface is UP and the interface has a valid IP address.
- The Layer 3 status of an IPv4 interface goes DOWN when its Layer 2 status goes down (for a Layer 3 VLAN, all VLAN ports must be down) or the IP address is removed from the routing table.

**Related Commands**

- `show track` — display information about tracked objects, including configuration, current state, and clients which track the object.
- `track interface line-protocol` — configure object tracking on the line-protocol state of a Layer 2 interface.
track interface line-protocol

Configure object tracking on the line-protocol state of a Layer 2 interface.

Syntax

```
track object-id interface interface line-protocol
```

To return to the default setting, use the `no track object-id` command.

Parameters

- **object-id**: Enter the ID number of the tracked object. The range is 1 to 500.
- **interface**: Enter one of the following values:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the `slot/port/subport/subport` information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the `slot/port` information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a tunnel interface, enter the keyword `tunnel`.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

Usage Information

Use this command to create an object that tracks the line-protocol state of a Layer 2 interface by monitoring its operational status (UP or DOWN).

When the link-level status goes down, the tracked object status is considered to be DOWN; if the link-level status is up, the tracked object status is considered to be UP.
Related Commands

- **show track** – display information about tracked objects, including configuration, current state, and clients which track the object.
- **track interface ip routing** – configure object tracking on the routing status of an IPv4 Layer 3 interface.

**track ip host reachability**

Configure object tracking on the reachability of an IPv4 host.

**Syntax**

```
track object-id ip host host-ip-address/prefix-len reachability [vrf vrf-name]
```

To return to the default setting, use the `no track object-id` command.

**Parameters**

- **object-id**
  - Enter the ID number of the tracked object. The range is 1 to 500.
- **ip-address/prefix-len**
  - Enter an IPv4 address in dotted decimal format. The valid IPv4 prefix lengths are from /0 to /32.
- **vrf vrf-name**
  - (Optional) You can configure a VPN routing and forwarding (VRF) instance to specify the virtual routing table to which the tracked route belongs.

### Usage Information

Use this command to create an object that tracks the UP and/or DOWN threshold of an IPv4 route metric. In order for a route’s metric to be tracked, the route must appear as an entry in the routing table.

A tracked IPv4 route is considered to match an entry in the routing table only if the exact IPv4 address and prefix length match a table entry. For example, when configured as a tracked route, 10.0.0.0/24 does not match the routing table entry 10.0.0.0/8. If no route-table entry has the exact IPv4 address and prefix length, the status of the tracked route is considered to be DOWN.

When you configure the threshold of an IPv4 route metric as a tracked object, the UP/DOWN state of the tracked route is also determined by the current metric for the route in the routing table.

To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower value to have priority over a higher value. The resulting scaled value is compared against the configured threshold values to determine the state of a tracked route as follows:

- If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.
- If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.

You configure the UP and DOWN thresholds for each tracked route by using the `threshold metric` command. The default UP threshold is **254**; the default DOWN threshold is **255**. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.

### Related Commands

- `show track` — display information about tracked objects, including configuration, current state, and clients which track the object.
- `threshold metric` — configure the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- `track resolution ip route` — configure the protocol-specific resolution value used to scale an IPv4 route metric.
track ip route reachability

Configure object tracking on the reachability of an IPv4 route.

Syntax

track object-id ip route ip-address/prefix-len reachability [vrf vrf-name]

To return to the default setting, use the no track object-id command.

Parameters

- **object-id**
  - Enter the ID number of the tracked object. The range is 1 to 500.

- **ip-address/prefix-len**
  - Enter an IPv4 address in dotted decimal format. The valid IPv4 prefix lengths are from /0 to /32.

- **vrf vrf-name**
  - (Optional) E-Series only: You can configure a VPN routing and forwarding (VRF) instance to specify the virtual routing table to which the tracked route belongs.

Defaults

None

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
8.3.12.0 Introduced on the S4810.
8.4.1.0 Introduced.

Usage Information

Use this command to create an object that tracks the reachability of an IPv4 route. In order for a route’s reachability to be tracked, the route must appear as an entry in the routing table.

A tracked IPv4 route is considered to match an entry in the routing table only if the exact IPv4 address and prefix length match a table entry. For example, when configured as a tracked route, 10.0.0.0/24 does not match the routing table entry 10.0.0.0/8. If no route-table entry has the exact IPv4 address and prefix length, the status of the tracked route is considered to be DOWN.

When you configure IPv4 route reachability as a tracked object, the UP/DOWN state of the tracked route is also determined by the entry of the next-hop address in the ARP cache. A tracked route is considered to be reachable if there is an ARP cache entry for the route’s next-hop address.
If the next-hop address in the ARP cache ages out for a route tracked for its reachability, an attempt is made to regenerate the ARP cache entry to if the next-hop address appears before considering the route DOWN.

Related Commands
• show track – display information about tracked objects, including configuration, current state, and clients which track the object.
• track ip route metric threshold – configure object tracking on the threshold of an IPv4 route metric.

**track resolution ip route**

Configure the protocol-specific resolution value used to scale an IPv4 route metric.

### Syntax
```
track resolution ip route {isis resolution-value | ospf resolution-value}
```

To return to the default setting, use the `no track object-id` command.

### Parameters
- **object-id**
  - Enter the ID number of the tracked object. The range is 1 to 500.
- **isis resolution-value**
  - Enter the resolution used to convert the metric in the routing table for ISIS routes to a scaled metric.
- **ospf resolution-value**
  - Enter the resolution used to convert the metric in the routing table for OSPF routes to a scaled metric.

</tbody>
</table>

### Usage Information
Use this command to configure the protocol-specific resolution value that converts the actual metric of an IPv4 route in the routing table to a scaled metric in the range 0 to 255.
The UP/DOWN state of a tracked IPv4 route is determined by a user-configurable threshold (the threshold metric command) for the route's metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible.

The protocol-specific resolution value calculates the scaled metric by dividing a route's cost by the resolution value set for the route protocol:

- For ISIS, you can set the resolution in the range 1 to 1000, where the default is 10.
- For OSPF, you can set the resolution in the range 1 to 1592, where the default is 1.
- The resolution value used to map static routes is not configurable. By default, Dell EMC Networking OS assigns a metric of 0 to static routes.
- The resolution value used to map RIP routes is not configurable. The RIP hop-count is automatically multiplied by 16 to scale it. For example, a RIP metric of 16 (unreachable) scales to 256, which considers the route to be DOWN.

**Related Commands**

- `threshold metric` — configure the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- `track ip route metric threshold` — configure object tracking on the threshold of an IPv4 route metric.

## IPv6 Object Tracking Commands

The following section describes the IPv6 object tracking commands. The following object tracking commands apply to IPv4 and IPv6:

- `debug track`
- `delay`
- `description`
- `show running-config track`
- `threshold metric`
- `track interface line-protocol`

### show track ipv6 route

Display information about all tracked IPv6 routes, including configuration, current tracked state (UP or DOWN), and the clients which are tracking an object.

**Syntax**

```
show track ipv6 route [brief]
```

**Parameters**

- `brief` (OPTIONAL) Display a single line summary of information for tracked IPv6 routes.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

- **8.4.1.0** Introduced.

### Usage Information
The following describes the `show track ipv6 route` command shown in the Example below.

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Track object-id</td>
<td>Displays the number of the tracked object.</td>
</tr>
<tr>
<td>Interface type slot/port, IP route ip-address, IPv6 route ipv6-address</td>
<td>Displays the interface type and slot/port number or address of the IPv4/IPv6 route that is being tracked.</td>
</tr>
<tr>
<td>object is Up/Down</td>
<td>Up/Down state of tracked object; for example, IPv4 interface, reachability or metric threshold of an IP route.</td>
</tr>
<tr>
<td>number changes, last change time</td>
<td>Number of times that the state of the tracked object has changed and the time since the last change in hours:minutes:seconds.</td>
</tr>
<tr>
<td>First hop interface</td>
<td>Displays the type and slot/port number of the first-hop interface of the tracked route.</td>
</tr>
<tr>
<td>Tracked by</td>
<td>Client that is tracking an object’s state; for example, VRRP.</td>
</tr>
</tbody>
</table>

### Example
```
DellEMC# show track ipv6 route

Track 2
  IPv6 route 2040::/64 metric threshold
  Metric threshold is Up (STATIC/0/0)
  5 changes, last change 00:02:30
  Metric threshold down 255 up 254
  First-hop interface is TenGigabitEthernet 1/2
  Tracked by:
    VRRP TenGigabitEthernet 2/4 IPv6 VRID 1

Track 3
  IPv6 route 2050::/64 reachability
  Reachability is Up (STATIC)
  5 changes, last change 00:02:30
  First-hop interface is TenGigabitEthernet 1/2
  Tracked by:
    VRRP TenGigabitEthernet 2/4 IPv6 VRID 1
```

### Usage Command
The following describes the `show track ipv6 route brief` command shown in the Example below.

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ResiID</td>
<td>Number of the tracked object.</td>
</tr>
</tbody>
</table>
### Description

<table>
<thead>
<tr>
<th>Resource</th>
<th>Type of tracked object.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Detailed description of the tracked object.</td>
</tr>
<tr>
<td>State</td>
<td>Up or Down state of the tracked object.</td>
</tr>
<tr>
<td>Last Change</td>
<td>Time since the last change in the state of the tracked object.</td>
</tr>
</tbody>
</table>

**Example (Brief)**

```plaintext
dellEMC# show track ipv6 route brief
ResId Resource Parameter State LastChange
2 IPv6 route metric threshold 2040::/64 Up 00:02:36
3 IPv6 route reachability 2050::/64 Up 00:02:36
```

**Related Commands**

- `show running-config track` — display configuration information about tracked objects.
- `show track` — display information about tracked objects, including configuration, current state, and clients which track the object.
- `track interface ipv6 routing` — configure object tracking on the routing status of an IPv6 Layer 3 interface.
- `track ipv6 route metric threshold` — configure object tracking on the threshold of an IPv6 route metric.
- `track ipv6 route reachability` — configure object tracking on the reachability of an IPv6 route.

---

### track interface ipv6 routing

Configure object tracking on the routing status of an IPv6 Layer 3 interface.

**Syntax**

```
track object-id interface interface ipv6 routing
```

To return to the default setting, use the `no track object-id` command.

**Parameters**

- `object-id` Enter the ID number of the tracked object. The range is 1 to 500.
- `interface` Enter one of the following values:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a tunnel interface, enter the keyword `tunnel`.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

None

**Command Modes**

- `CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Use this command to create an object that tracks the routing state of an IPv6 Layer 3 interface:

- The status of the IPv6 interface is UP only if the Layer 2 status of the interface is UP and the interface has a valid IP address.
- The Layer 3 status of an IPv6 interface goes DOWN when its Layer 2 status goes down (for a Layer 3 VLAN, all VLAN ports must be down) or the IP address is removed from the routing table.

Related Commands

- `show track ipv6 route` — display information about tracked IPv6 routes, including configuration, current state, and clients which track the route.
- `track interface ip routing` — configure object tracking on the routing status of an IPv4 Layer 3 interface.

**track ipv6 route metric threshold**

Configure object tracking on the threshold of an IPv4 route metric.

**Syntax**

```
track object-id ipv6 route ipv6-address/prefix-len metric threshold
```

To return to the default setting, use the `no track object-id` command.

**Parameters**

- `object-id` Enter the ID number of the tracked object. The range is 1 to 500.
- `ipv6-address/prefix-len` Enter an IPv6 address in X::X::X::X format. The valid IPv6 prefix lengths are from /0 to /128.

**Defaults**

None

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
- 9.10(0.0) Introduced on the S3148.

**Description**

- Introduced on the S6010-ON and S4048T-ON.
- Introduced on the S3148.
Usage Information

Use this command to create an object that tracks the UP and/or DOWN threshold of an IPv6 route metric. In order for a route's metric to be tracked, the route must appear as an entry in the routing table.

A tracked IPv6 route is considered to match an entry in the routing table only if the exact IPv6 address and prefix length match a table entry. For example, when configured as a tracked route, 3333:100:200:300:400::/80 does not match routing table entry 3333:100:200:300::/64. If no route-table entry has the exact IPv6 address and prefix length, the status of the tracked route is considered to be DOWN.

When you configure the threshold of an IPv6 route metric as a tracked object, the UP/DOWN state of the tracked route is also determined by the current metric for the route in the routing table.

To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower value to have priority over a higher value. The resulting scaled value is compared against the configured threshold values to determine the state of a tracked route as follows:

- If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.
- If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.

You configure the UP and DOWN thresholds for each tracked IPv6 route by using the `threshold metric` command. The default UP threshold is 254; the default DOWN threshold is 255. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.

Related Commands

- `show track ipv6 route` — display information about tracked IPv6 routes, including configuration, current state, and clients which track the route.
- `threshold metric` — configure the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- `track resolution ipv6 route` — configure the protocol-specific resolution value used to scale an IPv6 route metric.

**track ipv6 route reachability**

Configure object tracking on the reachability of an IPv6 route.

**Syntax**

```
track object-id ipv6 route ip-address/prefix-len reachability
```

To return to the default setting, use the `no track object-id` command.
Parameters

- **object-id**: Enter the ID number of the tracked object. The range is 1 to 500.
- **ipv6-address/prefix-len**: Enter an IPv6 address in X:X:X:X::X format. The valid IPv6 prefix lengths are from /0 to /128.

Defaults

None

</tbody>
</table>

Usage Information

Use this command to create an object that tracks the reachability of an IPv6 route. In order for a route's reachability to be tracked, the route must appear as an entry in the routing table.

A tracked route is considered to match an entry in the routing table only if the exact IPv6 address and prefix length match a table entry. For example, when configured as a tracked route, 3333:100:200:300:400::/80 does not match routing table entry 3333:100:200:300::/64. If no route-table entry has the exact IPv6 address and prefix length, the tracked route is considered to be DOWN.

When you configure IPv6 route reachability as a tracked object, the UP/DOWN state of the tracked route is also determined by the entry of the next-hop address in the ARP cache. A tracked route is considered to be reachable if there is an ARP cache entry for the route's next-hop address.

If the next-hop address in the ARP cache ages out for a route tracked for its reachability, an attempt is made to regenerate the ARP cache entry to if the next-hop address appears before considering the route DOWN.

Related Commands

- **show track ipv6 route** – display information about tracked IPv6 routes, including configuration, current state, and clients which track the route.
- **track ipv6 route reachability** – configure object tracking on the reachability of an IPv4 route.
track resolution ipv6 route

Configure the protocol-specific resolution value used to scale an IPv6 route metric.

Syntax

```
track resolution ipv6 route {isis resolution-value | ospf resolution-value}
```

To return to the default setting, use the `no track object-id` command.

Parameters

- **object-id**: Enter the ID number of the tracked object. Use the range to 1 to 500.
- **isis resolution-value**: Enter the resolution used to convert the metric in the routing table for ISIS routes to a scaled metric.
- **ospf resolution-value**: Enter the resolution used to convert the metric in the routing table for OSPF routes to a scaled metric.

Defaults

None

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the S6100-ON.
9.8(2.0)   Introduced on the S3100 series.
9.8(1.0)   Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0)   Introduced on the S6000-ON.
8.3.12.0   Introduced on the S4810.
8.4.1.0    Introduced.

Usage Information

- Use this command to configure the protocol-specific resolution value that converts the actual metric of an IPv6 route in the routing table to a scaled metric in the range 0 to 255.

- The UP/DOWN state of a tracked IPv6 route is determined by the user-configurable threshold (the `threshold metric` command) for a route's metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible.

- The protocol-specific resolution value calculates the scaled metric by dividing a route's cost by the resolution value set for the route protocol:
  - For ISIS, you can set the resolution in the range 1 to 1000, where the default is 10.
  - For OSPF, you can set the resolution in the range 1 to 1592, where the default is 1.
  - The resolution value used to map static routes is not configurable. By default, Dell EMC Networking OS assigns a metric of 0 to static routes.
The resolution value used to map RIP routes is not configurable. The RIP hop-count is automatically multiplied by 16 to scale it. For example, a RIP metric of 16 (unreachable) scales to 256, which considers the route to be DOWN.

**Related Commands**

- `threshold metric` — configure the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- `track ipv6 route metric threshold` — configure object tracking on the threshold of an IPv6 route metric.
Open Shortest Path First (OSPFv2 and OSPFv3)

Open Shortest Path First version 2 for IPv4 is supported on platform.
OSPF is an interior gateway protocol (IGP), which means that it distributes routing information between routers in a single autonomous system (AS). OSPF is also a link-state protocol in which all routers contain forwarding tables derived from information about their links to their neighbors.

The fundamental mechanisms of OSPF (flooding, DR election, area support, SPF calculations, and so on) are the same for OSPFv2 and OSPFv3. OSPFv3 runs on a per-link basis instead of on a per-IP-subnet basis.

The Dell EMC Networking OS versions 9.4(0.0) and 9.7(0.0) introduce support for VRF on OSPFv2 and OSPFv3 respectively. The multi-process OSPF feature supported on Dell EMC Networking OS version 7.8.1.0 is modified. In earlier versions, multiple OSPF processes were created without VRF (prior to 9.4(0.0)). In the Dell EMC Networking OS versions 9.4(0.0) and 9.7(0.0) (for OSPFv3), multiple OSPF processes can be created on a router, but with only one OSPF process per VRF. However, there can be one OSPFv2 and one OSPFv3 on the same VRF.

This section is divided into two sections. There is no overlap between the two sets of commands. You cannot use an OSPFv2 command in the IPv6 OSPFv3 mode. OSPFv2 is supported on IPv4 tunnels only and OSPFv3 is supported on IPv6 tunnels only.

Topics:
- OSPFv2 Commands
- OSPFv3 Commands

OSPFv2 Commands

The Dell EMC Networking implementation of OSPFv2 is based on IETF RFC 2328.

area default-cost

Set the metric for the summary default route the area border router (ABR) generates into the stub area. Use this command on the border routers at the edge of a stub area.

S4048-ON

Syntax

area area-id default-cost cost

To return default values, use the no area area-id default-cost command.

Parameters

area-id

Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.
**cost**

Specifies the stub area’s advertised external route metric. The range is from zero (0) to 65535.

**Defaults**

`cost = 1`; no areas are configured.

**Command Modes**

ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

In the Dell EMC Networking operating software (OS), cost is defined as reference bandwidth/bandwidth.

**Related Commands**

- `area stub` — create a stub area.

---

**area nssa**

Specify an area as a not so stubby area (NSSA).

**Syntax**

```
area area-id nssa [default-information-originate] [no-redistribution] [no-summary]
```

To delete an NSSA, use the `no area area-id nssa` command.

**Parameters**

- `area-id` Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.
no-redistribution  (OPTIONAL) Specify that the redistribute command does not distribute routes into the NSSA. This command can be used when the router is an autonomous system boundary router (ASBR) or area border router (ABR).

default-information originate  (OPTIONAL) Allows external routing information to be imported into the NSSA by using Type 7 default.

no-summary  (OPTIONAL) Specify that no summary LSAs should be sent into the NSSA.

Defaults
Not configured.

Command Modes
ROUTER OSPF

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version   Description
---------  -----------------------------------------------
9.13(0.0)  Introduced on the remaining DNOS platforms.
9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the S6100-ON.
9.8(2.0)   Introduced on the S3100 series.
9.8(1.0)   Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0)   Introduced on the S6000-ON.
9.2(1.0)   Introduced on the Z9500.
9.0.2.0    Introduced on the S6000.
8.3.19.0   Introduced on the S4820T.
8.3.11.1   Introduced on the Z9000.
8.3.7.0    Introduced on the S4810.
7.8.1.0    Added support for the Multi-Process OSPF.
7.6.1.0    Introduced on the S-Series.
7.5.1.0    Introduced on the C-Series.
pre- 6.1.1.1 Introduced on the E-Series.

area range
Summarize routes matching an address/mask at an area border router (ABR).

S4048–ON

Syntax
area area-id range ip-address mask [not-advertise]
To disable route summarization, use the no area area-id range ip-address mask command.

Parameters

- **area-id**
  - Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.

- **ip-address**
  - Specify an IP address in dotted decimal format.

- **mask**
  - Specify a mask for the destination prefix. Enter the full mask (for example, 255.255.255.0).

- **not-advertise**
  - (OPTIONAL) Enter the keywords not-advertise to set the status to DoNotAdvertise (that is, the Type 3 summary-LSA is suppressed and the component networks remain hidden from other areas.)

Defaults

Not configured.

Command Modes

- ROUTER OSPF

</table>

Usage Information

Only the routes within an area are summarized, and that summary is advertised to other areas by the ABR. External routes are not summarized.

Related Commands

- area stub — create a stub area.
- router ospf — enter ROUTER OSPF mode to configure an OSPF instance.
area stub

Configure a stub area, which is an area not connected to other areas.

**S4048-ON**

**Syntax**

```
area area-id stub [no-summary]
```

To delete a stub area, use the `no area area-id stub` command.

**Parameters**

- `area-id`  
  Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.

- `no-summary`  
  (OPTIONAL) Enter the keywords `no-summary` to prevent the ABR from sending summary Link State Advertisements (LSAs) into the stub area.

**Defaults**

Disabled.

**Command Modes**

ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Usage Information**

To configure all routers and access servers within a stub, use this command.
Related Commands

- `router ospf` — enter ROUTER OSPF mode to configure an OSPF instance.

### auto-cost

Specify how the OSPF interface cost is calculated based on the reference bandwidth method.

#### S4048-ON

**Syntax**

```
auto-cost [reference-bandwidth ref-bw]
```

To return to the default bandwidth or to assign cost based on the interface type, use the `no auto-cost [reference-bandwidth]` command.

**Parameters**

- `ref-bw` (OPTIONAL) Specify a reference bandwidth in megabits per second. The range is from 1 to 4294967. The default is **100 megabits per second**.

**Defaults**

**100 megabits per second.**

**Command Modes**

 ROUTER OSPF

clear ip ospf
Clear all OSPF routing tables.

S4048-ON

clear ip ospf process-id [vrf vrf-name] [process]

Parameters

- **process-id**: Enter the OSPF Process ID to clear a specific process. If no Process ID is entered, all OSPF processes are cleared.
- **vrf vrf-name**: Enter the keyword vrf and then the name of the VRF to clear all OSPF routing tables corresponding to that VRF.
- **process**: (OPTIONAL) Enter the keyword process to reset the OSPF process.

Command Modes

- EXEC Privilege

clear ip ospf statistics

Clear the packet statistics in interfaces and neighbors.

**S4048-ON**

**Syntax**

```
clear ip ospf [process-id] [vrf vrf-name] statistics [interface name (neighbor router-id)]
```

**Parameters**

- **process-id**: Enter the OSPF Process ID to clear a specific process. If no Process ID is entered, all OSPF processes are cleared.
- **vrf vrf-name**: Enter the keyword vrf followed by the name of the VRF to clear all OSPF routing tables corresponding to that VRF.
- **statistics**: Enter the keyword statistics to clear the packet statistics in interfaces and neighbors.
- **interface name**: (Optional) Enter the keyword interface then one of the following interface keywords and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a VLAN, enter the keyword vlan then a number from 1 to 4094.
  - For Port Channel groups, enter the keywords port-channel then a number.
- **neighbor router-id**: (Optional) Enter the keyword neighbor then the neighbor’s router-id in dotted decimal format (A.B.C.D.).

- **7.8.1.0**: Added support for the Multi-Process OSPF.
- **7.6.1.0**: Introduced on the S-Series.
- **7.5.1.0**: Introduced on the C-Series.
- **pre-6.1.1.1**: Introduced on the E-Series.

### Related Commands
- `show ip ospf statistics` — display the OSPF statistics.

### debug ip ospf

Display debug information on OSPF. Entering the `debug ip ospf` commands enables OSPF debugging for the first OSPF process.

**S4048-ON**

**Syntax**
```
debug ip ospf [process-id] [vrf vrf-name] [bfd |event | packet | spf | database-timer rate-limit]
```

To cancel the debug command, use the `no debug ip ospf` command.

**Parameters**

- `process-id`  
  Enter the OSPF Process ID to clear a specific process. If no Process ID is entered, all OSPF processes are cleared.

- `vrf vrf-name`  
  Enter the keyword `vrf` to view debugging information on OSPF corresponding to that VRF.

- `bfd`  
  (OPTIONAL) Enter the keyword `bfd` to debug only OSPF BFD information.

- `event`  
  (OPTIONAL) Enter the keyword `event` to debug only OSPF event information.

- `packet`  
  (OPTIONAL) Enter the keyword `packet` to debug only OSPF packet information.

- `spf`  
  (OPTIONAL) Enter the keyword `spf` to display the Shortest Path First information.

- `database-timer rate-limit`  
  (OPTIONAL) Enter the keywords `database-timer rate-limit` to display the LSA throttling timer information. This applies to the S4810 platform only.

**Command Modes**
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Version | Description
--- | ---
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P6) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.4(0.0) | Added support for VRF. Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.8.0 | Added the database-timer rate-limit option for the S4810.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Added support for the Multi-Process OSPF.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
pre- 6.1.1.1 | Introduced on the E-Series.

### Usage Information

</tr>
</tbody>
</table>
### default-information originate

To generate a default external route into an OSPF routing domain, configure Dell EMC Networking Operating System (OS).

#### Syntax

```
default-information originate [always] [metric metric-value] [metric-type type-value] [route-map map-name]
```

To return to the default values, use the `no default-information originate` command.
Parameters

always  (OPTIONAL) Enter the keyword always to specify that default route information must always be advertised.

metric metric-value  (OPTIONAL) Enter the keyword metric then a number to configure a metric value for the route. The range is from 1 to 16777214.

metric-type type-value  (OPTIONAL) Enter the keywords metric-type then an OSPF link state type of 1 or 2 for default routes. The values are:

  • 1 = Type 1 external route
  • 2 = Type 2 external route

route-map map-name  (OPTIONAL) Enter the keywords route-map then the name of an established route map.

Defaults

Disabled.

Command Modes

ROUTER OSPF

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version  Description

9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the S6100-ON.
9.8(2.0)   Introduced on the S3100 series.
9.8(1.0)   Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0)   Introduced on the S6000-ON.
9.2(1.0)   Introduced on the Z9500.
9.0.2.0    Introduced on the S6000.
8.3.19.0   Introduced on the S4820T.
8.3.11.1   Introduced on the Z9000.
8.3.7.0    Introduced on the S4810.
7.8.1.0    Added support for the Multi-Process OSPF.
7.6.1.0    Introduced on the S-Series.
7.5.1.0    Introduced on the C-Series.
pre-6.1.1.1 Introduced on the E-Series.

Related Commands

  • redistribute — redistributes routes from other routing protocols into OSPF.
default-metric

Change the metrics of redistributed routes to a value useful to OSPF. Use this command with the redistribute command.

S4048-ON

Syntax

default-metric number

To return to the default values, use the no default-metric [number] command.

Parameters

  number Enter a number as the metric. The range is from 1 to 16777214.

Defaults

Disabled.

Command Modes

ROUTER OSPF

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the S6100-ON.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100-ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000-ON.

9.2(1.0) Introduced on the Z9500.

9.0.2.0 Introduced on the S6000.

8.3.19.0 Introduced on the S4820T.

8.3.11.1 Introduced on the Z9000.

8.3.7.0 Introduced on the S4810.

7.8.1.0 Added support for the Multi-Process OSPF.

7.6.1.0 Introduced on the S-Series.

7.5.1.0 Introduced on the C-Series.

pre- 6.1.1.1 Introduced on the E-Series.
**description**

Add a description about the selected OSPF configuration.

### S4048–ON

**Syntax**

```
description description
```

To remove the OSPF description, use the `no description` command.

**Parameters**

- `description` Enter a text string description to identify the OSPF configuration (80 characters maximum).

**Defaults**

None

**Command Modes**

ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Related Commands**

- `show ip ospf asbr` — display the VLAN configuration.
distance

Define an administrative distance for particular routes to a specific IP address.

S4048-ON

distance weight [ip-address mask access-list-name]

To delete the settings, use the no distance weight [ip-address mask access-list-name] command.

Syntax

Parameters

**weight**

Specify an administrative distance. The range is from 1 to 255. The default is 110.

**ip-address**

(Optional) Enter a router ID in the dotted decimal format. If you enter a router ID, include the mask for that router address.

**mask**

(Optional) Enter a mask in dotted decimal format or /n format.

**access-list-name**

(Optional) Enter the name of an IP standard access list, up to 140 characters.

Defaults

110

**distance ospf**

Configure an OSPF distance metric for different types of routes.

### S4048-ON

**Syntax**

```plaintext
distance ospf [external dist3] [inter-area dist2] [intra-area dist1]
```

To delete these settings, use the no distance ospf command.

**Parameters**

- **external dist3** (OPTIONAL) Enter the keyword external then a number to specify a distance for external type 5 and 7 routes. The range is from 1 to 255. The default is 110.
- **inter-area dist2** (OPTIONAL) Enter the keywords inter-area then a number to specify a distance metric for routes between areas. The range is from 1 to 255. The default is 110.
- **intra-area dist1** (OPTIONAL) Enter the keywords intra-area then a number to specify a distance metric for all routes within an area. The range is from 1 to 255. The default is 110.

**Defaults**

- external dist3 = 110
- inter-area dist2 = 110
- intra-area dist1 = 110

**Command Modes**

- ROUTER OSPF

- **8.3.7.0**: Introduced on the S4810.
- **7.8.1.0**: Added support for the Multi-Process OSPF.
- **7.6.1.0**: Introduced on the S-Series.
- **7.5.1.0**: Introduced on the C-Series.
- **6.1.1.1**: Introduced on the E-Series.

**Usage Information**
To specify a distance for routes learned from other routing domains, use the `redistribute` command.

---

**distribute-list in**

Apply a filter to incoming routing updates from OSPF to the routing table.

### S4048-ON

**Syntax**

`distribute-list prefix-list-name in [interface]`

To delete a filter, use the `no distribute-list prefix-list-name in [interface]` command.

**Parameters**

- **prefix-list-name**: Enter the name of a configured prefix list.
- **interface**: (OPTIONAL) Enter one of the following keywords and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/[subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For Port Channel groups, enter the keywords `port-channel` then a number.
  - For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

`ROUTER OSPF`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

**distribute-list out**

To restrict certain routes destined for the local routing table after the SPF calculation, apply a filter.

**S4048-ON**

**Syntax**

```
distribute-list prefix-list-name out [bgp | connected | isis | rip | static]
```

To remove a filter, use the `no distribute-list prefix-list-name out [bgp | connected | isis | rip | static]` command.

**Parameters**

- `prefix-list-name` Enter the name of a configured prefix list.
- `bgp` (OPTIONAL) Enter the keyword `bgp` to specify that BGP routes are distributed.
  - **NOTE:** BGP and ISIS routes are not available on the C-Series. BGP, ISIS, and RIP routes are not available on the S-Series.
- `connected` (OPTIONAL) Enter the keyword `connected` to specify that connected routes are distributed.
- `isis` (OPTIONAL) Enter the keyword `isis` to specify that IS-IS routes are distributed.
  - **NOTE:** BGP and ISIS routes are not available on the C-Series. BGP, ISIS, and RIP routes are not available on the S-Series.
- `rip` (OPTIONAL) Enter the keyword `rip` to specify that RIP routes are distributed.
  - **NOTE:** BGP and ISIS routes are not available on the C-Series. BGP, ISIS, and RIP routes are not available on the S-Series.
- `static` (OPTIONAL) Enter the keyword `static` to specify that only manually configured routes are distributed.

**Defaults** Not configured.

</table>

**Usage Information**

The distribute-list out command applies to routes autonomous system boundary routers (ASBRs) redistributes into OSPF. It can be applied to external type 2 and external type 1 routes, but not to intra-area and inter-area routes.

**fast-convergence**

This command sets the minimum LSA origination and arrival times to zero (0), allowing more rapid route computation so that convergence takes less time.

**S4048-ON**

**Syntax**

```
fast-convergence {number}
```

To cancel fast-convergence, use the no fast convergence command.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Enter the convergence level desired. The higher this parameter is set, the faster OSPF converge takes place. The range is from 1 to 4.</td>
</tr>
</tbody>
</table>

**Defaults**

None.

</tr>
</tbody>
</table>

Usage Information

The higher this parameter is set, the faster OSPF converge takes place.

NOTE: The faster the convergence, the more frequent the route calculations and updates. This behavior impacts CPU utilization and may impact adjacency stability in larger topologies.

Generally, convergence level 1 meets most convergence requirements. Higher convergence levels should only be selected following consultation with Dell EMC Networking technical support.

graceful-restart grace-period

Specifies the time duration, in seconds, that the router’s neighbors continue to advertise the router as fully adjacent regardless of the synchronization state during a graceful restart.

NOTE: This command enables OSPFv2 graceful restart globally by setting the grace period (in seconds) that an OSPFv2 router’s neighbors continues to advertise the router as adjacent during a graceful restart.

S4048-ON

Syntax

graceful-restart grace-period seconds

To disable the grace period, use the no graceful-restart grace-period command.
Parameters

**seconds**

Time duration, in seconds, that specifies the duration of the restart process before OSPF terminates the process. The range is from 40 to 1800 seconds.

Defaults

Not Configured

</tbody>
</table>

Usage Information

The Helper mode is enabled by default on the device. To enable the restart mode also on the device, you must configure the grace period using this command. After you enable restart mode the router advertises the neighbor as fully adjacent during a restart.

**graceful-restart helper-reject**

Specify the OSPF router to not act as a helper during graceful restart.

**S4048-ON**

**Syntax**

```
graceful-restart helper-reject ip-address
```
Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ip-address</strong></td>
<td>Enter the OSPF router-id, in IP address format, of the restart router that will not act as a helper during graceful restart.</td>
</tr>
</tbody>
</table>

Defaults

Not configured.

Command Modes

ROUTER OSPF

**graceful-restart role**

Specify the role for your OSPF router during graceful restart.

**S4048-ON**

**Syntax**

graceful-restart role [helper-only | restart-only]

To disable graceful restart role, use the no graceful-restart role command.

**Parameters**

role helper-only

(Optionalal) Enter the keywords helper-only to specify the OSPF router is a helper only during graceful restart.

role restart-only

(Optionalal) Enter the keywords restart-only to specify the OSPF router is a restart only during graceful-restart.
Defaults
By default, OSPF routers are both helper and restart routers during a graceful restart.

ip ospf auth-change-wait-time

OSPF provides a grace period while OSPF changes its interface authentication type. During the grace period, OSPF sends out packets with new and old authentication scheme until the grace period expires.

S4048-ON

Syntax
ip ospf auth-change-wait-time seconds
To return to the default, use the no ip ospf auth-change-wait-time command.

Parameters
seconds
Enter the seconds. The range is from 0 to 300.

Defaults
zero (0) seconds.

Command Modes
INTERFACE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
ip ospf authentication-key

Enable authentication and set an authentication key on OSPF traffic on an interface.

**S4048-ON**

**Syntax**

```
ip ospf authentication-key [encryption-type] key
```

To delete an authentication key, use the `no ip ospf authentication-key` command.

**Parameters**

- `encryption-type`  
  (OPTIONAL) Enter 7 to encrypt the key.
- `key`  
  Enter an eight-character string. Strings longer than eight characters are truncated.

**Defaults**

Not configured.

**Command Modes**

### ip ospf cost

Change the cost associated with the OSPF traffic on an interface.

#### S4048-ON

**Syntax**

```
ip ospf cost cost
```

To return to default value, use the `no ip ospf cost` command.

**Parameters**

- `cost`  
  Enter a number as the cost. The range is from 1 to 65535.

**Defaults**

The default cost is based on the reference bandwidth.

**Command Modes**

</tr>
</tbody>
</table>

**Usage Information**

All neighboring routers in the same network must use the same password to exchange OSPF information.
### ip ospf dead-interval

Set the time interval since the last hello-packet was received from a router. After the interval elapses, the neighboring routers declare the router dead.

**Syntax**

```
ip ospf dead-interval seconds
```

To return to the default values, use the `no ip ospf dead-interval` command.

**Parameters**

- `seconds` Enter the number of seconds for the interval. The range is from 1 to 65535. The default is 40 seconds.

**Defaults**

40 seconds

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### Version Description
- **9.10(0.1)** Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)** Introduced on the S3148.
- **9.10(0.0)** Introduced on the S6100-ON.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100-ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **pre-6.1.1.1** Introduced on the E-Series.

#### Usage Information
By default, the dead interval is four times the default hello-interval.

#### Related Commands
- `ip ospf hello-interval` — set the time interval between the hello packets.

### ip ospf hello-interval

Specify the time interval between the hello packets sent on the interface.

**S4048-ON**

**Syntax**
```
ip ospf hello-interval seconds
```
To return to the default value, use the `no ip ospf hello-interval` command.

**Parameters**
- **seconds**
  Enter the number of seconds for the interval. The range is from 1 to 65535. The default is 10 seconds.

**Defaults**
- **10 seconds**

**Command Modes**
- INTERFACE

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### Version Description
- **9.10(0.1)** Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)** Introduced on the S3148.
- **9.10(0.0)** Introduced on the S6100-ON.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100-ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **pre- 6.1.1.1** Introduced on the E-Series.

### Usage Information
The time interval between the hello packets must be the same for routers in a network.

### Related Commands
- `ip ospf dead-interval` — set the time interval before a router is declared dead.

---

**ip ospf message-digest-key**

Enable OSPF MD5 authentication and send an OSPF message digest key on the interface.

**S4048-ON**

**Syntax**

```
ip ospf message-digest-key keyid md5 key
```

To delete a key, use the `no ip ospf message-digest-key keyid` command.

**Parameters**

- `keyid` Enter a number as the key ID. The range is from 1 to 255.
- `key` Enter a continuous character string as the password.

**Defaults**

No MD5 authentication is configured.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Version   Description
9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the S6100-ON.
9.8(2.0)   Introduced on the S3100 series.
9.8(1.0)   Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0)   Introduced on the S6000-ON.
9.2(1.0)   Introduced on the Z9500.
9.0.2.0    Introduced on the S6000.
8.3.19.0   Introduced on the S4820T.
9.1(0.0)   Included usage information on maximum number of digest keys per interface.
8.3.11.1   Introduced on the Z9000.
8.3.7.0    Introduced on the S4810.
7.6.1.0    Introduced on the S-Series.
7.5.1.0    Introduced on the C-Series.
pre- 6.1.1.1 Introduced on the E-Series.

Usage Information
You can configure a maximum of six digest keys on an interface. Of the available six digest keys, the switches select the MD5 key that is common. The remaining MD5 keys are unused.

To change to a different key on the interface, enable the new key while the old key is still enabled. Dell EMC Networking OS sends two packets: the first packet authenticated with the old key and the second packet authenticated with the new key. This process ensures that the neighbors learn the new key and communication is not disrupted by keeping the old key enabled.

After the reply is received and the new key is authenticated, delete the old key. Dell EMC recommends keeping only one key per interface.

NOTE: The MD5 secret is stored as plain text in the configuration file with service password encryption. Write down or otherwise record the key. You cannot learn the key once it is configured. Use caution when changing the key.

**ip ospf mtu-ignore**

Disable OSPF MTU mismatch detection upon receipt of database description (DBD) packets.

**S4048–ON**

Syntax   

```
ip ospf mtu-ignore
```

To return to the default, use the **no ip ospf mtu-ignore** command.
ip ospf network

Set the network type for the interface.

S4048–ON

Syntax

```
ip ospf network {broadcast | point-to-point}
```

To return to the default, use the `no ip ospf network` command.

Parameters

- **broadcast**
  Enter the keyword `broadcast` to designate the interface as part of a broadcast network.

- **point-to-point**
  Enter the keywords `point-to-point` to designate the interface as part of a point-to-point network.

Defaults

Broadcast.

Command Modes

ROUTER OSPF

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.
ip ospf priority

To determine the designated router for the OSPF network, set the priority of the interface.

S4048-ON

Syntax

ip ospf priority number

To return to the default setting, use the no ip ospf priority command.

Parameters

number

Enter a number as the priority. The range is from 0 to 255. The default is 1.

Defaults

1

Command Modes

INTERFACE

<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>pre- 6.1.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Setting a priority of 0 makes the router ineligible for election as a designated router or backup designated router.

Use this command for interfaces connected to multi-access networks, not point-to-point networks.

**ip ospf retransmit-interval**

Set the retransmission time between lost link state advertisements (LSAs) for adjacencies belonging to the interface.

**S4048-ON**

**Syntax**

```
ip ospf retransmit-interval seconds
```

To return to the default values, use the `no ip ospf retransmit-interval` command.

**Parameters**

- **seconds**: Enter the number of seconds as the interval between retransmission. The range is from 1 to 3600. The default is `5 seconds`.
  
  This interval must be greater than the expected round-trip time for a packet to travel between two routers.

**Defaults**

- `5 seconds`

**Command Modes**

- INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tr>
<td>pre- 6.1.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Set the time interval to a number large enough to prevent unnecessary retransmissions.

**ip ospf transmit-delay**

To send a link state update packet on the interface, set the estimated time elapsed.

**S4048-ON**

**Syntax**

```
ip ospf transmit-delay seconds
```

To return to the default value, use the `no ip ospf transmit-delay` command.

**Parameters**

- **seconds**
  - Enter the number of seconds as the interval between retransmission. The range is from 1 to 3600. The default is **1 second**.
  - This value must be greater than the transmission and propagation delays for the interface.

**Defaults**

**1 second**

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
log-adjacency-changes

To send a Syslog message about changes in the OSPF adjacency state, set Dell EMC Networking OS.

S4048-ON

Syntax

    log-adjacency-changes

To disable the Syslog messages, use the no log-adjacency-changes command.

Defaults

    Disabled.

Command Modes

    ROUTER OSPF

Command History

    This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>
maximum-paths

Enable the software to forward packets over multiple paths.

S4048-ON

Syntax

    maximum-paths number

To disable packet forwarding over multiple paths, use the `no maximum-paths` command.

Parameters

    number

Specify the number of paths. The range for OSPFv2 is from 1 to 64. The default for OSPFv2 is 4 paths. The range for OSPFv3 is from 1 to 64. The default for OSPFv3 is 8 paths.

Defaults

    4

Command Modes

    ROUTER OSPF for OSPFv2
    ROUTER OSPFv3 for OSPFv3

Command History

    This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

    Version Description
    9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
    9.10(0.0) Introduced on the S3148.
    9.10(0.0) Introduced on the S6100-ON.
    9.8(2.0) Introduced on the S3100 series.
    9.8(1.0) Introduced on the Z9100-ON.
network area

Define which interfaces run OSPF and the OSPF area for those interfaces.

**S4048-ON**

**Syntax**

```text
eight
```

To disable an OSPF area, use the `no network ip-address mask area area-id` command.

**Parameters**

- `ip-address`  
  Specify a primary or secondary address in dotted decimal format. The primary address is required before adding the secondary address.

- `mask`  
  Enter a network mask in `/prefix` format. (/x)

- `area-id`  
  Enter the OSPF area ID as either a decimal value or in a valid IP address. Decimal value range is from 0 to 65535. IP address format is dotted decimal format A.B.C.D.

---

**NOTE:** If the area ID is smaller than 65535, it is converted to a decimal value. For example, if you use an area ID of 0.0.0.1, it is converted to 1.

**Command Modes**  
ROUTER OSPF

**Command History**

pre- 6.1.1.1  
Introduced on the S4048-ON.

Introduced on the S3048-ON.

Introduced on the Z9500.

Introduced on the S6000.

Introduced support for OSPFv3 on the S4810 and Z9000.

Introduced on the S4820T.

Introduced on the Z9000.

Introduced on the S4810.

Added support for Multi-Process OSPF.

Introduced on the S-Series.

Introduced on the C-Series.

Introduced on the E-Series.
### passive-interface

Suppress both receiving and sending routing updates on an interface.

#### S4048-ON

**Syntax**

```
passive-interface {default | interface}
```

To enable both the receiving and sending routing, use the `no passive-interface interface` command.

To return all OSPF interfaces (current and future) to active, use the `no passive-interface default` command.

**Parameters**

- **default**: Enter the keyword `default` to make all OSPF interfaces (current and future) passive.
- **interface**: Enter the following keywords and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

For a VLAN, enter the keyword vlan then a number from 1 to 4094.

**Command Modes**

ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Although the passive interface does not send or receive routing updates, the network on that interface is still included in OSPF updates sent using other interfaces.

The default keyword sets all interfaces as passive. You can then configure individual interfaces, where adjacencies are desired, using the no passive-interface interface command. The no form of this command is inserted into the configuration for individual interfaces when the no passive-interface interface command is issued while passive-interface default is configured.

This command behavior has changed as follows:

```
passive-interface interface
```

- The previous no passive-interface interface is removed from the running configuration.
- The ABR status for the router is updated.
- Save passive-interface interface into the running configuration.
passive-interface default

- All present and future OSPF interfaces are marked as passive.
- Any adjacency is explicitly terminated from all OSPF interfaces.
- All previous passive-interface interface commands are removed from the running configuration.
- All previous no passive-interface interface commands are removed from the running configuration.

no passive-interface interface

- Remove the interface from the passive list.
- The ABR status for the router is updated.
- If passive-interface default is specified, then save no passive-interface interface into the running configuration.

No passive-interface default

- Clear everything and revert to the default behavior.
- All previously marked passive interfaces are removed.
- May update ABR status.

On configuring suppression using the passive-interface command, the state of the OSPF neighbor does not change to INIT; instead, the state of the OSPF neighbor changes to DOWN after the dead-timer expires.

redistribute

Redistribute information from another routing protocol throughout the OSPF process.

Syntax
redistribute {connected | isis | ospf | rip | static} [metric metric-value | metric-type type-value] [route-map map-name] [tag tag-value]
To disable redistribution, use the no redistribute {connected | isis | rip | static} command.

Parameters

- connected: Enter the keyword connected to specify that information from active routes on interfaces is redistributed.
- isis: Enter the keyword isis to specify that ISO IS-IS information is redistributed.
- ospf: Enter the keyword ospf to specify that information corresponding to OSPF is redistributed.
- rip: Enter the keyword rip to specify that RIP routing information is redistributed.
- static: Enter the keyword static to specify that information from static routes is redistributed.
- metric metric-value: (OPTIONAL) Enter the keyword metric then a number. The range is from 0 (zero) to 16777214.
- metric-type type-value: (OPTIONAL) Enter the keywords metric-type then one of the following:
  - 1 = OSPF External type 1
  - 2 = OSPF External type 2
- route-map map-name: (OPTIONAL) Enter the keywords route-map then the name of the route map.
**redistribute bgp**

Redistribute BGP routing information throughout the OSPF instance.

**Syntax**

```
redistribute bgp as number [metric metric-value] | [metric-type type-value] | [tag tag-value]
```

To disable redistribution, use the `no redistribute bgp as number [metric metric-value] | [metric-type type-value] [tag tag-value]` command.
Parameters

- **as number**: Enter the autonomous system number. The range is from 1 to 65535.
- **metric metric-value**: (OPTIONAL) Enter the keyword metric then the metric-value number. The range is from 0 to 16777214.
- **metric-type type-value**: (OPTIONAL) Enter the keywords metric-type then one of the following:
  - 1 = for OSPF External type 1
  - 2 = for OSPF External type 2
- **route-map map-name**: (OPTIONAL) Enter the keywords route-map then the name of the route map.
- **tag tag-value**: (OPTIONAL) Enter the keyword tag to set the tag for routes redistributed into OSPF. The range is from 0 to 4294967295.

Defaults

None

Command Modes

- **ROUTER OSPF**

</tbody>
</table>
**redistribute isis**

Redistribute IS-IS routing information throughout the OSPF instance.

**Syntax**

```
redistribute isis [tag] [level-1 | level-1-2 | level-2] [metric metric-value | metric-type type-value] [route-map map-name] [tag tag-value]
```

To disable redistribution, use the `no redistribute isis [tag] [level-1 | level-1-2 | level-2] [metric metric-value | metric-type type-value] [route-map map-name] [tag tag-value]` command.

**Parameters**

- `tag` (OPTIONAL) Enter the name of the IS-IS routing process.
- `level-1` (OPTIONAL) Enter the keywords `level-1` to redistribute only IS-IS Level-1 routes.
- `level-1-2` (OPTIONAL) Enter the keywords `level-1-2` to redistribute both IS-IS Level-1 and Level-2 routes.
- `level-2` (OPTIONAL) Enter the keywords `level-2` to redistribute only IS-IS Level-2 routes.
- `metric metric-value` (OPTIONAL) Enter the keyword `metric` then a number. The range is from 0 (zero) to 4294967295.
- `metric-type type-value` (OPTIONAL) Enter the keywords `metric-type` then one of the following:
  - 1 = for OSPF External type 1
  - 2 = for OSPF External type 2
- `route-map map-name` (OPTIONAL) Enter the keywords `route-map` then the name of the route map.
- `tag tag-value` (OPTIONAL) Enter the keyword `tag` to set the tag for routes redistributed into OSPF. The range is from 0 to 4294967295.

**Defaults**

Not configured.

**Command Modes**

- `ROUTER OSPF`

**Command History**

## router-id

To configure a fixed router ID, use this command.

**Syntax**

```
router-id ip-address
```

To remove the fixed router ID, use the `no router-id ip-address` command.

**Parameters**

- `ip-address` Enter the router ID in the IP address format.

**Defaults**

None.

**Command Modes**

ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Version Description

- **9.10(0.1)**  Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)**  Introduced on the S3148.
- **9.10(0.0)**  Introduced on the S6100-ON.
- **9.8(2.0)**  Introduced on the S3100 series.
- **9.8(1.0)**  Introduced on the Z9100-ON.
- **9.8(0.0P5)**  Introduced on the S4048-ON.
- **9.8(0.0P2)**  Introduced on the S3048-ON.
- **9.7(0.0)**  Introduced on the S6000-ON.
- **9.2(1.0)**  Introduced on the Z9500.
- **9.0.2.0**  Introduced on the S6000.
- **8.3.19.0**  Introduced on the S4820T.
- **8.3.11.1**  Introduced on the Z9000.
- **8.3.7.0**  Introduced on the S4810.
- **7.8.1.0**  Added support for Multi-Process OSPF.
- **7.5.1.0**  Introduced on the C-Series.
- **pre- 6.1.1.1**  Introduced on the E-Series.
router ospf

To configure an OSPF instance, enter ROUTER OSPF mode.

Syntax

```
router ospf process-id [vrf {vrf name}]
```

To clear an OSPF instance, use the `no router ospf process-id` command.

Parameters

- `process-id`  
  Enter a number for the OSPF instance. The range is from 1 to 65535.

- `vrf name`  
  (Optional) Enter the VRF process identifier to tie the OSPF instance to the VRF. All network commands under this OSPF instance are then tied to the VRF instance.

Defaults

Not configured.

</tbody>
</table>
**Usage Information**
You must have an IP address assigned to an interface to enter ROUTER OSPF mode and configure OSPF. You can create only one OSPFv2 process per VRF.

**Example**
```
DellEMC(conf)# router ospf 2
DellEMC(conf-router_ospf)#
```

### show config

Display the non-default values in the current OSPF configuration.

**S4048-ON**

**Syntax**
```
show config
```

**Command Modes**
ROUTER OSPF

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
---|---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.

9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
show ip ospf

Display information on the OSPF process configured on the switch.

**S4048-ON**

**Syntax**

```
show ip ospf [process-id | vrf vrf name]
```

**Parameters**

- `process-id` Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- `vrf vrf name` Show only the OSPF information tied to the VRF process.

**Command Modes**

- EXEC
- EXEC Privilege

### Version Description

- **9.4.0.0**: Added support for VRF.
- **9.2(1.0)**: Introduced on the Z9500.
- **9.0.2.0**: Introduced on the S6000.
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.11.1**: Introduced on the Z9000.
- **8.3.8.0**: Added output for LSA throttling timers.
- **8.3.7.0**: Introduced on the S4810.
- **7.9.1.0**: Added support for VRF.
- **7.8.1.0**: Added support of Multi-Process OSPF.
- **7.8.1.0**: Added the `process-id` option, in support of Multi-Process OSPF.
- **7.6.1.0**: Introduced on the S-Series.
- **7.5.1.0**: Introduced on the C-Series.
- **pre- 6.1.1.1**: Introduced on the E-Series.

#### Usage Information

If you delete all the network area commands for Area 0, the `show ip ospf` command output does not list Area 0.

The following describes the `show ip ospf` command shown in the following example.

<table>
<thead>
<tr>
<th>Line Beginning with</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Routing Process...</em></td>
<td>Displays the OSPF process ID and the IP address associated with the process ID.</td>
</tr>
<tr>
<td><em>Supports only...</em></td>
<td>Displays the number of Type of Service (TOS) routes supported.</td>
</tr>
<tr>
<td><em>SPF schedule...</em></td>
<td>Displays the delay and hold time configured for this process ID.</td>
</tr>
<tr>
<td><em>Convergence Level</em></td>
<td></td>
</tr>
<tr>
<td><em>Min LSA...</em></td>
<td>Displays the intervals set for LSA transmission and acceptance.</td>
</tr>
<tr>
<td><em>Number of...</em></td>
<td>Displays the number and type of areas configured for this process ID.</td>
</tr>
</tbody>
</table>

#### Example

```
DellEMC# show ip ospf 10
Routing Process ospf 10 with ID 1.1.1.1 Virtual router default-vrf
Supports only single TOS (TOS0) routes
SPF schedule delay 5 secs, Hold time between two SPF's 10 secs
Convergence Level 0
Min LSA origination 0 msec, Min LSA arrival 1000 msec
Min LSA hold time 5000 msec, Max LSA wait time 5000 msec
Number of area in this router is 1, normal 1 stub 0 nssa 0
  Area BACKBONE (0)
    Number of interface in this area is 1
    SPF algorithm executed 205 times
  Area ranges are
DellEMC#
```

#### Related Commands

- `show ip ospf database` — display information about the OSPF routes configured.
- `show ip ospf interface` — display the OSPF interfaces configured.
show ip ospf neighbor — display the OSPF neighbors configured.

show ip ospf asbr

Display all autonomous system boundary router (ASBR) routers visible to OSPF.

S4048-ON

Syntax

show ip ospf [process-id | vrf vrf-name] asbr

Parameters

process-id

Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

Defaults

None

Command Modes

• EXEC
• EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version | Description
---|---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.4.(0.0) | Added support for VRF.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Added the process-id option, in support of Multi-Process OSPF.
7.8.1.0 | Added support of Multi-Process OSPF.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series and E-Series.
Usage Information

To isolate problems with external routes, use this command. In OSPF, external routes are calculated by adding the LSA cost to the cost of reaching the ASBR router. If an external route does not have the correct cost, use this command to determine if the path to the originating router is correct. The display output is not sorted in any order.

**NOTE:** ASBRs that are not in directly connected areas are also displayed.

You can determine if an ASBR is in a directly connected area (or not) by the flags. For ASBRs in a directly connected area, E flags are set. In the following example, router 1.1.1.1 is in a directly connected area since the Flag is E/-/-/. For remote ASBRs, the E flag is clear (-/-/-/).

Example

DellEMC# show ip ospf 1 asbr

<table>
<thead>
<tr>
<th>RouterID</th>
<th>Flags</th>
<th>Cost</th>
<th>Nexthop</th>
<th>Interface</th>
<th>Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.3.3.3</td>

<td>2</td>
<td>10.0.0.2</td>
<td>Te 1/1</td>
<td>1</td>
</tr>
<tr>
<td>1.1.1.1</td>
<td>E/-/-/</td>
<td>0</td>
<td>0.0.0.0</td>
<td>-</td>
<td>0</td>
</tr>
</tbody>
</table>

DellEMC#

**show ip ospf database**

Display all LSA information. If you do not enable OSPF on the switch, no output is generated.

**S4048-ON**

**Syntax**

```
show ip ospf process-id [vrf vrf-name] database [database-summary]
```

**Parameters**

- **process-id**
  - Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- **vrf vrf-name**
  - Enter the keyword vrf and then the name of the VRF to view LSA information on OSPF processes corresponding to that VRF.
- **database-summary**
  - (OPTIONAL) Enter the keywords database-summary to display the number of LSA types in each area and the total number of LSAs.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Usage Information

The following describes the `show ip ospf process-id database` command shown in the following example.

#### Field | Description
--- | ---
Link ID | Identifies the router ID.
ADV Router | Identifies the advertising router’s ID.
Age | Displays the link state age.
Seq# | Identifies the link state sequence number. This number allows you to identify old or duplicate link state advertisements.
Checksum | Displays the Fletcher checksum of an LSA’s complete contents.
Link count | Displays the number of interfaces for that router.

#### Example

```
DellEMC> show ip ospf 1 database

OSPF Router with ID (11.1.2.1) (Process ID 1)
          Router (Area 0.0.0.0)
Link ID    ADV Router   Age  Seq#       Checksum Link count

```
show ip ospf database asbr-summary

Display information about autonomous system (AS) boundary LSAs.

S4048-ON

Syntax
show ip ospf [process-id | vrf vrf-name] database asbr-summary [link-state-id] [adv-router ip-address]

Parameters
- **process-id**: Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- **link-state-id**: (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
  - the network’s IP address for Type 3 LSAs or Type 5 LSAs
  - the router’s OSPF router ID for Type 1 LSAs or Type 4 LSAs
  - the default destination (0.0.0.0) for Type 5 LSAs
- **adv-router ip-address**: (OPTIONAL) Enter the keywords adv-router and the ip-address to display only the LSA information about that router.

Command Modes
- EXEC
- EXEC Privilege

Related Commands
•  show ip ospf database — display OSPF database information.

show ip ospf database external

Display information on the AS external (type 5) LSAs.

Syntax
show ip ospf [process-id | vrf vrf-name] database external [link-state-id] [adv-router ip-address]

Parameters
process-id  Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

vrf vrf-name Enter the keyword vrf followed by the name of the VRF to view information on AS external LSAs corresponding to the OSPF processes that are tied to a specific VRF.

link-state-id (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
  •  the network’s IP address for Type 3 LSAs or Type 5 LSAs
  •  the router’s OSPF router ID for Type 1 LSAs or Type 4 LSAs
  •  the default destination (0.0.0.0) for Type 5 LSAs

adv-router ip-address (OPTIONAL) Enter the keywords adv-router and the ip-address to display only the LSA information about that router.

Command Modes
•  EXEC
•  EXEC Privilege

   LS age: 1868
   Options: (No TOS-capability, DC)
   LS type: Type-5 AS External
   Link State ID: 24.216.12.0
   Advertising Router: 20.20.20.8
   LS Seq Number: 0x80000005
   Checksum: 0xa00e
   Length: 36
   Network Mask: /24
      Metrics Type: 2
      TOS: 0
      Metrics: 1
      Forward Address: 0.0.0.0
      External Route Tag: 701

DellEMC#  
```

**Related Commands**

- `show ip ospf database` — display OSPF database information.

**show ip ospf database network**

Display the network (type 2) LSA information.

**Syntax**

```
show ip ospf [process-id] database network [link-state-id] [adv-router ip-address]
```

**Parameters**

- `process-id`  
  Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
**link-state-id** *(OPTIONAL)* Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:

- the network’s IP address for Type 3 LSAs or Type 5 LSAs
- the router’s OSPF router ID for Type 1 LSAs or Type 4 LSAs
- the default destination (0.0.0.0) for Type 5 LSAs

**adv-router ip-address** *(OPTIONAL)* Enter the keywords `adv-router` and the `ip-address` to display only the LSA information about that router.

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**

       Attached Router: 20.20.20.5

DellEMC#
```

### Related Commands
- `show ip ospf database` — display OSPF database information.
show ip ospf database nssa-external

Display NSSA-External (type 7) LSA information.

Syntax
show ip ospf [process-id | vrf vrf-name] database nssa-external [link-state-id] [adv-router ip-address]

Parameters
process-id
Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

vrf vrf-name
Enter the keyword vrf followed by the name of the VRF to view NSSA-External LSA information corresponding to the OSPF process that is tied to a specific VRF.

link-state-id
(Optional) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
- the network’s IP address for Type 3 LSAs or Type 5 LSAs
- the router’s OSPF router ID for Type 1 LSAs or Type 4 LSAs
- the default destination (0.0.0.0) for Type 5 LSAs

adv-router ip-address
(Optional) Enter the keywords adv-router and the ip-address to display only the LSA information about that router.

Command Modes
- EXEC
- EXEC Privilege

**show ip ospf database opaque-area**

Display the opaque-area (type 10) LSA information.

**Syntax**

```
show ip ospf [process-id | vrf vrf-name] database opaque-area [link-state-id]
[adv-router ip-address]
```

**Parameters**

- **process-id**
  - Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

- **vrf vrf-name**
  - Enter the keyword vrf followed by the name of the VRF to view opaque-area LSA information corresponding to the OSPF process that is tied to a specific VRF.

- **link-state-id**
  - (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
    - the network’s IP address for Type 3 LSAs or Type 5 LSAs
    - the router’s OSPF router ID for Type 1 LSAs or Type 4 LSAs
    - the default destination (0.0.0.0) for Type 5 LSAs

- **adv-router ip-address**
  - (OPTIONAL) Enter the keywords adv-router and the ip-address to display only the LSA information about that router.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Opaque ID</td>
<td>Displays the Opaque type-specific ID (the remaining 24 bits of the Link State ID).</td>
</tr>
</tbody>
</table>

Example
```bash
DellEMC> show ip ospf 1 database opaque-area
OSPF Router with ID (3.3.3.3) (Process ID 1)
```
Type-10 Opaque Link Area (Area 0)

LS age: 1133
Options: (No TOS-capability, No DC, E)
LS type: Type-10 Opaque Link Area
Link State ID: 1.0.0.1
Advertising Router: 10.16.1.160
LS Seq Number: 0x80000002
Checksum: 0x376
Length: 28
Opaque Type: 1
Opaque ID: 1
Unable to display opaque data

LS age: 833
Options: (No TOS-capability, No DC, E)
LS type: Type-10 Opaque Link Area
Link State ID: 1.0.0.2
Advertising Router: 10.16.1.160
LS Seq Number: 0x80000002
Checksum: 0x19c2

Related Commands

• show ip ospf database — display OSPF database information.

show ip ospf database opaque-as

Display the opaque-as (type 11) LSA information.

Syntax

show ip ospf process-id database opaque-as [link-state-id] [adv-router ip-address]

Parameters

process-id

Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

link-state-id

(OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:

• the network’s IP address for Type 3 LSAs or Type 5 LSAs
• the router’s OSPF router ID for Type 1 LSAs or Type 4 LSAs
• the default destination (0.0.0.0) for Type 5 LSAs

adv-router ip-address

(OPTIONAL) Enter the keywords adv-router and the ip-address to display only the LSA information about that router.

Command Modes

• EXEC
• EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
show ip ospf database opaque-link

Display the opaque-link (type 9) LSA information.

Syntax

```
show ip ospf [process-id | vrf vrf-name] database opaque-link [link-state-id] [adv-router ip-address]
```

Parameters

- **process-id**
  - Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- **vrf vrf-name**
  - Enter the keyword vrf followed by the name of the VRF to view opaque-link LSA information corresponding to the OSPF process that is tied to a specific VRF.
- **link-state-id**
  - (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
    - the network’s IP address for Type 3 LSAs or Type 5 LSAs
    - the router’s OSPF router ID for Type 1 LSAs or Type 4 LSAs
    - the default destination (0.0.0.0) for Type 5 LSAs
adv-router ip-address  (OPTIONAL) Enter the keywords adv-router then the IP address of an Advertising Router to display only the LSA information about that router.

Command Modes

- EXEC
- EXEC Privilege

   TOS 0 Metric: 1

Link connected to: a Stub Network
   (Link ID) Network/subnet number: 11.1.5.0

Related Commands

- show ip ospf database — display OSPF database information.

**show ip ospf database summary**

Display the network summary (type 3) LSA routing information.

**Syntax**

```
show ip ospf [process-id | vrf vrf-name] database summary [link-state-id] [adv-router ip-address]
```

**Parameters**

- `process-id` Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

- `vrf vrf-name` Enter the keyword vrf followed by the name of the VRF to view LSA routing information corresponding to the OSPF process that is tied to a specific VRF.

- `link-state-id` (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following:
  - the network’s IP address for Type 3 LSAs or Type 5 LSAs
  - the router’s OSPF router ID for Type 1 LSAs or Type 4 LSAs
  - the default destination (0.0.0.0) for Type 5 LSAs

- `adv-router ip-address` (OPTIONAL) Enter the keywords adv-router then the IP address of an Advertising Router to display only the LSA information about that router.

**Command Modes**

- EXEC
- EXEC Privilege

DellEMC#
```

**Related Commands**

- `show ip ospf database` — display OSPF database information.
show ip ospf interface

Display the OSPF interfaces configured. If OSPF is not enabled on the switch, no output is generated.

Syntax

```
show ip ospf [process-id | vrf vrf-name] interface [interface]
```

Parameters

- **process-id**: Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- **vrf vrf-name**: Enter the keyword vrf followed by the name of the VRF to show the OSPF processes that are tied to a specific VRF.
- **interface**: (OPTIONAL) Enter the following keywords and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a Null interface, enter the keyword null then the Null interface number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Command Modes

- EXEC
- EXEC Privilege

### Usage Information

The following describes the `show ip ospf process-id interface` command shown in the following example.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GigabitEthernet...</td>
<td>This line identifies the interface type slot/port and the status of the OSPF protocol on that interface.</td>
</tr>
<tr>
<td>Internet Address...</td>
<td>This line displays the IP address, network mask and area assigned to this interface.</td>
</tr>
<tr>
<td>Process ID...</td>
<td>This line displays the OSPF Process ID, Router ID, Network type and cost metric for this interface.</td>
</tr>
<tr>
<td>Transmit Delay...</td>
<td>This line displays the interface’s settings for Transmit Delay, State, and Priority. In the State setting, BDR is Backup Designated Router.</td>
</tr>
<tr>
<td>Designated Router...</td>
<td>This line displays the ID of the Designated Router and its interface address.</td>
</tr>
<tr>
<td>Backup Designated...</td>
<td>This line displays the ID of the Backup Designated Router and its interface address.</td>
</tr>
<tr>
<td>Timer intervals...</td>
<td>This line displays the interface’s timer settings for Hello interval, Dead interval, Transmit Delay (Wait), and Retransmit Interval.</td>
</tr>
<tr>
<td>Hello due...</td>
<td>This line displays the amount time until the next Hello packet is sent out this interface.</td>
</tr>
<tr>
<td>Neighbor Count...</td>
<td>This line displays the number of neighbors and adjacent neighbors. Listed below this line are the details about each adjacent neighbor.</td>
</tr>
</tbody>
</table>

### Example

DellEMC> show ip ospf int

TenGigabitEthernet 1/7 is up, line protocol is up
  Internet Address 192.168.1.2/30, Area 0.0.0.1
  Process ID 1, Router ID 192.168.253.2, Network Type BROADCAST, Cost: 1
  Transmit Delay is 1 sec, State DR, Priority 1
  Designated Router (ID) 192.168.253.2, Interface address 192.168.1.2
  Backup Designated Router (ID) 192.168.253.1, Interface address 192.168.1.1
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  Hello due in 00:00:02
  Neighbor Count is 1, Adjacent neighbor count is 1
  Adjacent with neighbor 192.168.253.1 (Backup Designated Router)

TenGigabitEthernet 1/8 is up, line protocol is up
  Internet Address 192.168.0.1/24, Area 0.0.0.1
  Process ID 1, Router ID 192.168.253.2, Network Type BROADCAST, Cost: 1
  Transmit Delay is 1 sec, State DROTHER, Priority 1
  Designated Router (ID) 192.168.253.5, Interface address 192.168.1.2
  Backup Designated Router (ID) 192.168.253.3, Interface address 192.168.0.2
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  Hello due in 00:00:08
  Neighbor Count is 3, Adjacent neighbor count is 2
show ip ospf neighbor

Display the OSPF neighbors connected to the local router.

Syntax

```
show ip ospf [process-id | vrf vrf-name] neighbor
```

Parameters

- **process-id**
  - Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

- **vrf vrf-name**
  - Enter the keyword vrf followed by the name of the VRF to show information corresponding to the OSPF neighbors that are tied to a specific VRF.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.4(0.0) Added support for VRF.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Added support for Multi-Process OSPF.
7.6.1.0 Introduced on the S-Series.
Usage Information
The following describes the show ip ospf process-id neighbor command shown in the following example.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighbor ID</td>
<td>Displays the neighbor router ID.</td>
</tr>
<tr>
<td>Pri</td>
<td>Displays the priority assigned neighbor.</td>
</tr>
<tr>
<td>State</td>
<td>Displays the OSPF state of the neighbor.</td>
</tr>
<tr>
<td>Dead Time</td>
<td>Displays the expected time until the Dell OS declares the neighbor dead.</td>
</tr>
<tr>
<td>Address</td>
<td>Displays the IP address of the neighbor.</td>
</tr>
<tr>
<td>Interface</td>
<td>Displays the interface type slot/port information.</td>
</tr>
<tr>
<td>Area</td>
<td>Displays the neighbor's area (process ID).</td>
</tr>
</tbody>

DellEMC#

show ip ospf routes

Display routes OSPF calculates and stores in OSPF RIB.

Syntax

```plaintext
show ip ospf [process-id | vrf vrf-name] routes
```

Parameters

- `process-id`
  - Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.
- `vrf vrf-name`
  - Enter the keyword vrf followed by the name of the VRF to show the OSPF RIB information corresponding to the OSPF processes that are tied to a specific VRF.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Command History

</tr>
</tbody>
</table>

**Usage Information**

This command is useful in isolating routing problems between the OSPF and the RTM. For example, if a route is missing from the RTM/FIB but is visible from the display output of this command, the problem is with downloading the route to the RTM.

This command has the following limitations:

- The display output is sorted by prefixes; intra-area ECMP routes are not displayed together.
- For Type 2 external routes, Type 1 cost is not displayed.

**NOTE:** Starting with Version 9.4(0.0), the loopback IP address advertised to the neighbor is not displayed in the output because they are not accounted as inactive OSPF routes, whereas the loopback IP address is displayed until Dell EMC Networking OS Version 9.3(0.0). Starting with Version 9.4(0.0), the show ip ospf routes command displays the interface and area ID information of connected networks in addition to the other settings, whereas these details are not displayed until Dell EMC Networking OS Version 9.3(0.0). Starting with Version 9.4(0.0), the metric of E2 routes in the output is displayed as an external metric, whereas until Dell EMC Networking OS Version 9.3(0.0), the number of hops to the ASBR for E2 routes are displayed in the output.

**Example**

```
DellEMC# show ip ospf 100 route

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Cost</th>
<th>Nexthop</th>
<th>Interface</th>
<th>Area</th>
<th>Type</th>
</tr>
</thead>

<td>Intra-Area</td>
</tr>
</tbody>
</table>

DellEMC#
```
show ip ospf statistics

Display OSPF statistics.

Syntax

show ip ospf [process-id | vrf vrf-name] statistics global | [interface name (neighbor router-id)]

Parameters

process-id
Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

vrf vrf-name
Enter the keyword vrf followed by the name of the VRF to display statistics corresponding to the OSPF process that is tied to a specific VRF.

global
Enter the keyword global to display the packet counts received on all running OSPF interfaces and packet counts OSPF neighbors receive and transmit.

interface name
(Optional) Enter the keyword interface then one of the following interface keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

neighbor router-id
(Optional) Enter the keyword neighbor then the neighbor’s router-id in dotted decimal format (A.B.C.D.).

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Command History

<tr>
<td>LSR-Q</td>
<td>The queue, for transmission or reception, for the link state request packets.</td>
</tr>
<tr>
<td>Other-Q</td>
<td>The queue, for transmission or reception, for the link state acknowledgement, database description, and update packets.</td>
</tr>
</tbody>
</table>

The following describes the error definitions for the show ip ospf statistics process-id global command.

<table>
<thead>
<tr>
<th>Error Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intf_Down</td>
<td>Received packets on an interface that is either down or OSPF is not enabled.</td>
</tr>
<tr>
<td>Non-Dr</td>
<td>Received packets with a destination address of ALL_DRS even though SELF is not a designated router.</td>
</tr>
<tr>
<td>Self-Orig</td>
<td>Receive the self originated packet.</td>
</tr>
</tbody>
</table>
### Error Type

<table>
<thead>
<tr>
<th>Error Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wrong_Len</td>
<td>The received packet length is different to what was indicated in the OSPF header.</td>
</tr>
<tr>
<td>Invld-Nbr</td>
<td>LSA, LSR, LSU, and DDB are received from a peer which is not a neighbor peer.</td>
</tr>
<tr>
<td>Nbr-State</td>
<td>LSA, LSR, and LSU are received from a neighbor with stats less than the loading state.</td>
</tr>
<tr>
<td>Auth-Error</td>
<td>Simple authentication error.</td>
</tr>
<tr>
<td>MD5-Error</td>
<td>MD5 error</td>
</tr>
<tr>
<td>Cksum-Err</td>
<td>Checksum Error</td>
</tr>
<tr>
<td>Version</td>
<td>Version mismatch</td>
</tr>
<tr>
<td>AreaMismatch</td>
<td>Area mismatch</td>
</tr>
<tr>
<td>Conf-Issue</td>
<td>The received hello packet has a different hello or dead interval than the configuration.</td>
</tr>
<tr>
<td>No-Buffer</td>
<td>Buffer allocation failure.</td>
</tr>
<tr>
<td>Seq-no</td>
<td>A sequence no errors occurred during the database exchange process.</td>
</tr>
<tr>
<td>Socket</td>
<td>Socket Read/Write operation error.</td>
</tr>
<tr>
<td>Q-overflow</td>
<td>Packets dropped due to queue overflow.</td>
</tr>
<tr>
<td>Unknown-Pkt</td>
<td>Received packet is not an OSPF packet.</td>
</tr>
</tbody>
</table>

### Example

```
DellEMC# show ip ospf 1 statistics global

OSPF Packet Count
  RX 10    0     8     2      0     0     0
  TX 10    0     10    0      0     0     0

OSPF Global Queue Length
  Hello-Q  0       0       0       2
  LSR-Q    0       0       0       0
  Other-Q  0       0       0       0

Error packets (Only for RX)
  Intf-Down 0   Non-Dr     0   Self-Org 0
  Wrong-Len 0   Invld-Nbr 0   Nbr-State 0
  Auth-Err 0   MD5-Err    0   Chksum 0
  Version 0   AreaMis    0   Conf-Issues 0
  No-Buffer 0   Seq-No    0   Socket 0
  Q-Overflow 0   Unknown-Pkt 0

Error packets (Only for TX)
  Socket Errors 0

DellEMC#
```

### Usage Information

The `show ip ospf process-id statistics` command displays the error packet count received on each interface as:

- The hello-timer remaining value for each interface
- The wait-timer remaining value for each interface
- The grace-timer remaining value for each interface
- The packet count received and transmitted for each neighbor
- Dead timer remaining value for each neighbor
- Transmit timer remaining value for each neighbor
• The LSU Q length and its highest mark for each neighbor
• The LSR Q length and its highest mark for each neighbor

Example (Statistics)

```
DellEMC(conf-if-te-1/6)# do show ip ospf statistics
Interface TenGigabitEthernet 1/6
  Error packets (Receive statistics)
    Intf-Down 0 Non-Dr 0 Self-Org 0
    Wrong-Len 0 Invld-Nbr 0 Nbr-State 0
    Auth-Error 0 MDS-Error 0 Cksum-Err 0
    Version 0 AreaMisMatch 0 Conf-Issue 0
    SeqNo-Err 0 Unknown-Pkt 0 Bad-LsReq 0
    RtidZero 0
  Neighbor ID 4.4.4.4
  Packet Statistics
    Hello DDiscr LSReq LSUpd LSAck
    RX 5 2 1 3 2
    TX 6 5 1 3 3
  Timers
    Hello 0 Wait 0 Grace 0
    Dead 39 Transmit 4
  Queue Statistics
    LSU-Q-Len 0 LSU-Q-Wmark 1
    LSR-Q-Len 0 LSR-Q-Wmark 1
```

DellEMC(conf-if-te-1/6)#

Related Commands

• `clear ip ospf statistics` — clear the packet statistics in all interfaces and neighbors.

**show ip ospf timers rate-limit**

Show the LSA currently in the queue waiting for timers to expire.

**Syntax**

```
show ip ospf [process-id] timers rate-limit
```

**Parameters**

- `process-id` Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

**Defaults**

None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

<table>

</tbody>
</table>
show ip ospf topology

Display routers in directly connected areas.

Syntax

```
show ip ospf [process-id] topology
```

Parameters

- `process-id` Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S6100-ON.

Example

```
DellEMC# show ip ospf 10 timers rate-limit
List of LSAs in rate limit Queue
LSA id: 1.1.1.0 Type: 3 Adv Rtid: 3.3.3.3 Expiry time: 00:00:09.111
LSA id: 3.3.3.3 Type: 1 Adv Rtid: 3.3.3.3 Expiry time: 00:00:23.96

<td>7.6.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series and E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**
To isolate problems with inter-area and external routes, use this command. In OSPF inter-area and external routes are calculated by adding LSA cost to the cost of reaching the router. If an inter-area or external route is not of correct cost, the display can determine if the path to the originating router is correct or not.

**Example**
```
DellEMC# show ip ospf 1 topology

Router ID  Flags  Cost  Nexthop   Interface  Area
3.3.3.3    E/B/-/  1    20.0.0.3  Te 13/1   0
1.1.1.1    E/-/-/  1    10.0.0.1  Te 7/1    1
DellEMC#
```

**summary-address**
To advertise one external route, set the OSPF ASBR.

**Syntax**
```
summary-address ip-address mask [not-advertise] [tag tag-value]
```
To disable summary address, use the `no summary-address ip-address mask` command.

**Parameters**
- `ip-address`  Specify the IP address in dotted decimal format of the address to summarize.
- `mask`         Specify the mask in dotted decimal format of the address to summarize.
- `not-advertise` (OPTIONAL) Enter the keywords `not-advertise` to suppress that match the network prefix/mask pair.
- `tag tag-value` (OPTIONAL) Enter the keyword `tag` then a value to match on routes redistributed through a route map. The range is from 0 to 4294967295.
The `area range` command summarizes routes for the different areas. With the `not-advertise` parameter configured, you can use this command to filter out some external routes. For example, if you want to redistribute static routes to OSPF, but you don't want OSPF to advertise routes with prefix 1.1.0.0, you can configure the summary-address 1.1.0.0 255.255.0.0 not-advertise to filter out all the routes fall in range 1.1.0.0/16.

Related Commands

- `area range` — summarize routes within an area.

**timers spf**

Set the time interval between when the switch receives a topology change and starts a shortest path first (SPF) calculation.

**S4048-ON**

**Syntax**

```
timers spf delay holdtime msec
```
To return to the default, use the `no timers spf` command.

**Parameters**

- `delay` Enter a number as the delay. The range is from 0 to 2147483647. The default is 5 seconds.
- `holdtime` Enter a number as the hold time. The range is from 0 to 2147483647. The default is 10 seconds.
- `msec` Enter the keyword `msec` to specify the time interval value in milli seconds.

**NOTE:** If you do not specify the `msec` option, the timer values are considered as seconds.

**Defaults**

- `delay = 5 seconds`
- `holdtime = 10 seconds`

**Command Modes**

- `ROUTER OSPFv2`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
---|---
9.11.0.0 | Introduced the keyword `msec`.
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Added support for Multi-Process OSPF.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
pre-6.1.1.1 | Introduced on the E-Series.

**Usage Information**

Setting the `delay` and `holdtime` parameters to a low number enables the switch to an alternate path quickly but requires more CPU usage.
timers throttle lsa all

Configure LSA transmit intervals.

Syntax

`timers throttle lsa all {start-interval | hold-interval | max-interval}`

To return to the default, use the `no timers throttle lsa` command.

Parameters

- **start-interval**: Set the minimum interval between initial sending and resending the same LSA. The range is from 0 to 600,000 milliseconds.
- **hold-interval**: Set the next interval to send the same LSA. This interval is the time between sending the same LSA after the start-interval has been attempted. The range is from 1 to 600,000 milliseconds.
- **max-interval**: Set the maximum amount of time the system waits before sending the LSA. The range is from 1 to 600,000 milliseconds.

Defaults

- start-interval: **0 msec**
- hold-interval: **5000 msec**
- max-interval: **5000 msec**

Command Modes

- **ROUTER OSPF**

Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Version** | **Description**
---|---
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
9.0.2.0 | Introduced on the S6000.
8.3.11.1 | Introduced on the Z9000.
8.3.8.0 | Introduced on the S4810.

**Usage Information**
LSAs are sent after the start-interval and then after hold-interval until the maximum interval is reached. In throttling, exponential backoff is used when sending same LSA, so that the interval is multiplied until the maximum time is reached. For example, if the start-interval 5000 and hold-interval 1000 and max-interval 100,000, the LSA is sent at 5000 msec, then 1000 msec, then 2000 msec, them 4000 until 100,000 msec is reached.

**timers throttle lsa arrival**

Configure the LSA acceptance intervals.

**Syntax**
```text
timers throttle lsa arrival arrival-time
```

To return to the default, use the `no timers throttle lsa` command.

**Parameters**

- `arrival-time`
  Set the interval between receiving the same LSA repeatedly, to allow sufficient time for the system to accept the LSA. The range is from 0 to 600,000 milliseconds.

** Defaults**

- **1000 msec**

**Command Modes**

- ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
---|---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.

9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
OSPFv3 Commands

Open shortest path first version 3 (OSPFv3) for IPv6 is supported on the S4048-ON platform. The fundamental mechanisms of OSPF (flooding, DR election, area support, SPF calculations, and so on) remain unchanged. However, OSPFv3 runs on a per-link basis instead of on a per-IP-subnet basis. Most changes were necessary to handle the increased address size of IPv6.

The Dell EMC Networking OS implementation of OSPFv3 is based on IETF RFC 2740.

area authentication

Configure an IPsec authentication policy for OSPFv3 packets in an OFSPFv3 area.

Syntax

area area-id authentication ipsec spi number {MD5 | SHA1} [key-encryption-type] key

Parameters

area area-id

Area for which OSPFv3 traffic is to be authenticated. For area-id, you can enter a number. The range is from 0 to 4294967295.

ipsec spi number

Security Policy index (SPI) value that identifies an IPsec security policy. The range is from 256 to 4294967295.

MD5 | SHA1

Authentication type: Message Digest 5 (MD5) or Secure Hash Algorithm 1 (SHA-1).

key-encryption-type

(Optional) Specifies if the key is encrypted.

The values are 0 (key is not encrypted) or 7 (key is encrypted).

key

Text string used in authentication.

For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).

For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted).
### Defaults
Not configured.

### Command Modes
ROUTER OSPFv3

### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Usage Information
Before you enable IPsec authentication on an OSPFv3 area, you must first enable OSPFv3 globally on the router. Configure the same authentication policy (same SPI and key) on each interface in an OSPFv3 link.

An SPI number must be unique to one IPsec security policy (authentication or encryption) on the router.

If you have enabled IPsec encryption in an OSPFv3 area with the area encryption command, you cannot use the area authentication command in the area at the same time.

The configuration of IPsec authentication on an interface-level takes precedence over an area-level configuration. If you remove an interface configuration, an area authentication policy that has been configured is applied to the interface.

To remove an IPsec authentication policy from an OSPFV3 area, enter the no area area-id authentication spi number command.

### Related Commands
- `ipv6 ospf authentication` — configure an IPsec authentication policy on an OSPFV3 interface.
- `show crypto ipsec policy` — display the configuration of IPsec authentication policies.

### area encryption

Configure an IPsec encryption policy for OSPFV3 packets in an OSPFV3 area.

**Syntax**

```
area area-id encryption ipsec spi number esp encryption-algorithm [key-encryption-type] key authentication-algorithm [key-encryption-type] key
```

**Example**

```xml
area 1 encryption ipsec spi 12345 esp des-md5 hash md5 key 1234567890
```
Parameters

area area-id
Area for which OSPFv3 traffic is to be encrypted. For area-id, enter a number.
The range is from 0 to 4294967295.

ipsec spi number
Security Policy index (SPI) value that identifies an IPsec security policy.
The range is from 256 to 4294967295.

esp encryption-algorithm
Encryption algorithm used with ESP.
Valid values are: 3DES, DES, AES-CBC, and NULL.
For AES-CBC, only the AES-128 and AES-192 ciphers are supported.

key-encryption-algorithm
(Optional) Specifies if the key is encrypted.
Valid values: 0 (key is not encrypted) or 7 (key is encrypted).

key
Text string used in encryption.
The required lengths of a non-encrypted or encrypted key are:
3DES - 48 or 96 hex digits; DES - 16 or 32 hex digits; AES-CBC - 32 or 64 hex digits for AES-128 and 48 or 96 hex digits for AES-192.

authentication-algorithm
Specifies the authentication algorithm to use for encryption.
Valid values are MD5 or SHA1.

key-encryption-type
(Optional) Specifies if the authentication key is encrypted.
Valid values: 0 (key is not encrypted) or 7 (key is encrypted).

key
Text string used in authentication.
For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).
For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted).

null
Causes an encryption policy configured for the area to not be inherited on the interface.

Defaults
Not configured.

Command Modes
ROUTER OSPFv3

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### Version Description

- **9.10(0.1)** Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)** Introduced on the S3148.
- **9.10(0.0)** Introduced on the S6100-ON.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100-ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.1.(0.0)** Introduced on the S4810 and Z9000.
- **8.4.2.0** Introduced on the E-Series.
- **8.3.19.0** Introduced on the S4820T.

### Usage Information

Before you enable IPsec encryption on an OSPFv3 interface, first enable OSPFv3 globally on the router. Configure the same encryption policy (same SPI and keys) on each interface in an OSPFv3 link.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router.

When you configure encryption for an OSPFv3 area with the `area encryption` command, you enable both IPsec encryption and authentication. However, when you enable authentication on an area with the `area authentication` command, you do not enable encryption at the same time.

If you have enabled IPsec authentication in an OSPFv3 area with the `area authentication` command, you cannot use the `area encryption` command in the area at the same time.

The configuration of IPsec encryption on an interface-level takes precedence over an area-level configuration. If you remove an interface configuration, an area encryption policy that has been configured is applied to the interface.

To remove an IPsec encryption policy from an interface, enter the no area area-id encryption spi number command.

### Related Commands

- `ipv6 ospf encryption` — configure an IPsec encryption policy on an OSPFv3 interface.
- `show crypto ipsec policy` — display the configuration of IPsec encryption policies.

### area nssa

Specify an area as a not so stubby area (NSSA).

#### Syntax

```
area area-id nssa [default-information-originate] [no-redistribution] [no-summary]
```

To delete an NSSA, use the no area area-id nssa command.

#### Parameters

- `area-id` Specify the OSPF area by entering a number from zero (0) to 65535.
no-redistribution (OPTIONAL) Specify that the redistribute command does not distribute routes into the NSSA. This command can be used when the router is an autonomous system boundary router (ASBR) or area border router (ABR).

default-information-originate (OPTIONAL) Allows external routing information to be imported into the NSSA by using Type 7 default.

no-summary (OPTIONAL) Specify that no summary LSAs should be sent into the NSSA.

Defaults
Not configured.

Command Modes
ROUTER OSPF

</table>

**auto-cost**

Specify how the OSPF interface cost is calculated based on the reference bandwidth method.

**S4048-ON**

**Syntax**

```
auto-cost [reference-bandwidth ref-bw]
```
To return to the default bandwidth or to assign cost based on the interface type, use the `no auto-cost [reference-bandwidth ref-bw]` command.

**Parameters**

- **ref-bw**  
  (OPTIONAL) Specify a reference bandwidth in megabits per second. The range is from 1 to 4294967. The default is **100 megabits per second**.

**Defaults**

**100 megabits per second**

**Command Modes**

- ROUTER OSPFv3

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

ipv6 router ospf 10
  log-adjacency-changes
  auto-cost reference-bandwidth 2000
DellEMC(conf-ipv6-router ospf)# auto-cost reference-bandwidth ?
<1-4294967> Reference bandwidth in Mbits/second (default = 100)
DellEMC(conf-ipv6-router ospf)# no auto-cost ?
reference-bandwidth Use reference bandwidth method to assign OSPF cost <cr>
DellEMC(conf-ipv6-router_ospf)#
```

### clear ipv6 ospf process

**Description**

Reset an OSPFv3 router process without removing or re-configuring the process.

**Syntax**

```
clear ipv6 ospf [vrf vrf-name] process
```

**Parameters**

- **vrf vrf-name**  
  (Optional) Enter the keyword vrf followed by the name of the VRF to clear IPv6 routes corresponding to that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### Description

- **Version Description**
  - **9.10(0.1)** Introduced on the S6010-ON and S4048T-ON.
  - **9.10(0.0)** Introduced on the S3148.
  - **9.10(0.0)** Introduced on the S6100-ON.
  - **9.8(2.0)** Introduced on the S3100 series.
  - **9.8(1.0)** Introduced on the Z9100-ON.
  - **9.8(0.0P5)** Introduced on the S4048-ON.
  - **9.8(0.0P2)** Introduced on the S3048-ON.
  - **9.7(0.0)** Added support for VRF.
  - **9.2(1.0)** Introduced on the Z9500.
  - **9.1.(0.0)** Introduced on the S4810 and Z9000.
  - **8.3.19.0** Introduced on the S4820T.
  - **7.8.1.0** Added support for C-Series.
  - **7.4.1.0** Introduced on the E-Series.

---

### `debug ipv6 ospf bfd`

Display debug information and interface types for bidirectional forwarding detection (BFD) on OSPF IPv6 packets.

**Syntax**

```
[no] debug ipv6 ospf bfd [interface] [vrf vrf-name]
```

**Parameters**

- **interface**
  - (OPTIONAL) Enter one of the following keywords and slot/port or number information:
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- **vrf vrf-name**
  - Enter the keyword `vrf` to view debugging information on OSPF corresponding to that VRF.

**Command Modes**

- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- **9.11(2.1P1)** Introduced VRF support.
- **9.10(0.1)** Introduced on the S6010-ON and S4048T-ON.
**Version** | **Description**
--- | ---
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.2(1.0) | Introduced on the Z9500.
9.2.(0.0) | Introduced on the S4820T, S4810, and Z9000.

**Usage Information**
The following section describes the command fields.

**Lines Beginning With or Including**

**OSPFv3...** Debugging is on for all OSPFv3 packets and all interfaces.

**05:21:01** Displays the time stamp.

**Sending Ver:3** Sending OSPFV3 version.

**Example**

```
DellEMC(conf-if-te-1/2)# do debug ipv6 ospf bfd te 1/2

**debug ipv6 ospf events**

Display debug information and interface types on OSPF IPv6 events.

**Syntax**

display debug ipv6 ospf events [interface] [vrf vrf-name]

**Parameters**

- **interface**
  - (OPTIONAL) Enter one of the following keywords and slot/port or number information:
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/[subport] information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- **vrf vrf-name**
  - Enter the keyword `vrf` to view debugging information on OSPF corresponding to that VRF.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**debug ipv6 ospf packet**

Display debug information and interface types on OSPF IPv6 packets.

**Syntax**

```
debug ipv6 ospf packet [interface] [vrf vrf-name] [detail]
```

**Parameters**

- **interface**
  - (OPTIONAL) Enter one of the following keywords and slot/port or number information:
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
    - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
    - For a port channel interface, enter the keywords port-channel then a number.
For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

```
vrf vrf-name
```
Enter the keyword `vrf` to view debugging information on OSPF corresponding to that VRF.

```
detail
```
Enter the keyword `detail` to view detailed debugging information.

Open Shortest Path First (OSPFv2 and OSPFv3)  1349
debug ipv6 ospf spf

Display debug information for SPF timers on OSPF IPv6 packets.

Syntax

[no] debug ipv6 ospf spf [vrf vrf-name]

Parameters

interface

(Optional) Enter one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

vrf vrf-name

Enter the keyword vrf to view debugging information on OSPF corresponding to that VRF.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.11.0.0 Introduced the command.

Usage Information

The following section describes the command fields.
**default-information originate**

Configure the Dell EMC Networking OS to generate a default external route into an OSPFv3 routing domain.

**Syntax**

```
default-information originate [always] [metric metric-value] [metric-type type-value] [route-map map-name]
```

To return to the default values, use the `no default-information originate` command.

**Parameters**

- **always** (OPTIONAL) Enter the keyword `always` to specify that default route information must always be advertised.
- **metric metric-value** (OPTIONAL) Enter the keyword `metric` then a number to configure a metric value for the route. The range is from 1 to 16777214.
- **metric-type type-value** (OPTIONAL) Enter the keywords `metric-type` then an OSPFv3 link state type of 1 or 2 for default routes. The values are:
  - `1` = Type 1 external route

---

**Example**

```
DellEMC(conf-if-te-1/2)# do debug ipv6 ospf bfd te 1/2
OSPFv3 bfd related debugging is on for TenGigabitEthernet 1/2
00:59:26 : OSPFv3INFO: Received Interface mode bfd config command on interface Te 1/2 Enable 1, interval 0, min_rx 0, Multiplier 0, role 0, Disable 0
00:59:26 : OSPFv3INFO: Enabling BFD on interface Te 1/2 Cmd Add Session
00:59:27 : OSPFv3INFO: Sending OSPF3 version..
```

---

**Lines Beginning With or Including**

- **OSPFv3...**  Debugging is on for all OSPFv3 packets and all interfaces.
- **05:21:01**  Displays the time stamp.
- **Sending Ver:3**  Sending OSPF3 version..
route-map map-name

(OPTIONAL) Enter the keywords route-map then the name of an established route.

Defaults
Disabled.

Command Modes
ROUTER OSPFv3

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version    Description
---------    -----------
9.10(0.1)    Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)    Introduced on the S3148.
9.10(0.0)    Introduced on the S6100-ON.
9.8(2.0)     Introduced on the S3100 series.
9.8(1.0)     Introduced on the Z9100-ON.
9.8(0.0P5)   Introduced on the S4048-ON.
9.8(0.0P2)   Introduced on the S3048-ON.
9.2(1.0)     Introduced on the Z9500.
9.1.(0.0)    Introduced on the S4810 and Z9000.
8.3.19.0     Introduced on the S4820T.
7.8.1.0      Added support for C-Series.
7.4.1.0      Introduced on the E-Series.

Related Commands
• redistribute — redistribute routes from other routing protocols into OSPFv3.

graceful-restart grace-period

Enable OSPFv3 graceful restart globally by setting the grace period (in seconds) that an OSPFv3 router’s neighbors continues to advertise the router as adjacent during a graceful restart.

Syntax
graceful-restart grace-period seconds
To disable OSPFv3 graceful restart, enter no graceful-restart grace-period.

Parameters
seconds    Time duration, in seconds, that specifies the duration of the restart process before OSPFv3 terminates the process. The range is from 40 to 1800 seconds.

Defaults
OSPFv3 graceful restart is disabled and functions in a helper-only role.

Command Modes
ROUTER OSPFv3
Command History

</tr>
</tbody>
</table>

Usage Information

By default, OSPFv3 graceful restart is disabled and functions only in a helper role to help restarting neighbor routers in their graceful restarts when it receives a Grace LSA.

To enable OSPFv3 graceful restart, enter the ipv6 router ospf command to enter OSPFv3 configuration mode and then configure a grace period using the graceful-restart grace-period command. The grace period is the length of time that OSPFv3 neighbors continue to advertise the restarting router as though it is fully adjacent. When graceful restart is enabled (restarting role), an OSPFv3 restarting expects its OSPFv3 neighbors to help when it restarts by not advertising the broken link.

When you enable the helper-reject role on an interface with the ipv6 ospf graceful-restart helper-reject command, you reconfigure OSPFv3 graceful restart to function in a “restarting-only” role. In a “restarting-only” role, OSPFv3 does not participate in the graceful restart of a neighbor.

**graceful-restart mode**

Specify the type of events that trigger an OSPFv3 graceful restart.

**Syntax**

graceful-restart mode {planned-only | unplanned-only}

To disable graceful restart mode, enter no graceful-restart mode.

**Parameters**

- **planned-only** (OPTIONAL) Enter the keywords planned-only to indicate graceful restart is supported in a planned restart condition only.

- **unplanned-only** (OPTIONAL) Enter the keywords unplanned-only to indicate graceful restart is supported in an unplanned restart condition only.
OSPFv3 graceful restart supports both planned and unplanned failures.

**Command Modes**
ROUTER OSPFv3

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the S4820T.</td>
</tr>
</tbody>
</table>

**Usage Information**
OSPFv3 graceful restart supports planned-only and/or unplanned-only restarts. The default is support for both planned and unplanned restarts.

- A planned restart occurs when you enter the `redundancy force-failover rpm` command to force the primary RPM to switch to the backup RPM. During a planned restart, OSPF sends out a Type-11 Grace LSA before the system switches over to the backup RPM.
- An unplanned restart occurs when an unplanned event causes the active RPM to switch to the backup RPM, such as when an active process crashes, the active RPM is removed, or a power failure happens. During an unplanned restart, OSPF sends out a Grace LSA when the backup RPM comes online.

By default, both planned and unplanned restarts trigger an OSPFv3 graceful restart. Selecting one or the other mode restricts OSPFv3 to the single selected mode.

**ipv6 ospf area**
Enable IPv6 OSPF on an interface.

**Syntax**
```
ipv6 ospf process-id area area-id
```

To disable OSPFv6 routing for an interface, use the `no ipv6 ospf process-id area area-id` command.

**Parameters**
- `process-id` enter the process identification number.
- `area area-id` specify the OSPF area. The range is from 0 to 65535.
ipv6 ospf authentication

Configure an IPsec authentication policy for OSPFv3 packets on an IPv6 interface.

Syntax
ipv6 ospf authentication {null | ipsec spi number (MD5 | SHA1) [key-encryption-type] key}

Parameters
null
Causes an authentication policy configured for the area to not be inherited on the interface.

ipsec spi number
Security Policy index (SPI) value that identifies an IPsec security policy. The range is from 256 to 4294967295.

MD5 | SHA1
Authentication type: Message Digest 5 (MD5) or Secure Hash Algorithm 1 (SHA-1).

key-encryption-type
(Optional) Specifies if the key is encrypted.
Valid values: 0 (key is not encrypted) or 7 (key is encrypted).

key
Text string used in authentication.
For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).
For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted).

Defaults
Not configured.

Command Modes
INTERFACE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
9.1.(0.0) Introduced on S4810 and Z9000.
8.4.2.0 Introduced on the E-Series.
8.3.19.0 Introduced on the S4820T.

Usage Information
Before you enable IPsec authentication on an OSPFv3 interface, first enable IPv6 unicast routing globally, configure an IPv6 address and enable OSPFv3 on the interface, and assign the interface to an area.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router. Configure the same authentication policy (same SPI and key) on each OSPFv3 interface in a link.

To remove an IPsec authentication policy from an interface, enter the no ipv6 ospf authentication spi number command. To remove null authentication on an interface to allow the interface to inherit the authentication policy configured for the OSPFv3 area, enter the no ipv6 ospf authentication null command.

Related Commands
• area authentication — configure an IPsec authentication policy for an OSPFV3 area.
• show crypto ipsec policy — display the configuration of IPsec authentication policies.
• show crypto ipsec sa ipv6 — display the security associations set up for OSPFV3 interfaces in authentication policies.

ipv6 ospf bfd all-neighbors
Establish BFD sessions with all OSPFV3 neighbors on a single interface or use non-default BFD session parameters.

Syntax
ipv6 ospf bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]
To disable all BFD sessions on an OSPFv3 interface implicitly, use the `no ipv6 ospf bfd all-neighbors disable` command in interface mode.

**Parameters**

- **disable**  
  (OPTIONAL) Enter the keyword `disable` to disable BFD on this interface.

- **interval milliseconds**  
  (OPTIONAL) Enter the keyword `interval` to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200.

- **min_rx milliseconds**  
  Enter the keywords `min_rx` to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is 200.

- **multiplier value**  
  Enter the keyword `multiplier` to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3.

- **role [active | passive]**  
  Enter the role that the local system assumes:
  - **Active** — active system initiates the BFD session. Both systems can be active for the same session.
  - **Passive** — passive system does not initiate a session. It only responds to a request for session initialization from the active system.

  The default is **Active**.

**Defaults**

See Parameters.

**Command Modes**

- INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**  
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2.0.0 Introduced on the Z9000, S4820T, and S4810.

**Usage Information**

This command provides the flexibility to fine-tune the timer values based on individual interface needs when you configure ipv6 ospf BFD in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the bfd all-neighbors command. Using the `no` form of this command does not disable BFD if you configure BFD in CONFIGURATION mode.

To disable BFD on a specific interface while you configure BFD in CONFIGURATION mode, use the keyword `disable`.
ipv6 ospf cost

Explicitly specify the cost of sending a packet on an interface.

Syntax
ipv6 ospf interface-cost

Parameters

interface-cost Enter a unsigned integer value expressed as the link-state metric. The range is from 1 to 65535.

Defaults
Default cost based on the bandwidth.

Command Modes
INTERFACE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information
In general, the path cost is calculated as:

\[ 10^8 / \text{bandwidth} \]

Using this formula, the default path cost is calculated as:

- GigabitEthernet — Default cost is 1
- TenGigabitEthernet — Default cost is 1
- FortygigEthernet — Default cost is 1
- Ethernet — Default cost is 10
**ipv6 ospf dead-interval**

Set the time interval since the last hello-packet was received from a router. After the time interval elapses, the neighboring routers declare the router down.

**Syntax**

```
ipv6 ospf dead-interval seconds
```

To return to the default time interval, use the `no ipv6 ospf dead-interval` command.

**Parameters**

- `seconds` Enter the time interval in seconds. The range is from 1 to 65535 seconds.

**Defaults**

40 seconds (Ethernet).

**Command Modes**

INTERFACE

**Command History**

</tbody>
</table>

**Usage Information**

By default, the dead interval is four times longer than the default hello-interval.

**Related Commands**

- `ipv6 ospf hello-interval` — specify the time interval between hello packets.
ipv6 ospf encryption

Configure an IPsec encryption policy for OSPFv3 packets on an IPv6 interface.

Syntax
ipv6 ospf encryption {null | ipsec spi number esp encryption-algorithm [key-encryption-type] key authentiction-algorithm [key-encryption-type] key}

Parameters

null
Causes an encryption policy configured for the area to not be inherited on the interface.

ipsec spi number
Security Policy index (SPI) value that identifies an IPsec security policy. The range is from 256 to 4294967295.

esp encryption-algorithm
Encryption algorithm used with ESP.
Valid values are: 3DES, DES, AES-CBC, and NULL.
For AES-CBC, only the AES-128 and AES-192 ciphers are supported.

key-encryption-type (OPTIONAL)
Specifies if the key is encrypted.
Valid values: 0 (key is not encrypted) or 7 (key is encrypted).

key
Text string used in authentication.
The required lengths of a non-encrypted or encrypted key are:
3DES - 48 or 96 hex digits; DES - 16 or 32 hex digits; AES-CBC -32 or 64 hex digits for AES-128 and 48 or 96 hex digits for AES-192.

authentication-algorithm
Specifies the authentication algorithm to use for encryption. Valid values are MD5 or SHA1.

key-encryption-type (OPTIONAL)
Specifies if the authentication key is encrypted.
Valid values: 0 (key is not encrypted) or 7 (key is encrypted).

key
Text string used in authentication.
For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).
For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted).

Defaults
Not configured.

Command Modes
INTERFACE

</tr>
</tbody>
</table>

Before you enable IPsec encryption on an OSPFv3 interface, first enable IPv6 unicast routing globally, configure an IPv6 address and enable OSPFV3 on the interface, and assign the interface to an area.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router. Configure the same encryption policy (same SPI and key) on each OSPFV3 interface in a link.

To remove an IPsec encryption policy from an interface, enter the no ipv6 ospf encryption spi number command. To remove null authentication on an interface to allow the interface to inherit the authentication policy configured for the OSPFV3 area, enter the no ipv6 ospf no ipv6 ospf encryption null command.

### Related Commands

- `area encryption` — configure an IPsec encryption policy for an OSPFV3 area.
- `show crypto ipsec policy` — display the configuration of IPsec encryption policies.
- `show crypto ipsec sa ipv6` — display the security associations set up for OSPFV3 interfaces in encryption policies.

**ipv6 ospf graceful-restart helper-reject**

Configure an OSPFV3 interface to not act upon the Grace LSAs that it receives from a restarting OSPFV3 neighbor.

**Syntax**

```
ipv6 ospf graceful-restart helper-reject
```

To disable the helper-reject role, enter `no ipv6 ospf graceful-restart helper-reject`.

**Defaults**

The helper-reject role is not configured.

**Command Modes**

- INTERFACE
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

### Usage Information

By default, OSPFv3 graceful restart is disabled and functions only in a helper role to help restarting neighbor routers in their graceful restarts when it receives a Grace LSA.

When configured in a helper-reject role, an OSPFv3 router ignores the Grace LSAs that it receives from a restarting OSPFv3 neighbor.

The graceful-restart role command is not supported in OSPFv3. When you enable the helper-reject role on an interface, you reconfigure an OSPFv3 router to function in a “restarting-only” role.

### ipv6 ospf hello-interval

Specify the time interval between the hello packets sent on the interface.

**Syntax**

```
ipv6 ospf hello-interval seconds
```

To return to the default time interval, enter `no ipv6 ospf hello-interval`.

**Parameters**

- `seconds`

Enter the time interval in seconds as the time between hello packets. The range is from 1 to 65525 seconds.

**Defaults**

10 seconds (Ethernet).

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
The time interval between hello packets must be the same for routers in a network.

Related Commands

- **ipv6 ospf dead-interval** — specify the time interval between hello packets was received from a router.

**ipv6 ospf priority**

To determine the Designated Router for the OSPFv3 network, set the priority of the interface.

**Syntax**

```
ipv6 ospf priority number
```

To return to the default time interval, use the no ipv6 ospf priority command.

**Parameters**

- **number**

  Enter the number as the priority. The range is from 1 to 255.

**Defaults**

1

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.1.(0.0)
- 7.8.1.0
- 7.4.1.0
- 8.3.19.0

**Description**

- Introduced on the S6010-ON and S4048T-ON.
- Introduced on the S3148.
- Introduced on the S6100-ON.
- Introduced on the S3100 series.
- Introduced on the Z9100-ON.
- Introduced on the S4048-ON.
- Introduced on the S3048-ON.
- Introduced on the Z9500.
- Introduced on the S4810 and Z9000.
- Added support for the C-Series.
- Introduced on the E-Series.
- Introduced on the S4820T.
**ipv6 router ospf**

Enable OSPF for IPv6 router configuration.

```
Syntax
ipv6 router ospf process-id [vrf vrf-name]
To exit OSPF for IPv6, use the no ipv6 router ospf process-id command.
```

**Parameters**

- `process-id` Enter the process identification number. The range is from 1 to 65535.

- `vrf vrf-name` (Optional) Enter the keyword vrf followed by the name of the VRF to install IPv6 routes in that VRF.

**Defaults**

None

**Command Modes**

CONFIGURATION

7.8.1.0 | Added support for the C-Series.
7.4.1.0 | Introduced on the E-Series.
7.8.1.0 | Added support for the C-Series.
maximum-paths

Enable the software to forward packets over multiple paths.

Syntax

maximum-paths number

To disable packet forwarding over multiple paths, use the no maximum-paths command.

Parameters

number

Specify the number of paths. The range is from 1 to 64. The default is 8 paths.

Defaults

8

Command Modes

ROUTER OSPF

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.

Open Shortest Path First (OSPFv2 and OSPFv3)
passive-interface

Disable (suppress) sending routing updates on an interface.

Syntax

passive-interface interface

To enable sending routing updates on an interface, use the no passive-interface interface command.

Parameters

interface

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Defaults

Enabled, that is sending of routing updates are enabled by default.

Command Modes

ROUTER OSPF for OSPFv2

ROUTER OSPFv3 for OSPFv3

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
9.1.(0.0) Introduced support for OSPFv3 on the S4810 and Z9000.
### Usage Information

By default, no interfaces are passive. Routing updates are sent to all interfaces on which the routing protocol is enabled.

If you disable the sending of routing updates on an interface, the particular address prefix continues to be advertised to other interfaces, and updates from other routers on that interface continue to be received and processed.

OSPFv3 for IPv6 routing information is not sent or received through the specified router interface. The specified interface address appears as a stub network in the OSPFv3 for IPv6 domain.

On configuring suppression using the passive-interface command, the state of the OSPF neighbor does not change to INIT; instead, the state of the OSPF neighbor changes to DOWN after the dead-timer expires.

---

### redistribute

Redistribute into OSPFv3.

**Syntax**

```
redistribute (bgp as number){connected | static}{metric metric-value | metric-type type-value} [route-map map-name] [tag tag-value]
```

To disable redistribution, use the `no redistribute {connected | static}` command.

**Parameters**

- `bgp as number`
Enter the keyword bgp then the autonomous system number.
  
  The range is from 1 to 65535.

- `connected`
  Enter the keyword connected to redistribute routes from physically connected interfaces.

- `static`
  Enter the keyword static to redistribute manually configured routes.

- `metric metric-value`
  Enter the keyword metric then the metric value.
  
  The range is from 0 to 16777214.
  
  The default is 20.

- `metric-type type-value`
  (OPTIONAL) Enter the keywords metric-type then the OSPFv3 link state type of 1 or 2 for default routes. The values are:
  
  - 1 for a type 1 external route
  - 2 for a type 2 external route
route-map map-name (OPTIONAL) Enter the keywords route-map then the name of an established route map. If the route map is not configured, the default is deny (to drop all routes).

tag tag-value (OPTIONAL) Enter the keyword tag to set the tag for routes redistributed into OSPFv3.

The range is from 0 to 4294967295

The default is 0.

Defaults Not configured.

Command Modes ROUTER OSPF for OSPFv2

ROUTER OSPFv3 for OSPFv3

Command History This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information To redistribute the default route (x:x:x:x), use the default-information originate command.

Related Commands
- default-information originate – configure default external route into OSPFv3.

router-id

Designate a fixed router ID.

Syntax router-id ip-address
To return to the previous router ID, use the no router-id ip-address command.

**Parameters**

- **ip-address**
  Enter the router ID in the dotted decimal format.

**Defaults**

The router ID is selected automatically from the set of IPv4 addresses configured on a router.

**Command Modes**

- ROUTER OSPF for OSPFv2
- ROUTER OSPFv3 for OSPFv3

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

You can configure an arbitrary value in the IP address for each router. However, each router ID must be unique.

If this command is used on an OSPFv3 process that is already active (has neighbors), all the neighbor adjacencies are brought down immediately and new sessions are initiated with the new router ID.

**Related Commands**

- clear ipv6 ospf process — reset an OSPFv3 router process.

---

**show crypto ipsec policy**

Display the configuration of IPsec authentication and encryption policies.

**Syntax**

```plaintext
show crypto ipsec policy [name name]
```

**Usage Information**

This command allows you to display the configuration of IPsec authentication and encryption policies.

- **name**
  Specifies the name of the IPsec policy. If no name is specified, the command displays all IPsec policies.
Parameters

name name

(OPTIONAL) Displays configuration details about a specified policy.

Defaults

No default behavior or values.

Command Modes

EXEC

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Usage Information

The `show crypto ipsec policy` command output displays the AH and ESP parameters configured in IPsec security policies, including the SPI number, keys, and algorithms used.

When configured in a helper-reject role, an OSPFv3 router ignores the Grace LSAs that it receives from a restarting OSPFv3 neighbor.

Related Commands

`show crypto ipsec sa ipv6`—displays the IPsec security associations used on OSPFv3 interfaces.

Example

```
DellEMC# show crypto ipsec policy
Crypto IPSec client security policy data

show crypto ipsec sa ipv6

Display the IPsec security associations (SAs) used on OSPFv3 interfaces.

Syntax

```
show crypto ipsec sa ipv6 [interface interface]
```

Parameters

- `interface interface` (OPTIONAL) Displays information about the SAs used on a specified OSPFv3 interface, where `interface` is one of the following values:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**Defaults**
No default behavior or values.

**Command Modes**
- EXEC
- EXEC Privilege

**Usage Information**
The `show crypto ipsec sa ipv6` command output displays security associations set up for OSPFv3 links in IPsec authentication and encryption policies on the router.

**Related Commands**
- `show crypto ipsec policy` — displays the configuration of IPsec authentication and encryption policies.

**Example**
```
DellEMC# show crypto ipsec policy
DellEMC# show crypto ipsec sa ipv6

Interface: TenGigabitEthernet 1/1
Link Local address: fe80::201:e8ff:fe40:4d10
IPSecv6 policy name: OSPFv3-1-500

inbound ah sas
spi : 500 (0x1f4)
transform : ah-md5-hmac
in use settings : {Transport, }
replay detection support : N
STATUS : ACTIVE

outbound ah sas
spi : 500 (0x1f4)
transform : ah-md5-hmac
```

Open Shortest Path First (OSPFv2 and OSPFv3) 1373
show ipv6 ospf database

Display information in the OSPFV3 database, including link-state advertisements (LSAs) in detail.

Syntax

show ipv6 ospf [process-number] [vrf vrf-name] database [database-summary | grace-lsa | external | inter-area-prefix | inter-area-router | intra-area-prefix | link | network | router | nssa-external]

Parameters

process-number Enter the OSPF process number.

vrf vrf-name (Optional) Enter the keyword vrf followed by the name of the VRF to display neighbors corresponding to that VRF.

NOTE: If you do not specify this option, neighbors corresponding to the default VRF are displayed.

database-summary (OPTIONAL) Enter the keyword database-summary to view a summary of database LSA information.

external (OPTIONAL): Enter the keyword external to display the external link states.

grace-lsa (OPTIONAL): Enter the keyword grace-lsa to display the Type-11 Grace LSAs sent and received on an OSPFV3 router.

inter-area-prefix (OPTIONAL): Enter the keyword inter-area-prefix to display the inter area prefix link states.

inter-area-router (OPTIONAL): Enter the keyword inter-area-router to display the inter area router link states.

intra-area-prefix (OPTIONAL): Enter the keyword intra-area-prefix to display the intra area prefix link states.

link (OPTIONAL): Enter the keyword link to display the link states.

network (OPTIONAL): Enter the keyword network to display the network link states.

nssa-external (OPTIONAL): Enter the keyword nssa-external to display the nssa link state information.

router (OPTIONAL): Enter the keyword router to display the router link states.

Version Description

9.13(0.0) Added support to display all the types of LSAs in detail.

9.10(0.1)Introduced on the S6010-ON and S4048T-ON.
## Version | Description
--- | ---
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Added support for VRF.
9.2(1.0) | Introduced on the Z9500.
9.1.(0.0) | Added support for OSPFv3 on the S4810 and Z9000.
8.4.2.2 | Added support for the display of graceful restart parameters and Type-11 Grace LSAs on E-Series routers.
8.3.19.0 | Introduced on the S4820T.
7.8.1.0 | Added support for C-Series.

### Usage Information
The `show ipv6 ospf database` command output displays detailed information on the OSPFv3 database, including link-state advertisements (LSAs).

**Example (grace-lsa)**
```text
dellEMC# show ipv6 ospf 3 database grace-lsa

Type-11 Grace LSA (Area 0)
LS Age : 10
Link State ID : 6.16.192.66
Advertising Router : 100.1.1.1
LS Seq Number : 0x80000001
Checksum : 0x1DF1
Length : 36
Associated Interface : Te 1/3
Restart Interval : 180
Restart Reason : Switch to Redundant Processor
```

**Example (database-summary)**
```text
dellEMC# show ipv6 ospf 3 database database-summary

show ipv6 ospf interface

View OSPFv3 interface information.

Syntax

```
show ipv6 ospf [process-number] [vrf vrf-name] [interface]
```

Parameters

- **process-number**: Enter the OSPF process number.
- **vrf vrf-name**: (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display neighbors corresponding to that VRF.
  
  **NOTE:** If you do not specify this option, neighbors corresponding to the default VRF are displayed.

- **interface**: (OPTIONAL) Enter one of the following keywords and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

### show ipv6 ospf neighbor

Display the OSPF neighbor information on a per-interface basis.

**Syntax**

```
show ipv6 ospf [process-number] [vrf vrf-name] neighbor [interface]
```

**Parameters**

- `process-number`  
  Enter the OSPF process number.
- `vrf vrf-name`  
  (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display OSPF neighbors corresponding to that VRF.

  **NOTE:** If you do not specify this option, neighbors corresponding to the default VRF are displayed.
- `interface`  
  (OPTIONAL) Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

<tr>
<td>7.8.1.0</td>
<td>Added support for the C-Series.</td>
</tr>
<tr>
<td>7.4.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Example

```
DellEMC# show ipv6 ospf 3 neighbor gi 1/2
Neighbor ID  Pri  State       Dead Time   Interface   ID Interface
            63.114.8.36 1   FULL/DR  00:00:38       4               Te 1/2
DellEMC#
```

```
timers spf
```

Set the time interval between when the switch receives a topology change and starts a shortest path first (SPF) calculation.

```
S4048-ON
```

Syntax

```
timers spf delay holdtime msec
```

To return to the default, use the no timers spf command.

Parameters

- **delay**: Enter a number as the delay. The range is from 0 to 2147483647. The default is 5 seconds. When configured in milli seconds, 100 is the least value that is allowed to be configured.

- **holdtime**: Enter a number as the hold time. The range is from 0 to 2147483647. The default is 10 seconds. When configured in milli seconds, 200 is the least value that is allowed to be configured.
Enter the keyword `msec` to specify the time interval value in milliseconds.

**NOTE:** If you do not specify the `msec` option, the timer values are considered as seconds.

**Defaults**
- delay = 5 seconds
- holdtime = 10 seconds

**Command Modes**
- ROUTER OSPFv3 for OSPFv3 and ROUTER OSPFv2 for OSPFv2

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11.0.0</td>
<td>Introduced the keyword <code>msec</code>.</td>
</tr>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S6010-ON and S4048T-ON.</td>
</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S6100-ON.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100-ON.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.8(0.0)</td>
<td>Introduced on the S6000-ON, S6000, S4820T, S4810, S5000.</td>
</tr>
</tbody>
</table>

**Usage Information**
Setting the `delay` and `holdtime` parameters to a low number enables the switch to an alternate path quickly but requires more CPU usage.

**Example**
```
DellEMC# conf
DellEMC(conf)# ipv6 router ospf 1
DellEMC(conf-ipv6-router_ospf)# timer spf 2 5 msec
DellEMC(conf-ipv6-router_ospf)# show config
ipv6 router ospf 1
  timers spf 2 5 msec
DellEMC(conf-ipv6-router_ospf)# end
DellEMC#  
```
Policy-based Routing (PBR)

Policy-based routing (PBR) allows you to apply routing policies to specific interfaces. To enable PBR, create a redirect list and apply it to the interface. After the redirect list is applied to the interface, all traffic passing through the interface is subject to the rules defined in the redirect list. PBR is supported by the Dell EMC Networking OS.

You can apply PBR to physical interfaces and logical interfaces (such as a link aggregation group [LAG] or virtual local area network [VLAN]). Trace lists and redirect lists do not function correctly when you configure both in the same configuration.

NOTE: Apply PBR to Layer 3 interfaces only.

NOTE: For more information, see Content Addressable Memory (CAM).

Topics:

- description
- ip redirect-group
- ip redirect-list
- permit
- redirect
- seq
- show cam pbr
- show ip redirect-list

description

Add a description to this redirect list.

Syntax

description {description}

To remove the description, use the no description {description} command.

Parameters

description {description} Enter a description to identify the IP redirect list (16 characters maximum).

Defaults

None

Command Modes

REDIRECT-LIST

8.4.2.0 | Introduced on the E-Series.
7.7.1.0 | Introduced on the E-Series.

Related Commands
- `ip redirect-list` — enable an IP Redirect List.

**ip redirect-group**

Apply a redirect list (policy-based routing) on an interface. You can apply multiple redirect lists to an interface by entering this command multiple times.

**Syntax**

```
ip redirect-group redirect-list-name test [l2-switch]
```

To remove a redirect list from an interface, use the `no ip redirect-group name` command.

**Parameters**

- `redirect-list-name` Enter the name of a configured redirect list.
- `l2-switch` Enter the keyword `l2-switch` to enable PBR on Layer2 (switched) traffic.

**Defaults**

None

**Command Modes**

INTERFACE (conf-if-vl-)

# ip redirect-list

Configure a redirect list and enter REDIRECT-LIST mode.

## Syntax

```
ip redirect-list redirect-list-name
```

To remove a redirect list, use the `no ip redirect-list` command.

## Parameters

- **redirect-list-name**: Enter the name of a redirect list.

## Defaults

None

## Command Modes

- CONFIGURATION

---

### Usage Information

You can apply any number of redirect-groups to an interface. A redirect list can contain any number of configured rules. These rules includes the next-hop IP address where the incoming traffic is to be redirected.

If the next hop address is reachable, traffic is forwarded to the specified next hop. Otherwise, the normal routing table is used to forward traffic. When a redirect-group is applied to an interface and the next-hop is reachable, the rules are added into the PBR CAM region. When incoming traffic hits an entry in the CAM, the traffic is redirected to the corresponding next-hop IP address specified in the rule.

**NOTE**: Apply the redirect list to physical, VLAN, or LAG interfaces only.

The Layer2 PBR option matches the layer2 traffic flow. If you un-configure this option, then the Layer2 traffic is not matched. You can apply the `l2-switch` option to redirect Layer2 traffic only on a VLAN interface. This VLAN interface must be configured with an IP address for ARP resolution.

**NOTE**: The `l2-switch` option that redirects Layer2 traffic is applicable only on VLAN interfaces.

The Layer3 routing is not affected on the same interface on which Layer2 PBR is applied. The port from which Layer2 packets egress and the destination MAC are re-written from static ARP. Layer 2 packets with the re-written destination MAC are forwarded through the outgoing port on the same incoming VLAN interface. The l2-switch option ensures that the outgoing VLAN and MAC-SA are changed and TTL is not decremented.

### Related Commands

- `show cam pbr` — display the content of the PBR CAM.
- `show ip redirect-list` — display the redirect-list configuration.

**permit**

Configure a permit rule. A permit rule excludes the matching packets from PBR classification and routes them using conventional routing.

**Syntax**

```
permit {ip-protocol-number | protocol-type} {source mask | any | host ip-address} {destination mask | any | host ip-address} [bit] [operators]
```

To remove the rule, use one of the following:

- If you know the filter sequence number, use the `no seq sequence-number` syntax command.
- You can also use the `no permit {ip-protocol-number | protocol-type} {source mask | any | host ip-address} {destination mask | any | host ip-address} [bit] [operators]` command.

**Parameters**

- **ip-protocol-number**  Enter a number from 0 to 255 for the protocol identified in the IP protocol header.
- **protocol-type**  Enter one of the following keywords as the protocol type:
  - icmp for internet control message protocol
  - ip for any internet protocol
  - tcp for transmission control protocol
  - udp for user datagram protocol
- **source**  Enter the IP address of the network or host from which the packets were sent.
- **destination**  Enter the IP address of the network or host to which the packets are sent.
- **bit**  (OPTIONAL)  Enter a bit string for the bit field of the IP header. You can enter up to six bits, with ‘1’ indicating the bit is set and ‘0’ indicating the bit is clear.
- **operators**  (OPTIONAL)  Enter one or a combination of the following operators:  
  - ge for greater than or equal to 
  - le for less than or equal to 
  - eu for equal to 
  - ne for not equal to
mask

Enter a network mask in /prefix format (/x).

any

Enter the keyword any to specify that all traffic is subject to the filter.

host ip-address

Enter the keyword host then he IP address to specify a host IP address.

destination

Enter the IP address of the network or host to which the packets are sent.

bit

(Optional) For the TCP protocol type only, enter one or a combination of the following TCP flags:

- ack = acknowledgement
- fin = finish (no more data from the user)
- psh = push function
- rst = reset the connection
- syn = synchronize sequence number
- urg = urgent field

operator

(Optional) For TCP and UDP parameters only. Enter one of the following logical operand:

- eq = equal to
- neq = not equal to
- gt = greater than
- lt = less than
- range = inclusive range of ports (you must specify two ports for the port command parameter.)

</table>
Version Description
7.5.1.0 Introduced on the E-Series.

redirect

Configure a rule for the redirect list.

Syntax

```plaintext
redirect {ip-address | slot/port | tunnel tunnel-id}[track <obj-id>] {ip-protocol-number | protocol-type [bit]} {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator]
```

To remove this filter, use one of the following:

- Use the no seq sequence-number command if you know the filter’s sequence number.
- You can also use the no redirect {ip-address | slot/port | tunnel tunnel-id}[track <obj-id>] {ip-protocol-number [bit] | protocol-type} {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator] command.

Parameters

- **redirect** Enter the keyword redirect to assign the sequence to the redirect list.
- **ip-address** Enter the IP address of the forwarding router.
- **slot/port** Enter the keyword slot / port followed by the slot/port information.
- **tunnel** Enter the keyword tunnel to configure the tunnel setting.
- **tunnel-id** Enter the keyword tunnel-id to redirect the traffic.
- **track** Enter the keyword track to enable the tracking.
- **track <obj-id>** Enter the keyword track <obj-id> to track object-id.
- **ip-protocol-number** Enter a number from 0 to 255 for the protocol identified in the IP protocol header.
- **protocol-type** Enter one of the following keywords as the protocol type:
  - icmp for internet control message protocol
  - ip for any internet protocol
  - tcp for transmission control protocol
  - udp for user datagram protocol
- **bit** (OPTIONAL) For the TCP protocol type only, enter one or a combination of the following TCP flags:
  - ack = acknowledgement
  - fin = finish (no more data from the user)
  - psh = push function
  - rst = reset the connection
  - syn = synchronize sequence number
  - urg = urgent field
- **source** Enter the IP address of the network or host from which the packets were sent.
- **mask** Enter a network mask in /prefix format (/x).
Enter the keyword any to specify that all traffic is subject to the filter.

Enter the keyword host then the IP address to specify a host IP address.

Enter the IP address of the network or host to which the packets are sent.

(Optional) For TCP and UDP parameters only. Enter one of the following logical operand:

- eq = equal to
- neq = not equal to
- gt = greater than
- lt = less than
- range = inclusive range of ports (you must specify two ports for the port command parameter.)

Defaults

None

Command Modes

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.7(0.0) | Added support for the track-id on the S4810, S4820T, S6000, and Z9000.
9.5(0.1) | Introduced on the Z9500.
9.4(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000.
8.4.2.1 | Introduced on the C-Series and S-Series.
8.4.2.0 | Introduced on the E-Series.
7.7.1.0 | Introduced on the E-Series.
Configure a filter with an assigned sequence number for the redirect list.

**Syntax**

```
seq sequence-number {permit | redirect {ip-address | tunnel tunnel-id} [track <obj-id>] } {ip-protocol-number | protocol-type} {source mask | any | host ip-address} {destination mask | any | host ip-address} [bit] [operator] {source-port source-port | source-port-range start-port - end-port} {destination-port destination-port | destination-port-range start-port - end-port}
```

To delete a filter, use the `no seq sequence-number` command.

**Parameters**

- **sequence-number**: Enter a number from 1 to 65535.
- **permit**: Enter the keyword `permit` to assign the sequence to the permit list.
- **redirect**: Enter the keyword `redirect` to assign the sequence to the redirect list.
- **ip-address**: Enter the keyword `ip-address` of the forwarding router.
- **tunnel**: Enter the keyword `tunnel` to configure the tunnel setting.
- **tunnel-id**: Enter the keyword `tunnel-id` to redirect the traffic.
- **track**: Enter the keyword `track` to enable the tracking.
- **track <obj-id>**: Enter the keyword `track <obj-id>` to track object-id.
- **ip-protocol-number**: Enter the keyword `ip-protocol-number` then the number from 0 to 255 for the protocol identified in the IP protocol header.
- **protocol-type**: Enter one of the following keywords as the protocol type:
  - `icmp` for internet control message protocol
  - `ip` for any internet protocol
  - `tcp` for transmission control protocol
  - `udp` for user datagram protocol
- **source**: Enter the IP address of the network or host from which the packets were sent.
- **mask**: Enter a network mask in /prefix format (/x).
- **any**: Enter the keyword `any` to specify that all traffic is subject to the filter.
- **host ip-address**: Enter the keyword `host` then the IP address to specify a host IP address.
- **destination**: Enter the IP address of the network or host to which the packets are sent.
- **bit**: (OPTIONAL) For the TCP protocol type only, enter one or a combination of the following TCP flags:
  - `ack` = acknowledgement
  - `fin` = finish (no more data from the user)
  - `psh` = push function
- **rst** = reset the connection
- **syn** = synchronize sequence number
- **urg** = urgent field

**operator**

(Optional) For the TCP and UDP parameters only. Enter one of the following logical operands:
- **eq** = equal to
- **neq** = not equal to
- **gt** = greater than
- **lt** = less than
- **range** = inclusive range of ports (you must specify two ports for the port command parameter.)

**source-port**

Enter the keywords `source-port` then the port number to be matched in the ACL rule in the ICAP rule.

**destination-port**

Enter the keywords `destination-port` then the port number to be matched in the ACL rule in the ICAP rule.

**source-port-range**

Enter the keywords `source-port-range` then the range of the start port to end port to be matched in the ACL rule in the ICAP rule.

**destination-port-range**

Enter the keywords `destination-port-range` then the range of the start port to end port to be matched in the ACL rule in the ICAP rule.

show cam pbr

Display the PBR CAM content.

Syntax

show cam pbr {interface interface | stack–unit slot-number port-set number} [pipeline number] [summary]

Parameters

interface interface Enter the keyword interface then the name of the interface.
stack–unit slot-number Enter the keyword stack-unit then the slot number.
port-set number Enter the keywords port-set then the port-pipe number.
summary Enter the keyword summary to view only the total number of CAM entries.

Related Commands

- ip redirect-group – applies a redirect group to an interface.
- show ip redirect-list – displays the redirect-list configuration.
**show ip redirect-list**

View the redirect list configuration and the interfaces it is applied to.

**Syntax**

```
show ip redirect-list redirect-list-name
```

**Parameters**

- `redirect-list-name` Enter the name of a configured Redirect list.

**Command Modes**

- EXEC
- EXEC Privilege

```
IPv4 PIM-Sparse Mode Commands

The following describes the IPv4 PIM-sparse mode (PIM-SM) commands.

clear ip pim rp-mapping

The bootstrap router (BSR) feature uses this command to remove all or particular rendezvous point (RP) advertisement.

Syntax

clear ip pim [vrf vrf-name] rp-mapping [rp-address]

Parameters

vrf vrf-name  (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to configure this setting on that VRF.  

NOTE: Applies to specific VRF if input is provided, else applies to Default VRF.

rp-address  (OPTIONAL) Enter the RP address in dotted decimal format (A.B.C.D).

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version  Description

9.10(0.1)    Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)    Introduced on the S3148.
9.10(0.0)    Introduced on the S6100-ON.
9.8(2.0)     Introduced on the S3100 series.
9.8(1.0)     Introduced on the Z9100-ON.
9.8(0.0P5)   Introduced on the S4048-ON.
9.8(0.0P2)   Introduced on the S3048-ON.
9.7(0.0)     Added support for VRF. Introduced on the S6000-ON.
### clear ip pim tib

Clear PIM tree information from the PIM database.

**Syntax**
```
clear ip pim [vrf vrf-name] tib [group]
```

**Parameters**
- **vrf vrf-name**: (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **group**: (OPTIONAL) Enter the multicast group address in dotted decimal format (A.B.C.D).

**Command Modes**
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
**Version** | **Description**
---|---
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.1.1.0 | Introduced on the E-Series.
7.8.1.0 | Introduced on the S-Series.

**Usage Information**
If you use this command on a local VLT node, all multicast routes from the local PIM TIB, the entire multicast route table, and all the entries in the data plane are deleted. The local VLT node sends a request to the peer VLT node to download multicast routes learned by the peer. Both local and synced routes are removed from the local VLT node multicast route table. The peer VLT node clears synced routes from the node.

If you use this command on a peer VLT node, only the synced routes are deleted from the multicast route table.

---

**debug ip pim**

View IP PIM debugging messages.

**Syntax**

d debug ip pim [vrf vrf-name] [bsr | events | group | packet [in | out] | register | state | timer [assert | hello | joinprune | register]]

To disable PIM debugging, use the no debug ip pim [vrf vrf-name] command or use the undebug all to disable all debugging command.

**Parameters**

- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **bsr** (OPTIONAL) Enter the keyword bsr to view PIM Candidate RP/BSR activities.

- **events** (OPTIONAL) Enter the keyword group to view PIM messages for a specific group.

- **group** (OPTIONAL) Enter the keyword group to view PIM messages for a specific group.

- **packet [in | out]** (OPTIONAL) Enter the keyword packet to view PIM packets. Enter one of the optional parameters:

  - **in:** to view incoming packets
  - **out:** to view outgoing packets

- **register** (OPTIONAL) Enter the keyword register to view PIM register address in dotted decimal format (A.B.C.D).

- **state** (OPTIONAL) Enter the keyword state to view PIM state changes.
timer [assert | hello | joinprune | register]  (OPTIONAL) Enter the keyword timer to view PIM timers. Enter one of the optional parameters:
  • assert: to view the assertion timer
  • hello: to view the PIM neighbor keepalive timer
  • joinprune: to view the expiry timer (join/prune timer)
  • register: to view the register suppression timer

Defaults
Disabled.

</tbody>
</table>

Usage Information

This command is applied to the subsequent PIM-BSR. Existing BSR advertisements are cleaned up by time-out. To clean the candidate RP advertisements, use the clear ip pim rp-mapping command.

**ip pim bsr-candidate**

To join the Bootstrap election process, configure the PIM router.

**Syntax**

```plaintext
ip pim [vrf vrf-name] bsr-candidate interface [hash-mask-length] [priority]
```

To return to the default value, use the no ip pim bsr-candidate [vrf vrf-name] command.

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to configure the PIM router on a VRF.
- `interface` Enter the following keywords and slot/port or number information:
  - For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
  - For a Port Channel interface, enter the keywords port-channel then a number.
  - For a VLAN, enter the keyword vlan then a number from 1 to 4094.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

```
hash-mask-length (OPTIONAL) Enter the hash mask length. The range is from zero (0) to 32. The default is 30.
```

```
priority (OPTIONAL) Enter the priority used in Bootstrap election process. The range is from zero (0) to 255. The default is zero (0).
```

**Defaults**

Not configured.

**ip pim dr-priority**

Change the designated router (DR) priority for the interface.

**Syntax**

```
ip pim dr-priority priority-value
```

To remove the DR priority value assigned, use the `no ip pim dr-priority` command.

**Parameters**

```
priority-value Enter a number. Preference is given to larger/higher number. The range is from 0 to 4294967294. The default is 1.
```

**Defaults**

1
Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.1.1.0 Introduced on the E-Series.
7.8.1.0 Introduced on the C-Series on port-channels and the S-Series.

Usage Information

The router with the largest value assigned to an interface becomes the designated router. If two interfaces contain the same designated router priority value, the interface with the largest interface IP address becomes the designated router.

ip pim join-filter

Permit or deny PIM Join/Prune messages on an interface using an extended IP access list. This command prevents the PIM-SM router from creating state based on multicast source and/or group.

Syntax

ip pim join-filter ext-access-list [in | out]

Parameters

ext-access-list Enter the name of an extended access list.

Defaults

none

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### Version Description
- **9.10(0.1)** Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)** Introduced on the S3148.
- **9.10(0.0)** Introduced on the S6100-ON.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100-ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Removed the in and out parameters. Introduced on the S6000-ON.
- **9.5(0.1)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **8.1.1.0** Introduced on the E-Series.
- **7.8.1.0** Introduced on the C-Series for the port-channels and the S-Series.
- **7.7.1.0** Introduced on the E-Series.

#### Usage Information
When you configure a join filter, it is applicable for both ingress and egress flows. There is no option to specify in or out parameters while configuring a join filter.

#### Example
```plaintext
DellEMC(conf)# ip access-list extended iptv-channels
DellEMC(config-ext-nacl)# permit ip 10.1.2.3/24 225.1.1.0/24
DellEMC(config-ext-nacl)# permit ip any 232.1.1.0/24
DellEMC(config-ext-nacl)# permit ip 100.1.1.0/16 any
DellEMC(config-if-te-1/1)# ip pim join-filter iptv-channels
```

#### Related Commands
- `ip access-list extended` — configure an access list based on IP addresses or protocols.

---

### ip pim ingress-interface-map

When the Dell EMC Networking system is the RP, statically map potential incoming interfaces to (*,G) entries to create a lossless multicast forwarding environment.

#### Syntax
`ip pim ingress-interface-map std-access-list`

#### Parameters
- **std-access-list** Enter the name of a standard access list.

#### Defaults
none

#### Command Modes
INTERFACE
ip pim neighbor-filter

To prevent a router from participating in protocol independent multicast (PIM), configure this feature.

Syntax

```
ip pim [vrf vrf-name] neighbor-filter {access-list}
```

To remove the restriction, use the no ip pim [vrf vrf-name] neighbor-filter {access-list} command.

Parameters

- **vrf vrf-name**
  
  (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to prevent that VRF from participating in PIM.

 NOTE: Applies to specific VRF if input is provided, else applies to default VRF.

- **access-list**
  
  Enter the name of a standard access list. Maximum 16 characters.

Defaults

none

DellEMC(config-if-te-1/1)# ip pim ingress-interface-map map1
DellEMC(config-if-te-1/1)#
```
### ip pim query-interval

Change the frequency of PIM Router-Query messages.

**Syntax**

```
ip pim query-interval seconds
```

To return to the default value, use the `no ip pim query-interval seconds` command.

**Parameters**

- `seconds`  
  Enter a number as the number of seconds between router query messages. The range is from 0 to 65535. The default is 30 seconds.

**Defaults**

30 seconds

**ip pim register-filter**

To prevent a PIM source DR from sending register packets to an RP for the specified multicast source and group, use this feature.

**Syntax**

```
ip pim [vrf vrf-name] register-filter access-list
```

To return to the default, use the `no ip pim [vrf vrf-name] register-filter access-list` command.

**Parameters**

- **vrf vrf-name**
  - (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF.
  - **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **access-list**
  - Enter the name of an extended access list. Maximum 16 characters.

**Defaults**

Not configured.

</tr>
</tbody>
</table>

**Usage Information**

The access name is an extended IP access list that denies PIM register packets to RP at the source DR based on the multicast and group addresses. Do not enter this command before creating the access-list.

### ip pim rp-address

Configure a static PIM rendezvous point (RP) address for a group or access-list.

**Syntax**

```plaintext
ip pim [vrf vrf-name] rp-address address {group-address group-address mask} [override]
```

To remove an RP address, use the `no ip pim [vrf vrf-name] rp-address address {group-address group-address mask} [override]` command.

**Parameters**

- **vrf vrf-name**
  - (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF.
  - **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **address**
  - Enter the RP address in dotted decimal format (A.B.C.D).

- **group-address**
  - Enter the keywords `group-address` then a group-address mask, in dotted decimal format (/xx), to assign that group address to the RP.

- **group-address mask**
  - Enter the keyword `mask`.

- **override**
  - Enter the keyword `override` to override the BSR updates with static RP. The override takes effect immediately during enable/disable.
  - **NOTE:** This option is applicable to multicast group range.

**Defaults**

Not configured.

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**
First-hop routers use this address by to send register packets on behalf of source multicast hosts. The RP addresses are stored in the order in which they are entered. The RP is chosen based on a longer prefix match for a group. The RP selection does not depend on dynamic or static RP assignments.

**ip pim rp-candidate**

Configure a PIM router to send out a Candidate-RP-Advertisement message to the bootstrap (BS) router or define group prefixes that are defined with the RP address to PIM BSR.

**Syntax**

```
ip pim [vrf vrf-name] rp-candidate {interface [priority] [acl-name]}
```

To return to the default value, use the `no ip pim [vrf vrf-name] rp-candidate {interface [priority]}` command.

**Parameters**

- **vrf vrf-name**

  (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF.

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **interface**

  Enter the following keywords and slot/port or number information:
  
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.

- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

**priority** (OPTIONAL) Enter the priority used in Bootstrap election process. The range is zero (0) to 255. The default is 192.

**acl-name** (OPTIONAL) Enter the name of an ACL to configure a PIM router to act as an RP for a specific set of multicast group addresses that are defined in the ACL.

**Defaults**
Not configured.

**Command Modes**

<td>Introduced on the E-Series.</td>
</tr>
<tr>
<td>7.8.1.0</td>
<td>Introduced on the C-Series for the port-channels and the S-Series.</td>
</tr>
</tbody>
</table>

Usage Information

The interface must be enabled (the no shutdown command) and not have the switchport command configured. Multicast must also be enabled globally (using the ip multicast-lag-hashing command). PIM is supported on the port-channel interface.

ip pim sparse-mode sg-expiry-timer

Enable expiry timers globally for all sources.

Syntax

ip pim [vrf vrf-name] sparse-mode sg-expiry-timer seconds [access-list-name]

To disable configured timers and return to default mode, use the no ip pim [vrf vrf-name] sparse-mode sg-expiry-timer command.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vrf vrf-name</td>
<td>(OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable expiry timer for all sources on that VRF.</td>
</tr>
<tr>
<td>seconds</td>
<td>Enter the number of seconds the S, G entries are retained. The range is from 211 to 65535.</td>
</tr>
</tbody>
</table>

NOTE: Applies to specific VRF if input is provided, else applies to Default VRF.
**access-list-name**  (OPTIONAL) Enter the name of a previously configured Extended ACL to enable the expiry time to specified S,G entries.

**Defaults**  
Disabled. The default expiry timer (with no times configured) is 210 sec.

</tr>
</tbody>
</table>

**Usage Information**  
This command configures an expiration timer for all S,G entries, unless they are assigned to an Extended ACL. Even though the FHR nodes act as RPs, these nodes still send Register encap messages to themselves and expect to receive a Register stop message (for Anycast RP support). As a result, if the DLT timer expires, SG is not deleted until the register state is deleted in the node. This register state expires 210 seconds after the last Null register is received.

**ip pim ssm-range**

Specify the SSM group range using an access list.

**Syntax**  
```text
ip pim [vrf vrf-name] ssm-range {access_list_name}
```

**Parameters**  

- **vrf vrf-name**  
  (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to specify the SSM group range for that VRF.
**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **access_list_name**: Enter the name of the access list.

**Defaults**
Default SSM range is 232/8 and ff3x/32

</tbody>
</table>

**Usage Information**
Dell EMC Networking OS supports standard access lists for the SSM range. You cannot use extended ACLs for configuring the SSM range. If you configure an extended ACL and then used in the `ip pim ssm-range {access list name}` configuration, an error is reported.

However, if you configure `ip pim ssm-range {access list name}` first and then you configure the ACL as an Extended ACL, an error is not reported and the ACL is not applied to the SSM range.

Dell EMC Networking OS-recommended best-practices are to configure the standard ACL, and then apply the ACL to the SSM range. After the SSM range is applied, the changes are applied internally without requiring clearing of the tree information base (TIB).

When the ACL rules change, the ACL and protocol-independent multicast (PIM) modules apply the new rules automatically.
When you configure the SSM range, Dell EMC Networking OS supports SSM for configured group range as well as the default SSM range.

When you remove the SSM ACL, PIM SSM is supported for the default SSM range only.

**ip pim spt-threshold**

To switch to the shortest path tree when the traffic reaches the specified threshold value, configure the PIM router.

**Syntax**

```
ip pim [vrf vrf-name] spt-threshold [value | infinity]
```

To return to the default value, use the `no ip pim [vrf vrf-name] spt-threshold [infinity]` command.

**Parameters**

- `value`  
  (OPTIONAL) Enter the traffic value in kilobits per second. The default is 10 packets per second. A value of zero (0) causes a switchover on the first packet.

- `vrf vrf-name`  
  (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure the PIM router on that VRF.

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- `infinity`  
  (OPTIONAL) Enter the keyword `infinity` to never switch to the source-tree.

**Defaults**

Not configured.

**Command Modes**

- CONFIGURATION

no ip pim snooping dr-flood

Disable the flooding of multicast packets to the PIM designated router.

Syntax

no ip pim snooping dr-flood

To re-enable the flooding of multicast packets to the PIM designated router, use the ip pim snooping dr-flood command.

Defaults

Enabled.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.4.1.0 Introduced on the E-Series.

Usage Information

By default, when you enable PIM-SM snooping, a switch floods all multicast traffic to the PIM designated router (DR), including unnecessary multicast packets. To minimize the traffic sent over the network to the designated router, you can disable designated-router flooding.

When designated-router flooding is disabled, PIM-SM snooping only forwards the multicast traffic, which belongs to a multicast group for which the switch receives a join request, on the port connected towards the designated router.

If the PIM DR flood is not disabled (default setting):

- Multicast traffic is transmitted on the egress port towards the PIM DR if the port is not the incoming interface.
- Multicast traffic for an unknown group is sent on the port towards the PIM DR. When DR flooding is disabled, multicast traffic for an unknown group is dropped.
**show ip pim bsr-router**

View information on the Bootstrap router.

**S4048-ON**

**Syntax**

```
show ip pim [vrf vrf-name] bsr-router
```

**Parameters**

- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to configure this setting on VRF.

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Usage Information**

The following describes the `show ip pim interface` command shown in the following example.
### Field Description

- **Address**: Lists the IP addresses of the interfaces participating in PIM.
- **Interface**: List the interface type, with either slot/port information or ID (VLAN or Port Channel), of the interfaces participating in PIM.
- **Ver/Mode**: Displays the PIM version number and mode for each interface participating in PIM:
  - v2 = PIM version 2
  - S = PIM Sparse mode
- **Nbr Count**: Displays the number of PIM neighbors discovered over this interface.
- **Query Intvl**: Displays the query interval for Router Query messages on that interface (configured with `ip pim query-interval` command).
- **DR Prio**: Displays the Designated Router priority value configured on the interface (use the `ip pim dr-priority` command).
- **DR**: Displays the IP address of the Designated Router for that interface.

The `show ip pim interface` command does not display information corresponding to the loop-back interfaces.

### Example

```
DellEMC# show ip pim interface
Address          Interface Ver/  Nbr    Query  DR       DR
               Mode   Count  Intvl  Prio
165.87.34.5      Te 1/10   v2/S   0      30     1        165.87.34.5
10.1.1.2         Vl 10     v2/S   1      30     1        10.1.1.2
20.1.1.5         Vl 20     v2/S   1      30     1        20.1.1.5
165.87.31.200    Vl 30     v2/S   1      30     1        165.87.31.201
DellEMC#
```

### show ip pim neighbor

View PIM neighbors.

#### S4048-ON

**Syntax**

```
show ip pim [vrf vrf-name] neighbor
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### Version Description

- **9.10(0.1)**: Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)**: Introduced on the S3148.
- **9.10(0.0)**: Introduced on the S6100-ON.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100-ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Added support for VRF. Introduced on the S6000-ON.
- **9.5(0.1)**: Introduced on the Z9500.
- **9.0.2.0**: Introduced on the S6000.
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.12.0**: Introduced on the S4810.
- **8.3.11.1**: Introduced on the Z9000.
- **8.1.1.0**: Introduced on the E-Series.
- **7.8.1.0**: Introduced on the S-Series.

### Usage Information

The following describes the `show ip pim neighbor` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighbor address</td>
<td>Displays the IP address of the PIM neighbor.</td>
</tr>
<tr>
<td>Interface</td>
<td>List the interface type, with either slot/port information or ID (VLAN or Port Channel), on which the PIM neighbor was found.</td>
</tr>
<tr>
<td>Uptime/Expires</td>
<td>Displays the amount of time the neighbor has been up then the amount of time until the neighbor is removed from the multicast routing table (that is, until the neighbor hold time expires).</td>
</tr>
<tr>
<td>Ver</td>
<td>Displays the PIM version number.</td>
</tr>
<tr>
<td></td>
<td>• v2 = PIM version 2</td>
</tr>
<tr>
<td>DR prio/Mode</td>
<td>Displays the Designated Router priority and the mode.</td>
</tr>
<tr>
<td></td>
<td>• 1 = default Designated Router priority (use the ip pim dr-priority command)</td>
</tr>
<tr>
<td></td>
<td>• DR = Designated Router</td>
</tr>
<tr>
<td></td>
<td>• S = Sparse mode</td>
</tr>
</tbody>
</table>

### Example

```
DellEMC# show ip pim neighbor
Neighbor Address   Interface  Uptime/Expires Ver DR Prio/Mode
127.87.3.4 Te 1/16  09:44:58/00:01:24  v2 1 / S
DellEMC#
```
show ip pim rp

View all multicast groups-to-RP mappings.

S4048-ON

Syntax

show ip pim [vrf vrf-name] rp [mapping | group-address]

Parameters

vrf vrf-name
  (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to configure this setting on that VRF.

mapping
  (OPTIONAL) Enter the keyword mapping to display the multicast groups-to-RP mapping and information on how RP is learnt.

group-address
  (OPTIONAL) Enter the multicast group address mask in dotted decimal format to view RP for a specific group.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version  Description

9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.

9.10(0.0)  Introduced on the S3148.

9.10(0.0)  Introduced on the S6100-ON.

9.8(2.0)   Introduced on the S3100 series.

9.8(1.0)   Introduced on the Z9100-ON.

9.8(0.0P6) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0)   Added support for VRF. Introduced on the S6000-ON.

9.5(0.1)   Introduced on the Z9500.

9.0.2.0     Introduced on the S6000.

8.3.19.0    Introduced on the S4820T.

8.3.12.0    Introduced on the S4810.

8.3.11.1    Introduced on the Z9000.

8.1.1.0     Introduced on the E-Series.

7.8.1.0     Introduced on the S-Series.

Example

DellEMC# show ip pim rp
Group        RP
224.2.197.115  165.87.20.4
show ip pim snooping interface

Display information on VLAN interfaces with PIM-SM snooping enabled.

Syntax
show ip pim snooping interface [vlan vlan-id]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan vlan-id</td>
<td>(OPTIONAL) Enter a VLAN ID to display information about a specified VLAN configured for PIM-SM snooping. The valid VLAN IDs range is from 1 to 4094.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
Field | Description
---|---
• v2 = PIM version 2
• S = PIM Sparse mode

Nbr Count | Displays the number of neighbors learned through PIM-SM snooping on the interface.

DR Prio | Displays the Designated Router priority value configured on the interface (ip pim dr-priority command).

DR | Displays the IP address of the Designated Router for that interface.

Example (##2)
```
DellEMC# show ip pim snooping interface
Interface Ver Nbr Count  DR  DR Prio
Vlan 2   v2   3   1   165.87.32.2
DellEMC#
```

show ip pim snooping neighbor

Display information on PIM neighbors learned through PIM-SM snooping.

Syntax
```
show ip pim snooping neighbor [vlan vlan-id]
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan vlan-id</td>
<td>(OPTIONAL) Enter a VLAN ID to display information about PIM neighbors that PIM-SM snooping discovered on a specified VLAN. The valid VLAN IDs range is from 1 to 4094.</td>

<td>0</td>
</tr>
</tbody>
</table>
```

### show ip pim snooping tib

Display information from the tree information base (TIB) PIM-SM snooping discovered about multicast group members and states.

**Syntax**

```
show ip pim snooping tib [vlan vlan-id] [group-address [source-address]]
```

**Parameters**

- **vlan vlan-id** (OPTIONAL) Enter a VLAN ID to display TIB information PIM-SM snooping discovered on a specified VLAN. The valid VLAN IDs range is from 1 to 4094.
- **group-address** (OPTIONAL) Enter the group address in dotted decimal format (A.B.C.D) to display TIB information PIM-SM snooping discovered for a specified multicast group.
- **source-address** (OPTIONAL) Enter the source address in dotted decimal format (A.B.C.D) to display TIB information PIM-SM snooping discovered for a specified multicast source.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>
Version | Description
--- | ---
8.4.1.1 | Introduced on the E-Series.

### Usage Information
The following describes the `show ip pim snooping tib` commands shown in the following example.

#### Field | Description
--- | ---
(S, G) | Displays the entry in the PIM multicast snooping database.
uptime | Displays the amount of time the entry has been in the PIM multicast route table.
expires | Displays the amount of time until the entry expires and is removed from the database.
RP | Displays the IP address of the RP/source for this entry.
flags | List the flags to define the entries:
  - S = PIM Sparse Mode
  - C = directly connected
  - L = local to the multicast group
  - P = route was pruned
  - R = the forwarding entry is pointing toward the RP
  - F = Dell EMC Networking OS is registering this entry for a multicast source
  - T = packets were received via Shortest Tree Path
  - J = first packet from the last hop router is received and the entry is ready to switch to SPT
  - K=acknowledge pending state
Incoming interface | Displays the reverse path forwarding (RPF) interface towards the RP/source.
RPF neighbor | Displays the next hop from this interface towards the RP/source.
Outgoing interface list: | Lists the interfaces that meet one of the following criteria:
  - a directly connect member of the Group
  - statically configured member of the Group
  - received a (*,G) Join message

### Example
```
DellEMC# show ip pim snooping tib
PIM Multicast Snooping Table
Flags: J/P - (*,G) Join/Prune, j/p - (S,G) Join/Prune
SGR-P - (S,G,R) Prune
Timers: uptime/expires
*: Inherited port
(*, 225.1.2.1), uptime 00:00:01, expires 00:02:59, RP 165.87.70.1, flags: J
Incoming interface: Vlan 2, RPF neighbor 0.0.0.0
Outgoing interface list:
  TenGigabitEthernet 2/11 RPF 165.87.32.2 00:00:01/00:02:59
  TenGigabitEthernet 2/13 Upstream Port -/-

DellEMC# show ip pim snooping tib vlan 2 225.1.2.1 165.87.1.7
PIM Multicast Snooping Table
Flags: J/P - (*,G) Join/Prune, j/p - (S,G) Join/Prune
SGR-P - (S,G,R) Prune
Timers: Uptime/Expires
*: Inherited port
```
show ip pim ssm-range

Display the non-default groups added using the SSM range feature.

**4048-ON**

**Syntax**

```
show ip pim [vrf vrf-name] ssm-range
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

show ip pim tib

View the PIM tree information base (TIB).

S4048-ON

**Syntax**

```
show ip pim [vrf vrf-name] tib [group-address [source-address]]
```

**Parameters**

- **vrf vrf-name**
  - (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to configure this setting on that VRF.
  - **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **group-address**
  - (OPTIONAL) Enter the group address in dotted decimal format (A.B.C.D).
source-address (OPTIONAL) Enter the source address in dotted decimal format (A.B.C.D).

Command Modes
- EXEC
- EXEC Privilege

Usage Information
The following describes the show ip pim tib command shown in the following example.

Field       Description
(S, G)      Displays the entry in the multicast PIM database.
uptime      Displays the amount of time the entry has been in the PIM route table.
expires     Displays the amount of time until the entry expires and is removed from the database.
RP          Displays the IP address of the RP/source for this entry.
flags       List the flags to define the entries:
             • D = PIM Dense Mode
             • S = PIM Sparse Mode
             • C = directly connected
             • L = local to the multicast group
             • P = route was pruned
             • R = the forwarding entry is pointing toward the RP
             • F = Dell EMC Networking OS is registering this entry for a multicast source
             • T = packets were received via Shortest Tree Path
Field                          Description
• J = first packet from the last hop router is received and the entry is ready to switch to SPT
• K = acknowledge pending state

Incoming interface          Displays the reverse path forwarding (RPF) interface towards the RP/source.
RPF neighbor                Displays the next hop from this interface towards the RP/source.
Outgoing interface list:    Lists the interfaces that meet one of the following criteria:
• a directly connect member of the Group
• statically configured member of the Group
• received a (*,G) Join message

Example
DellEMC# do show ip pim tib

PIM Multicast Routing Table
Flags: D - Dense, S - Sparse, C - Connected, L - Local, P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set, J - Join SPT, M - MSDP created entry, A - Candidate for MSDP Advertisement, K - Ack-Pending State
Timers: Uptime/Expires
Interface state: Interface, next-Hop, State/Mode

(*, 225.1.1.1), uptime 00:40:16, expires 00:00:00, RP 20.40.4.4, flags: SCJ
  Incoming interface: Vlan 2007, RPF neighbor 20.30.124.4
  Outgoing interface list:
  Vlan 2006  Forward/Sparse   00:06:21/Never

(20.10.4.9, 225.1.1.1), uptime 00:06:21, expires 00:02:06, flags: CT
  Incoming interface: Vlan 2007, RPF neighbor 20.30.124.4
  Outgoing interface list:
  Vlan 2006  Forward/Sparse   00:06:21/Never

(*, 225.1.1.2), uptime 00:40:15, expires 00:00:00, RP 20.40.4.4, flags: SCJ
  Incoming interface: Vlan 2007, RPF neighbor 20.30.124.4
  Outgoing interface list:
  Vlan 2006  Forward/Sparse   00:06:21/Never

(20.10.4.9, 225.1.1.2), uptime 00:06:21, expires 00:02:06, flags: CT
  Incoming interface: Vlan 2007, RPF neighbor 20.30.124.4
  Outgoing interface list:
  Vlan 2006  Forward/Sparse   00:06:21/Never
DellEMC#

show running-config pim

Display the current configuration of PIM-SM.

Syntax                      show running-config pim
Command Modes               EXEC Privilege
Command History             This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

ipv6 pim vrf VRF2 rp-address 2001:100::1 group-address ff00::/8
```
Port Monitoring

The port monitoring feature allows you to monitor network traffic by forwarding a copy of each incoming or outgoing packet from one port to another port.

Important Points to Remember

- Port monitoring is supported on physical ports and logical interfaces, such as port channels and virtual local area networks (VLANs).
- The monitoring (destination, “MG”) and monitored (source, “MD”) ports must be on the same switch.
- In general, a monitoring port should have `no ip address` and `no shutdown` as the only configuration; Dell EMC Networking OS permits a limited set of commands for monitoring ports; display them using the `?` command. A monitoring port also may not be a member of a VLAN.
- A total of 4 MG may be configured in a single port-pipe.
- MG and MD ports can be reside anywhere across a port-pipe.
- The Dell EMC Networking OS supports multiple source ports to be monitored by a single destination port in one monitor session.
- One monitor session can have only one MG port.

**NOTE:** The monitoring port should not be a part of any other configuration.

Topics:
- description
- erpm
- monitor multicast-queue
- monitor session
- rate-limit
- show config
- show monitor session
- show running-config
- source (port monitoring)

**description**

Enter a description of this monitoring session.

**Syntax**

```
description {description}
```

To remove the description, use the `no description {description}` command.

**Parameters**

- `description`  
  Enter a description regarding this session (80 characters maximum).

**Defaults**

none

**Command Modes**

Related Commands

- `monitor session` — enables a monitoring session.

erpm

Configure the source and destination IP address for ERPM traffic.

Syntax

```
erpm source-ip ip-address dest-ip ip-address [gre-protocol value]
```

To remove the configuration, use the `no erpm source-ip IP-address dest-ip IP-address [gre-protocol value]` command.

Parameters

- `source-ip ip-address` Enter the keywords `source-ip` then the source IP address in dotted decimal format.
- `destination-ip ip-address` Enter the keywords `destination-ip` then the destination IP address in dotted decimal format.
- `gre-protocol value` (OPTIONAL) Enter the keywords `gre-protocol` then the protocol type value for ERPM type monitor session. The range is from 1 to 65535.
monitor multicast-queue

Configure monitor GoS multicast queue ID.

Syntax

```plaintext
monitor multicast-queue queue-id
```

To remove the configuration, use the `no monitor multicast-queue` command.

Parameters

- `queue-id`: Enter the GoS multicast queue ID. The range is from 0 to 9.

Defaults

- `queue-id`: 0

Enable status: Disabled

Command Modes

- `CONFIGURATION`

Example

```plaintext
DellEMC(conf)#monitor multicast-queue 7
```

Command History

</tbody>
</table>

Related Commands

- `show running-config monitor session` — displays information about monitor configurations.
monitor session

Create a session for monitoring traffic with port monitoring.

Syntax

```
monitor session session-ID [type { rpm | erpm [set ip dscp dscp_value | set ip ttl ttl_value]}] [drop]
```

To delete a session, use the `no monitor session session-ID` command.

To delete all monitor sessions, use the `no monitor session all` command.

Parameters

- `session-ID` Enter a session identification number. The range is from 0 to 65535.
- `type` Specifies one of the following type:
  - `rpm`
  - `erpm`
- `rpm` Creates a remote port monitoring (rpm) session.
- `erpm` Creates an encapsulated remote port monitoring (erpm) session.
- `set ip dscp` Configures the Differentiated Services Code Point (DSCP) value of the packets in the Encapsulated Remote Switched Port Analyzer (ERSPAN) traffic. To revert to the default value, use the no form of this command.
- `dscp_value` DSCP value of the packets in the ERSPAN traffic. The range is from 0 to 63. The default value is 0.
- `set ip ttl` Configures the IP time-to-live (TTL) value of the Encapsulated Remote Switched Port Analyzer (ERSPAN) traffic. To revert to the default configuration, use the no form of this command.
- `ttl_value` IP TTL value of the ERSPAN traffic. The range is from 1 to 255. The default value is 255.
- `drop` Monitors only the dropped packets in the Ingress.

Defaults

none

Command Modes

- `CONFIGURATION`

</tbody>
</table>
**rate-limit**

Configure the rate-limit to limit the mirrored packets.

**Syntax**

```
rate-limit limit
```

To remove the limit, use the `no rate-limit limit` command.

**Parameters**

- **limit**: Enter the rate-limit value. The range is from 0 to 40000 Megabits per second.

**Defaults**

60

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S6000-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.7.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
8.1.1.0 Introduced on the E-Series.
7.7.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
7.4.1.0 Introduced on the E-Series.

Example

DellEMC(conf-mon-sess-1)# show config
!
monitor session 1
  source TenGigabitEthernet 1/1 destination Port-channel 1 direction rx
**show monitor session**

Display information about monitoring sessions.

**Syntax**

```
show monitor session {session-ID} [access-list]
```

To display monitoring information for all sessions, use the `show monitor session` command.

**Parameters**

- **session-ID**  
  (OPTIONAL) Enter a session identification number. The range is from 0 to 65535.
- **[access-list]**  
  (OPTIONAL) Enter the `access-list` keyword to display the ACLs applied to monitor sessions.

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

The monitoring command is saved in the running configuration at the Monitor Session mode level and can be restored after a chassis reload.

**Example**

```
DellEMC# show running-config monitor session
!
monitor session 1
source TenGigabitEthernet 1/1 destination TenGigabitEthernet 1/2 direction rx
!
monitor multicast-queue 7
DellEMC#
```

**Related Commands**

- `monitor session` — creates a monitoring session.
- `show monitor session` — displays a monitoring session.

### source (port monitoring)

Configure a port monitor source.

**Syntax**

```
source {interface | range | any} destination interface direction {rx | tx | both}
```

**Port Monitoring**

1435
To disable a monitor source, use the `no source interface destination interface direction {rx | tx | both} command.

### Parameters

- **source interface**: Enter one of the following keywords and slot/port information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a VLAN interface enter the keyword `VLAN` followed by a number from 1 to 4094.
  - For a port channel interface, enter the keywords `port-channel` then a number.

- **range**: Enter the keyword `range` to specify the list of interfaces.

- **any**: Enter the keyword `any` to specify all interfaces.

- **destination**: Enter the keyword `destination` to specify the destination interface.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.

- **interface**: Enter one of the following keywords and slot/port information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a VLAN interface, enter the keyword `VLAN` then a number from 1 to 4094.
  - For a port channel interface, enter the keywords `port-channel` then a number.

- **direction (rx | tx | both)**: Enter the keyword `direction` then one of the packet directional indicators.
  - `rx`: to monitor receiving packets only.
  - `tx`: to monitor transmitting packets only.
  - `both`: to monitor both transmitting and receiving packets.

### Defaults

`none`

### Command Modes

MONITOR SESSION (conf-mon-sess-session-ID)

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Example**

```plaintext
DellEMC# monitor session 0
source Port-channel 10 destination TenGigabitEthernet 1/3 direction tx
DellEMC#
```
Private VLAN (PVLAN)

The private VLAN (PVLAN) feature of the Dell EMC Networking OS is supported on the platforms. Private VLANs extend the Dell EMC Networking OS security suite by providing Layer 2 isolation between ports within the same private VLAN. A private VLAN partitions a traditional VLAN into subdomains identified by a primary and secondary VLAN pair. The Dell EMC Networking OS private VLAN implementation is based on RFC 3069.

For more information, see the following commands. The command output is augmented in Dell EMC Networking OS version 7.8.1.0 at later to provide PVLAN data:

- show arp
- show vlan

Private VLAN Concepts

Primary VLAN:

The primary VLAN is the base VLAN and can have multiple secondary VLANs. There are two types of secondary VLAN — community VLAN and isolated VLAN:

- A primary VLAN can have any number of community VLANs and isolated VLANs.
- Private VLANs block all traffic to isolated ports except traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous ports or trunk ports.

Community VLAN:

A community VLAN is a secondary VLAN of the primary VLAN:

- Ports in a community VLAN can talk to each other. Also, all ports in a community VLAN can talk to all promiscuous ports in the primary VLAN and vice versa.
- Devices on a community VLAN can communicate with each other using member ports, while devices in an isolated VLAN cannot.

Isolated VLAN:

An isolated VLAN is a secondary VLAN of the primary VLAN:

- Ports in an isolated VLAN cannot talk to each other. Servers would be mostly connected to isolated VLAN ports.
- Isolated ports can talk to promiscuous ports in the primary VLAN, and vice versa.

Port Types:

- Community port — a community port is a port that belongs to a community VLAN and is allowed to communicate with other ports in the same community VLAN and with promiscuous ports.
- Isolated port — an isolated port is a port that, in Layer 2, can only communicate with promiscuous ports that are in the same PVLAN.
- Promiscuous port — a promiscuous port is a port that is allowed to communicate with any other port type.
- Trunk port — a trunk port carries VLAN traffic across switches:
  - A trunk port in a PVLAN is always tagged.
  - A trunk port in Tagged mode carries primary or secondary VLAN traffic. The tag on the packet helps identify the VLAN to which the packet belongs.
A trunk port can also belong to a regular VLAN (non-private VLAN).

Topics:
- ip local-proxy-arp
- private-vlan mode
- private-vlan mapping secondary-vlan
- switchport mode private-vlan

**ip local-proxy-arp**

Enable/disable Layer 3 communication between secondary VLANs in a private VLAN.

**S4048**

**Syntax**

```
[no] ip local-proxy-arp
```

To disable Layer 3 communication between secondary VLANs in a private VLAN, use the `no ip local-proxy-arp` command in INTERFACE VLAN mode for the primary VLAN.

To disable Layer 3 communication in a particular secondary VLAN, use the `no ip local-proxy-arp` command in INTERFACE VLAN mode for the selected secondary VLAN.

**NOTE:** Even after you disable `ip-local-proxy-arp` (use `no ip-local-proxy-arp`) in a secondary VLAN, Layer 3 communication may happen between some secondary VLAN hosts, until the address resolution protocol (ARP) timeout happens on those secondary VLAN hosts.

**Defaults**

Layer 3 communication is disabled between secondary VLANs in a private VLAN.

**Command Modes**

INTERFACE VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
private-vlan mode

Set PVLAN mode of the selected VLAN to community, isolated, or primary.

S4048

Syntax

[no] private-vlan mode {community | isolated | primary}

To remove the PVLAN configuration, use the no private-vlan mode {community | isolated | primary} command syntax.

Parameters

- community
  - Enter the keyword community to set the VLAN as a community VLAN.
- isolated
  - Enter the keyword isolated to configure the VLAN as an isolated VLAN.
- primary
  - Enter the keyword primary to configure the VLAN as a primary VLAN.

Defaults

- none

Command Modes

- INTERFACE VLAN

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
**Usage Information**

The VLAN:

- can be in only one mode, either `community`, `isolated`, or `primary`.
- mode to `community` or `isolated` even before associating it to a primary VLAN. This secondary VLAN continues to work normally as a normal VLAN even though it is not associated to a primary VLAN. (A syslog message indicates this.)
- must not have a port in it when VLAN mode is being set.

Only ports (and port channels) configured as promiscuous, host, or PVLAN trunk ports (as previously described) can be added to the PVLAN. No other regular ports can be added to the PVLAN.

After using this command to configure a VLAN as a primary VLAN, use the `private-vlan mapping secondary-vlan` command to map secondary VLANs to this VLAN.

**Related Commands**

- `private-vlan mapping secondary-vlan` — maps secondary VLANs to the selected primary VLAN.
- `switchport mode private-vlan` — sets PVLAN mode of the selected port.

### private-vlan mapping secondary-vlan

Map secondary VLANs to the selected primary VLAN.

**Syntax**

```
[no] private-vlan mapping secondary-vlan vlan-list
```

To remove specific secondary VLANs from the configuration, use the `no private-vlan mapping secondary-vlan vlan-list` command syntax.

**Parameters**

- `vlan-list` Enter the list of secondary VLANs to associate with the selected primary VLAN. The list can be in comma-delimited or hyphenated-range format, following the convention for the range input.

**Defaults**

none

**Command Modes**

INTERFACE VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
### switchport mode private-vlan

Set PVLAN mode of the selected port.

#### S4048

**Syntax**

[no] switchport mode private-vlan {host | promiscuous | trunk}

To remove PVLAN mode from the selected port, use the no switchport mode private-vlan command.

**Parameters**

- **host**
  
  Enter the keyword host to configure the selected port or port channel as an isolated interface in a PVLAN.

- **promiscuous**
  
  Enter the keyword promiscuous to configure the selected port or port channel as a promiscuous interface.

- **trunk**
  
  Enter the keyword trunk to configure the selected port or port channel as a trunk port in a PVLAN.

**Defaults**

Disabled.

**Command Modes**

INTERFACE

Usage Information

The assignment of the various PVLAN port types to port and port channel (LAG) interfaces is shown in the following example.

Example

```
DellEMC#conf
DellEMC(conf)# interface TenGigabitEthernet 2/1
DellEMC(conf-if-te-2/1)# switchport mode private-vlan promiscuous
DellEMC(conf)# interface TenGigabitEthernet 2/2
DellEMC(conf-if-te-2/2)# switchport mode private-vlan host
DellEMC(conf)# interface TenGigabitEthernet 2/3
DellEMC(conf-if-te-2/3)# switchport mode private-vlan trunk
DellEMC(conf)# interface port-channel 10
DellEMC(conf-if-te-2/3)# switchport mode private-vlan promiscuous
DellEMC(conf-if-te-2/3)#
```

Related Commands

- `private-vlan mode` — sets the mode of the selected VLAN to community, isolated, or primary.
- `private-vlan mapping secondary-vlan` — sets the mode of the selected VLAN to primary and then associates the secondary VLANs to it.
**Per-VLAN Spanning Tree Plus (PVST+)**

The Dell EMC Networking OS implementation of per-VLAN spanning tree plus (PVST+) is based on the IEEE 802.1w standard spanning tree protocol. Dell EMC Networking OS supports PVST+ on the S4048 platform.

**NOTE:** For easier command line entry, the plus (+) sign is not used at the command line.

**Topics:**
- description
- disable
- extend system-id
- protocol spanning-tree pvst
- show spanning-tree pvst
- spanning-tree pvst
- spanning-tree pvst err-disable
- tc-flush-standard
- vlan bridge-priority
- vlan forward-delay
- vlan hello-time
- vlan max-age

### description

Enter a description of the PVST+.

**S4048**

**Syntax**

description {
  (description)
}

To remove the description, use the no description (description) command.

**Parameters**

- **description**
  
Enter a description to identify the spanning tree (80 characters maximum).

**Defaults**

- none

**Command Modes**

- SPANNING TREE PVST+ (The prompt is “config-pvst”)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

Related Commands

- `protocol spanning-tree pvst` — enter PVST+ mode.

**extend system-id**

To augment the Bridge ID with a VLAN ID so that PVST+ differentiate between BPDUs for each VLAN, use `extend system-id`. If the VLAN receives a BPDU meant for another VLAN, PVST+ does not detect a loop, and both ports can remain in Forwarding state.

**S4048**

**Syntax**

```
extend system-id
```

**Defaults**

Disabled

**Command Modes**

PROTOCOL PVST

**Command History**

**Example**

```
DellEMC# conf
DellEMC(conf)# protocol spanning-tree pvst
DellEMC(conf-pvst)# no disable
DellEMC(conf-pvst)# vlan 2 bridge-priority 4096
DellEMC(conf-pvst)# vlan 3 bridge-priority 16384
DellEMC(conf-pvst)#
DellEMC(conf-pvst)# show config
!
protocol spanning-tree pvst
  no disable
  vlan 2 bridge-priority 4096
  vlan 3 bridge-priority 16384
DellEMC#
```

**Usage Information**

After you enable PVST+, the device runs an STP instance for each VLAN it supports.

**Related Commands**

- `disable` — disables PVST+.
- `show spanning-tree pvst` — displays the PVST+ configuration.

### show spanning-tree pvst

View the Per-VLAN spanning tree configuration.

**S4048**

**Syntax**

```
show spanning-tree pvst [vlan vlan-id] [brief] [guard]
```

**Parameters**

- `vlan vlan-id` 
  (OPTIONAL) Enter the keyword `vlan` then the VLAN ID. The range is 1 to 4094.
- `brief` 
  (OPTIONAL) Enter the keyword `brief` to view a synopsis of the PVST+ configuration information.
- `interface` 
  (OPTIONAL) Enter one of the interface keywords along with the slot/port information:
For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.

For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

For a Port Channel interface, enter the keyword port-channel then a number:

guard  (OPTIONAL) Enter the keyword guard to display the type of guard enabled on a PVST interface and the current port state.

Defaults
none

Command Modes
  • EXEC
  • EXEC Privilege

Usage Information
The following describes the show spanning-tree pvst command shown in the following examples.
### Field | Description
--- | ---
Interface Name | PVST interface.
Instance | PVST instance.
Sts | Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), or shut down (EDS Shut).
Guard Type | Type of STP guard configured (Root, Loop, or BPDU guard).

#### Example (Brief)

```plaintext
DellEMC# show spanning-tree pvst vlan 3 brief
VLAN 3
Executing IEEE compatible Spanning Tree Protocol
Root ID Priority 4096, Address 0001.e801.6aa8
Bridge hello time 2, max age 20, forward delay 15
Bridge ID Priority 16384, Address 0001.e805.e306
Configured hello time 2, max age 20, forward delay 15

#### Example

```plaintext
DellEMC# show spanning-tree pvst vlan 2
VLAN 2
Root Identifier has priority 4096, Address 0001.e805.e306
Bridge Identifier has priority 4096, Address 0001.e805.e306
Configured hello time 2, max age 20, forward delay 15
Current root has priority 4096, Address 0001.e805.e306
Number of topology changes 3, last change occurred 00:57:00

Port 130 (TenGigabitEthernet 1/4) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier 128.130
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.130, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1567, received 3
The port is not in the Edge port mode

Port 131 (TenGigabitEthernet 1/1) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier 128.131
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.131, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1567, received 0
The port is not in the Edge port mode

Port 146 (TenGigabitEthernet 1/16) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier 128.146
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
```
Designated port id is 128.146, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1578, received 0
The port is in the Edge port mode

Port 147 (TenGigabitEthernet 1/17) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier 128.147
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.147, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1579, received 0
The port is in the Edge port mode

Example (EDS/LBK)
DellEMC# show spanning-tree pvst vlan 2 interface tengigabitethernet 1/1
TenGigabitEthernet 1/1 of VLAN 2 is LBK_INC discarding
Edge port: no (default) port guard: none (default)
Link type: point-to-point (auto) bpdu filter: disable (default)
Bpu guard: disable (default)
Bpdus sent 152, received 27562

Example (EDS/PVID)
DellEMC# show spanning-tree pvst vlan 2 interface tengigabitethernet 1/1
TenGigabitEthernet 1/1 of VLAN 2 is PVID_INC discarding
Edge port: no (default) port guard: none (default)
Link type: point-to-point (auto) bpdu filter: disable (default)
Bpu guard: disable (default)
Bpdus sent 1, received 0

Example (Guard)
DellEMC# show spanning-tree pvst vlan 5 guard
Interface
Name Instance Sts Guard type
-----------------------------------
Te 1/1 5 INCON (Root) Rootguard
Te 1/2 5 FWD Loopguard
Te 1/3 5 EDS (Shut) Bpduguard

Related Commands
• spanning-tree pvst — configure PVST+ on an interface.
spanning-tree pvst

Configure a PVST+ interface with one of these settings: edge port with optional bridge port data unit (BPDU) guard, port disablement if an error condition occurs, port priority or cost for a VLAN range, loop guard, or root guard.

S4048

Syntax

```
spanning-tree pvst {edge-port [bpduguard [shutdown-on-violation]] | err-disable | vlan vlan-range {cost number | priority value} | loopguard | rootguard}
```

Parameters

- **edge-port**
  - Enter the keywords `edge-port` to configure the interface as a PVST+ edge port.

- **bpduguard**
  - Enter the keyword `portfast` to enable Portfast to move the interface into Forwarding mode immediately after the root fails.
  - Enter the keyword `bpduguard` to disable the port when it receives a BPDU.

- **shutdown-on-violation** (OPTIONAL)
  - Enter the keywords `shutdown-on-violation` to hardware disable an interface when a BPDU is received and the port is disabled.

- **err-disable**
  - Enter the keywords `err-disable` to enable the port to be put into the error-disable state (EDS) if an error condition occurs.

- **vlan vlan-range**
  - Enter the keyword `vlan` then the VLAN numbers. The range is from 1 to 4094.

- **cost number**
  - Enter the keyword `cost` then the port cost value. The range is from 1 to 200000.
  - **Defaults:**
    - 100 Mb/s Ethernet interface = 200000.
    - 1-Gigabit Ethernet interface = 20000.
    - 10-Gigabit Ethernet interface = 2000.
    - Port Channel interface with one 100 Mb/s Ethernet = 200000.
    - Port Channel interface with one 1 Gigabit Ethernet = 20000.
    - Port Channel interface with one 10 Gigabit Ethernet = 2000.
    - Port Channel with two 1 Gigabit Ethernet = 18000.
    - Port Channel with two 10 Gigabit Ethernet = 1800.
    - Port Channel with two 100 Mbps Ethernet = 180000.

- **priority value**
  - Enter the keyword `priority` then the Port priority value in increments of 16. The range is from 0 to 240. The default is 128.

- **loopguard** (C-, S-, and E-Series only)
  - Enter the keyword `loopguard` to enable loop guard on a PVST+ port or port-channel interface.

- **rootguard** (C-, S-, and E-Series only)
  - Enter the keyword `rootguard` to enable root guard on a PVST+ port or port-channel interface.

Defaults

- Not configured.

<td>Added the optional Bridge Port Data Unit (BPDU) guard.</td>
</tr>
<tr>
<td>6.2.1.1</td>
<td>Introduced.</td>
</tr>
</tbody>
</table>

### Usage Information
The BPDU guard option prevents the port from participating in an active STP topology in case a BPDU appears on a port unintentionally, or is misconfigured, or is subject to a DOS attack. This option places the port into the Error Disable state if a BPDU appears, and a message is logged so that the administrator can take corrective action.

**NOTE:** A port configured as an edge port, on a PVST switch, immediately transitions to the forwarding state. Only ports connected to end-hosts should be configured as an edge port. Consider an edge port similar to a port with a spanning-tree portfast enabled.

If you do not enable **shutdown-on-violation**, BPDUs are still sent to the route process module (RPM) CPU.

You cannot enable **root guard** and **loop guard** at the same time on a port. For example, if you configure **loop guard** on a port on which **root guard** is already configured, the following error message is displayed: % Error: RootGuard is configured. Cannot configure LoopGuard.

When used in a PVST+ network, loop guard is performed per-port or per-port channel at a VLAN level. If no BPDUs are received on a VLAN interface, the port or port-channel transitions to a Loop-Inconsistent (blocking) state only for this VLAN.
Enabling Portfast BPDU guard and loop guard at the same time on a port results in a port that remains in a Blocking state and prevents traffic from flowing through it. For example, when Portfast BPDU guard and loop guard are both configured:

- If a BPDU is received from a remote device, BPDU guard places the port in an Err-Disabled Blocking state and no traffic is forwarded on the port.
- If no BPDU is received from a remote device, loop guard places the port in a Loop-Inconsistent Blocking state and no traffic is forwarded on the port.

Example

```bash
DellEMC(conf-if-te-1/1)# spanning-tree pvst vlan 3 cost 1800
DellEMC(conf-if-te-1/1)# end
DellEMC(conf-if-te-1/1)# show config
!
interface TenGigabitEthernet 1/1
  no ip address
  switchport
  spanning-tree pvst vlan 3 cost 1800
  no shutdown
DellEMC(conf-if-te-1/1)# end
DellEMC#
```

Related Commands

- `show spanning-tree pvst` — views the PVST+ configuration.

**spanning-tree pvst err-disable**

Place ports in an Err-Disabled state if they receive a PVST+ BPDU when they are members an untagged VLAN.

**S4048**

**Syntax**

```none
spanning-tree pvst err-disable cause invalid-pvst-bpdu
```

**Defaults**

Enabled; ports are placed in the Err-Disabled state if they receive a PVST+ BPDU when they are members of an untagged VLAN.

**Command Modes**

INTERFACE

</tr>
</tbody>
</table>
## Usage Information

Some non-Dell EMC Networking systems which have hybrid ports participating in PVST+ transmit two kinds of BPDUs: an 802.1D BPDU and an untagged PVST+ BPDU.

Dell EMC Networking systems do not expect PVST+ BPDU on an untagged port. If this happens, Dell EMC Networking OS places the port in the Error-Disable state. This behavior might result in the network not converging. To prevent Dell EMC Networking OS from executing this action, use the `no spanning-tree pvst err-disable` command.

### Related Commands

- `show spanning-tree pvst` — views the PVST+ configuration.

## tc-flush-standard

Enable the MAC address flushing after receiving every topology change notification.

### S4048

**Syntax**

```plaintext
tc-flush-standard
```

To disable, use the `no tc-flush-standard` command.

**Defaults**

Disabled.

**Command Modes**

- CONFIGURATION

### vlan bridge-priority

Set the PVST+ bridge-priority for a VLAN or a set of VLANs.

**S4048**

**Syntax**

```
vlan vlan-range bridge-priority value
```

To return to the default value, use the `no vlan bridge-priority` command.

**Parameters**

- **vlan VLAN-range**
  - Enter the keyword `vlan` then the VLAN numbers. The range is from 1 to 4094.

- **bridge-priority value**
  - Enter the keywords `bridge-priority` then the bridge priority value in increments of 4096. The range is from 0 to 61440. The default is 32768.

**Defaults**

32768

**Command Modes**

Related Commands

- `vlan forward-delay` — changes the time interval before Dell EMC Networking OS transitions to the Forwarding state.
- `vlan hello-time` — change the time interval between BPDUs.
- `vlan max-age` — changes the time interval before PVST+ refreshes.
- `show spanning-tree pvst` — displays the PVST+ configuration.

**vlan forward-delay**

Set the amount of time the interface waits in the Listening state and the Learning state before transitioning to the Forwarding state.

**S4048**

Syntax

```
vlan vlan-range forward-delay seconds
```

To return to the default setting, use the `no vlan forward-delay` command.

Parameters

- `vlan vlan-range` Enter the keyword `vlan` then the VLAN numbers. The range is from 1 to 4094.
- `forward-delay seconds` Enter the keywords `forward-delay` then the time interval, in seconds, that Dell EMC Networking OS waits before transitioning PVST+ to the forwarding state. The range is from 4 to 30 seconds. The default is 15 seconds.

Defaults

15 seconds

- `vlan max-age` — changes the time interval before PVST+ refreshes.
- `show spanning-tree pvst` — displays the PVST+ configuration.

### `vlan hello-time`

Set the time interval between generation of PVST+ 7 BPDUs.

**S4048**

**Syntax**

```
vlan vlan-range hello-time seconds
```

To return to the default value, use the `no vlan hello-time` command.

**Parameters**

- `vlan vlan-range` Enter the keyword `vlan` then the VLAN numbers. The range is from 1 to 4094.
- `hello-time seconds` Enter the keywords `hello-time` then the time interval, in seconds, between transmission of BPDUs. The range is from 1 to 10 seconds. The default is 2 seconds.

**Defaults**

- **2 seconds**

- `vlan forward-delay` — changes the time interval before Dell EMC Networking OS transitions to the forwarding state.
- `vlan max-age` — changes the time interval before PVST+ refreshes.
- `show spanning-tree pvst` — displays the PVST+ configuration.

### vlan max-age

To maintain configuration information before refreshing that information, set the time interval for the PVST+ bridge.

#### S4048

**Syntax**

```
vlan vlan-range max-age seconds
```

To return to the default, use the `no vlan max-age` command.

**Parameters**

- `vlan vlan-range` Enter the keyword `vlan` then the VLAN numbers. The range is from 1 to 4094.
- `max-age seconds` Enter the keywords `max-age` then the time interval, in seconds, that Dell EMC Networking OS waits before refreshing configuration information. The range is from 6 to 40 seconds. The default is **20 seconds**.

**Defaults**

- **20 seconds**

Quality of Service (QoS)

The Dell EMC Networking OS commands for quality of service (QoS) include traffic conditioning and congestion control. QoS commands are not universally supported on all Dell EMC Networking products.

Topics:

- Global Configuration Commands
- Per-Port QoS Commands
- Policy-Based QoS Commands
- DSCP Color Map Commands

Global Configuration Commands

There is only one global configuration QoS command.

```plaintext
qos-rate-adjust
```

By default, while rate limiting, policing, and shaping, Dell EMC Networking OS does not include the Preamble, SFD, or the IFG fields. These fields are overhead; only the fields from MAC destination address to the CRC are used for forwarding and are included in these rate metering calculations. You can optionally include overhead fields in rate metering calculations by enabling QoS Rate Adjustment.

**Syntax**

`qos-rate-adjustment overhead-bytes`

**Parameters**

- `overhead-bytes`: Include a specified number of bytes of packet overhead to include in rate limiting, policing, and shaping calculations. The range is from 1 to 31.

**Defaults**

QoS rate adjustment is disabled by default.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Usage Information
By default, when rate policing and shaping, the system does not include the Preamble, SFD, or the IFG fields. These fields are overhead; only the fields from MAC destination address to the CRC are used for forwarding and are included in these rate metering calculations.

Per-Port QoS Commands

Per-port QoS (port-based QoS) allows you to define the QoS configuration on a per-physical-port basis.

dot1p-priority

Assign a value to the IEEE 802.1p bits on the traffic this interface receives.

Syntax

dot1p-priority priority-value

To delete the IEEE 802.1p configuration on the interface, use the no dot1p-priority command.

Defaults
none

</tbody>
</table>
The `dot1p-priority` command changes the priority of incoming traffic on the interface. The system places traffic marked with a priority in the correct queue and processes that traffic according to its queue.

When you set the priority for a port channel, the physical interfaces assigned to the port channel are configured with the same value. You cannot assign the `dot1p-priority` command to individual interfaces in a port channel.

### rate police

Police the incoming traffic rate on the selected interface.

**Syntax**

```
rate police [kbps] committed-rate [burst-KB] [peak [kbps] peak-rate [burst-KB]] [vlan vlan-id]
```

**Parameters**

- **kbps**
  - Enter the keyword `kbps` to specify the rate limit in Kilobits per second (Kbps). The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps).

- **committed-rate**
  - Enter the bandwidth in Mbps. The range is from 0 to 40000.

- **burst-KB**
  - (OPTIONAL) Enter the burst size in KB. The range is from 16 to 200000. The default is 50.

- **peak peak-rate**
  - (OPTIONAL) Enter the keyword `peak` then a number to specify the peak rate in Mbps. The range is from 0 to 40000.

- **vlan vlan-id**
  - (OPTIONAL) Enter the keyword `vlan` then a VLAN ID to police traffic to those specific VLANs. The range is from 1 to 4094.

**Defaults**

Granularity for `committed-rate` and `peak-rate` is Mbps unless you use the `kbps` option.

**Command Modes**

`INTERFACE`

### rate-shape

Shape the traffic output on the selected interface.

**Syntax**

```
rate shape [kbps] rate [burst-KB]
```

**Parameters**

- **kbps**
  - Enter the keyword `kbps` to specify the rate limit in Kilobits per second (Kbps). Enter the value in multiples of 64. The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps).

- **rate**
  - The range is from 10 to 40000.

- **burst-KB**
  - (OPTIONAL) Enter the burst size in KB. The range is from 0 to 10000. The default is 50.

**Defaults**

Granularity for rate is **Mbps** unless you use the `kbps` option.

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

If traffic is shaped between 64 and 1000 Kbs, for some values, the shaped rate is much less than the value configured.

On 40-port 10G stack-unit if the traffic is shaped between 64 and 1000 Kbs, for some values, the shaped rate is much less than the value configured.

**NOTE:** When packets of size greater than 7000 bytes are expected to be received from the network, Dell EMC Networking recommends that you configure the burst value to be more than 175 KB if you configured the rate shape. Such a setting ensures proper bandwidth sharing across queues.

**Related Commands**

- **rate-shape** — shapes traffic output as part of the designated policy.

### service-class dot1p-mapping

Configure a service-class criterion based on a dot1p value.

**S4048-ON**

**Syntax**

```
service-class dot1p-mapping {dot1p0 queue | dot1p1 queue | dot1p2 queue | dot1p3 queue | dot1p4 queue | dot1p5 queue | dot1p6 queue | dot1p7 queue}
```

**Parameters**

- **queue**
  
  Enter a value from 0 to 7.

**Defaults**

For each dot1p Priority, the default CoS queue value is:

- Dot1p Priority : 0 1 2 3 4 5 6 7

**Command Modes**

- CONFIGURATION

</tbody>
</table>

Usage Information

To apply dot1p-queue-mapping, use the service-class dynamic dot1p command.

Related Commands

- show qos dot1p-queue-mapping — displays the dot1p priority to queue mapping on the switch.

service-class dynamic dot1p

Honor all 802.1p markings on incoming switched traffic on an interface (from INTERFACE mode) or on all interfaces (from CONFIGURATION mode). A CONFIGURATION mode entry supersedes an INTERFACE mode entry.

S4048-ON

Syntax

service-class dynamic dot1p

To return to the default setting, use the no service-class dynamic dot1p command.

Defaults

All dot1p traffic is mapped to Queue 0 unless you enable the service-class dynamic dot1p command. The default mapping is as follows:

<table>
<thead>
<tr>
<th>dot1p</th>
<th>Queue ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>

<td>Expanded the command to permit configuration on port channels.</td>
</tr>
<tr>
<td>6.1.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

To honor all incoming 802.1p markings on incoming switched traffic on the interface, enter this command. By default, this facility is not enabled (that is, the 802.1p markings on incoming traffic are not honored).

You can apply this command on both physical interfaces and port channels. When you set the service-class dynamic for a port channel, the physical interfaces assigned to the port channel are automatically configured; you cannot assign the service-class dynamic command to individual interfaces in a port channel.

- All dot1p traffic is mapped to Queue 0 unless you enable the service-class dynamic dot1p command on an interface or globally.
- Layer 2 or Layer 3 service policies supersede dot1p service classes.
strict-priority unicast

Configure a unicast queue as a strict-priority (SP) queue.

**Syntax**

```
strict-priority unicast number
```

**Parameters**

- `unicast number` Enter the keyword `unicast` then the queue number. The range is from 1 to 3.

**Defaults**

- none

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

After you configure a unicast queue as strict-priority, that particular queue, on the entire chassis, is treated as a strict-priority unicast. Traffic for a strict priority is scheduled before any other queues are serviced. For example, if you send 100% line rate traffic over the SP queue, it starves all other queues on the ports on which this traffic is flowing.

**Policy-Based QoS Commands**

Policy-based traffic classification is handled with class maps. These maps classify data traffic into one of eight classes. Dell EMC Networking OS enables you to match multiple class maps and specify multiple match criteria. Policy-based QoS is not supported on logical interfaces, such as port-channels, VLANs, or loopbacks.
**bandwidth-percentage**

Assign a percentage of weight to the class/queue.

### S4048-ON

**Syntax**

```
bandwidth-percentage percentage
```

To remove the bandwidth percentage, use the `no bandwidth-percentage` command.

**Parameters**

- `percentage`  
  Enter the percentage assignment of bandwidth to the class/queue. The range is from 1 to 100% (granularity 1%).

**Defaults**

none

**Command Modes**

CONFIGURATION (conf-qos-policy-out)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

The unit of bandwidth percentage is 1%. If the sum of the bandwidth percentages given to all eight classes exceeds 100%, the bandwidth percentage automatically scales down to 100%.

**Related Commands**

- `qos-policy-output` — creates a QoS output policy.
Create/access a class map. Class maps differentiate traffic so that you can apply separate quality-of-service policies to each class.

Syntax

```
class-map {match-all | match-any} class-map-name [cpu-qos] [layer2]
```

Parameters

- **match-all**: Determines how packets are evaluated when multiple match criteria exist. Enter the keywords `match-all` to determine that the packets must meet all the match criteria in order to be a member of the class.

- **match-any**: Determines how packets are evaluated when multiple match criteria exist. Enter the keywords `match-any` to determine that the packets must meet at least one of the match criteria in order to be a member of the class.

- **class-map-name**: Enter a name of the class for the class map in a character format (32 character maximum).

- **cpu-qos**: Enter the keyword `cpu-qos` to assign this Class Map to control plane traffic only (CoPP).

- **layer2**: Enter the keyword `layer2` to specify a Layer 2 Class Map. The default is **Layer 3**.

Defaults

Layer 3

### clear qos statistics

Clear qos statistics clears statistics from show qos statistics.

**S4048-ON**

**Syntax**

```
clear qos statistics interface-name
```

**Parameters**

- `interface-name` Enter one of the following keywords:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults**

`none`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

**Related Commands**

- `show qos statistics` — displays the QoS statistics.
match ip access-group

Configure match criteria for a class map, based on the access control list (ACL).

**NOTE:** IPv6 class-maps and IP-any class-maps do not match. This condition is true for IPv6 and IP-any class-maps on both ACLs as well as VLANs.

**Syntax**

```
[seq sequence number] match ip access-group access-group-name [set-ip-dscp value | set-color value]
```

To remove ACL match criteria from a class map, use the `no [seq sequence number] match ip access-group access-group-name [set-ip-dscp value | set-color value]` command.

**Parameters**

- `seq sequence number` (OPTIONAL) Enter the keyword `seq` then the sequence number. The range is from 1 to 100. By default, the sequence number are assigned in multiples of five.
- `access-group-name` Enter the ACL name whose contents are used as the match criteria in determining if packets belong to the class the class-map specifies.
- `set-ip-dscp value` (OPTIONAL) Enter the keywords `set-ip-dscp` then the IP DSCP value. The matched traffic is marked with the DSCP value. The range is from 0 to 63.
- `set-color value` (Optional) Enter the keyword `set-color` followed by a color value. Traffic that fulfills the match criteria is marked with the color value that you specify. The default value is Yellow.

**Defaults**

- none

</tbody>
</table>

Usage Information
To access this command, enter the class-map command. After the class map is identified, you can configure the match criteria. For class-map match-any, a maximum of five ACL match criteria are allowed. For class-map match-all, only one ACL match criteria is allowed.

Related Commands

match ip dscp

Use a differentiated services code point (DSCP) value as a match criteria.

Syntax

```
[seq sequence number] match {ip | ipv6 | ip-any} dscp dscp-list [set-ip-dscp value]
```

To remove a DSCP value as a match criteria, use the no [seq sequence number] match {ip | ipv6 | ip-any} dscp dscp-list [[multicast] set-ip-dscp value] command.
Parameters

- seq sequence number
  (OPTIONAL) Enter the keyword seq then the sequence number. The range is from 1 to 100. By default, the sequence number are assigned in multiples of five.

- ip
  Enter the keyword ip to support IPv4 traffic.

- ipv6
  Enter the keyword ipv6 to support IPv6 traffic.

- ip-any
  Enter the keyword ip-any to support IPv4 and IPv6 traffic.

- dscp-list
  Enter the IP DSCP values that is to be the match criteria. Separate values by commas — no spaces (1,2,3) or indicate a list of values separated by a hyphen (1-3). The range is from 0 to 63.

- set-ip-dscp value
  (OPTIONAL) Enter the keywords set-ip-dscp then the IP DSCP value. The matched traffic is marked with the DSCP value. The range is from 0 to 63.

Defaults

none

</tr>
</tbody>
</table>
Usage Information

To access this command, enter the class-map command. After the class map is identified, you can configure the match criteria.

The match ip dscp and match ip precedence commands are mutually exclusive.

Up to 64 IP DSCP values can be matched in one match statement. For example, to indicate IP DCSP values 0 1 2 3 4 5 6 7, enter either the match ip dscp 0,1,2,3,4,5,6,7 or match ip dscp 0-7 command.

**NOTE:** Only one of the IP DSCP values must be a successful match criterion, not all of the specified IP DSCP values must match.

Related Commands

- `class-map` — identifies the class map.

match ip precedence

Use IP precedence values as a match criteria.

**Syntax**

```plaintext
[seq sequence number] match {ip | ipv6 | ip-any} precedence ip-precedence-list
[set-ip-dscp value]
```

To remove IP precedence as a match criteria, use the no match {ip | ipv6 | ip-any} precedence ip-precedence-list [multicast] set-ip-dscp value command.

**Parameters**

- `seq sequence number` (OPTIONAL) Enter the keyword seq then the sequence number. The range is from 1 to 100. By default, the sequence number are assigned in multiples of five.
- `ip` Enter the keyword ip to support IPv4 traffic.
- `ipv6` Enter the keyword ipv6 to support IPv6 traffic.
- `ip-any` Enter the keyword ip-any to support IPv4 and IPv6 traffic.
- `ip-precedence-list` Enter the IP precedence value(s) as the match criteria. Separate values by commas — no spaces (1,2,3) or indicate a list of values separated by a hyphen (1-3). The range is from 0 to 7.
- `set-ip-dscp value` (OPTIONAL) Enter the keywords set-ip-dscp then the IP DSCP value. The matched traffic is marked with the DSCP value. The range is from 0 to 63.

**Defaults**

none

### Usage Information

To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria.

The `match ip precedence` command and the `match ip dscp` command are mutually exclusive.

Up to eight precedence values can be matched in one match statement. For example, to indicate the IP precedence values 0 1 2 3, enter either the `match ip precedence 0-3` or `match ip precedence 0,1,2,3` command.

**NOTE:** Only one of the IP precedence values must be a successful match criterion, not all of the specified IP precedence values must match.

### Related Commands

- `class-map` — identifies the class map.

### match ip vlan

Uses a VLAN as the match criterion for an L3 class map.

**Syntax**

```
[seq sequence number] match ip vlan vlan-id
```

**Parameters**

- `seq sequence number` (OPTIONAL) Enter the keyword seq then the sequence number. The range is from 1 to 100. By default, the sequence number are assigned in multiples of five.

```bash
tenant ingressaclass-map class1
set match ip precedence 3
action forward

!tenant ingressaclass-map class2
set match ip vlan 456
action forward
```
The `vlan vlan-id` command allows you to enter the keyword `vlan` and then the ID of the VLAN. The range is from 1 to 4094.

**Defaults**
- None.

**Command Modes**
- CONF-CLASS-MAP

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.12(0.0) | Introduced the `seq` option for the class-map on all the Dell EMC Networking OS platforms.
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5(0.1) | Introduced on the Z9500.
9.4(.0) | Introduced on the S-Series and Z-Series.

**Usage Information**
- To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria.
- Use this command to match an IP class-map against a single VLAN ID.

**Related Commands**
- `class-map` — identifies the class map.

### match ip vrf

**Description**
Uses a VRF as the match criterion for an L3 class map.

**S4048-ON**

**Syntax**
```
match ip vrf vrf-id
```

**Parameters**
- `vrf vrf-id`
Enter the `vrf` keyword and then the ID of the VRF. The range is from 1 to 63.

**Defaults**
- none

**Command Modes**
- CONF-CLASS-MAP

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Version | Description
--- | ---
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5.(0.1) | Introduced on the Z9500.
9.4.(0.0) | Introduced on the S-Series and Z-Series.

Usage Information
To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria.
Use this command to match an IP class-map against a single VRF ID.

Related Commands
- `class-map` — identifies the class map.

**match mac access-group**

Configure a match criterion for a class map, based on the contents of the designated MAC ACL.

Syntax
```
[seq sequence number] match mac access-group {mac-acl-name}
```

Parameters
- `mac-acl-name` Enter a MAC ACL name. Its contents is used as the match criteria in the class map.

Defaults
none

Command Modes
- CLASS-MAP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0(2.0) | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
### match mac dot1p

Configure a match criterion for a class map based on a dot1p value.

**Syntax**
```
[seq sequence number] match mac dot1p {dot1p-list}
```

**Parameters**
- `seq sequence number` (OPTIONAL) Enter the keyword seq then the sequence number. The range is from 1 to 100. By default, the sequence number are assigned in multiples of five.
- `dot1p-list` Enter a dot1p value. The range is from 0 to 7.

**Defaults**
none

**Command Modes**
CLASS-MAP

9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
### match mac vlan

Configure a match criterion for a class map based on VLAN ID.

**Syntax**

```
[seq sequence number] match mac vlan number
```

**Parameters**

- `seq sequence number` (OPTIONAL) Enter the keyword seq then the sequence number. The range is from 1 to 100. By default, the sequence number are assigned in multiples of five.
- `number` Enter the VLAN ID. The range is from 1 to 4094.

**Defaults**

none

**Command Modes**

CLASS-MAP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

---

**Usage Information**

To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria.

**Related Commands**

- `class-map` — identifies the class map.
**Policy-aggregate**

Allow an aggregate method of configuring per-port QoS via policy maps. An aggregate QoS policy is part of the policy map (output) applied on an interface.

### S4048–ON

**Syntax**

```
policy-aggregate qos-policy-name
```

To remove a policy aggregate configuration, use the `no policy-aggregate qos-policy-name` command.

**Parameters**

- **qos-policy-name** Enter the name of the policy map in character format (32 characters maximum).

**Defaults**

- none

**Command Modes**

- CONFIGURATION (policy-map-input and policy-map-output)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

</tr>
</tbody>
</table>
Usage Information
An aggregate output QoS policy applies to all outbound port traffic. An aggregate output QoS policy can coexist with per-queue output QoS policies. If the rate shape exists in both aggregate and per-queue qos-policy, minimum of 2 take effect. Some of all Queue-rate will not exceed aggregate.

Related Commands
- policy-map-input — creates an input policy map.
- policy-map-output — creates an output policy map.

policy-map-input
Create an input policy map.

S4048-ON

Syntax

policy-map-input policy-map-name cpu-qos | [layer2] [cpu-qos]

To remove an input policy map, use the no policy-map-input policy-map-name cpu-qos | [layer2] [cpu-qos] command.

Parameters

- policy-map-name: Enter the name of the policy map in character format (32 characters maximum).
- cpu-qos: Enter the cpu-qos keyword to assign this ACL to control plane traffic only.
- layer2: (OPTIONAL) Enter the keyword layer2 to specify a Layer 2 Class Map. The default is Layer 3.
- cpu-qos: (OPTIONAL) Enter the keyword cpu-qos to create an input policy to be used to rate-limit control-plane traffic (CoPP).

Defaults

Layer 3

Command Modes
CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
The input policy map is used to classify incoming traffic to different flows using class-map, QoS policy, or incoming packets DSCP. This command enables Policy-Map-Input Configuration mode (conf-policy-map-in). When you configure an input policy map for CoPP, you must enter the keyword cpu-qos.

Related Commands

- service-queue — assigns a class map and QoS policy to different queues.
- service-policy input — applies an input policy map to the selected interface.

**policy-map-output**

Create an output policy map.

**Syntax**

```
policy-map-output policy-map-name
```

To remove a policy map, use the `no policy-map-output policy-map-name` command.

**Parameters**

- `policy-map-name` Enter the name for the policy map in character format (32 characters maximum).

**Defaults**

none

**Command Modes**

CONFIGURATION

**Command History**

8.2.1.0 | Policy name character limit increased from 16 to 32.
7.6.1.0 | Introduced on the C-Series and S-Series.
6.1.1.1 | Introduced on the E-Series.

Usage Information
To assign traffic to different flows using QoS policy, use the Output Policy map. This command enables Policy-Map-Output Configuration mode (conf-policy-map-out).

Related Commands
- service-queue — assigns a class map and QoS policy to different queues.
- policy-aggregate — allows an aggregate method of configuring per-port QoS using policy maps.
- service-policy output — applies an output policy map to the selected interface.

qos-policy-input
Create a QoS input policy on the router.

Syntax
qos-policy-input qos-policy-name cpu-qos | layer2

Parameters
- **qos-policy-name**: Enter the name for the policy map in character format (32 characters maximum).
- **cpu-qos**: (OPTIONAL) Enter the keyword cpu-qos keyword to assign this ACL to control plane traffic only.
- **layer2**: (OPTIONAL) Enter the keyword layer2 to specify a Layer 2 Class Map. The default is Layer 3.

Defaults
Layer 3

</tbody>
</table>

## Usage Information

Use this command to specify the name of the input QoS policy. Once input policy is specified, rate-police can be defined. This command enables the qos-policy-input configuration mode — (conf-qos-policy-in).

When changing a Service-Queue configuration in a QoS policy map, all QoS rules are deleted and re-added automatically to ensure that the order of the rules is maintained. As a result, the Matched Packets value shown in the show qos statistics command is reset.

If you create a QoS input policy to be used for CoPP, you must enter the keyword cpu-qos.

### Related Commands

- **rate police** — incoming traffic policing function.

## qos-policy-output

Create a QoS output policy.

### Syntax

```plaintext
qos-policy-output qos-policy-name
```

To remove an existing output QoS policy, use the `no qos-policy-output qos-policy-name` command.

### Parameters

- **qos-policy-name**
  
  Enter your output QoS policy name in character format (32 characters maximum).
Defaults
none

</tbody>
</table>

Usage Information
Use this command to specify the name of the output QoS policy. Once output policy is specified, rate-shape, scheduler strict, bandwidth-percentage, and WRED can be defined. This command enables the qos-policy-output configuration mode—(conf-qos-policy-out).

Related Commands
- bandwidth-percentage — assigns percentage of bandwidth to the class/queue.
- wred — assigns yellow or green drop precedence.

queue egress

Assign a WRED Curve to all eight egress Multicast queues or designate the percentage for the Multicast bandwidth queue.

Syntax
queue egress multicast linecard {slot number port-set number | all} [wred-profile name | multicast-bandwidth percentage]

Parameters
- linecard number: Enter the keyword linecard then the line card slot number.
- slot number: Enter the keyword slot then the slot number.
- port-set number: Enter the keyword port-set then the port-set number.
- all: Enter the keyword all to apply the settings to all ports.
- wred-profile name: Enter the keyword wred-profile then the name of the WRED profile.
- multicast-bandwidth percentage: Enter the keyword multicast-bandwidth followed by the percentage for the Multicast bandwidth queue.

To return to the default, use the no queue egress multicast linecard {slot number port-set number | all} [wred-profile name | multicast-bandwidth percentage] command.
port-set number Enter the keywords port-set then the line card’s port pipe. The range is from 0 or 1.
all Enter the keyword all to apply to all line cards.
wred-profile name (OPTIONAL) Enter the keywords wred-profile then your WRED profile name in character format (16 character maximum). Or use one of the pre-defined WRED profile names.
Pre-defined Profiles: wred_drop, wred-ge_y, wred_ge_g, wred_teng_y, wred_teng_g.
multicast-bandwidth percentage (OPTIONAL) Enter the keywords multicast-bandwidth then the bandwidth percentage. The range is from 0 to 100%.

Defaults none

<td>Added support for multicast-bandwidth.</td>
</tr>
<tr>
<td>7.4.1.0 and 6.5.3.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

This command does not uniquely identify a queue, but rather identifies only a set of queues. The WRED curve is applied to all eight egress Multicast queues.

Important Points to Remember — Multicast-Bandwidth Option

- A unique multicast weighted fair queuing (WFG) setting can be applied only on a per port-pipe basis. The minimum percentage of the multicast bandwidth assigned to any of the ports in the port-pipe takes effect for the entire port-pipe.
- If the percentage of multicast bandwidth is 0, control traffic going through multicast queues are dropped.
- The no form of the command without multicast-bandwidth and wred-profile, removes both the wred-profile and multicast-bandwidth configuration.
- On 10-Gigabit ports only, the multicast bandwidth option works only if the total unicast bandwidth is more than the multicast bandwidth.
- If strict priority is applied along with multicast-bandwidth, the effect of strict priority is on all ports where unicast and multicast bandwidth are applied.
- When multicast bandwidth is assigned along with unicast bandwidth, first multicast bandwidth is reserved for that port, then the remaining unicast bandwidth configured is adjusted according to the bandwidth available after reserving for multicast bandwidth.
queue ingress

Assign a WRED Curve to all eight ingress Multicast queues or designate the percentage for the Multicast bandwidth queue.

Syntax

```
queue ingress multicast {linecard slot number port-set number | all} [wred-profile name]
```

To return to the default, use the `no queue ingress multicast {linecard slot number port-set number | all} [wred-profile name]` command.

Parameters

- **linecard number**: Enter the keyword `linecard` then the line card slot number.
- **port-set number**: Enter the keywords `port-set` then the line card’s port pipe. The range is from 0 or 1.
- **all**: Enter the keyword `all` to apply to all line cards.
- **wred-profile name**: (OPTIONAL) Enter the keywords `wred-profile` then your WRED profile name in character format (16 character maximum). Or use one of the pre-defined WRED profile names.
  - Pre-defined Profiles: `wred_drop`, `wred_ge_y`, `wred_ge_g`, `wred_teng_y`, `wred_teng_g`.

Defaults

None

Command Modes

CONFIGURATION

Command History

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>7.4.1.0 and 6.5.3.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

This command does not uniquely identify a queue, but rather identifies only a set of queues. The WRED Curve is applied to all eight ingress Multicast queues.

**NOTE:** The `multicast-bandwidth` option is not supported on queue ingress. If you attempt to use the `multicast-bandwidth` option, the following reject error message is generated: `% Error: Bandwidth-percent is not allowed for ingress multicast."

rate-police

Specify the policing functionality on incoming traffic.

Syntax

```
rate-police [kbps] committed-rate [burst-KB] [peak [kbps] peak-rate [burst-KB]]
```
**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kbps</td>
<td>Enter the keyword <strong>kbps</strong> to specify the rate limit in Kilobits per second (Kbps). Make the following value a multiple of 64. The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps).</td>
</tr>
<tr>
<td>committed-rate</td>
<td>Enter the bandwidth in Mbps. The range is from 0 to 40000.</td>
</tr>
<tr>
<td>burst-KB</td>
<td>(OPTIONAL) Enter the burst size in KB. The range is from 16 to 200000. The default is <strong>100</strong>.</td>
</tr>
<tr>
<td>peak peak-rate</td>
<td>(OPTIONAL) Enter the keyword <strong>peak</strong> then a number to specify the peak rate in Mbps. The range is from 0 to 40000. The default is the same as designated for <strong>committed-rate</strong>.</td>
</tr>
</tbody>
</table>

**Defaults**

Burst size is 100KB. **peak-rate** is by default the same as **committed-rate**. Granularity for **committed-rate** and **peak-rate** is Mbps unless you use the **kbps** option.

</tr>
</tbody>
</table>

**Usage Information**

The default burst size is 100KB. If a different value is required, you must configure the burst size to the required value.

**Related Commands**

- **rate police** — specifies traffic policing on the selected interface.
- **qos-policy-input** — creates a QoS output policy.
rate-shape

Shape traffic output as part of the designated policy.

Syntax

Parameters
- **kbps**: Enter the keyword **kbps** to specify the rate limit in Kilobits per second (Kbps). Make the following value a multiple of 64. The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps).
- **pps**: Enter the keyword **pps** to specify the rate limit in packets per second (pps).
- **burst-kbps** (OPTIONAL) Enter the burst size in KB. The range is from 0 to 40000. The default is 100.
- **burst-packets**: Enter the peak rate or committed rate burst size in packets per seconds.

Defaults
Burst size is 10KB. Granularity for rate is Mbps unless you use the kbps option.

Command Modes
- QOS-POLICY-OUT

</tbody>
</table>

Usage Information
On 40-port 10G stack-unit if the traffic is shaped between 64 and 1000 Kbs, for some values, the shaped rate is much less than the value configured. You must configure the peak rate and peak burst size using the same value: kilobits or packets per second. Similarly, you must configure the committed rate and committed burst size with the...
same measurement. Peak rate refers to the maximum rate for traffic arriving or exiting an interface under normal traffic conditions. Peak burst size indicates the maximum size of unused peak bandwidth that is aggregated. This aggregated bandwidth enables brief durations of burst traffic that exceeds the peak rate and committed burst. Committed rate refers to the guaranteed bandwidth for traffic entering or leaving the interface under normal network conditions. When traffic propagates at an average rate that is less than or equal to the committed rate, it is considered to be green-colored or coded. When the transmitted traffic falls below the committed rate, the bandwidth, which is not used by any traffic that is traversing the network, is aggregated to form the committed burst size. Traffic is considered to be green-colored up to the point at which the unused bandwidth does not exceed the committed burst size.

Related Commands
- `rate shape` — shapes traffic output as part of the designated policy.
- `qos-policy-output` — creates a QoS output policy.

**service-policy input**

Apply an input policy map to the selected interface.

**S4048-ON**

**Syntax**

```
service-policy input policy-map-name [layer2]
```

To remove the input policy map from the interface, use the no service-policy input policy-map-name [layer2] command.

**Parameters**

- `policy-map-name` Enter the name for the policy map in character format (32 characters maximum). You can identify an existing policy map or name one that does not yet exist.
- `layer2` (OPTIONAL) Enter the keyword layer2 to specify a Layer 2 Class Map. The default is Layer 3.

**Defaults**

Layer 3

**Command Modes**

INTERFACE

**Command History**

</tbody>
</table>
## Version Description

- **9.0.2.0**
  Introduced on the S6000.

- **8.3.19.0**
  Introduced on the S4820T.

- **8.3.11.1**
  Introduced on the Z9000.

- **8.3.7.0**
  Introduced on the S4810.

- **7.6.1.0**
  Introduced on the S-Series.

- **7.5.1.0**
  Introduced on the C-Series.

- **7.4.1.0**
  E-Series Only: Expanded to add support for Layer 2.

- **6.1.1.1**
  Introduced on the E-Series.

### Usage Information

You can attach a single policy-map to one or more interfaces to specify the service-policy for those interfaces. A policy map attached to an interface can be modified.

**NOTE:** The `service-policy` commands are not allowed on a port channel. The `service-policy input policy-map-name` command and the `service-class dynamic dot1p` command are not allowed simultaneously on an interface. However, the `service-policy input` command (without the `policy-map-name` option) and the `service-class dynamic dot1p` command are allowed on an interface.

### Related Commands

- `policy-map-input` — creates an input policy map.

---

## service-policy output

Apply an output policy map to the selected interface.

### S4048-ON

**Syntax**

```plaintext
service-policy output policy-map-name
```

To remove the output policy map from the interface, use the `no service-policy output policy-map-name` command.

**Parameters**

- `policy-map-name` Enter the name for the policy map in character format (32 characters maximum). You can identify an existing policy map or name one that does not yet exist.

**Defaults**

- None

**Command Modes**

- INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

<table>

</tbody>
</table>
A single policy-map can be attached to one or more interfaces to specify the service-policy for those interfaces. A policy map attached to an interface can be modified.

Related Commands

- policy-map-output — creates an output policy map.

**service-queue**

Assign a class map and QoS policy to different queues.

**S4048-ON**

**Syntax**

```
service-queue queue-id [class-map class-map-name] [qos-policy qos-policy-name]
```

To remove the queue assignment, use the no service-queue queue-id [class-map class-map-name] [qos-policy qos-policy-name] command.

**Parameters**

- **queue-id**: Enter the value used to identify a queue. The range is from 0 to 7.
- **class-map class-map-name**: (OPTIONAL) Enter the keyword class-map then the class map name assigned to the queue in character format (32 character maximum).
  
  **NOTE**: This option is available under policy-map-input only.

- **qos-policy qos-policy-name**: (OPTIONAL) Enter the keywords qos-policy then the QoS policy name assigned to the queue in text format (32 characters maximum). This specifies the input QoS policy assigned to the queue under policy-map-input and output QoS policy under policy-map-output context.

**Defaults**

none

**Command Modes**

CONFIGURATION (conf-policy-map-in and conf-policy-map-out)
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

### Usage Information

There are eight queues per interface on the S6000 and four queues on the S-Series. This command assigns a class map or QoS policy to different queues.

### Related Commands

- `class-map` — identifies the class map.
- `service-policy input` — applies an input policy map to the selected interface.
- `service-policy output` — applies an output policy map to the selected interface.

---

**set**

Mark outgoing traffic with a differentiated service code point (DSCP) or dot1p value.

### S4048-ON

**Syntax**

```plaintext
set {ip-dscp value | mac-dot1p value}
```

**Parameters**

- `ip-dscp value` (OPTIONAL) Enter the keywords `ip-dscp` then the IP DSCP value. The range is from 0 to 63.
- `mac-dot1p value` Enter the keywords `mac-dot1p` then the dot1p value. The range is from 0 to 7.

**Defaults**

`none`
Command Modes

CONFIGURATION (conf-qos-policy-in)

Command History

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

After the IP DSCP bit is set, other QoS services can then operate on the bit settings.

**show qos class-map**

View the current class map information.

**Syntax**

```sh
show qos class-map [class-name]
```

**Parameters**

- `class-name` (Optional) Enter the name of a configured class map.

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Example

```
DellEMC# show qos class-map
Class-map match-any CM
  seq 5 Match ip access-group ACL
DellEMC#
```

### Related Commands

- `class-map` — identifies the class map.

### show qos dot1p-queue-mapping

Displays the dot1p priority to queue mapping on the switch.

#### Syntax

```
show qos dot1p-queue-mapping
```

#### Defaults

- **Dot1p Priority:** 0 1 2 3 4 5 6 7
- **Queue:** 0 0 0 1 2 3 3 3

#### Command Modes

- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Usage Information**

trust dot1p, dot1p-priority, service-class dynamic dot1; all these features work over the mapping in this command output.

**Related Commands**

- `service-class dot1p-mapping` — Identifies the class map.

---

**show qos policy-map**

View the QoS policy map information.

**S4048-ON**

**Syntax**

```
show qos policy-map {summary [interface] | detail}
```

**Parameters**

- **9.8(0.0P5)**
  - Introduced on the S4048-ON.
- **9.8(0.0P2)**
  - Introduced on the S3048-ON.
- **summary interface**
  - To view a policy map interface summary, enter the keyword `summary` and optionally one of the following keywords and slot/port or number information:
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- **detail**
  - To view a policy map interface in detail, enter the keyword `detail` and optionally one of the following keywords and slot/port or number information:
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults**

```
none
```

**Command Modes**

```
• EXEC
• EXEC Privilege
```

```

**Example (IPv4)**

```
DellEMC# show qos policy-map detail tengigabitethernet 1/1

Interface TeGigabitEthernet 4/1
Policy-map-input policy
    Trust dffserv

Queue# Class-map-name Qos-policy-name
    0 -                     q0
    1  CM1                   q1
    2  CM2                   q2
    3  CM3                   q3

DellEMC#
```

**Example (IPv6)**

```
DellEMC# show qos policy-map detail Tengigabitethernet 1/1

Interface TeGigabitEthernet 4/1
Policy-map-input pmap1

DellEMC#
```
show qos policy-map-input

View the input QoS policy map details.

**S4048-ON**

**Syntax**

```
show qos policy-map-input [policy-map-name] [class class-map-name] [qos-policy-input qos-policy-name]
```

**Parameters**

- `policy-map-name` Enter the policy map name.
- `class class-map-name` Enter the keyword class then the class map name.
- `qos-policy-input qos-policy-name` Enter the keyword qos-policy-input then the QoS policy name.

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

show qos policy-map-input

View the input QoS policy map details.

Syntax

```
show qos policy-map-input [policy-map-name] [qos-policy-input qos-policy-name]
```

Parameters

- `policy-map-name`: Enter the policy map name.
- `qos-policy-input`: Enter the keyword `qos-policy-input` then the QoS policy name.

Defaults

none
show qos qos-policy-input

View the input QoS policy details.

**S4048-ON**

**Syntax**

```
show qos qos-policy-input [qos-policy-name]
```

**Parameters**

- **qos-policy-name**: Enter the QoS policy name.

**Defaults**

```
none
```
show qos qos-policy-output

View the output QoS policy details.

S4048-ON

Syntax

show qos qos-policy-output [qos-policy-name]

Parameters

- **qos-policy-name**: Enter the QoS policy name.

Defaults

- none
show qos qos-policy-output

Example

```
DellEMC# show qos qos-policy-output
Qos-policy-output qosOut
   Rate-limit 50 50 peak 50 50
   Wred yellow 1
   Wred green 1
DellEMC#
```

**show qos statistics**

View QoS statistics.

**Syntax**

```
show qos statistics {egress-queue [interface]} | {wred-profile [interface]} | [interface]
```

**Parameters**

- **egress-queue**
  - Enter the keyword egress-queue to display the egress-queue statistics and optionally one of the following keywords and slot/port or number information.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

Enter the keyword `wred-profile` and optionally one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

Enter one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

Example of show qos statistics egress-queue with per queue per port tx and drop rates

DellEMC(conf)#do show qos statistics wred-profile
Global Wred State : Enabled
Interface Te 1/11
Drop-statistic  Dropped Pkts
Green           0
Yellow          6730113
Out of Profile  0

Usage Information

In a dual homing setup, you can use this command only from the primary VLT peer.

The following list describes output of the show qos statistics command in the example:

- **Queue #** — Queue Number.
- **Queued Bytes** — Snapshot of the byte count in that queue.
- **Queued Pkts** — Cumulative packet count in that queue.
- **Matched Pkts** — The number of packets that matched the class-map criteria.

**NOTE:** When you configure trust, matched packet counters are not incremented in this field.

- **Matched Bytes** — The number of bytes that matched the class-map criteria.

**NOTE:** When you configure trust, matched byte counters are not incremented in this field.

- **Dropped Pkts** — The total of the number of packets dropped for green, yellow and out-of-profile.

### show qos wred-profile

View the WRED profile details.

**Syntax**

```
show qos wred-profile wred-profile-name
```

**Parameters**

- **wred-profile-name** Enter the WRED profile name to view the profile details.

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

DellEMC#
```

**test cam-usage**

Check the Input Policy Map configuration for the CAM usage.

**S4048-ON**

**Syntax**
```
test cam-usage service-policy input policy-map stack-unit {number port-set portpipe number} | [all]
```

**Parameters**
- **policy-map**
  - Enter the policy map name.
- **stack-unit number**
  - (OPTIONAL) Enter the keyword stack-unit then the stack-unit slot number.
- **port-set portpipe number**
  - Enter the keywords port-set then the stack-unit port pipe number. The range is from 0 or 1.
- **stack-unit all**
  - (OPTIONAL) Enter the keywords stack-unit all to indicate all stack-unit.
Defaults

none

</tr>
</tbody>
</table>

Usage Information
This feature allows you to determine if the CAM has enough space available before applying the configuration on an interface.

An input policy map with both Trust and Class-map configuration, the Class-map rules are ignored and only the Trust rule is programmed in the CAM. In such an instance, the Estimated CAM output column contains the size of the CAM space required for the Trust rule and not the Class-map rule.

The following describes the `test cam-usage service-policy input policy-map stack-unit` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stack-unit</td>
<td>Indicates the stack-unit slot number.</td>
</tr>
<tr>
<td>Portpipe</td>
<td>Indicates the portpipe number.</td>
</tr>
<tr>
<td>CAM Partition</td>
<td>The CAM space where the rules are added.</td>
</tr>
<tr>
<td>Available CAM</td>
<td>Indicates the free CAM space, in the partition, for the classification rules.</td>
</tr>
</tbody>
</table>

**NOTE:** The CAM entries reserved for the default rules are not included in the Available CAM column; free entries, from the default rules space, cannot be used as a policy map for the classification rules.

<table>
<thead>
<tr>
<th>Estimated CAM per Port</th>
<th>Indicates the number of free CAM entries required (for the classification rules) to apply the input policy map on a single interface.</th>
</tr>
</thead>
</table>

**NOTE:** The CAM entries for the default rule are not included in this column; a CAM entry for the default rule is always dedicated to a port and is always available for that interface.
### Field Description

**Status (Allowed ports)**
Indicates if the input policy map configuration on an interface belonging to a stack-unit/port-pipe is successful — Allowed (n) — or not successful — Exception. The allowed number (n) indicates the number of ports in that port-pipe on which the Policy Map can be applied successfully.

**NOTE:** In a Layer 2 Policy Map, IPv4/IPv6 rules are not allowed; therefore, the output contains only L2ACL CAM partition entries.

<table>
<thead>
<tr>
<th>Example</th>
</tr>
</thead>
</table>

DellEMC# test cam-usage service-policy input pmap_l2 stack-unit all

For a L2 Input Policy Map pmap_l2, the output must be as follows,

<table>
<thead>
<tr>
<th>stack-unit</th>
<th>Portpipe</th>
<th>CAM Partition</th>
<th>Available CAM per Port</th>
<th>Estimated CAM per Port</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>

</tbody>
</table>

**threshold**

Specify the minimum and maximum threshold values for the configured WRED profiles.

### S4048-ON

**Syntax**

threshold min number max number max-drop-drop

To remove the threshold values, use the no threshold min number max number command.

**Parameters**

- **min number**
  - Enter the keyword min then the minimum threshold number for the WRED profile. The range is from 1 to 9360.

- **max number**
  - Enter the keyword max then the maximum threshold number for the WRED profile. The range is from 1 to 9360 KB.

- **max-drop-drop number**
  - Enter the keyword max-drop-drop followed by the maximum number of packets for the WRED profile. The range is from 0 to 100 KB.

**Defaults**

- none

**Command Modes**

- CONFIGURATION (config-wred)
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Usage Information

To configure the minimum and maximum threshold values for user-defined profiles, use this command. Additionally, to modify the minimum and maximum threshold values for the pre-defined WRED profiles, use this command. If you delete the threshold values of the pre-defined WRED profiles, the profiles revert to their original default values.

**Table 4. Threshold Values for the Pre-defined WRED Profiles**

</tbody>
</table>

Related Commands

- `wred-profile` — creates a WRED profile.
**trust**

Specify dynamic classification (DSCP) or dot1p to trust.

### S4048–ON

**Syntax**

```
trust {diffserv [fallback] | dot1p [fallback]}
```

**Parameters**

- `diffserv` Enter the keyword `diffserv` to specify trust of DSCP markings.
- `dot1p` Enter the keyword `dot1p` to specify trust dot1p configuration.
- `fallback` Enter the keyword `fallback` to classify packets according to their DSCP or dot1p value as a secondary option in case no match occurs against the configured class maps.

**Defaults**

`none`

</table>

**wred**

Designate the WRED profile to yellow or green traffic.

**S4048-ON**

**Syntax**

```
wred {yellow | green} profile-name
```

To remove the WRED drop precedence, use the no wred {yellow | green} [profile-name] command.

**Parameters**

- `yellow | green`  
Enter the keyword yellow for yellow traffic. A DSCP value of xxx110 and xxx100, xxx101 maps to yellow.

- `profile-name`  
Enter your WRED profile name in character format (32 character maximum). Or use one of the five pre-defined WRED profile names.

Pre-defined Profiles: wred_drop, wred_ge_y, wred_ge_g, wred_teng_y, wred_teng_g.

**Defaults**

When WRED green is applied, default WRED yellow profiles take effect and vice-versa.

Usage Information

To assign drop precedence to green or yellow traffic, use this command. If there is no honoring enabled on the input, all the traffic defaults to green drop precedence.

Related Commands

- **wred-profile** — creates a WRED profile and name that profile.
- **trust** — defines the dynamic classification to trust DSCP.

**wred ecn**

To indicate network congestion, rather than dropping packets, use explicit congestion notification (ECN).

**S4048-ON**

**Syntax**

`wred ecn`

To stop marking packets, use the `no wred ecn` command.

**Defaults**

none

8.3.19.0 | Introduced on the S4820t.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.

**Usage Information**

When you enable `wred ecn`, and the number of packets in the queue is below the minimum threshold, packets are transmitted per the usual WRED treatment.

When you enable `wred ecn`, and the number of packets in the queue is between the minimum threshold and the maximum threshold, one of the following two scenarios can occur:

- If the transmission endpoints are ECN-capable and traffic is congested, and the WRED algorithm determines that the packet should have been dropped based on the drop probability, the packet is transmitted and marked so the routers know the system is congested and can slow transmission rates.
- If neither endpoint is ECN-capable, the packet may be dropped based on the WRED drop probability. This behavior is the identical treatment that a packet receives when WRED is enabled without ECN configured on the router.

When you enable `wred ecn`, and the number of packets in the queue is above the maximum threshold, packets are dropped based on the drop probability. This behavior is the identical treatment a packet receives when WRED is enabled without ECN configured on the router.

**Related Commands**

- `wred-profile` — creates a WRED profile and name that profile.

### wred-profile

Create a WRED profile and name the profile.

**S4048-ON**

**Syntax**

```plaintext
wred-profile wred-profile-name
```

To remove an existing WRED profile, use the `no wred-profile` command.
Parameters

**wred-profile-name**
Enter your WRED profile name in character format (32 character maximum). Or use one of the pre-defined WRED profile names. You can configure up to 26 WRED profiles plus the five pre-defined profiles, for a total of 31 WRED profiles.

Pre-defined Profiles: wred_drop, wred-ge_y, wred_ge_g, wred_teng_y, wred_teng_g.

Defaults

The five pre-defined WRED profiles. When you configure a new profile, the minimum and maximum threshold defaults to predefined wred_ge_g values.

If green profile is applied, default yellow also take effect and vice-versa.

</tbody>
</table>

Usage Information

Use the default pre-defined profiles or configure your own profile. You cannot delete the pre-defined profiles or their default values. This command enables WRED configuration mode — (conf-wred).

Related Commands

- **threshold** — specifies the minimum and maximum threshold values of the WRED profile.
DSCP Color Map Commands

The DSCP color map allows you to set the number of specific DSCP values to yellow or red. Traffic marked as yellow delivers traffic to the egress queue which will either transmit the packet if it has available bandwidth or drop the packet due to no ability to send. Traffic marked as red (high drop precedence) is dropped.

dscp

Sets the number of specific DSCP values for a color map profile to yellow or red.

Syntax

dscp {yellow | red} [list-dscp-values]

Parameters

- **Yellow**: Enter the yellow keyword. Traffic marked as yellow delivers traffic to the egress queue which either transmits the packet if it has available bandwidth or drops the packet due to no ability to send.

- **Red**: Enter the red keyword. Traffic marked as red is dropped.

- **dscp-list**: Enter a list of IP DSCP values. The dscp-list parameter specifies the full list of IP DSCP value(s) for the specified color. Each DSCP value in a list is separate values by commas – no spaces (1,2,3) or indicates a list of values separated by a hyphen (1-3). Range is 0 to 63.

Defaults

- None

Command Modes

- CONFIG-COLOR-MAP

Command History

<tr>
<td>9.5.0.0</td>
<td>Introduced on the Z9000, S6000, S4820T, S4810, and MXL.</td>
</tr>
</tbody>
</table>

Usage Information

If the specified color-map does not exist, the Diffserv Manager (DSM) creates a color map and sets all the DSCP values to green (low drop precedence).
The default setting for each DSCP value (0-63) is green (low drop precedence). This command allows setting the number of specific DSCP values to yellow or red.

**Important Points to Remember**

- All DSCP values that are not specified as yellow or red are colored green.
- A DSCP value cannot be in both the yellow and red lists. Setting the red or yellow list with any DSCP value that is already in the other list results in an error and no update to that list is made.
- Each color map can only have one list of DSCP values for each color; any DSCP values previously listed for that color that are not in the new DSCP list are colored green.

**Example**

```
DellEMC(conf-dscp-color-map)# dscp yellow 9,10,11,13,15,16
```

**Related Commands**

- `qos dscp-color-map` — configures the DSCP color map.
- `qos dscp-color-policy` — configures a DSCP color policy.

**qos dscp-color-map**

Configure the DSCP color map.

**Syntax**

```
qos dscp-color-map map-name
```

To remove a color map, use the `no qos dscp-color-map map-name` command.

**Parameters**

- **map-name**: Enter the name of the DSCP color map. The map name can have a maximum of 32 characters.

**Defaults**

- None

**Command Modes**

- **CONFIGURATION**

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

</tr>
</tbody>
</table>
Usage Information

A color map outlines the codepoint mappings to the appropriate color mapping (green, yellow, red) for the traffic. The system uses this information to handle the traffic on the interface based on the traffic priority and places it into the appropriate shaping queue. You cannot delete a DSCP color map when it is configured on an interface. If you do, all the DSCP values are set to green (low drop precedence). To delete the DSCP color map that is being used by one or more interfaces, remove the DSCP map from each interface.

Example

DellEMC(conf)#qos dscp-color-map mymap

Related Commands

- **qos dscp-color-map** — associates the DSCP color map profile with an interface so that all IP packets received on it are given a color based on that color map.
- **dscp** — sets the number of specific DSCP values for color map profile to yellow or red.

### qos dscp-color-policy

Associates the DSCP color map profile with an interface so that all IP packets received on it are given a color based on that color map.

**Syntax**

```
dscp-color-policy color-map-profile-name
```

To remove a color policy map profile, use the `no dscp-color-policy color-map-profile-name` command.

**Parameters**

- `color-map-profile-name` Enter the color map profile name. The name can have a maximum of 32 characters.

**Defaults**

None

**Command Modes**

CONFIG-INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the S6000-ON.</td>
</tr>
<tr>
<td>9.5(0.1)</td>
<td>Introduced on the Z9500.</td>
</tr>
</tbody>
</table>

**Usage Information**

If the specified color-map does not exist, the Diffserv Manager (DSM) creates a color map and sets all the DSCP values to green (low drop precedence).
The following example assigns the color map, `bat-enclave-map`, to interface `te 1/11`.

```
DellEMC(conf)# int te 1/11
DellEMC(conf-if-te-1/11)# qos dscp-color-policy bat-enclave-map
```

### Related Commands
- `dscp` — sets the number of specific DSCP values for color map profile to yellow or red.
- `qos dscp-color-map` — configures the DSCP color map.

### show qos dscp-color-policy

Display DSCP color policy configuration for one or all interfaces.

**Syntax**

```
show qos dscp-color-policy {summary [interface] | detail [interface]}
```

**Parameters**

- `summary` Enter the `summary` keyword to display summary information about a color policy on one or more interfaces.
- `Detail` Enter the `detail` keyword to display detailed information about a color policy on one or more interfaces.
- `interface` Enter the name of the interface that has color policy configured.

**Defaults**

None

**Command Modes**

EXEC

**Command History**

</table>

**Example**

Display summary information about a color policy on one or more interfaces.

```
DellEMC# show qos dscp-color-policy summary

Interface   dscp-color-map
TE 1/10     mapONE
TE 1/11     mapTWO
```

Display summary information about a color policy on a specific interface.

```
DellEMC# show qos dscp-color-policy summary te 1/10
```
Interface    dscp-color-map
TE 1/10      mapONE

Displayed detailed color policy information on an interface.

DellEMC# show qos dscp-color-policy detail te 1/10
Interface TenGigabitEthernet 1/10

Dscp-color-map mapONE
  yellow 4,7
  red 20,30

Related Commands
  • show qos dscp-color-map — displays DSCP color maps.

show qos dscp-color-map

Display the DSCP color map for one or all interfaces.

Syntax
  show qos dscp-color-map map-name

Parameters
  map-name  Enter the name of the color map.

Defaults
  None

Command Modes
  EXEC

Command History
  This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Routing Information Protocol (RIP)

Routing information protocol (RIP) is a distance vector routing protocol. The Dell EMC Networking OS supports both RIP version 1 (RIPv1) and RIP version 2 (RIPv2).

The Dell EMC Networking OS implementation of RIP is based on IETF RFCs 2453 and RFC 1058. For more information about configuring RIP, see the Dell EMC Networking OS Configuration Guide.

Topics:
- auto-summary
- clear ip rip
- debug ip rip
- default-information originate
- default-metric
- description
- distance
- distribute-list in
- distribute-list out
- ip poison-reverse
- ip rip receive version

- output-delay
- passive-interface
- redistribute
- redistribute isis
- redistribute ospf
- router rip
- show config
- show ip rip database
- show running-config rip
- timers basic
- version
auto-summary

Restore the default behavior of automatic summarization of subnet routes into network routes. This command applies only to RIP version 2.

Syntax

auto-summary

To send sub-prefix routing information, use the no auto-summary command.

Defaults

Enabled.

Command Modes

ROUTER RIP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Usage Information

This command triggers updates of the main RIP routing tables.

### debug ip rip

Examine RIP routing information for troubleshooting.

#### S4048-ON

**Syntax**

```plaintext
debug ip rip [interface | database | events [interface] | trigger]
```

To turn off debugging output, use the `no debug ip rip` command.

**Parameters**

- **interface** (OPTIONAL) Enter the interface type and ID as one of the following:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Port Channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.
database

(Optionalal) Enter the keyword database to display messages when there is a change to the RIP database.

events

(Optionalal) Enter the keyword events to debug only RIP protocol changes.

trigger

(Optionalal) Enter the keyword trigger to debug only RIP trigger extensions.

Command Modes

EXEC Privilege

default-information originate

Generate a default route for the RIP traffic.

S4048–ON

Syntax

default-information originate [always] [metric metric-value] [route-map map-name]

To return to the default values, use the no default-information originate command.
Parameters
- **always** (OPTIONAL) Enter the keyword always to enable the switch software to always advertise the default route.
- **metric metric-value** (OPTIONAL) Enter the keyword metric then a number as the metric value. The range is from 1 to 16. The default is 1.
- **route-map map-name** (OPTIONAL) Enter the keywords route-map then the name of a configured route-map.

Defaults

Command Modes
- ROUTER RIP

</tbody>
</table>

Usage Information
The default route must be present in the switch routing table for the default-information originate command to take effect.
**default-metric**

Change the default metric for routes. To ensure that all redistributed routes use the same metric value, use this command with the `redistribute` command.

**S4048-ON**

Syntax

```
default-metric number
```

To return the default metric to the original values, use the `no default-metric` command.

Parameters

- `number` Specify a number. The range is from 1 to 16. The default is 1.

Defaults

1

</tbody>
</table>

Usage Information

This command ensures that route information being redistributed is converted to the same metric value.

Related Commands

- `redistribute` — allows you to redistribute routes learned by other methods.
**description**

Enter a description of the RIP routing protocol.

**S4048-ON**

**Syntax**

description {description}

To remove the description, use the no description {description} command.

**Parameters**

- **description**
  
Enter a description to identify the RIP protocol (80 characters maximum).

**Defaults**

none

**Command Modes**

ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Related Commands**

- **router rip** — enters ROUTER mode on the switch.
distance

Assign a weight (for prioritization) to all routes in the RIP routing table or to a specific route. Lower weights ("administrative distance") are preferred.

**S4048-ON**

distance weight [ip-address mask [prefix-name]]

To return to the default values, use the no distance weight [ip-address mask] command.

**Syntax**

- weight
- ip-address (OPTIONAL) Enter the IP address, in dotted decimal format (A.B.C.D), of the host or network to receive the new distance metric.
- mask If you enter an IP address, also enter a mask for that IP address, in either dotted decimal format or /prefix format (/x).
- prefix-name (OPTIONAL) Enter a configured prefix list name.

**Parameters**

- **weight** Enter a number from 1 to 255 for the weight (for prioritization). The default is 120.
- **ip-address** (OPTIONAL) Enter the IP address, in dotted decimal format (A.B.C.D), of the host or network to receive the new distance metric.
- **mask** If you enter an IP address, also enter a mask for that IP address, in either dotted decimal format or /prefix format (/x).
- **prefix-name** (OPTIONAL) Enter a configured prefix list name.

**Defaults**

- weight = 120

**Command Modes**

- ROUTER RIP

**Command History**

**Version** | **Description**
---|---
pre-6.2.1.1 | Introduced on the E-Series.

**Related Commands**
- `default-metric` — assigns one distance metric to all routes learned using the `redistribute` command.

### distribute-list in

Configure a filter for incoming routing updates.

**S4048-ON**

**Syntax**
```
distribute-list prefix-list-name in [interface]
```

To delete the filter, use the `no distribute-list prefix-list-name in` command.

**Parameters**
- `prefix-list-name` Enter the name of a configured prefix list.
- `interface` (OPTIONAL) Identifies the interface type slot/port as one of the following:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Port Channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**
Not configured.

**Command Modes**
ROUTER RIP

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>
Related Commands

- `ip prefix-list` — enters PREFIX-LIST mode and configures a prefix list.

**distribute-list out**

Configure a filter for outgoing routing updates.

**S4048-ON**

`distribute-list prefix-list-name out [interface | bgp | connected | isis | ospf | static]`

To delete the filter, use the no `distribute-list prefix-list-name out` command.

**Parameters**

- `prefix-list-name` (OPTIONAL) Enter the name of a configured prefix list.
- `interface` (OPTIONAL) Identifies the interface type slot/port as one of the following:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Port Channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.
- `connected` (OPTIONAL) Enter the keyword `connected` to filter only directly connected routes.
- `isis` (OPTIONAL) Enter the keyword `isis` to filter only IS-IS routes.
- `ospf` (OPTIONAL) Enter the keyword `ospf` to filter all OSPF routes.
- `static` (OPTIONAL) Enter the keyword `static` to filter manually configured routes.

**Defaults**

Not configured.

**Command Modes**

- `ROUTER RIP`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*. 
ip poison-reverse

Set the prefix of the RIP routing updates to the RIP infinity value.

S4048-ON

Syntax

ip poison-reverse
To disable poison reverse, use the no ip poison-reverse command.

Defaults

Disabled.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.5.1.0 Added support for 4-port 40G line cards on the E-Series.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
7.6.1.0 Introduced on the C-Series.
pre- 6.2.1.1 Introduced on the E-Series.
**ip rip receive version**

To receive specific versions of RIP, set the interface. The RIP version you set on the interface overrides the version command in ROUTER RIP mode.

### S4048–ON

**Syntax**

```
ip rip receive version [1] [2]
```

To return to the default, use the `no ip rip receive version` command.

**Parameters**

- **1**
  - (OPTIONAL) Enter the number 1 for RIP version 1.
- **2**
  - (OPTIONAL) Enter the number 2 for RIP version 2.

**Defaults**

RIPv1 and RIPv2

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**
If you want the interface to receive both versions of RIP, use the `ip rip receive version 1 2` command.

**Related Commands**
- `ip rip send version` — sets the RIP version for sending RIP traffic on an interface.
- `version` — sets the RIP version the switch software uses.

### ip rip send version

To send a specific version of RIP, set the interface. The version you set on the interface overrides the version command in ROUTER RIP mode.

#### S4048-ON

**Syntax**

```
ip rip send version [1] [2]
```

To return to the default value, use the `no ip rip send version` command.

**Parameters**

- **1**
  - (OPTIONAL) Enter the number 1 for RIP version 1. The default is RIP version 1.
- **2**
  - (OPTIONAL) Enter the number 2 for RIP version 2.

**Defaults**

RIPv1

**Command Modes**

INTERFACE

**Command History**

</tr>
</tbody>
</table>

**Usage Information**

To enable the interface to send both version of RIP packets, use the `ip rip send version 1 2` command.

**Related Commands**

- `ip rip receive version` — sets the RIP version for the interface to receive traffic.
- `version` — sets the RIP version for the switch software.

### ip split-horizon

Enable split-horizon for RIP data on the interface. As described in RFC 2453, the split-horizon scheme prevents any routes learned over a specific interface to be sent back out that interface.

#### S4048-ON

**Syntax**

```plaintext
ip split-horizon
```

To disable split-horizon, use the `no ip split-horizon` command.

**Defaults**

Enabled

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

**Related Commands**

- `ip poison-reverse` — sets the prefix for RIP routing updates.

**maximum-paths**

Set RIP to forward packets over multiple paths.

**S4048-ON**

```markdown
Syntax
maximum-paths number
To return to the default values, use the no maximum-paths commands.

Parameters

- **number**
  Enter the number of paths. The range is from 1 to 16. The default is 4 paths.

Defaults

- 4

Command Modes

- ROUTER RIP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>

<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
</tbody>
</table>
RIP supports a maximum of 16 ECMP paths.

**neighbor**

Define a neighbor router with which to exchange RIP information.

**S4048-ON**

**Syntax**

```
neighbor ip-address
```

To delete a neighbor setting, use the `no neighbor ip-address` command.

**Parameters**

`ip-address` Enter the IP address, in dotted decimal format, of a router with which to exchange information.

**Defaults**

Not configured.

**Command Modes**

ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
Version | Description
--- | ---
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.6.1.0 | Introduced on the C-Series.
pre-6.2.1.1 | Introduced on the E-Series.

Usage Information

When a neighbor router is identified, unicast data exchanges occur. Multiple neighbor routers are possible.

To ensure that only specific interfaces are receiving and sending data, use the `passive-interface` command with the `neighbor` command.

Related Commands

- `passive-interface` — sets the interface to only listen to RIP broadcasts.

**network**

Enable RIP for a specified network. To enable RIP on all networks connected to the switch, use this command.

**S4048-ON**

**Syntax**

```
network ip-address
```

To disable RIP for a network, use the `no network ip-address` command.

**Parameters**

- `ip-address` Specify an IP network address in dotted decimal format. You cannot specify a subnet.

**Defaults**

No RIP network is configured.

**Command Modes**

- `ROUTER RIP`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.1(0.1) | Introduced on the S6010-ON and S4048T-ON.
Version Description
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
7.6.1.0 Introduced on the C-Series.
pre- 6.2.1.1 Introduced on the E-Series.

Usage Information
You can enable an unlimited number of RIP networks.
RIP operates over interfaces configured with any address the network command specifies.

offset-list

Specify a number to add to the incoming or outgoing route metrics learned using RIP.

S4048–ON

Syntax
offset-list prefix-list-name {in | out} offset [interface]
To delete an offset list, use the no offset-list prefix-list-name {in | out} offset [interface] command.

Parameters

prefix-list-name
Enter the name of an established Prefix list to determine which incoming routes are modified.

offset
Enter a number from zero (0) to 16 to be applied to the incoming route metric matching the access list specified. If you set an offset value to zero (0), no action is taken.

interface (OPTIONAL) Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

Defaults
Not configured.

Command Modes
ROUTER RIP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>pre- 6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information
When the offset metric is applied to an interface, that value takes precedence over an offset value that is not extended to an interface.

Related Commands
- `ip prefix-list` — enters PREFIX-LIST mode and configure a prefix list.

**output-delay**

Set the interpacket delay of successive packets to the same neighbor.

**S4048-ON**

**Syntax**

```
output-delay delay
```

To return to the switch software defaults for interpacket delay, use the `no output-delay` command.
Parameters

**delay**

Specify a number of milliseconds as the delay interval. The range is from 8 to 50.

Defaults

Not configured.

Command Modes

ROUTER RIP

Usage Information

This command is intended for low-speed interfaces.

**passive-interface**

Suppress routing updates on a specified interface.

**S4048-ON**

Syntax

```
passive-interface interface
```

To delete a passive interface, use the no passive-interface interface command.

Parameters

**interface**

Enter the following information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**
Not configured.

**Command Modes**
ROUTER RIP

**Command History**

</tbody>
</table>

**Usage Information**
Although the passive interface does not send or receive routing updates, the network on that interface still includes in RIP updates sent using other interfaces.

**Related Commands**
- `neighbor` — enables RIP for a specified network.
- `network` — defines a neighbor.

### redistribute

Redistribute information from other routing instances.

**Syntax**
```
redistribute {connected | static}
```
To disable redistribution, use the no redistribute {connected | static} command.

**Parameters**

connected

Enter the keyword connected to specify that information from active routes on interfaces is redistributed.

static

Enter the keyword static to specify that information from static routes is redistributed.

**Defaults**

Not configured.

**Command Modes**

ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>

**Usage Information**

To redistribute the default route (0.0.0.0/0), configure the default-information originate command.

**Related Commands**

- default-information originate — generates a default route for RIP traffic.

---

redistribute isis

Redistribute routing information from an IS-IS instance.

**Syntax**

redistribute isis [tag] [level-1 | level-1-2 | level-2] [metric metric-value] [route-map map-name]
To disable redistribution, use the no redistribute isis [tag] [level-1 | level-1-2 | level-2] [metric metric-value] [route-map map-name] command.

**Parameters**

- **tag** (OPTIONAL) Enter the name of the IS-IS routing process.
- **level-1** (OPTIONAL) Enter the keywords level-1 to redistribute only IS-IS Level-1 routes.
- **level-1-2** (OPTIONAL) Enter the keywords level-1-2 to redistribute both IS-IS Level-1 and Level-2 routes.
- **level-2** (OPTIONAL) Enter the keywords level-2 to redistribute only IS-IS Level-2 routes.
- **metric metric-value** (OPTIONAL) Enter the keyword metric then a number as the metric value. The range is from 0 to 16.
- **route-map map-name** (OPTIONAL) Enter the keywords route-map then the name of a configured route map.

**Defaults**

Not configured.

**Command Modes**

ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.2(1.0) | Introduced on the Z9500.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
pre-6.2.1.1 | Introduced on the E-Series.

**redistribute ospf**

Redistribute routing information from an OSPF process.

**Syntax**

redistribute ospf process-id [match external {1 | 2} | match internal | metric metric-value] [route-map map-name]

To disable redistribution, use the no redistribute ospf process-id [match external {1 | 2} | match internal | metric metric-value] [route-map map-name] command.
Parameters

- **process-id**: Enter a number that corresponds to the OSPF process ID to redistribute. The range is from 1 to 65535.

- **match external (1 | 2)**: (OPTIONAL) Enter the keywords `match external` then the numbers 1 or 2 to indicate that external 1 routes or external 2 routes should be redistributed.

- **match internal**: (OPTIONAL) Enter the keywords `match internal` to indicate that internal routes should be redistributed.

- **metric metric-value**: (OPTIONAL) Enter the keyword `metric` then a number as the metric value. The range is from 0 to 16.

- **route-map map-name**: (OPTIONAL) Enter the keywords `route-map` then the name of a configured route map.

Defaults

Not configured.

Command Modes

- **ROUTER RIP**

**Usage Information**
To enable RIP, assign a network address using the `network` command.

**Example**
```
DellEMC(conf)# router rip
DellEMC(conf-router_rip)#
```

**Related Commands**
- `network` — enables RIP.
- `exit` — returns to CONFIGURATION mode.

---

**show config**

Display the changes you made to the RIP configuration. The default values are not shown.

**S4048-ON**

**Syntax**
```
show config
```

1546  Routing Information Protocol (RIP)
show ip rip database

Display the routes that RIP learns. If the switch learned no RIP routes, no output is generated.

**S4048-ON**

**Syntax**

show ip rip database [ip-address mask]

**Parameters**

- **ip-address** *(OPTIONAL)*: Specify an IP address in dotted decimal format to view RIP information on that network only. If you enter an IP address, also enter a mask for that IP address.
- **mask** *(OPTIONAL)*: Specify a mask, in /network format, for the IP address.

**Command Modes**

EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

**Example**

DellEMC# show running-config rip

```
router rip
   distribute-list Test1 in
```
**timers basic**

Manipulate the RIP timers for routing updates, invalid, holddown times, and flush time.

**S4048-ON**

**Syntax**

```text
timers basic update invalid holddown flush
```

To return to the default settings, use the `no timers basic` command.

**Parameters**

- **update**
  
  Enter the number of seconds to specify the rate at which RIP routing updates are sent. The range is from zero (0) to 4294967295. The default is **30 seconds**.

- **invalid**
  
  Enter the number of seconds to specify the time interval before routing updates are declared invalid or expired. The invalid value should be at least three times the update timer value. The range is from zero (0) to 4294967295. The default is **180 seconds**.

- **holddown**
  
  Enter the number of seconds to specify a time interval during which the route is marked as unreachable but still sending RIP packets. The holddown value should be at least three times the update timer value. The range is from zero (0) to 4294967295. The default is **180 seconds**.

- **flush**
  
  Enter the number of seconds to specify the time interval during which the route is advertised as unreachable. When this interval expires, the route is flushed from the routing table. The flush value should be greater than the update value. The range is from zero (0) to 4294967295. The default is **240 seconds**.

**Defaults**

- `update = 30 seconds`
- `invalid = 180 seconds`
- `holddown = 180 seconds`
- `flush = 240 seconds`

**Command Modes**

- `ROUTER RIP`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Version**

<table>
<thead>

<td>Introduced on the S6100-ON.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>
### version

Specify either RIP version 1 or RIP version 2.

**Syntax**

```
version {1 | 2}
```

To return to the default version setting, use the `no version` command.

**Parameters**

- `1` Enter the keyword 1 to specify RIP version 1.
- `2` Enter the keyword 2 to specify RIP version 2.

**Defaults**

The Dell EMC Networking OS sends RIPv1 and receives RIPv1 and RIPv2.

**Command Modes**

ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Related Commands**

- `ip rip receive version` — sets the RIP version the interface receives.
- `ip rip send version` — sets the RIP version the interface sends.
Remote Monitoring (RMON)

Dell EMC Networking OS RMON is based on IEEE standards, providing both 32-bit and 64-bit monitoring and long-term statistics collection. Dell EMC Networking OS RMON supports the following RMON groups, as defined in RFC-2819, RFC-3273, RFC-3434, and RFC-4502:

- Ethernet Statistics Table; RFC-2819
- Ethernet Statistics High-Capacity Table; RFC-3273, 64bits
- Ethernet History Control Table; RFC-2819
- Ethernet History Table; RFC-2819
- Ethernet History High-Capacity Table; RFC-3273, 64bits
- Alarm Table; RFC-2819
- High-Capacity Alarm Table (64bits); RFC-3434, 64bits
- Event Table; RFC-2819
- Log Table; RFC-2819
- User History; RFC-4502
- Probe Configuration (Capabilities, SoftwareRev, HardwareRev, DateTime and ResetControl); RFC-4502

Dell EMC Networking OS RMON does not support the following statistics:

- etherStatsCollisions
- etherHistoryCollisions
- etherHistoryUtilization

**NOTE:** Only SNMP GET/GETNEXT access is supported. Configure RMON using the RMON commands. Collected data is lost during a chassis reboot.

Topics:

- rmon alarm
- rmon collection history
- rmon collection statistics
- rmon event
- rmon hc-alarm
- show rmon
- show rmon alarms
- show rmon events
- show rmon hc-alarm
- show rmon history
- show rmon log
- show rmon statistics
rmon alarm

Set an alarm on any MIB object.

Syntax

```plaintext
rmon alarm number variable interval {delta | absolute} rising-threshold value event-number falling-threshold value event-number [owner string]
```

To disable the alarm, use the `no rmon alarm number` command.

Parameters

- **number**: Enter the alarm integer number from 1 to 65535. The value must be unique in the RMON alarm table.
- **variable**: Enter the MIB object to monitor. The variable must be in the SNMP OID format; for example, 1.3.6.1.2.1.1.3. The object type must be a 32-bit integer.
- **interval**: Time, in seconds, the alarm monitors the MIB variables; this is the alarmSampleType in the RMON alarm table. The range is from 5 to 3600 seconds.
- **delta**: Enter the keyword `delta` to test the change between MIB variables. This is the alarmSampleType in the RMON alarm table.
- **absolute**: Enter the keyword `absolute` to test each MIB variable directly. This is the alarmSampleType in the RMON alarm table.
- **rising-threshold**: Enter the keywords `rising-threshold` then the value (32 bit) the rising-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the rising threshold exceeds its limit. This value is the same as the alarmRisingEventIndex or alarmTable of the RMON MIB. If there is no corresponding rising-threshold event, the value is zero.
- **falling-threshold**: Enter the keywords `falling-threshold` then the value (32 bit) the falling-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the falling threshold exceeds its limit. This value is the same as the alarmFallingEventIndex or the alarmTable of the RMON MIB. If there is no corresponding falling-threshold event, the value is zero.
- **owner string**: (OPTIONAL) Enter the keyword `owner` then the owner name to specify an owner for the alarm. This is the alarmOwner object in the alarmTable of the RMON MIB.

Defaults

```
owner
```

9.10(0.0)   Introduced on the S3148.
9.10(0.0)   Introduced on the S6100-ON.
9.8(2.0)    Introduced on the S3100 series.
9.8(1.0)    Introduced on the Z9100-ON.
```
rmon collection history

Enable the RMON MIB history group of statistics collection on an interface.

Syntax

rmon collection history {controlEntry integer} [owner name] [buckets number] [interval seconds]

To remove a specified RMON history group of statistics collection, use the no rmon collection history {controlEntry integer} command.

Parameters

- **controlEntry integer**: Enter the keyword controlEntry to specify the RMON group of statistics using a value. Then enter an integer value from 1 to 65535 that identifies the RMON group of statistics. The integer value must be a unique index in the RMON history table.
- **owner name**: (OPTIONAL) Enter the keyword owner then the owner name to record the owner of the RMON group of statistics.
- **buckets number**: (OPTIONAL) Enter the keyword buckets then the number of buckets for the RMON collection history group of statistics. The bucket range is from 1 to 1000. The default is 50.
- **interval seconds**: (OPTIONAL) Enter the keyword interval then the number of seconds in each polling cycle. The range is from 5 to 3600 seconds. The default is 1800 seconds.

Defaults

none

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S6000-ON.
9.10(0.0) Introduced on the S6010-ON.
9.10(0.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4810.
8.3.7.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
6.1.1.0 Introduced on the E-Series.
rmon collection statistics

Enable RMON MIB statistics collection on an interface.

Syntax

```
rmon collection statistics {controlEntry integer} [owner name]
```

To remove RMON MIB statistics collection on an interface, use the no rmon collection statistics {controlEntry integer} command.

Parameters

- **controlEntry integer**: Enter the keyword `controlEntry` to specify the RMON group of statistics using a value. Then enter an integer value from 1 to 65535 that identifies the RMON Statistic Table. The integer value must be a unique in the RMON statistic table.

- **owner name**: (OPTIONAL) Enter the keyword `owner` then the owner name to record the owner of the RMON group of statistics.

Defaults

none

## rmon event

Add an event in the RMON event table.

### Syntax

```
rmon event number [log] [trap community] [description string]
```

To disable RMON on an interface, use the `no rmon event number` command.

### Parameters

- **number**
  
  Assign an event number in integer format. The range is from 1 to 65535. You must ensure that the value you enter is unique in the RMON event table.

- **log**
  
  (OPTIONAL) Enter the keyword `log` to generate an RMON event log. This option sets the eventType to either log or log-and-snmptrap in the RMON event table. The default is None.

- **trap community**
  
  (OPTIONAL) Enter the keyword `trap` followed by the SNMP community string to generate SNMP traps for an RMON event entry. This option sets the eventType to either snmptrap or log-and-snmptrap in the RMON event table. In addition to the SNMP traps, this option also generates a syslog.

- **description string**
  
  (OPTIONAL) Enter the keyword `description` then a string describing the event.

- **owner name**
  
  (OPTIONAL) Enter the keyword `owner` then the name of the owner of this event.

### Defaults

As noted in the Parameters section.

6.1.1.0 | Introduced on the E-Series.
8.3.19.0 | Introduced on the S4820T.
rmon hc-alarm

Set an alarm on any MIB object.

Syntax

```
rmon hc-alarm number variable interval {delta | absolute} rising-threshold value event-number falling-threshold value event-number [owner string]
```

To disable the alarm, use the `no rmon hc-alarm number` command.

Parameters

- **number**: Enter the alarm integer number from 1 to 65535. The value must be unique in the RMON alarm table.
- **variable**: The MIB object to monitor. The variable must be in the SNMP OID format; for example, `1.3.6.1.2.1.1.3` The object type must be a 64-bit integer.
- **interval**: Time, in seconds, the alarm monitors the MIB variables; this is the alarmSampleType in the RMON alarm table. The range is from 5 to 3600 seconds.
- **delta**: Enter the keyword `delta` to test the change between MIB variables. This is the alarmSampleType in the RMON alarm table.
- **absolute**: Enter the keyword `absolute` to test each MIB variable directly. This is the alarmSampleType in the RMON alarm table.
- **rising-threshold value event-number**: Enter the keywords `rising-threshold` then the value (64 bit) the rising-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the rising threshold exceeds its limit. This value is the same as the alarmRisingEventIndex or alarmTable of the RMON MIB. If there is no corresponding rising-threshold event, the value is zero.
- **falling-threshold value event-number**: Enter the keywords `falling-threshold` then the value (64 bit) the falling-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the falling threshold exceeds its limit. This value is the same as the alarmFallingEventIndex or the
alarmTable of the RMON MIB. If there is no corresponding falling-threshold event, the value is zero.

owner string (OPTIONAL) Enter the keyword owner then the owner name to specify an owner for the alarm. This is the alarmOwner object in the alarmTable of the RMON MIB.

show rmon alarms

Display the contents of the RMON alarm table.

Syntax

```
show rmon alarms [index] [brief]
```

Parameters

- **index** (OPTIONAL) Enter the table index number to display just that entry.
- **brief** (OPTIONAL) Enter the keyword `brief` to display the RMON alarm table in an easy-to-read format.

Defaults

```
none
```

Command Modes

```
EXEC
```

Example

```
DellEMC# show rmon
  RMON status
  total memory used 218840 bytes.
  ether statistics table: 8 entries, 4608 bytes
  ether history table: 8 entries, 6000 bytes
  alarm table: 390 entries, 102960 bytes
  high-capacity alarm table: 5 entries, 1680 bytes
  event table: 500 entries, 206000 bytes
  log table: 2 entries, 552 bytes
DellEMC#

alarm sampling failed 0 times.
alarm owner:
alarm storage type: non-volatile.
alarm status: OK

Example (Brief)

DellEMC# show rmon hc-alarm brief
index       SNMP OID
-------------
1   1.3.6.1.2.1.1.3
2   1.3.6.1.2.1.1.3
3   1.3.6.1.2.1.1.3
4   1.3.6.1.2.1.1.3
5   1.3.6.1.2.1.1.3

show rmon history

Display the contents of the RMON Ethernet history table.

S4048-ON

Syntax
show rmon history [index] [brief]

Parameters
- index (OPTIONAL) Enter the table index number to display just that entry.
- brief (OPTIONAL) Enter the keyword brief to display the RMON Ethernet history table in an
  easy-to-read format

Defaults
none

Command Modes
EXEC

</table>
show rmon log

Display the contents of the RMON log table.

S4048–ON

Syntax

```
show rmon log [index] [brief]
```

Parameters

- **index**  
  (OPTIONAL) Enter the table index number to display just that entry.
- **brief**  
  (OPTIONAL) Enter the keyword `brief` to display the RMON log table in an easy-to-read format.

Defaults

`none`

Command Modes

`EXEC`

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
**show rmon log**

The log table has a maximum of 500 entries. If the log exceeds that maximum, the oldest log entry is purged to allow room for the new entry.

**Example (Index)**

```
DellEMC# show rmon log 2
RMON log entry, alarm table index 2, log index 1
    log time: 14638 (THU AUG 12 22:10:40 2004)
    description: 2
DellEMC#
```

**Example (Brief)**

```
DellEMC# show rmon log br
eventIndex description
--------------------
  2              2
  4              4
DellEMC#
```

### show rmon statistics

Display the contents of RMON Ethernet statistics table.

**S4048–ON**

**Syntax**

```
show rmon statistics [index] [brief]
```

**Parameters**

- **index** (OPTIONAL) Enter the table index number to display just that entry.
brief

(OPTIONAL) Enter the keyword brief to display the RMON Ethernet statistics table in an easy-to-read format.

**Defaults**

none

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

DellEMC#
Rapid Spanning Tree Protocol (RSTP)

The Dell EMC Networking OS implementation of rapid spanning tree protocol (RSTP) is based on the IEEE 802.1w standard spanning-tree protocol. The RSTP algorithm configures connectivity throughout a bridged local area network (LAN) that is comprised of LANs interconnected by bridges.

Dell EMC Networking OS supports RSTP.

**Topics:**
- bridge-priority
- debug spanning-tree rstp
- description
- disable
- forward-delay
- hello-time
- max-age
- protocol spanning-tree rstp
- show config
- show spanning-tree rstp
- spanning-tree rstp
- tc-flush-standard

**bridge-priority**

Set the bridge priority for RSTP.

**Syntax**

```
bridge-priority priority-value
```

To return to the default value, use the `no bridge-priority` command.

**Parameters**

- `priority-value` Enter a number as the bridge priority value in increments of 4096. The range is from 0 to 61440. The default is 32768.

**Defaults**

32768

**Command Modes**

CONFIGURATION RSTP (conf-rstp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant **Dell EMC Networking OS Command Line Reference Guide**.

<td>Introduced on the S3148.</td>
</tr>
</tbody>
</table>
**Version** | **Description**
---|---
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
6.2.1.1 | Introduced on the E-Series.

**Related Commands**
- `protocol spanning-tree rstp` — enters rapid spanning tree mode.

---

**debug spanning-tree rstp**

Enable debugging of RSTP and view information on the protocol.

**Syntax**
```
d debug spanning-tree rstp [all | bpdu interface {in | out} | events]
```

To disable debugging, use the `no debug spanning-tree rstp` command.

**Parameters**
- `all`  
  (OPTIONAL) Enter the keyword all to debug all spanning tree operations.
- `bpdu interface {in | out}`  
  (OPTIONAL) Enter the keyword bpdu to debug the bridge protocol data units.
  
  (OPTIONAL) Enter the keyword interface along with the interface information:
  
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a port-channel interface, enter the keywords port-channel then the port-channel ID.

  Optionally, enter an in or out parameter with the optional interface:
  
  - For Receive, enter in.
  - For Transmit, enter out.
- `events`  
  (OPTIONAL) Enter the keyword events to debug RSTP events.
Command Modes

EXEC Privilege

</tbody>
</table>

Example

DellEMC# debug spanning-tree rstp bpdu tengigabitethernet 2/1 ?
in Receive (in)
out Transmit (out)

**description**

Enter a description of the rapid spanning tree.

Syntax

description {description}

To remove the description, use the no description {description} command.

Parameters

description Enter a description to identify the rapid spanning tree (80 characters maximum).

Defaults

none

Command Modes

SPANNING TREE (The prompt is “config-rstp”)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Related Commands

- `protocol spanning-tree rstp` — enters SPANNING TREE mode on the switch.

**disable**

Disable RSTP globally on the system.

**Syntax**

```markdown
disable
```

To enable Rapid Spanning Tree Protocol, use the `no disable` command.

**Defaults**

RSTP is disabled.

**Command Modes**

- CONFIGURATION RSTP (conf-rstp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

6.2.1.1 | Introduced on the E-Series.

**Related Commands**
- `protocol spanning-tree rstp` — enters SPANNING TREE mode on the switch.

---

**forward-delay**

Configure the amount of time the interface waits in the Listening State and the Learning State before transitioning to the Forwarding State.

**Syntax**

```
forward-delay seconds
```

To return to the default setting, use the `no forward-delay` command.

**Parameters**

- `seconds` Enter the number of seconds that Dell EMC Networking OS waits before transitioning RSTP to the forwarding state. The range is from 4 to 30. The default is **15 seconds**.

**Defaults**

**15 seconds**

**Command Modes**

CONFIGURATION RSTP (conf-rstp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
hello-time

Set the time interval between the generation of the RSTP bridge protocol data units (BPDUs).

**Syntax**

```
hello-time [milli-second] seconds
```

To return to the default value, use the `no hello-time` command.

**Parameters**

- `seconds` Enter a number as the time interval between transmission of BPDUs. The range is from 1 to 10 seconds. The default is **2 seconds**.
- `milli-second` Enter the keywords `milli-second` to configure a hello time on the order of milliseconds. The range is from 50 to 950 milliseconds.

**Defaults**

**2 seconds**

**Command Modes**

- **CONFIGURATION RSTP (conf-rstp)**

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.

**Related Commands**

- `hello-time` — changes the time interval between BPDUs.
- `max-age` — changes the wait time before RSTP refreshes the protocol configuration information.
Usage Information
The hello time is encoded in BPDUs in increments of 1/256ths of a second. The standard minimum hello time in seconds is 1 second, which is encoded as 256. Millisecond hello times are encoded using values less than 256; the millisecond hello time equals \((x/1000)\times256\).

When you configure millisecond hellos, the default hello interval of 2 seconds is still used for edge ports; the millisecond hello interval is not used.

Related Commands
- forward-delay — changes the wait time before RSTP transitions to the Forwarding state.
- max-age — changes the wait time before RSTP refreshes the protocol configuration information.

max-age
To maintain configuration information before refreshing that information, set the time interval for the RSTP bridge.

Syntax
max-age seconds
To return to the default values, use the no max-age command.

Parameters
max-age Enter a number of seconds the Dell EMC Networking OS waits before refreshing configuration information. The range is from 6 to 40 seconds. The default is 20 seconds.

Defaults
20 seconds

Command Modes
CONFIGURATION RSTP (conf-rstp)

9.7(0.0)  | Introduced on the S6000-ON.
9.2(1.0)  | Introduced on the Z9500.
9.0.2.0   | Introduced on the S6000.
8.3.19.0  | Introduced on the S4820T.
8.3.11.1  | Introduced on the Z9000.
8.3.7.0   | Introduced on the S4810.
7.6.1.0   | Introduced on the S-Series.
7.5.1.0   | Introduced on the C-Series.
6.2.1.1   | Introduced on the E-Series.

Example
DellEMC(conf-rstp)# show config
show spanning-tree rstp

Display the RSTP configuration.

Syntax
   show spanning-tree rstp [brief] [guard]

Parameters
   brief   (OPTIONAL) Enter the keyword brief to view a synopsis of the RSTP configuration information.
   guard   (OPTIONAL) Enter the keyword guard to display the type of guard enabled on an RSTP interface and the current port state.

Command Modes
   • EXEC
   • EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1)   Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)   Introduced on the S3148.
9.10(0.0)   Introduced on the S6100-ON.
9.8(2.0)    Introduced on the S3100 series.
9.8(1.0)    Introduced on the Z9100-ON.
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)    Introduced on the S6000-ON.
9.2(1.0)    Introduced on the Z9500.
9.0.2.0      Introduced on the S6000.
8.3.19.0     Introduced on the S4820T.
8.3.111      Introduced on the Z9000.
8.4.2.1      Added support for the optional guard keyword on the C-Series, S-Series, and E-Series.
8.3.7.0      Introduced on the S4810.
7.6.1.0      Introduced on the S-Series.
7.5.1.0      Introduced on the C-Series.
6.4.1.0      Introduced on the E-Series.
6.2.1.1      Added support for the optional guard keyword on the C-Series, S-Series, and E-Series.
Usage Information

The following describes the `show spanning-tree rstp guard` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface Name</td>
<td>RSTP interface.</td>
</tr>
<tr>
<td>Instance</td>
<td>RSTP instance.</td>
</tr>
<tr>
<td>Sts</td>
<td>Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), disabled (DIS), or shut down (EDS Shut).</td>
</tr>
<tr>

DellEMC# show spanning-tree rstp
Root Identifier has priority 32768, Address 0001.e801.6aa8
Root Bridge hello time 2, max age 20, forward delay 15, max hops 0
Bridge Identifier has priority 32768, Address 0001.e801.6aa8
Configured hello time 2, max age 20, forward delay 15, max hops 0
We are the root
Current root has priority 32768, Address 0001.e801.6aa8
Number of topology changes 1, last change occurred 00:00:31 ago on Te 1/1
Port 257 (TenGigabitEthernet 1/1) is LBK_INC Discarding
Port path cost 20000, Port priority 128, Port Identifier 128.257
Designated root has priority 32768, address 0001.e801.6aa8
Designated bridge has priority 32768, address 0001.e801.6aa8
```
Designated port id is 128.257, designated path cost 0
Number of transitions to forwarding state 1
BPDU : sent 27, received 9
The port is not in the Edge port mode

Example (Guard)
DellEMC# show spanning-tree rstp guard
Interface
Name   Instance Sts         Guard type
--------- -------- -------------------
Te 1/1 0        INCON(Root) Rootguard
Te 1/2 0        FWD         Loopguard
Te 1/3 0        BLK         Bpduguard

spanning-tree rstp

Configure an RSTP interface with one of these settings: port cost, edge port with optional bridge port data unit (BPDU) guard, port priority, loop guard, or root guard.

Syntax
```
spanning-tree rstp {cost port-cost | edge-port [bpduguard [shutdown-on-violation]] | priority priority | {loopguard | rootguard}}
```

Parameters
- **cost port-cost**
Enter the keyword cost then the port cost value. The range is from 1 to 200000. The defaults are:
  - 100 Mb/s Ethernet interface = 200000
  - 1-Gigabit Ethernet interface = 20000
  - 10-Gigabit Ethernet interface = 2000
  - Port Channel interface with one 100 Mb/s Ethernet = 200000
  - Port Channel interface with one 1 Gigabit Ethernet = 20000
  - Port Channel interface with one 10 Gigabit Ethernet = 2000
  - Port Channel with two 1 Gigabit Ethernet = 18000
  - Port Channel with two 10 Gigabit Ethernet = 1800
  - Port Channel with two 100 Mbps Ethernet = 180000

- **edge-port**
Enter the keywords edge-port to configure the interface as a rapid spanning tree edge port.

- **bpduguard**
  (OPTIONAL) Enter the keyword portfast to enable Portfast to move the interface into Forwarding mode immediately after the root fails.
  Enter the keyword bpduguard to disable the port when it receives a BPDU.

- **shutdown-on-violation**
  (OPTIONAL) Enter the keywords shutdown-on-violation to hardware disable an interface when a BPDU is received and the port is disabled.

- **priority priority**
Enter keyword priority then a value in increments of 16 as the priority. The range is from 0 to 240. The default is 128.

- **loopguard**
Enter the keyword loopguard to enable loop guard on an RSTP port or port-channel interface.

- **rootguard**
Enter the keyword rootguard to enable root guard on an RSTP port or port-channel interface.

 Defaults
Not configured.

</tr>
</tbody>
</table>

Usage Information

The BPDU guard option prevents the port from participating in an active STP topology in case a BPDU appears on a port unintentionally, or is misconfigured, or is subject to a DOS attack. This option places the port into an Error Disable state if a BPDU appears and a message is logged so that the administrator can take corrective action.

**NOTE:** A port configured as an edge port, on an RSTP switch, immediately transitions to the Forwarding state. Only configure ports connected to end-hosts as edge ports. Consider an edge port similar to a port with a spanning-tree portfast enabled.

If you do not enable shutdown-on-violation, BPDUs are still sent to the RPM CPU.

You cannot enable STP root guard and loop guard at the same time on a port. For example, if you configure loop guard on a port on which root guard is already configured, the following error message displays: % Error: RootGuard is configured. Cannot configure LoopGuard.

Enabling Portfast BPDU guard and loop guard at the same time on a port results in a port that remains in a Blocking state and prevents traffic from flowing through it. For example, when Portfast BPDU guard and loop guard are both configured:

- If a BPDU is received from a remote device, BPDU guard places the port in an Err-Disabled Blocking state and no traffic is forwarded on the port.
If no BPDU is received from a remote device, loop guard places the port in a Loop-Inconsistent Blocking state and no traffic is forwarded on the port.

Example

```
DellEMC(conf)# interface tengigabitethernet 4/1
DellEMC(conf-if-gi-4/0)# spanning-tree rstp edge-port
DellEMC(conf-if-gi-4/0)# show config
!
interface TenGigabitEthernet 4/1
   no ip address
   switchport
   spanning-tree rstp edge-port
   no shutdown
DellEMC#
```

**tc-flush-standard**

Enable the MAC address flushing after receiving every topology change notification.

**Syntax**

```
tc-flush-standard
```

To disable, use the no tc-flush-standard command.

**Defaults**

Disabled

**Command Modes**

CONFIGURATION (conf-rstp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
6.5.1.0 | Introduced on the E-Series.
By default, Dell EMC Networking OS implements an optimized flush mechanism for RSTP. This implementation helps in flushing MAC addresses only when necessary (and less often), allowing for faster convergence during topology changes. However, if a standards-based flush mechanism is needed, you can turn on this knob command to enable flushing MAC addresses after receiving every topology change notification.
Software-Defined Networking (SDN)

The Dell EMC Networking OS supports software-defined networking (SDN). For more information, see the SDN Deployment Guide.
The commands in this chapter are available on Dell EMC Networking OS.
For configuration details, see the Security section in the Dell EMC Networking OS Configuration Guide.

**NOTE:** Dell EMC Networking OS implements LEAP with MSCHAP v2 supplicant.

**Topics:**
- AAA Accounting Commands
- Authorization and Privilege Commands
- Obscure Password Commands
- Authentication and Password Commands
- RADIUS Commands

- replay-protection-window
- terminate-session
- TACACS+ Commands
- Port Authentication (802.1X) Commands
- SSH and SCP Commands
- Secure DHCP Commands
- Role-Based Access Control Commands
- System Security Commands

## AAA Accounting Commands

AAA Accounting enables tracking of services that users are accessing and the amount of network resources being consumed by those services. When you enable AAA Accounting, the network server reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record is comprised of accounting AV pairs and is stored on the access control server.

As with authentication and authorization, you must configure AAA Accounting by defining a named list of accounting methods, and then applying that list to various interfaces.

### aaa accounting

Enable AAA Accounting and create a record for monitoring the accounting function.

**Syntax**

```
aaa accounting {system | exec | commands level | role role-name} {name | default}{start-stop | wait-start | stop-only} {tacacs+}
```
To disable AAA Accounting, use the `no aaa accounting {system | exec | command level} {name | default}{start-stop | wait-start | stop-only} {tacacs+} command.

### Parameters

- **system**: Enter the keyword `system` to send accounting information of any other AAA configuration.
- **exec**: Enter the keyword `exec` to send accounting information when a user has logged in to EXEC mode.
- **commands (level | role role-name)**: Enter the keyword `command` then a privilege level for accounting of commands executed at that privilege level or enter the keyword `role` then the role name for accounting of commands executed by a user with that user role.
- **name | default**: Enter one of the following:
  - For `name`, enter a user-defined name of a list of accounting methods.
  - For `default`, the default accounting methods used.
- **start-stop**: Enter the keywords `start-stop` to send a “start accounting” notice at the beginning of the requested event and a “stop accounting” notice at the end of the event.
- **wait-start**: Enter the keywords `wait-start` to ensure that the TACACS+ security server acknowledges the start notice before granting the user’s process request.
- **stop-only**: Enter the keywords `stop-only` to instruct the TACACS+ security server to send a “stop record accounting” notice at the end of the requested user process.
- **tacacs+**: Enter the keyword `tacacs+` to use TACACS+ data for accounting. The Dell EMC Networking OS currently only supports TACACS+ accounting.

### Defaults

- none

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5(0.0) | Added support for roles on the Z9000, S6000, S4820T, S4810, and MXL.
9.2(1.0) | Introduced on the Z9500.
9.2(0.0) | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
### accounting

Apply an accounting method list to terminal lines.

**Syntax**

```
accounting {exec | commands {level | role role-name}} method-list
```

**Parameters**

- **exec**
  Enter the keyword `exec` to apply an EXEC level accounting method list.

- **commands (level | role role-name)**
  Enter the keywords `commands` `level` to apply an EXEC and CONFIGURATION level accounting method list or enter the keyword `role` and then the role name for accounting of commands executed by a user with that user role.

- **method-list**
  Enter a method list that you defined using the `aaa accounting exec` or `aaa accounting commands` command.

**Defaults**

`none`

**Command Modes**

- **LINE**

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Related Commands**

- `aaa accounting` — enables AAA Accounting and creates a record for monitoring the accounting function.

**aaa accounting suppress**

Prevent the generation of accounting records of users with the user name value of NULL.

**Syntax**

```
aaa accounting suppress null-username
```

To permit accounting records to users with user name value of NULL, use the `no aaa accounting suppress null-username` command.

**Defaults**

Accounting records are recorded for all users.

**Command Modes**

CONFIGURATION

**Command History**

### Usage Information

Dell EMC Networking OS issues accounting records for all users on the system, including users whose username string, due to protocol translation, is NULL. For example, a user who comes on line with the `aaa authentication login method-list none` command is applied. To prevent the accounting records from being generated for sessions that do not have user names associated to them, use the `aaa accounting suppress` command.
### show accounting

Display the active accounting sessions for each online user.

**Syntax**

```
show accounting
```

**Defaults**

none

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Usage Information**

This command steps through all active sessions and then displays the accounting records for the active account functions.

**Example**

```plaintext
DellEMC# show accounting
Active accounted actions on tty2, User admin Priv 1 Role
  Task ID 2, EXEC Accounting record, 00:02:03 Elapsed, service=shell
Active accounted actions on tty3, User ad Priv 15 Role
  Task ID 7, EXEC Accounting record, 00:01:22 Elapsed, service=shell
Active accounted actions on tty4, User ad Priv 15 Role
  Task ID 11, EXEC Accounting record, 00:00:35 Elapsed, service=shell
Active accounted actions on tty5, User ad1 Priv 1 Role sysadmin
  Task ID 16, EXEC Accounting record, 00:00:04 Elapsed, service=shell
DellEMC#
```

**Related Commands**

- `aaa accounting` — enables AAA Accounting and creates a record for monitoring the accounting function.

## Authorization and Privilege Commands

To set command line authorization and privilege levels, use the following commands.

### authorization

Apply an authorization method list to terminal lines.

**Syntax**

```plaintext
authorization {exec | commands {level | role role-name}} method-list
```

**Parameters**

- `exec` Enter the keyword `exec` to apply an EXEC level authorization method list.
- `commands {level | role role-name}` Enter the keyword commands followed by either a privilege level for accounting of commands executed at that privilege level, or enter the keyword `role` then the role name for authorization of commands executed by a user with that user role.
- `method-list` Enter a method list that you defined using the `aaa accounting exec` or `aaa accounting commands` commands.
Defaults: none

Command Modes: LINE

Command History:
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

- aaa authorization exec — sets the parameters that restrict (or permit) a user’s access to EXEC level commands.

### aaa authorization commands

Set parameters that restrict (or permit) a user’s access to EXEC and CONFIGURATION level commands.

**Syntax**

```plaintext
aaa authorization commands {level | role role-name}{name|default} {local | tacacs+ | none}
```

**Parameters**

- `commands level` : Enter the keyword `commands` then the command privilege level for command level authorization.

**Description**

- no aaa authorization commands {level | role role-name}{name|default} {local | tacacs+ | none} command.
**role role-name**

Enter the keyword `role` then the role name.

**name**

Define a name for the list of authorization methods.

**default**

Define the default list of authorization methods.

**local**

Use the authorization parameters on the system to perform authorization.

**tacacs+**

Use the TACACS+ protocol to perform authorization.

**none**

Enter the keyword `none` to apply no authorization.

**Defaults**

`none`

**Usage Information**

Certain TACACS+ servers do not authenticate the device if you use the `aaa authorization commands level default local tacacs+` command. To resolve the issue, use the `aaa authorization commands level default tacacs+ local` command.
aaa authorization config-commands

Set parameters that restrict (or permit) a user’s access to EXEC level commands.

Syntax

```
aaa authorization config-commands
```

Disable authorization checking for CONFIGURATION level commands using the no aaa authorization config-commands command.

Defaults

Enabled when you configure aaa authorization commands command.

Usage Information

By default, the aaa authorization commands command configures the system to check both EXEC level and CONFIGURATION level commands. Use the command no aaa authorization config-commands to enable only EXEC-level command checking.

aaa authorization exec

Set parameters that restrict (or permit) a user’s access to EXEC-level commands.

Syntax

```
aaa authorization exec {name | default} {local || tacacs+ || if-authenticated || none}
```

Security
To disable authorization checking for EXEC level commands, use the no aaa authorization exec command.

**Parameters**

- **name**
  Define a name for the list of authorization methods.

- **default**
  Define the default list of authorization methods.

- **local**
  Use the authorization parameters on the system to perform authorization.

- **tacacs+**
  Use the TACACS+ protocol to perform authorization.

- **none**
  Enter the keyword none to apply no authorization.

**Defaults**

none

**privilege level (CONFIGURATION mode)**

Change the access or privilege level of one or more commands.

**Syntax**

```
privilege mode {level level command | reset command}
```

To delete access to a level and command, use the no privilege mode level level command command.
Parameters

mode

Enter one of the following keywords as the mode for which you are controlling access:

• configure for CONFIGURATION mode
• exec for EXEC mode
• interface for INTERFACE modes
• line for LINE mode
• route-map for ROUTE-MAP mode
• router for ROUTER OSPF, ROUTER RIP, ROUTER ISIS and ROUTER BGP modes

level level

Enter the keyword level then a number for the access level. The range is from 0 to 15. Level 1 is EXEC mode and Level 15 allows access to all CLI modes and commands.

reset

Enter the keyword reset to return the security level to the default setting.

command

Enter the command’s keywords to assign the command to a certain access level. You can enter one or all of the keywords.

Defaults

Not configured.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
pre-6.1.1.0 Introduced on the E-Series.

Usage Information

To define a password for the level to which you are assigning privilege or access, use the enable password command.
privilege level (LINE mode)

Change the access level for users on the terminal lines.

Syntax

```
privilege level level
```

To delete access to a terminal line, use the `no privilege level level` command.

Parameters

- `level level`
  - Enter the keyword `level` then a number for the access level. The range is from 0 to 15.
  - Level 1 is EXEC mode and Level 15 allows access to all CLI modes.

Defaults

`level = 15`

</tr>
</tbody>
</table>

**Usage Information**

By default, the `service password-encryption` command stores encrypted passwords. For greater security, you can also use the `service obscure-passwords` command to prevent a user from reading the passwords and keys, including RADIUS, TACACS+ keys, router authentication strings, VRRP authentication by obscuring this information. Passwords and keys are stored encrypted in the configuration file and by default are displayed in the encrypted form when the configuration is displayed. Enabling the `service obscure-passwords` command displays asterisks instead of the encrypted passwords and keys. This command prevents a user from reading these passwords and keys by obscuring this information with asterisks.

Password obscuring masks the password and keys for display only but does not change the contents of the file. The string of asterisks is the same length as the encrypted string for that line of configuration. To verify that you have successfully obscured passwords and keys, use the `show running-config command` or `show startup-config command`.

If you are using role-based access control (RBAC), only the system administrator and security administrator roles can enable the `service obscure-passwords` command.
Related Commands

- show running-config — Display the current configuration and display changes from the default values.
- service password-encryption — Encrypts all passwords configured in the system.

Authentication and Password Commands

To manage access to the system, use the following the commands.

aaa authentication enable

Configure AAA Authentication method lists for user access to EXEC privilege mode (the “Enable” access).

Syntax

aaa authentication enable {default | method-list-name} method [... method2]

To return to the default setting, use the no aaa authentication enable {default | method-list-name} method [... method2] command.

Parameters

default Enter the keyword default then the authentication methods to use as the default sequence of methods for the Enable login. The default is default enable.

method-list-name Enter a text string (up to 16 characters long) to name the list of enabled authentication methods activated at login.

method Enter one of the following methods:

- enable: use the password the enable password command defines in CONFIGURATION mode.
- line: use the password the password command defines in LINE mode.
- none: no authentication.
- radius: use the RADIUS servers configured with the radius-server host command.
- tacacs+: use the TACACS+ server(s) configured with the tacacs-server host command.

... method2 (OPTIONAL) In the event of a “no response” from the first method, Dell EMC Networking OS applies the next configured method.

Defaults

Use the enable password.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
### aaa authentication login

Configure AAA Authentication method lists for user access to EXEC mode (Enable log-in).

**Syntax**

```plaintext
aaa authentication login {method-list-name | default} method [... method]
```

To return to the default setting, use the `no aaa authentication login {method-list-name | default}` command.

**Parameters**

- `method-list-name` Enter a text string (up to 16 characters long) as the name of a user-configured method list that can be applied to different lines.

### Usage Information

By default, the Enable password is used. If you configure `aaa authentication enable default`, Dell EMC Networking OS uses the methods defined for Enable access instead.

Methods configured with the `aaa authentication enable` command are evaluated in the order they are configured. If authentication fails using the primary method, Dell EMC Networking OS employs the second method (or third method, if necessary) automatically. The fallback to the second method would happen only if the authentication failure is due to a non-reachable server or invalid TACACS server key. The fallback would not occur if the authentication failure is due to invalid credentials. For example, if the TACACS+ server is reachable, but the server key is invalid, Dell EMC Networking OS proceeds to the next authentication method.

### Related Commands

- `enable password` — changes the password for the `enable` command.
- `login authentication` — enables AAA login authentication on the terminal lines.
- `password` — creates a password.
- `radius-server host` — specifies a RADIUS server host.
- `tacacs-server host` — specifies a TACACS+ server host.
default

Enter the keyword default to specify that the method list specified is the default method for all terminal lines.

method

Enter one of the following methods:

- **enable**: use the password the enable password command defines in CONFIGURATION mode. Not available if role-only is in use.
- **line**: use the password the password command defines in LINE mode. Not available if role-only is in use.
- **local**: use the password for the userid contained in the local password database.
- **none**: no authentication. Not available if role-only is in use.
- **radius**: use the RADIUS servers configured with the radius-server host command.
- **tacacs+**: use the TACACS+ servers configured with the tacacs-server host command.

... method4

(OPTIONAL) Enter up to four additional methods. In the event of a “no response” from the first method, the system applies the next configured method (up to four configured methods).

Defaults

Not configured (that is, no authentication is performed).

Command Modes

</tr>
</tbody>
</table>
Version | Description
--- | ---
7.5.1.0 | Introduced on the C-Series.
pre-6.2.1.0 | Introduced on the E-Series.

Usage Information

By default, the locally configured username password is used. If you configure `aaa authentication login default`, Dell EMC Networking OS uses the methods this command defines for login instead.

Methods configured with the `aaa authentication login` command are evaluated in the order they are configured. If users encounter an error with the first method listed, Dell EMC Networking OS applies the next method configured. If users fail the first method listed, no other methods are applied. The only exception is the local method. If the user’s name is not listed in the local database, the next method is applied. If the correct user name/password combination is not entered, the user is not allowed access to the switch.

**NOTE:** If authentication fails using the primary method, Dell EMC Networking OS employs the second method (or third method, if necessary) automatically. For example, if the TACACS+ server is reachable, but the server key is invalid, Dell EMC Networking OS proceeds to the next authentication method. The TACACS+ is incorrect, but the user is still authenticated by the secondary method.

After configuring the `aaa authentication login` command, configure the `login authentication` command to enable the authentication scheme on terminal lines.

Connections to the SSH server work with the following login mechanisms: local, radius, and tacacs.

Related Commands

- `login authentication` — enables AAA login authentication on the terminal lines.
- `password` — creates a password.
- `radius-server host` — specifies a RADIUS server host.
- `tacacs-server host` — specifies a TACACS+ server host.

### aaa reauthenticate enable

Enable re-authentication of user whenever there is a change in the authenticators.

**Syntax**

```
aaa reauthenticate enable
```

To disable the re-authentication option, use the `no aaa reauthenticate enable` command.

**Defaults**

Disabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.11(0.0) | Introduced this command.

**Usage Information**

When an operating system enables to change the user authenticators, the users might access resources and perform tasks that they do not have authorization.
Once re-authentication is enabled, Dell EMC Networking OS prompts the users to re-authenticate whenever there is a change in authenticators.

The change in authentication happens when:

- Add or remove an authentication server (RADIUS/TACACS+)
- Modify an AAA authentication/authorization list
- Change to role-only (RBAC) mode

The re-authentication is also applicable for authenticated 802.1x devices. When there is a change in the authentication servers, the supplicants connected to all the ports are forced to re-authenticate.

Example

DellEMC(config)#aaa reauthenticate enable
DellEMC(config)#aaa authentication login vty_auth_list radius
Force all logged-in users to re-authenticate (y/n)?
DellEMC(config)#radius-server host 192.100.0.12
Force all logged-in users to re-authenticate (y/n)?

**access-class**

Restrict incoming connections to a particular IP address in a defined IP access control list (ACL).

**Syntax**

```
access-class access-list-name
```

To delete a setting, use the no access-class command.

**Parameters**

- `access-list-name` Enter the name of an established IP Standard ACL.

**Defaults**

Not configured.

**Command Modes**

LINE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### enable password

Change the password for the `enable` command.

**Syntax**

```
enable password [level level] [encryption-type] password
```

To delete a password, use the `no enable password [encryption-type] password [level level]` command.

**Parameters**

- **level level** (OPTIONAL) Enter the keyword `level` then a number as the level of access. The range is from 1 to 15.
- **encryption-type** (OPTIONAL) Enter the number 7 or 0 as the encryption type.

Enter a ? then a text string as the hidden password. The text string must be a password that was already encrypted by a Dell EMC Networking router.

Use this parameter only with a password that you copied from the `show running-config` file of another Dell EMC Networking router.

- **password** Enter a text string, up to 96 characters long, as the clear text password.

**Defaults**

No password is configured. `level` = 15.

**Command Modes**

- `CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>
Usage Information

To control access to command modes, use this command to define a password for a level and use the `privilege level (CONFIGURATION mode)` command.

Passwords must meet the following criteria:

- Start with a letter, not a number.
- Passwords can have a regular expression as the password. To create a password with a regular expression in it, use CNTL + v prior to entering regular expression. For example, to create the password `abcd\]e`, you type `"abcd CNTL v \]e"`. When the password is created, you do not use the CNTL + v key combination and enter "abcd\]e".

**NOTE:** The question mark (?) is not a supported character.

Related Commands

- `show running-config` — views the current configuration.
- `privilege level (CONFIGURATION mode)` — controls access to the command modes within the switch.

---

**enable sha256-password**

Configure SHA-256 based password for the `enable` command.

**Syntax**

```
enable sha256-password [level level] [encryption-type] password
```

To delete a password, use the `no enable sha256-password [encryption-type] password [level level]` command.

**Parameters**

- `sha256-password`
  - Enter the keyword `sha256-password` then the `encryption-type` or the password.
- `level level`
  - (OPTIONAL) Enter the keyword `level` then a number as the level of access. The range is from 1 to 15.
- `encryption-type`
  - (OPTIONAL) Enter the number 8 or 0 as the encryption type.
Enter 8 to enter the sha256–based hashed password.

**password**
Enter a text string, up to 96 characters long, as the clear text password.

**Defaults**
No password is configured.  

**Command Modes**
CONFIGURATION

**Command History**

</tr>
</tbody>
</table>

**Related Commands**
- `show running-config` — views the current configuration.
- `privilege level (CONFIGURATION mode)` — controls access to the command modes within the switch.

### enable restricted

Allows Dell EMC Networking technical support to access restricted commands.

**Syntax**
```
enable restricted [encryption-type] password
```

To disallow access to restricted commands, use the `no enable restricted` command.

**Parameters**
- **encryption-type**  
  (OPTIONAL) Enter the number 7 as the encryption type.

  Enter 7 followed a text string as the hidden password. The text string must be a password that was already encrypted by a Dell EMC Networking router.

  Use this parameter only with a password that you copied from the `show running-config` file of another Dell EMC Networking router.

- **password**  
  Enter a text string, up to 32 characters long, as the clear text password.

**Defaults**
Not configured.

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
Usage Information

Only Dell EMC Networking Technical Support staff use this command.

enable secret

Change the password for the enable command.

Syntax

enable secret [level level] [encryption-type] password

To delete a password, use the no enable secret [encryption-type] password [level level] command.

Parameters

level level

(OPTIONAL) Enter the keyword level then a number as the level of access. The range is from 1 to 15.

encryption-type

(OPTIONAL) Enter the number 5 or 0 as the encryption type.

Enter a 5 then a text string as the hidden password. The text string must be a password that was already encrypted by a Dell EMC Networking router.

Use this parameter only with a password that you copied from the show running-config file of another Dell EMC Networking router.

password

Enter a text string, up to 32 characters long, as the clear text password.

Defaults

No password is configured. level = 15.

**Usage Information**

To control access to command modes, use this command to define a password for a level and use the `privilege level` (CONFIGURATION mode) command.

Passwords must meet the following criteria:

- Start with a letter, not a number.
- Passwords can have a regular expression as the password. To create a password with a regular expression in it, use CNTL + v prior to entering regular expression. For example, to create the password `abcd\]e`, you type "abcd CNTL v ]e". When the password is created, you do not use the CNTL + v key combination and enter "abcd\]e".

**NOTE:** The question mark (?) is not a supported character.

**Related Commands**

- `show running-config` — views the current configuration.
- `privilege level (CONFIGURATION mode)` — controls access to the command modes within the switch.

---

**login authentication**

To configure authentication for console or remote access, apply an authentication method list.

**Syntax**

```
login authentication {method-list-name | default}
```

To use the local user/password database for login authentication, use the `no login authentication` command.
### Parameters

<table>
<thead>
<tr>
<th>method-list-name</th>
<th>Enter the keywords method-list-name to specify that method list, created in the aaa authentication login command, to be applied to the designated terminal line.</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Enter the keyword default to specify that the default method list, created in the aaa authentication login command, is applied to the terminal line.</td>
</tr>
</tbody>
</table>

### Defaults

No authentication is performed on the console lines. Local authentication is performed on the virtual terminal and auxiliary lines.

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

### Usage Information

If you configure the aaa authentication login default command, the login authentication default command automatically is applied to all terminal lines.

When configuring authentication, consider the following:

- If you configure the default authentication list using the default keyword, the list applies it to all the local and remote connections globally, unless you have specified some another authentication list for a specific connection.
- If you configure an authentication lists other than default, you must apply those authentication lists to each connection.
If you configure the `aaa authentication login default` command, the `login authentication default` command automatically is applied to all terminal lines.

Related Commands

- `aaa authentication login` — selects the login authentication methods.

### password

Specify a password for users on terminal lines.

**Syntax**

```sql
password [encryption-type] password
```

To delete a password, use the `no password password` command.

**Parameters**

- `encryption-type` (OPTIONAL) Enter either zero (0) or 7 as the encryption type for the password entered.
  
  The options are
  
  - 0 is the default and means the password is not encrypted and stored as clear text.
  - 7 means that the password is encrypted and hidden.
  
- `password` Enter a text string up to 96 characters long. The first character of the password must be a letter. You cannot use spaces in the password.

**Defaults**

No password is configured.

**Command Modes**

LINE

**Command History**

</tbody>
</table>
**Version**  | **Description**  
---|---  
7.6.1.0 | Introduced on the S-Series.  
7.5.1.0 | Introduced on the C-Series.  
pre-6.1.1.0 | Introduced on the E-Series.  

**Usage Information**  
Dell EMC Networking OS prompts users for these passwords when the method for authentication or authorization used is "line".

**Related Commands**  
- `enable password` — sets the password for the `enable` command.  
- `login authentication` — configures an authentication method to log in to the switch.  
- `service password-encryption` — encrypts all passwords configured in Dell EMC Networking OS.  
- `radius-server key` — configures a key for all RADIUS communications between the switch and the RADIUS host server.  
- `tacacs-server key` — configures a key for communication between a TACACS+ server and client.  
- `username` — establishes an authentication system based on user names.

### password-attributes

Configure the password attributes (strong password).

**Syntax**

```
password-attributes [min-length number] [max-retry number] [lockout-period minutes] [user-lockout-period minutes] [character-restriction [upper number] [lower number] [numeric number] [special-char number]]
```

To return to the default, use the `no password-attributes [min-length number] [max-retry number] [lockout-period minutes] [user-lockout-period minutes] [character-restriction [upper number] [lower number] [numeric number] [special-char number]]` command.

**Parameters**

- `min-length number` | (OPTIONAL) Enter the keywords `min-length` then the number of characters. The range is from 0 to 32 characters.  
- `max-retry number` | (OPTIONAL) Enter the keywords `max-retry` then the number of maximum password retries. The range is from 0 to 16.  
- `lockout-period minutes` | (OPTIONAL) Enter the keyword `lockout-period` then the number of minutes. The range is from 1 to 1440 minutes. The default is 0 minutes and the lockout-period is not enabled. This parameter enhances the security of the switch by locking out sessions on the Telnet or SSH sessions for which there has been a consecutive failed login attempts. The console is not locked out.  
- `user-lockout-period minutes` | (OPTIONAL) Enter the keyword `user-lockout-period` then the number of minutes. The range is from 1 to 1440 minutes. The default is 0 minutes and the lockout-period is not enabled. This parameter enhances the security of the switch by locking out the local user account if there are more number of unsuccessful login attempts than what is configured using the `max-retry` parameter. The default value is 3 times.  
- `character-restriction` | (OPTIONAL) Enter the keywords `character-restriction` to indicate a character restriction for the password.  
- `upper number` | (OPTIONAL) Enter the keyword `upper` then the upper number. The range is from 0 to 31.
lower number  
(OPTIONAL) Enter the keyword lower then the lower number. The range is from 0 to 31.

numeric number  
(OPTIONAL) Enter the keyword numeric then the numeric number. The range is from 0 to 31.

special-char number  
(OPTIONAL) Enter the keywords special-char then the number of special characters permitted. The range is from 0 to 31.

The following special characters are supported:

! " # % & ' ( ) ; < = > ? [ \ ] * + , - . / : ^ _ { | } ~ @ $

Defaults
none

Command Modes
CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the S6100-ON.
9.8(2.0)  Introduced on the S3100 series.
9.8(1.0)  Introduced on the Z9100-ON.
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)  Introduced on the S6000–ON.
9.5(0.1)  Introduced lockout-period option on the Z9500.
9.5(0.0)  Introduced lockout-period option on the Z9000, S6000, S4820T, S4810, and MXL.
9.2(1.0)  Introduced on the Z9500.
9.0.2.0  Introduced on the S6000.
8.3.19.0  Introduced on the S4820T.
8.3.11.1  Introduced on the Z9000.
8.3.7.0  Introduced on the S4810.
7.6.1.0  Introduced on the S-Series.
7.5.1.0  Introduced on the C-Series.
6.3.1.0  Introduced on the E-Series.

Example
In the following example, after 5 un-successful login attempts, the session (SSH/TELNET) goes into a locked state for 5 minutes. If all the 10 sessions are locked out with 5 un-successful attempts in each session, no users can login during the lockout-period.

DellEMC(conf)# password-attributes max-retry 5 lockout-period 5

Related Commands
  
  - password — specifies a password for users on terminal lines.
secure-cli enable

Enable the secured CLI mode.

**Syntax**

```
secure-cli enable
```

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11(0.0)</td>
<td>Introduced this command.</td>
</tr>
</tbody>
</table>

**Usage Information**

The secured CLI mode prevents the users from enhancing the permissions or promoting the privilege levels. After entering the command, save the running-configuration.

Once you save the running-configuration, the secured CLI mode is enabled. If you do not want to enter the secured mode, do not save the running-configuration.

Once saved, to disable the secured CLI mode, you need to manually edit the startup-configuration file and reboot the system.

service password-encryption

Encrypt all passwords configured in Dell EMC Networking OS.

**Syntax**

```
service password-encryption
```

To store new passwords as clear text, use the no service password-encryption command.

**Defaults**

Enabled.

**Command Modes**

CONFIGURATION

7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
pre-6.1.1.0 | Introduced on the E-Series.

Usage Information
The following describes the `show user` command shown in the following example.

Field | Description
--- | ---
(untitled) | Indicates with an asterisk (*) which terminal line you are using.
Line | Displays the terminal lines currently in use.
User | Displays the user name of all users logged in.
Host(s) | Displays the terminal line status.
Location | Displays the IP address of the user.

Example
```
DellEMC# show users
Authorization Mode:  role or privilege
---------------------------  ---------------------------  ------------  ------
Line  User                      Role             Priv
Host(s) Location
*   0  console 0                                unassigned         1  idle
    2 vty 0          admin                     unassigned         1
      idle       10.16.127.35
    3 vty 1          ad                           unassigned        15
      idle       10.16.127.145
    4 vty 2          adl                         sysadmin           1
      idle       10.16.127.141
    5 vty 3          adl                         sysadmin           1
      idle       10.16.127.145
    6 vty 4          admin                     unassigned         1
      idle       10.16.127.141
    7 vty 5          ad                           unassigned        15
      idle       10.16.127.141
DellEMC#
```

Related Commands
- `username` — enables a user.

**timeout login response**

Specify how long the software waits for the login input (for example, the user name and password) before timing out.

**Syntax**
```
timeout login response seconds
```

To return to the default values, use the `no timeout login response` command.
Parameters

seconds

Enter a number of seconds the software waits before logging you out. The range is:

- VTY — range is from 1 to 30 seconds, the default is 30 seconds.
- Console — range is from 1 to 300 seconds, the default is 0 seconds (no timeout).
- AUX — range is from 1 to 300 seconds, the default is 0 seconds (no timeout).

Defaults

See Parameters.

</tbody>
</table>

Usage Information

The software measures the period of inactivity defined in this command as the period between consecutive keystrokes. For example, if your password is “password” you can enter “p” and wait 29 seconds to enter the next letter.

username

Establish an authentication system based on user names.

Syntax

username name [access-class access-list-name] [nopassword | {password | secret | sha256-password} [encryption-type] password [dynamic-salt]] [ privilege level] [role role-name]

If you do not want a specific user to enter a password, use the nopassword option.
To delete authentication for a user, use the `no username name` command.

**Parameters**

- `name` Enter a text string for the name of the user up to 63 characters.
- `access-class` Enter the keywords `access-class` then the name of a configured access control list (either an IP access control list or MAC access control list).
- `access-list-name` Enter the keyword `access-list-name` to specify that the user should not enter a password.
- `nopassword` Enter the keyword `nopassword` then the encryption-type or the password.
- `password` Enter the keyword `password` then the encryption-type or the password.
- `encryption-type` Enter an encryption type for the `password` that you enter.
  - `0` directs the system to store the password as clear text. It is the default encryption type when using the `password` option.
  - `8` to indicate that a password encrypted using a sha256 hashing algorithm follows. This encryption type is available with the `sha256-password` option only, and is the default encryption type for this option.
  - `7` to indicate that a password encrypted using a DES hashing algorithm follows. This encryption type is available with the `password` option only.
  - `5` to indicate that a password encrypted using an MD5 hashing algorithm follows. This encryption type is available with the `secret` option only, and is the default encryption type for this option.
- `password` Enter a string up to 32 characters long.
- `dynamic-salt` Enter the keyword `dynamic-salt` to have an additional random input in the password encryption process.
- `privilege level` Enter the keyword `privilege` then a number from zero (0) to 15.
- `role role-name` Enter the keyword `role` followed by the role name to associate with that user ID.
- `secret` Enter the keyword `secret` then the encryption type.
- `sha256-password` Enter the keyword `sha256-password` then the encryption-type or the password.

**Defaults**

The default encryption type for `password` option is `0`. The default encryption type for `secret` option is `5`. The default encryption type for `sha256-password` option is `8`. The default value of `privilege level` is `1`.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.13.0.0 | Enhanced to display a warning message when a weak password is used. Introduced the `dynamic-salt` option on the MXL, S5000, S4048-ON, S6000, S6000-ON, S3048-ON, S3100 Series, C9010, S4048T-ON, Z9500, Z9100-ON, S6100-ON, S6010-ON.
9.12(1.0) | Introduced on the S5048F-ON.
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Added support for the `sha256-password` option for S3100, S3048--ON, S4048--ON, S4810, S4820T, S5000, S6000, S6000--ON, Z9100--ON, MXL, and Z9500.
9.8(2.0) | Introduced on the S3100 series.
## RADIUS Commands

The following RADIUS commands are supported by Dell EMC Networking OS.

### aaa radius auth-method

Configure the authentication method to use with RADIUS for user access.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa radius auth-method {pap</td>
<td>mschapv2}</td>
</tr>
</tbody>
</table>

Usage Information

To view the defined user names, use the `show running-config user` command. You can use the `dynamic-salt` option only under the `secret` and the `password` options.

When you configure the password, the system alerts if your password does not match the following criteria. The system accepts your password even if these conditions are not met. Dell EMC Networking recommends selecting a strong password for enhanced security.

- A minimum of eight characters in length
- A minimum of one lower case letter (a to z)
- A minimum of one upper case letter (A to Z)
- A minimum of one numeric character (0 to 9)
- A minimum of one special character including a space ("!"#$%&'()*+,-./:;<=>?@\^_`{|}~")

Related Commands

- `password` — specifies a password for users on terminal lines.
- `show running-config` — views the current configuration.
To undo the RADIUS authentication method configuration, use the `no aaa radius auth-method` command.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pap</code></td>
<td>Enter the keyword <code>pap</code> to use the Password Authentication Protocol (PAP) for RADIUS authentication. This protocol uses the username and password attributes in the access-request message sent to the RADIUS server.</td>
</tr>
<tr>
<td><code>mschapv2</code></td>
<td>Enter the keyword <code>mschapv2</code> to use the Microsoft Challenge-Handshake Authentication Protocol (MS-CHAPv2) for RADIUS authentication. This protocol is considered to be more secure than PAP and uses mutual authentication based on a random challenge and challenge response.</td>
</tr>
</tbody>
</table>

**Defaults**

PAP

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11(2.0P1)</td>
<td>Introduced the command on all Dell EMC Networking OS platforms.</td>
</tr>
</tbody>
</table>

**Usage Information**

If an authentication method is not configured using this command, then PAP is used for authentication with the RADIUS server.

You can configure the RADIUS authentication method to access the switch using the following applications: Console, Telnet, SSH, REST, and OMI.

### client

Configures trusted DAC clients.

**Syntax**

```plaintext
client {ipv4-addr | ipv6-addr | hostname} [vrf vrf-name] [key [encryption-type] key]
```

To undo the DAC client configuration, enter the `no client host` command.

**Defaults**

If VRF is not configured, default VRF is considered.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ipv4-addr</code></td>
<td>Enter the keyword <code>ipv4-addr</code> to specify the IPv4 address of the DAC.</td>
</tr>
<tr>
<td><code>ipv6-addr</code></td>
<td>Enter the keyword <code>ipv6-addr</code> to specify the IPv6 address of the DAC.</td>
</tr>
<tr>
<td><code>hostname</code></td>
<td>Enter the keyword <code>hostname</code> to enter the name of the host.</td>
</tr>
<tr>
<td><code>vrf vrf-name</code></td>
<td>Enter the keyword <code>vrf</code> followed by the name of the VRF to associate a VRF with the client.</td>
</tr>
<tr>
<td><code>key</code></td>
<td>(Optional) Enter the keyword <code>key</code> to specify an encryption key.</td>
</tr>
<tr>
<td><code>encryption-type</code></td>
<td>(Optional) Enter either 0 or 7 as the encryption type for the specified key. The options are:</td>
</tr>
</tbody>
</table>

- 0 – implies that the key is not encrypted and is stored as clear text.
- 7 – implies that the key is encrypted and hidden.
**key**
Enter a string that is the key to be exchanged between the switch and the dynamic authorization client. The key can be up to 42 characters long.

**Command Modes**
- CONF-DYNAMIC-AUTH

**Usage Information**
- It is possible to configure more than one dynamic authorization clients Duplicate (ipv4-addr or ipv6-addr or host-name) configurations are not allowed.

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.13(0.0)</td>
<td>Introduced on the C9010, S3100, S3048–ON, S4048T-ON, S4048–ON, S5000, S6010–ON, S6000–ON, S6100–ON, S6000, Z9100–ON, Z9500, FM-IOM, and MXL.</td>
</tr>
</tbody>
</table>

### client-key

Configures global shared key for the trusted DAC clients.

**Syntax**
```
client-key [encryption-type] key
```
To remove the shared key configuration, enter the `no client-key` command.

**Defaults**
None.

**Parameters**
- `encryption-type`:
  - (OPTIONAL) Enter either 0 or 7 as the encryption type for the key entered. The options are:
    - 0 — is the default and means the key is not encrypted and stored as clear text.
    - 7 — means that the key is encrypted and hidden.

- `key`:
  - Enter a string that is the key to be exchanged between the switch and RADIUS servers. It can be up to 42 characters long.

**Command Modes**
- CONF-DYNAMIC-AUTH

**Usage Information**
- Configure global shared key applicable for DA clients. If client configuration has shared key configured, that will take precedence.

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command.
**coa-bounce-port**

Configure NAS to allow or reject the port bounce RADIUS messages from DAC.

**Syntax**

```
coa-bounce-port
```

To remove the port bounce configuration, enter the `no coa-bounce-port` command.

**Defaults**

Enabled.

**Command Modes**

- CONF-DYNAMIC-AUTH

**Usage Information**

- Configure `no coa-bounce-port` to drop radius CoA port-bounce requests from the DAC.

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.13(0.0)</td>
<td>Introduced on the C9010, S3100, S3048–ON, S4048T-ON, S4048–ON, S5000, S6010–ON, S6000–ON, S6100–ON, S6000, Z9100–ON, Z9500, FN-IOM, and MXL.</td>
</tr>
</tbody>
</table>

**coa-disable-port**

Configure NAS to reject disable-port requests from DAC.

**Syntax**

```
coa-disable-port
```

To undo this configuration, enter the `no coa-disable-port` command.

**Defaults**

Enabled.

**Command Modes**

- CONF-DYNAMIC-AUTH

**Usage Information**

- Configure `no coa-disable-port` DAS to drop radius CoA disable-port requests from DAC.

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.13(0.0)</td>
<td>Introduced on the C9010, S3100, S3048–ON, S4048T-ON, S4048–ON, S5000, S6010–ON, S6000–ON, S6100–ON, S6000, Z9100–ON, Z9500, FN-IOM, and MXL.</td>
</tr>
</tbody>
</table>
**coa-reauthenticate**

Configure NAS to re-authenticate dot1x user session requests from DAC.

**Syntax**

```
coa-reauthenticate
```

To allow or reject re-authentication requests, enter the `no coa-reauthenticate` command.

**Defaults**

Enabled.

**Command Modes**

- CONF-DYNAMIC-AUTH

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.13(0.0)</td>
<td>Introduced on the C9010, S3100, S3048-ON, S4048T-ON, S4048-ON, S5000, S6010-ON, S6000-ON, S6100-ON, S6000, Z9100-ON, Z9500, FN-IOM, and MXL.</td>
</tr>
</tbody>
</table>

**debug radius**

View RADIUS transactions to assist with troubleshooting.

**Syntax**

```
debug radius
```

To disable debugging of RADIUS, use the `no debug radius` command.

**Defaults**

Disabled.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command.

<table>
<thead>
<tr>

</tr>
<tr>
<td>9.8(0.0P6)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
</tbody>
</table>
da-rsp-timeout

Configure timeout value for the back end task to respond to DAC requests.

Syntax
```
da-rsp-timeout minutes
```

To undo the configuration, enter the `no da-rsp-timeout` command.

Defaults
10 Minutes.

Parameters
- **minutes**
  Enter the time out value.

Command Modes
- CONF-DYNAMIC-AUTH

Usage Information
- Time for DAS to wait before the back end response is received.

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command.

<table>
<thead>

</tr>
</tbody>
</table>

disconnect-user

Configure NAS to allow or reject DM requests corresponding to AAA users-sessions coming from the DAC.

Syntax
```
disconnect-user
```
To undo this configuration, enter the `no disconnect-user` command.

**Defaults**
Enabled.

**Command Modes**
- CONF-DYNAMIC-AUTH

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command.

<table>
<thead>

</tr>
</tbody>
</table>

### dynamic-auth-enable

Configure NAS to receive and process dynamic authorization messages.

**Syntax**
```
dynamic-auth-enable
```

To stop NAS from receiving and processing dynamic authorization messages, use the `no dynamic-auth-enable` command.

**Defaults**
Disabled.

**Command Modes**
- CONF-DYNAMIC-AUTH

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command.

<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.13(0.0)</td>
<td>Introduced on the C9010, S3100, S3048–ON, S4048T-ON, S4048–ON, S5000, S6010–ON, S6000–ON, S6100–ON, S6000, Z9100–ON, Z9500, FN-IOM, and MXL.</td>
</tr>
</tbody>
</table>

**Usage Information**
If this configuration is not enabled, then dynamic authorization messages are not handled by the NAS.

### ip radius source-interface

Specify an interface's IP address as the source IP address for RADIUS connections.

**Syntax**
```
ip radius source-interface interface
```

To delete a source interface, use the `no ip radius source-interface` command.

**Parameters**
- `interface`
Enter the following keywords and the interface information:
For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.

For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.

For a port channel interface, enter the keywords port-channel then a number.

For a Null interface, enter the keyword null then the Null interface number.

For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**Defaults**
Not configured.

**Command Modes**
CONFIGURATION

</tr>
</tbody>
</table>

**port**

Configures NAS port number to accept CoA or DM requests.

**Syntax**

```
port port-number
```

To remove the NAS port configuration, enter the no port command.
radius dynamic-auth

Enters a new sub-mode, RADIUS-DYNAMIC-AUTH, which enables you to modify dynamic authorization settings.

Syntax

radius dynamic-auth

To remove the dynamic authorization method for RADIUS users, enter the no radius dynamic-auth command.

Defaults

Disabled.

Command Modes

- CONFIGURATION

Usage Information

- All dynamic authorization commands are configured by entering this mode.

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>
radius-server deadtime

Configure a time interval during which non-responsive RADIUS servers to authentication requests are skipped.

Syntax
radius-server deadtime seconds

To disable this function or return to the default value, use the no radius-server deadtime command.

Parameters

seconds Enter a number of seconds during which non-responsive RADIUS servers are skipped.
The range is from 0 to 2147483647 seconds. The default is 0 seconds.

Defaults
0 seconds

Command Modes CONFIGURATION

Command History

9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
pre-6.1.1.0 Introduced on the E-Series.

radius-server group

Creates or deletes a group of radius servers.

Syntax
radius-server group group-name

Security 1629
radius-server host

Configure a RADIUS server host.

Syntax

radius-server host {hostname | ipv4-address | ipv6-address} [auth-port port-number] [retransmit retries] [timeout seconds] [key [encryption-type] key]

Parameters

hostname Enter the name of the RADIUS server host.

ipv4-address | ipv6-address Enter the IPv4 address (A.B.C.D) or IPv6 address (X:X::X) of the RADIUS server host.
auth-port port-number  (OPTIONAL) Enter the keywords auth-port then a number as the port number. The range is from zero (0) to 65535. The default port-number is 1812.

retransmit retries  (OPTIONAL) Enter the keyword retransmit then a number as the number of attempts. This parameter overwrites the radius-server retransmit command. The range is from zero (0) to 100. The default is 3 attempts.

timeout seconds  (OPTIONAL) Enter the keyword timeout then the seconds the time interval the switch waits for a reply from the RADIUS server. This parameter overwrites the radius-server timeout command. The range is from 0 to 1000. The default is 5 seconds.

key [encryption-type] key  (OPTIONAL) Enter the keyword key then an optional encryption-type and a string up to 42 characters long as the authentication key. The RADIUS host server uses this authentication key and the RADIUS daemon operating on this switch. For the encryption-type, enter either zero (0) or 7 as the encryption type for the key entered. The options are:

- 0 is the default and means the password is not encrypted and stored as clear text.
- 7 means that the password is encrypted and hidden.

Configure this parameter last because leading spaces are ignored.

Defaults  Not configured.

Command Modes  •  RADIUS SERVER GROUP
                •  CONFIGURATION

### Usage Information

To configure any number of RADIUS server hosts for each server host that is configured, use this command. Dell EMC Networking OS searches for the RADIUS hosts in the order they are configured in the software.

The global default values for the `timeout`, `retransmit`, and `key` optional parameters are applied, unless those values are specified in the `radius-server host` or other commands. To return to the global default values, if you configure the `timeout`, `retransmit`, or `key` values, include those keywords when using the `no radius-server host` command syntax.

You can use duplicate host names or IP addresses among RADIUS groups. However, you cannot use duplicate host names or IP addresses within the same RADIUS group. If a VRF is not configured on the RADIUS group, then servers configured in the group are considered to be on the default VRF. RADIUS servers that are configured in the `CONFIGURATION` mode are also considered to be on the default VRF.

You must configure the RADIUS group explicitly with the `aaa radius group` command in order for the AAA servers to use the group of RADIUS servers. The 802.1x servers use the group of RADIUS servers based on the VRF where the 802.1x request is received. As a result, it is possible that both globally configured RADIUS servers as well as the group-configured RADIUS servers (without VRF or default VRF) are used for processing the 802.1x requests that are received at the default VRF. The order in which the RADIUS servers are tried depends on the order in which the RADIUS servers are configured.

### Example

```bash
DellEMC(config)#radius-server host 192.100.0.12
Force all logged-in users to re-authenticate (y/n)?
```

```bash
DellEMC(config)#no radius-server host 192.100.0.12
Force all logged-in users to re-authenticate (y/n)?
```

### Related Commands

- `login authentication` — sets the database to be checked when a user logs in.
- `radius-server key` — sets an authentication key for RADIUS communications.
- `radius-server retransmit` — sets the number of times the RADIUS server attempts to send information.
- `radius-server timeout` — sets the time interval before the RADIUS server times out.

### radius-server vrf

Create an association between a RADIUS server group and a VRF and source interface.

#### Syntax

```
radius-server vrf vrf-name [source-interface interface]
```

To delete the association between a RADIUS server group and a VRF and source interface, use the `no radius-server vrf vrf-name [source-interface interface]` command.
Parameters

vrf vrf-name  Enter the keyword vrf and then the name of the VRF to associate a RADIUS server group with that VRF.

interface  Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
- For a port channel interface, enter the keywords port-channel then a number.
- For a Null interface, enter the keyword null then the Null interface number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Defaults  Not configured.

Command Modes  RADIUS SERVER GROUP

Command History  This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Usage Information  You can use this command to associate a group of RADIUS servers with a VRF and source interface. You can configure the source interface only with the VRF attribute and source interface is optional with the VRF attributes.

If VRF is not configured on the RADIUS group, then the group is considered to be on the default VRF. It is possible to use the default VRF name; however, you cannot configure the source interface with the default VRF as such a configuration results in conflicts between the source interfaces corresponding to the 802.1x supplicants on that default VRF.

RADIUS groups and VRFs have one-to-one mapping. If a VRF is configured with one RADIUS group, then you cannot use the same VRF with another RADIUS group. When the VRF is removed, then the corresponding RADIUS group is also removed automatically.
Example
DellEMC(conf)#radius-server group group1
DellEMC(conf-radius-group)#radius-server vrf vrf1 source-interface tengigabitethernet 1/40
DellEMC(conf)#radius-server group group2
DellEMC(conf-radius-group)#radius-server vrf default

radius-server key

Configure a key for all RADIUS communications between the switch and the RADIUS host server.

Syntax
radius-server key [encryption-type] key
To delete a password, use the no radius-server key command.

Parameters
encryption-type (OPTIONAL) Enter either zero (0) or 7 as the encryption type for the key entered. The options are:
- 0 is the default and means the key is not encrypted and stored as clear text.
- 7 means that the key is encrypted and hidden.

key Enter a string that is the key to be exchanged between the switch and RADIUS servers. It can be up to 96 characters long.

Defaults Not configured.

</table>
### Usage Information

The key configured on the switch must match the key configured on the RADIUS server daemon.

If you configure the key parameter in the `radius-server host` command, the key configured with the `radius-server key` command is the default key for all RADIUS communications.

### Related Commands

- `radius-server host` — configures a RADIUS host.

---

**radius-server retransmit**

Configure the number of times the switch attempts to connect with the configured RADIUS host server before declaring the RADIUS host server unreachable.

**Syntax**

```plaintext
radius-server retransmit retries
```

To configure zero retransmit attempts, use the `no radius-server retransmit` command.

To return to the default setting, use the `radius-server retransmit 3` command.

**Parameters**

- `retries` Enter a number of attempts that the Dell OS tries to locate a RADIUS server. The range is from zero (0) to 100. The default is `3 retries`.

**Defaults**

3 retries

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.

9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
radius-server timeout

To reply to a request, configure the amount of time the RADIUS client (the switch) waits for a RADIUS host server.

Syntax
radius-server timeout seconds

To return to the default value, use the no radius-server timeout command.

Parameters

- **seconds**
  
Enter the number of seconds between an unsuccessful attempt and the Dell EMC Networking OS times out. The range is from zero (0) to 1000 seconds. The default is 5 seconds.

Defaults

- 5 seconds

</tbody>
</table>
rate-limit

Configure NAS to allow or reject RADIUS dynamic authorization (DA) packets based on the configurable rate limit value.

Syntax
rate-limit packets per minute
To undo the configuration, enter the no rate-limit command.

Defaults
30 packets per minute.

Parameters
- **packet per minute**: Enter the number of packets that you want processed per minute. The range is between 10 to 60 packets per minute.

Command Modes
- CONF-DYNAMIC-AUTH

Usage Information
- Packets are dropped after number of packets reaches the configured rate-limit.

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

replay-protection-window

Configure replay protection window period to drop the duplicate packets.

Syntax
replay-protection-window minutes
To undo the configuration, enter the no replay-protection-window command.

Defaults
5 Minutes.

Parameters
- **minutes**: Enter the number of minutes to drop the packets. The range is from 1 to 10 minutes.
terminate-session

Configure NAS to reject dot1x terminate-session requests from DAC.

Syntax

```
terminate-session
```

To drop the DM terminate-session requests from DAC, enter the `no terminate-session` command.

Defaults

Enabled.

Command Modes

- CONF-DYNAMIC-AUTH

Command History

**TACACS+ Commands**

Dell EMC Networking OS supports TACACS+ as an alternate method for login authentication.

**tacacs-server group**

Creates a group of TACACS servers to be used for Authentication, Authorization, and Accounting.

Syntax

```
aaa tacacsgroup group-name
```

To delete a group of TACACS servers, use the `no tacacs-server group group-name` command
Parameters

**group-name** Enter the name of the TACACS server group.

Defaults

Not configured.

Command Modes

Usage Information

If the TACACS group is not configured for Authentication, Authorization, and Accounting, then globally configured TACACS servers are used for the purposes. When the TACACS group is removed, the AAA configuration is also removed.

Example

```
Usage Information
```

Related Commands

- `aaa authentication login` — specifies the login authentication method.
- `tacacs-server key` — configures a TACACS+ key for the TACACS server.

**debug tacacs+**

To assist with troubleshooting, view TACACS+ transactions.

Syntax

```
debug tacacs+
```

To disable debugging of TACACS+, use the `no debug tacacs+` command.

Defaults

Disabled.

Command Modes

EXEC Privilege

**ip tacacs source-interface**

Specify an interface’s IP address as the source IP address for TACACS+ connections.

**Syntax**

```
ip tacacs source-interface interface
```

To delete a source interface, use the `no ip tacacs source-interface` command.

**Parameters**

- **interface**
  
  Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a Null interface, enter the keyword `null` then the Null interface number.

</tr>
</tbody>
</table>

**Usage Information**

You can associate a TACACS server group with a VRF.

**Example**

```
DellEMC(conf)# tacacs-server group group1
DellEMC(conf-tacacs-group)# tacacs-server host 1.1.1.1 key secret
DellEMC(conf-tacacs-group)# tacacs-server host 2.2.2.2 key secret
DellEMC(conf-tacacs-group)# tacacs-server vrf vrf1 source-interface tengigabitethernet 1/42
DellEMC(conf-tacacs-group)# show config
!
tacacs-server group group1
tacacs-server vrf vrf1 source-interface TenGigabitEthernet 1/42
tacacs-server host 1.1.1.1 key 7 9a2f3ec0c65c6f41
tacacs-server host 2.2.2.2 key 7 9a2f3ec0c65c6f41
DellEMC(conf-tacacs-group)#
```

**Related Commands**

- `aaa authentication login` — specifies the login authentication method.
- `tacacs-server key` — configures a TACACS+ key for the TACACS server.

## tacacs-server host

Specify a TACACS+ host.

**Syntax**

```
tacacs-server host {hostname | ipv4-address | ipv6-address} [port number] [timeout seconds] [key key]
```

**Parameters**

- `hostname`
  - Enter the name of the TACACS+ server host.
- `ipv4-address | ipv6-address`
  - Enter the IPv4 address (A.B.C.D) or IPv6 address (X:X:X:X::X) of the TACACS+ server host.
- `port number`
  - (OPTIONAL) Enter the keyword `port` then a number as the port to be used by the TACACS+ server. The range is from zero (0) to 65535. The default is 49.
- `timeout seconds`
  - (OPTIONAL) Enter the keyword `timeout` then the number of seconds the switch waits for a reply from the TACACS+ server. The range is from 0 to 1000. The default is 10 seconds.
- `key key`
  - (OPTIONAL) Enter the keyword `key` then a string up to 42 characters long as the authentication key. This authentication key must match the key specified in the `tacacs-server key` for the TACACS+ daemon.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

### Usage Information

To list multiple TACACS+ servers to be used by the `aaa authentication login` command, configure this command multiple times.

If you are not configuring the switch as a TACACS+ server, you do not need to configure the `port`, `timeout` and `key` optional parameters. If you do not configure a key, the key assigned in the `tacacs-server key` command is used.

You can use duplicate host names or IP addresses among TACACS groups. However, you cannot use duplicate host names or IP addresses within the same TACACS group.

If a VRF is not configured on the TACACS group, then servers configured in the group are considered to be on the default VRF. TACACS servers that are configured in the `CONFIGURATION` mode are also considered to be on the default VRF.

For AAA servers to use a group of TACACS servers, you must explicitly configure the group using the `aaa tacacs group` `group-name` command. The order in which the TACACS servers are tried depends on the order in which they are configured.

### Example

```
DellEMC(conf)# tacacs-server group group1
DellEMC(conf-tacacs-group)# tacacs-server host 1.1.1.1 key secret
DellEMC(conf-tacacs-group)# no tacacs-server host 1.1.1.1
DellEMC(conf-tacacs-group)#
```
Related Commands

- `aaa authentication login` — specifies the login authentication method.
- `tacacs-server key` — configures a TACACS+ key for the TACACS server.

### tacacs-server key

Configure a key for communication between a TACACS+ server and a client.

**Syntax**

```plaintext
tacacs-server key [encryption-type] key
```

To delete a key, use the `no tacacs-server key key` command.

**Parameters**

- `encryption-type` (OPTIONAL) Enter either zero (0) or 7 as the encryption type for the key entered. The options are:
  - 0 is the default and means the key is not encrypted and stored as clear text.
  - 7 means that the key is encrypted and hidden.

- `key` Enter a text string, up to 42 characters long, as the clear text password. Leading spaces are ignored.

**Defaults**

Not configured.

**Command Modes**

</tbody>
</table>

**Usage Information**

The key configured with this command must match the key configured on the TACACS+ daemon.

### tacacs-server vrf

Create an association between a TACACS server group and a VRF and source interface.

**Syntax**

```plaintext
tacacs-server vrf vrf-name [source-interface interface]
```

To delete the association between a TACACS server group and a VRF and source interface, use the `no tacacs-server vrf vrf-name [source-interface interface]` command.

**Parameters**

- **vrf vrf-name**
  - Enter the keyword `vrf` and then the name of the VRF to associate a TACACS server group with that VRF.
- **interface**
  - Enter the following keywords and slot/port or number information:
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
    - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a Null interface, enter the keyword `null` then the Null interface number.
    - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

TACACS SERVER GROUP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>

</tr>
</tbody>
</table>
You can use this command to associate a group of TACACS servers with a VRF and source interface. You can configure the source interface only with the VRF attribute and source interface is optional with the VRF attributes.

If VRF is not configured on the TACACS group, then the group is considered to be on the default VRF.

RADIUS groups and VRFs have one-to-one mapping. If a VRF is configured with one RADIUS group, then you cannot use the same VRF with another RADIUS group. When the VRF is removed, then the corresponding RADIUS group is also removed automatically.

```
DellEMC(conf)# tacacs-server group group1
DellEMC(conf-tacacs-group)# tacacs-server vrf vrf1 source-interface tengigabitethernet 1/36
DellEMC(conf)# tacacs-server group group2
DellEMC(conf-tacacs-group)# tacacs-server vrf default
```

### Port Authentication (802.1X) Commands

An authentication server must authenticate a client connected to an 802.1X switch port. Until the authentication, only Extensible Authentication Protocol over LAN (EAPOL) traffic is allowed through the port to which a client is connected. After authentication is successful, normal traffic passes through the port.

Dell EMC Networking OS supports RADIUS and Active Directory environments using 802.1X Port Authentication.

**Important Points to Remember**

Dell EMC Networking OS limits network access for certain users by using VLAN assignments. 802.1X with VLAN assignment has these characteristics when configured on the switch and the RADIUS server:

- 802.1X is supported on Dell EMC Networking OS.
- 802.1X is not supported on the LAG or the channel members of a LAG.
- If no VLAN is supplied by the RADIUS server or if 802.1X authorization is disabled, the port is configured in its access VLAN after successful authentication.
- If 802.1X authorization is enabled but the VLAN information from the RADIUS server is not valid, the port returns to the Unauthorized state and remains in the configured access VLAN. This prevents ports from appearing unexpectedly in an inappropriate VLAN due to a configuration error. Configuration errors create an entry in Syslog.
- If 802.1X authorization is enabled and all information from the RADIUS server is valid, the port is placed in the specified VLAN after authentication.
- If port security is enabled on an 802.1X port with VLAN assignment, the port is placed in the RADIUS server assigned VLAN.
- If 802.1X is disabled on the port, it is returned to the configured access VLAN.
- When the port is in the Force Authorized, Force Unauthorized, or Shutdown state, it is placed in the configured access VLAN.
- If an 802.1X port is authenticated and put in the RADIUS server assigned VLAN, any change to the port access VLAN configuration does not take effect.
- The 802.1X with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN membership.

**dot1x authentication (Configuration)**

Enable dot1x globally; dot1x must be enabled both globally and at the interface level.

**Syntax**

`dot1x authentication`
To disable dot1x on globally, use the `no dot1x authentication` command.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION

### dot1x auth-fail-vlan

Configure an authentication failure VLAN for users and devices that fail 802.1X authentication.

**Syntax**
```
dot1x auth-fail-vlan 
```

To delete the authentication failure VLAN, use the `no dot1x auth-fail-vlan` command.

**Parameters**
- `vlan-id`  
  - Enter the VLAN Identifier. The range is from 1 to 4094.

- `max-attempts number`  
  - (OPTIONAL) Enter the keywords `max-attempts` then number of attempts desired before authentication fails. The range is from 1 to 5. The default is 3.

**Defaults**
- 3 attempts

- `dot1x authentication (Configuration) — enable dot1x globally.`
dot1x

Version Description
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.7.0 Introduced on the S4810.
7.6.1.0 Introduced on the C-Series, S-Series, and E-Series.

Usage Information
If the host responds to 802.1X with an incorrect login/password, the login fails. The switch attempts to authenticate again until the maximum attempts configured is reached. If the authentication fails after all allowed attempts, the interface is moved to the authentication failed VLAN.

After the authentication VLAN is assigned, the port-state must be toggled to restart authentication. Authentication occurs at the next re-authentication interval (dot1x reauthentication).

Related Commands
- dot1x port-control — enables port-control on an interface.
- dot1x guest-vlan — configures a guest VLAN for non-dot1x devices.
- show dot1x interface — displays the 802.1X information on an interface.

dot1x auth-server

Configure the authentication server to RADIUS.

Syntax
dot1x auth-server radius

Defaults none

</tbody>
</table>
Usage Information

802.1X authentication is enabled when an interface is connected to the switch. If the host fails to respond within a designated amount of time, the authenticator places the port in the guest VLAN.

If a device does not respond within 30 seconds, it is assumed that the device is not 802.1X capable. Therefore, a guest VLAN is allocated to the interface and authentication for the device occurs at the next re-authentication interval (dot1x reauthentication).

If the host fails authentication for the designated number of times, the authenticator places the port in authentication failed VLAN (dot1x auth-fail-vlan).

**NOTE:** The layer 3 portion of guest VLAN and authentication fail VLANs can be created regardless if the VLAN is assigned to an interface or not. After an interface is assigned a guest VLAN (which has an IP address), routing through the guest VLAN is the same as any other traffic. However, the interface may join/leave a VLAN dynamically.

Related Commands

- `dot1x auth-fail-vlan` — configures a VLAN for authentication failures.
- `dot1x reauthentication` — enables periodic re-authentication.
- `show dot1x interface` — displays the 802.1X information on an interface.

**dot1x mac-auth-bypass**

Enable MAC authentication bypass. If 802.1X times out because the host did not respond to the Identity Request frame, Dell EMC Networking OS attempts to authenticate the host based on its MAC address.

**Syntax**

```
[no] dot1x mac-auth-bypass
```

**Default**

Disabled

9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
 Usage Information

To disable MAC authentication bypass on a port, enter the no dot1x mac-auth-bypass command.

**dot1x max-eap-req**

Configure the maximum number of times an extensive authentication protocol (EAP) request is transmitted before the session times out.

**Syntax**

```plaintext
dot1x max-eap-req number
```

To return to the default, use the no dot1x max-eap-req command.

**Parameters**

- `number` 
  Enter the number of times an EAP request is transmitted before a session time-out. The range is from 1 to 10. The default is 2.

**Defaults**

2

Related Commands

- interface range — configure a range of interfaces.

**dot1x port-control**

Enable port control on an interface.

**Syntax**

```plaintext
dot1x port-control {force-authorized | auto | force-unauthorized}
```

**Parameters**

- `force-authorized`: Enter the keywords `force-authorized` to forcibly authorize a port.
- `auto`: Enter the keyword `auto` to authorize a port based on the 802.1X operation result.
- `force-unauthorized`: Enter the keywords `force-unauthorized` to forcibly de-authorize a port.

**Usage Information**

The authenticator performs authentication only when port-control is set to auto.
**dot1x quiet-period**

Set the number of seconds that the authenticator remains quiet after a failed authentication with a client.

**Syntax**

```
dot1x quiet-period seconds
```

To disable quiet time, use the `no dot1x quiet-time` command.

**Parameters**

```
seconds
```

Enter the number of seconds. The range is from 1 to 65535. The default is 30.

**Defaults**

30 seconds

**dot1x reauthentication**

Enable periodic re-authentication of the client.

**Syntax**

```
dot1x reauthentication [interval seconds]
```

To disable periodic re-authentication, use the `no dot1x reauthentication` command.
**Parameters**

interval seconds  
(Optional) Enter the keyword interval then the interval time, in seconds, after which re-authentication is initiated. The range is from 1 to 31536000 (1 year). The default is **3600 (1 hour)**.

**Defaults**

3600 seconds (1 hour)

**Related Commands**

- `interface range` — configures a range of interfaces.

### dot1x reauth-max

Configure the maximum number of times a port can re-authenticate before the port becomes unauthorized.

**Syntax**

dot1x reauth-max number  
To return to the default, use the no dot1x reauth-max command.

**Parameters**

- `number`  
Enter the permitted number of re-authentications. The range is from 1 to 10. The default is **2**.

**Defaults**

2

show dot1x interface

Display the 802.1X information on an interface.

Syntax

show dot1x interface interface

Parameters

interface

Enter one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.

Defaults

none

Command Modes

- EXEC
- EXEC privilege

**SSH and SCP Commands**

Dell EMC Networking OS supports secure shell (SSH) protocol version 2.0. SSH is a protocol for secure remote login over an insecure network. SSH sessions are encrypted and use authentication.
crypto key generate

Generate keys for the SSH server.

Syntax

```
NOTE: Some of the parameters in this command require licensing to access. For more information, contact your Dell EMC Networking representative.

crypto key generate {rsa}
```

Parameters

- **rsa**

  Enter the keyword `rsa` then the key size to generate a SSHv2 RSA host keys. The range is from 1024 to 2048 if you did not enable FIPS mode; if you enabled FIPS mode, you can only generate a 2048-bit key. The default is **1024**.

  **NOTE:** You must have a license to access the FIPS mode. For more information, contact your Dell EMC Networking representative.

Defaults

Key size **1024**: if you enable FIPS mode, the key size is **2048**.

</tbody>
</table>
Usage Information

The host keys are required for key-exchange by the SSH server. If the keys are not found when you enable the server (ip ssh server enable), the keys are automatically generated.

This command requires user interaction and generates a prompt prior to overwriting any existing host keys.

**NOTE:** Only a user with superuser permissions should generate host-keys.

Example

```
DellEMC(conf)# crypto key generate rsa
Enter key size <1024-2048>. Default<1024>  :
Host key already exists. Overwrite (y/n)?y
Generating 1024-bit SSHv2 RSA key.

DellEMC(conf)#
```

Related Commands

- `ip ssh server` — enables the SSH server.
- `show crypto` — displays the SSH host public keys.

**crypto key zeroize rsa**

Removes the generated RSA host keys and zeroize the key storage location.

**Syntax**

```
crypto key zeroize rsa
```

**Defaults**

none

<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>pre-6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Debug information includes details for key-exchange, authentication, and established session for each connection.

**ip scp topdir**

Identify a location for files used in secure copy transfer.

**Syntax**

```plaintext
ip scp topdir directory
```

**Usage Information**

Use this command to specify the directory from which to copy files on the host.

Use the `set scpoct` command to specify the TCP port used for the secure copy transfer.
To return to the default setting, use the `no ip scp topdir` command.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Enter a directory name.</td>
</tr>
</tbody>
</table>

**Defaults**
The internal flash (`flash:`) is the default directory.

**Command Modes**
CONFIGURATION

</table>

**Usage Information**
To configure the switch as an SCP server, use the `ip ssh server` command.

**Related Commands**
- `ip ssh server` — enables the SSH and SCP server on the switch.

### ip ssh authentication-retries

Configure the maximum number of attempts that should be used to authenticate a user.

**Syntax**

```
ip ssh authentication-retries 1-10
``` 

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>pre-6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information  This command specifies the maximum number of attempts to authenticate a user on an SSH connection with the remote host for password authentication. SSH disconnects when the number of password failures exceeds authentication-retries.

**ip ssh challenge-response-authentication**

Enable challenge response authentication for SSHv2.

Syntax  

```
ip ssh challenge-response-authentication enable
```

To disable the challenge response authentication, use the 
```
no ip ssh challenge-response-authentication enable
```
command.

Parameters  

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enter the keyword enable to enable the challenge response authentication for SSHv2.</td>
</tr>
</tbody>
</table>

Defaults  

Disabled.

Command Modes  

CONFIGURATION

Command History  

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
ip ssh cipher

Configure the list of ciphers supported on both SSH client and SCP.

Syntax

ip ssh cipher cipher-list

Parameters

cipher cipher-list  Enter the keyword cipher and then a space-delimited list of ciphers that the SSH client supports. The following ciphers are available.

- aes256-ctr
- aes256-cbc
- aes192-ctr
- aes192-cbc
- aes128-ctr
- aes128-cbc
- 3des-cbc

Defaults

The default list of ciphers is in the order as shown below:

- aes256-ctr
- aes256-cbc
- aes192-ctr
- aes192-cbc
- aes128-ctr
- aes128-cbc
- 3des-cbc

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version  Description

9.11(0.0)  Introduced on the S4810, S4820T, S3048-ON, S3100 Series, S4048-ON, S5000, S6000, S6000-ON, Z9500, Z9100-ON, S6100-ON, S6010-ON, S4048T-ON, C9000, and MXL.

Usage Information

If both the challenge response authentication and password authentication methods are configured, the challenge response authentication takes priority.

• You can select one or more ciphers from the list.
The default list of supported ciphers is same irrespective of whether FIPS mode is enabled or disabled.

Client-supported cipher list gets preference over the server-supported cipher list in selecting the cipher for the SSH session.

When the `cipher (-c)` option is used with the SSH CLI, it overrides the configured or default cipher list.

When FIPS is enabled or disabled, the client ciphers get default configuration.

---

**ip ssh connection-rate-limit**

Configure the maximum number of incoming SSH connections per minute.

**Syntax**

```
ip ssh connection-rate-limit 1-60
```

**Parameters**

- **1-60**
  
  Enter the number of maximum numbers of incoming SSH connections allowed per minute. The range is from 1 to 60 per minute. The default is **10 per minute**.

**Defaults**

**10 per minute**

**Command Modes**

**CONFIGURATION**

ip ssh hostbased-authentication

Enable hostbased-authentication for the SSHv2 server.

Syntax

```
ip ssh hostbased-authentication enable
```

To disable hostbased-authentication for SSHv2 server, use the `no ip ssh hostbased-authentication enable` command.

Parameters

- `enable` Enter the keyword `enable` to enable hostbased-authentication for SSHv2 server.

Defaults

Disabled.

</tr>
</tbody>
</table>

Usage Information

If you enable this command, clients can log in without a password prompt. This command provides two levels of authentication:

- rhost-authentication is done with the file specified in the `ip ssh rhostfile` command.
- checking client host-keys is done with the file specified in the `ip ssh pub-key-file` command.

**NOTE:** Administrators must specify the two files (`rhosts` and `pub-key-file`) to configure host-based authentication.
Related Commands

• `ip ssh pub-key-file` — public keys of trusted hosts from a file.
• `ip ssh rhostsfile` — trusted hosts and users for rhost authentication.

**ip ssh key-size**

Configure the size of the server-generated RSA SSHv1 key.

**Syntax**

```
ip ssh key-size 512-869
```

**Parameters**

- `512-869` Enter the key-size number for the server-generated RSA SSHv1 key. The range is from 512 to 869. The default is **768**.

**Defaults**

- **Key size 768**

**Command Modes**

- **CONFIGURATION**

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant **Dell EMC Networking OS Command Line Reference Guide**.

<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>pre-6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

The server-generated key is used for SSHv1 key-exchange.

**ip ssh mac**

Configure the list of MAC algorithms supported on both SSH client and SCP.

**Syntax**

```
ip ssh mac mac-list
```

**Usage Information**

The server-generated key is used for SSHv1 key-exchange.
Parameters  

mac mac-list

Enter the keyword mac then a space-delimited list of message authentication code (MAC) algorithms supported by the SSH client. The following MAC algorithms are available.

When FIPS mode is enabled:

- hmac-sha2-256
- hmac-shal
- hmac-shal-96

When FIPS mode is disabled:

- hmac-sha2-256
- hmac-shal
- hmac-shal-96
- hmac-md5
- hmac-md5-96

Defaults

The default list of MAC algorithm is in the order as shown below:

When FIPS mode is enabled:

- hmac-sha2-256
- hmac-shal
- hmac-shal-96

When FIPS mode is disabled:

- hmac-sha2-256
- hmac-shal
- hmac-shal-96
- hmac-md5
- hmac-md5-96

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON, S6000, S6000-ON, S5000, S4810, S4820T, S3048-ON, S4048-ON, MXL, C9010, S3100 series, and Z9100-ON.

Usage Information

- You can select one or more MAC algorithms from the list.
- Client-supported MAC list gets preference over the server-supported MAC list in selecting the MAC algorithm for the SSH session.
- When the MAC (-m) option is used with the SSH CLI, it overrides the configured or default MAC list.
When FIPS is enabled or disabled, the client MACs get default configuration.

**ip ssh password-authentication**

Enable password authentication for the SSH server.

**Syntax**

```
ip ssh password-authentication enable
```

To disable password-authentication, use the `no ip ssh password-authentication enable` command.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

</tr>
</tbody>
</table>

**Usage Information**

This command specifies the file used for the host-based authentication. The `creates/` file overwrites the `flash:/ADMIN_DIR/ssh/knownhosts` file and deletes the user-specified file. Even though this command is a global configuration command, it does not appear in the running configuration because you only need to run this command once.

The file contains the OpenSSH-compatible public keys of the host for which host-based authentication is allowed. An example known host file format:

```bash
poclab4,123.123.1.123 ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAIEAOx/ QQp8xYhz0xn07yg4VGPA0UfgKoleTH09G4sNV+ui+DWEc3cgYAcU5Lai1MU20DrzhCwyDNp05tKBu3t
```
NOTE: For `rhostfile` and `pub-key-file`, the administrator must FTP the file to the chassis.

Example

```
DellEMC(conf)# ip ssh pub-key-file flash://knownhosts
```

Related Commands

- `show ip ssh client-pub-keys` — displays the client-public keys used for the host-based authentication.

**ip ssh rekey**

Configures the time rekey-interval or volume rekey-limit threshold at which to re-generate the SSH key during an SSH session.

Syntax

```
ip ssh rekey [time rekey-interval] [volume rekey-limit]
```

To reset to the default, use no `ip ssh rekey [time rekey-interval] [volume rekey-limit]` command.

Parameters

- **time minutes**
  
  Enter the keywords `time` then the amount of time in minutes. The range is from 10 to 1440 minutes. The default is **60 minutes**

- **volume rekey-limit**
  
  Enter the keywords `volume` then the amount of volume in megabytes. The range is from 1 to 4096 megabytes. The default is **1024 megabytes**

Defaults

The default time is **60 minutes**. The default volume is **1024 megabytes**.

Command Modes

</tr>
</tbody>
</table>

Example

```
DellEMC#conf
DellEMC(conf)# ip ssh rhostsfile flash://shosts
DellEMC(conf)#
```

Usage Information

This command specifies the host file used for host-based authentication. This creates/ file overwrites the flash:/ADMIN_DIR/ssh/shosts file and deletes the user-specified file. Even though this command is a global configuration command, it does not appear in the running configuration because you only need to run this command once.

This file contains hostnames and usernames, for which hosts and users, rhost-authentication can be allowed.
For `rhostfile` and `pub-key-file`, the administrator must FTP the file to the switch.

**ip ssh rsa-authentication (Config)**

Enable RSA authentication for the SSHv2 server.

**Syntax**

```
ip ssh rsa-authentication enable
```

To disable RSA authentication, use the `no ip ssh rsa-authentication enable` command.

**Parameters**

- **enable**
  - Enter the keyword `enable` to enable RSA authentication for the SSHv2 server.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

Enabling RSA authentication allows the user to log in without being prompted for a password. In addition, the OpenSSH compatible SSHv2 RSA public key must be added to the list of authorized keys (`ip ssh rsa-authentication my-authorized-keys device://filename command`).
ip ssh server

Syntax

```plaintext
NOTE: Some of the parameters in this command require licensing to access. For more information, contact your Dell EMC Networking representative.

ip ssh server {ciphers cipher-list} {enable | port port-number} [kex key-exchange-algorithm] [mac hmac-algorithm] [version 2]

To disable SSH server functions, use the no ip ssh server {ciphers cipher-list} {enable | port port-number} [kex key-exchange-algorithm] [mac hmac-algorithm] command.
```

Parameters

- **enable**
  Enter the key word `enable` to start the SSH server.

- **ciphers cipher-list**
  Enter the keyword `ciphers` and then a space-delimited list of ciphers that the SSH server supports. The following ciphers are available:
  ```plaintext
  - 3des-cbc
  - aes128-cbc
  - aes192-cbc
  - aes256-cbc
  - aes128-ctr
  - aes192-ctr
  - aes256-ctr
  ```
  The default cipher list is used.

- **mac hmac-algorithm**
  Enter the keyword `mac` then a space-delimited list of hash message authentication code (HMAC) algorithms supported by the SSH server for keying hashing for the message authentication.
  The following HMAC algorithms are available:
  ```plaintext
  - hmac-sha1
  - hmac-sha1-96
  - hmac-sha2-256
  ```
  When FIPS is enabled, the default HMAC algorithm is `hmac-sha1-96`.
  When FIPS is not enabled, the default HMAC algorithms are the following:
  ```plaintext
  - hmac-md5
  ```
Enter the keyword `kex` and then a space-delimited list of key exchange algorithms supported by the SSH server.

The following key exchange algorithms are available:

- `diffie-hellman-group-exchange-sha1`
- `diffie-hellman-group1-sha1`
- `diffie-hellman-group14-sha1`

When FIPS is enabled, the default key-exchange-algorithm is `diffie-hellman-group14-sha1`.

When FIPS is not enabled, the default key-exchange-algorithms are the following:

- `diffie-hellman-group-exchange-sha1`
- `diffie-hellman-group1-sha1`
- `diffie-hellman-group14-sha1`

(OPTIONAL) Enter the keyword `port` then the port number of the listening port of the SSH server. The range is from 1 to 65535. The default is 22.

(Optional) Enter the keyword `version` then the SSH version 2, to specify SSHv2.

Default listening port is 22.

Default cipher list is 3des-cbc,aes128-cbc,aes192-cbc,aes256-cbc,aes128-ctr,aes192-ctr,aes256-ctr.

When FIPS is enabled, the default is hmac-sha1-96.

When FIPS is not enabled, the default is hmac-md5,hmac-md5-96,hmac-sha1,hmac-sha1-96,hmac-sha2-256.

When FIPS is enabled, the default is diffie-hellman-group14-sha1.

When FIPS is not enabled, the default is diffie-hellman-group-exchange-sha1,diffie-hellman-group1-sha1,diffie-hellman-group14-sha1.

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Version Description
- 9.8(2.0) Introduced on the S3100 series.
- 9.8(1.0) Introduced on the Z9100-ON.
- 9.8(0.0P5) Introduced on the S4048-ON.
- 9.8(0.0P2) Introduced on the S3048-ON.
- 9.7(0.0) Introduced on the S6000–ON.
- 9.5(0.1) Introduced the cipher, kex and mac options on the Z9500.
- 9.5(0.0) Introduced the cipher, kex and mac options on the Z9000, S6000, S4820T, S4810, and MXL.
- 9.2(1.0) Introduced on the Z9500.
- 9.0.2.0 Introduced on the S6000.
- 8.3.19.0 Introduced on the S4820T.
- 8.3.11.1 Introduced on the Z9000.
- 8.3.7.0 Introduced on the S4810.
- 7.6.1.0 Introduced on the S-Series.
- 7.5.1.0 Introduced on the C-Series.
- pre-6.1.1.0 Introduced on the E-Series.

### Usage Information
This command enables the SSH server and begins listening on a port. If a port is not specified, listening is on SSH default port 22.

**NOTE:** Starting with Dell EMC Networking OS Release 9.2(0.0), SSH server is enabled by default.

### Example
```
DellEMC# conf
DellEMC(conf)# ip ssh server port 45
DellEMC(conf)# ip ssh server enable
DellEMC#
```

### ip ssh server dns enable
Enable or disable the DNS in SSH server configuration to resolve hostname for host-based authentication.

**Syntax**
```
ip ssh server dns enable
```

To disable the DNS in SSH server configuration, use the `no ip ssh server dns enable` command.

**Defaults**
Disabled.

**Command Modes**
- CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### ip ssh server vrf

Configure an SSH server on either a specific VRF or a management VRF.

**Syntax**

```plaintext
ip ssh server vrf {any | management | vrf-name}
```

To disable the SSH server configuration, use the `no ip ssh server vrf {management | vrf-name}` command.

**Parameters**

- **any**
  - Enter the keyword `any` to enable access to the server from any VRF.

- **vrf management**
  - Enter the keyword `vrf` followed by the keyword `management` to configure an SSH server on a management VRF.

- **vrf vrf-name**
  - Enter the keyword `vrf` followed by the VRF name to configure an SSH server on that VRF.

**Defaults**

None

**Command Modes**

`CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.1)
  - Introduced on the S6010-ON and S4048T-ON.

- 9.10(0.0)
  - Introduced on the S3148.

- 9.10(0.0)
  - Introduced on the S6100-ON.

- 9.8(2.0)
  - Introduced on the S3100 series.

- 9.8(1.0)
  - Introduced on the Z9100-ON.

- 9.8(0.0P5)
  - Introduced on the S4048-ON.

- 9.8(0.0P2)
  - Introduced on the S3048-ON.

- 9.7(0.0)
  - Introduced on the S6000-ON.

- 9.5(0.1)
  -Introduced on the Z9500.

- 9.4(0.0)
  - Introduced on the S-Series and Z9000.

**Usage Information**

To disable the DNS in SSH server configuration, use the `no ip ssh server dns enable` command.
You can enable the SSH server on either a management VRF or a user defined VRF but not both. If no VRF is specified, then the SSH server is enabled on the default VRF.

If the SSH server is enabled on a VRF with name vrf1, then use the following command to restart the SSH server on a VRF with name vrf2: `ip ssh server vrf vrf2`. If the SSH server is enabled on a VRF with name vrf1, then use the following command to restart the SSH server on the default VRF: `ip ssh server vrf`.

```
•    DellEMC(conf)# ip ssh server vrf any
•    DellEMC(conf)# no ip ssh server vrf
•    DellEMC(conf)# ip ssh server vrf vrf1
•    DellEMC(conf)# no ip ssh server vrf
•    DellEMC(conf)# ip ssh server vrf management
•    DellEMC(conf)# no ip ssh server vrf
```

**Related Commands**

- `show ip ssh` — displays the ssh information.

### ip ssh source-interface

Specifies an interface's IP address as the source IP address for an outgoing SSH connections.

**Syntax**

```
ip ssh source-interface interface
```

To delete a source interface, use the `no ip ssh source-interface` command.

**Parameters**

- `interface` Enter the following keywords and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a Null interface, enter the keyword `null` then the Null interface number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

- **CONFIGURATION**

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

The `source-interface interface` attribute is applicable for both the SSH client as well as the COPY (SCP) commands. Using these attributes the client session tags an error to the user during run time, in case there is a mismatch between this command and the `ip ssh vrf` command.

**Example**

```
DellEMC(conf)#ip ssh source-interface tengigabitethernet 1/42
DellEMC(conf)#do ssh 10.10.10.2 -l admin
DellEMC(conf)#no ip ssh source-interface
```

**ip ssh vrf**

Specify a VRF for an outgoing SSH connections.

**Syntax**

```
ip ssh vrf vrf-name
```

To delete a VRF for an outgoing SSH connection, use the `no ip ssh vrf vrf-name` command.

**Parameters**

- `vrf vrf-name`: Enter the keyword `vrf` and then the name of the VRF to configure that VRF for an outgoing SSH session.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the S-Series and Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**

If you configure a VRF for an SSH session, then you need not explicitly mention the same VRF for the SSH client sessions intended for that VRF. The `vrf` attribute in the `ip ssh vrf` command is applicable for both the SSH client as well as the COPY (SCP) commands.

**Example**

```
DellEMC(conf)#ip ssh vrf vrf1
DellEMC(conf)#do ssh 10.10.10.2 -l admin
DellEMC(conf)#no ip ssh vrf vrf1
```

---

**show crypto**

Display the public part of the SSH host-keys.

**Syntax**

```
NOTE: Some of the parameters in this command require licensing to access. For more information, contact your Dell EMC Networking representative.

show crypto key mypubkey {rsa}
```

**Parameters**

- **Key**
  - Enter the keyword `key` to display the host public key.
- **mypubkey**
  - Enter the keyword `mypubkey` to display the host public key.
- **rsa**
  - Enter the keyword `rsa` to display the host SSHv2 RSA public key.

**Defaults**

```
none
```

**Command Modes**

```
EXEC
```

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

```

Related Commands
- `ip ssh pub-key-file` — configures the filename for the host-based authentication.

show ip ssh rsa-authentication
Display the authorized-keys for the RSA authentication.

Syntax
```
show ip ssh rsa-authentication {my-authorized-keys}
```

Parameters
- `my-authorized-keys` Display the RSA authorized keys.

Defaults
- none

Command Modes
- EXEC

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Version                  | Description
---                      | ---
9.10(0.1)                | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)                | Introduced on the S3148.
9.10(0.0)                | Introduced on the S6100-ON.
9.8(2.0)                 | Introduced on the S3100 series.
9.8(1.0)                 | Introduced on the Z9100-ON.
9.8(0.0P5)               | Introduced on the S4048-ON.
9.8(0.0P2)               | Introduced on the S3048-ON.
9.7(0.0)                 | Introduced on the S6000-ON.
9.2(1.0)                 | Introduced on the Z9500.
9.0.2.0                  | Introduced on the S6000.
8.3.19.0                 | Introduced on the S4820T.
8.3.11.1                 | Introduced on the Z9000.
8.3.7.0                  | Introduced on the S4810.
7.6.1.0                  | Introduced on the S-Series.
7.5.1.0                  | Introduced on the C-Series.
pre-6.1.1.0              | Introduced on the E-Series.

Usage Information

This command displays the contents of the flash:/ADMIN_DIR/ssh/authorized-keys.username file.

Example

```
DellEMC# show ip ssh rsa-authentication my-authorized-keys
ssh-rsa
AAAAB3NzaC1yc2EAAAABiwsAAEAgAAAKgAC ratx0S7kigD

DellEMC#
```

Related Commands

- `ip ssh rsa-authentication (Config)` — configures the RSA authorized keys.

**ssh**

Open an SSH connection specifying the hostname, username, encryption cipher, HMAC algorithm, port number, and version of the SSH client.

Syntax

```
ssh [vrf vrf-name] {hostname | ipv4 address | ipv6 address} [-c encryption cipher | -l username | -m HMAC algorithm | -p port-number | -v 1 | 2]
```

Parameters

- `vrf vrf-name` (OPTIONAL) Enter the keyword vrf and then the name of the VRF to specify the VRF used with the SSH session.
NOTE: The VRF configured using this command has a higher precedence than the VRF configured using the `ip ssh vrf vrf-name` command. If you do not configure a VRF using this command, then the SSH client uses the configured VRF (if any). If there is a mismatch between VRFs that are configured using the `ip ssh source-interface` command and the `ssh vrf vrf-name` command, then an error is reported.

**hostname**
(OPTIONAL) Enter the IP address or the host name of the remote device.

**vrf instance**
(OPTIONAL) E-Series Only: Enter the keyword `vrf` then the VRF Instance name to open an SSH connection to that instance.

**ipv4 address**
(OPTIONAL) Enter the IP address in dotted decimal format A.B.C.D.

**ipv6-address prefix-length**
(OPTIONAL) Enter the IPv6 address in the x:x::x format then the prefix length in the /x format. The range is from /0 to /128.

**-c encryption cipher**
Enable the "FIPS mode enable", this mode will support the v2 client.
"no fips mode enable"(disable) will support v1 & v2 client. This comment is applicable for both ciphers & HMAC algorithms:

- 3des-cbc: Force ssh to use 3des-cbc encryption cipher.
- aes128-cbc: Force ssh to use aes128-cbc encryption cipher
- aes192-cbc: Force ssh to use aes192-cbc encryption cipher
- aes256-cbc: Force ssh to use aes256-cbc encryption cipher
- aes128-ctr: Force ssh to use aes128-ctr encryption cipher
- aes192-ctr: Force ssh to use aes192-ctr encryption cipher
- aes256-ctr: Force ssh to use aes256-ctr encryption cipher

**-l username**
(OPTIONAL) Enter the keyword `-l` then the user name used in this SSH session. The default is the user name of the user associated with the terminal.

**-m HMAC algorithm**
Enter one of the following HMAC algorithms to use:
"no fips mode enable"(disable) will support v1 & v2 client.

- hmac-md5: Force ssh to use hmac-md5 HMAC algorithm.
- hmac-md5-96: Force ssh to use hmac-md5-96 HMAC algorithm.
- hmac-sha1: Force ssh to use hmac-sha1 HMAC algorithm.
- hmac-sha1-96: Force ssh to use hmac-sha1-96 HMAC algorithm.
- hmac-sha2-256: Force ssh to use hmac-sha2-256 HMAC algorithm.

**-p port-number**
(OPTIONAL) Enter the keyword `-p` then the port number. The range is from 1 to 65535. The default is 22.

**-v {1 | 2}**
(OPTIONAL) Enter the keyword `-v` then the SSH version 1 or 2. The default is the version from the protocol negotiation.

**Defaults**
As shown in the Parameters section.

**Command Modes**
EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information
Dell EMC Networking OS supports both inbound and outbound SSH sessions using IPv4 or IPv6 addressing. Inbound SSH supports accessing the system through the management interface as well as through a physical Layer 3 interface.

Example

```
DellEMC#ssh 10.16.151.48 -l anvltest
Trying 10.16.151.48...
01:18:16: %STKUNIT0-M:CP %SEC-5-SSH_USAGE: Initiated SSH Client v2 (FIPS Disabled) to anvltest@10.16.151.48 by default from console
anvltest@10.16.151.48's password:
Last login: Thu Jan  5 00:17:47 2012 from login-maa-101
```
Secure DHCP Commands

DHCP as defined by RFC 2131 provides no authentication or security mechanisms. Secure DHCP is a suite of features that protects networks that use dynamic address allocation from spoofing and attacks.

clear ip dhcp snooping

Clear the DHCP binding table.

Syntax

```
clear ip dhcp snooping binding
```

Defaults

none

Command Modes

EXEC Privilege

Related Commands

- `show ip dhcp snooping` — display the contents of the DHCP binding table.
ip dhcp relay

Enable Option 82.

Syntax

ip dhcp relay information-option [trust-downstream | vrf]

Parameters

- **trust-downstream**: Configure the system to trust Option 82 when it is received from the previous-hop router.
- **vrf**: Enter the keyword vrf to include VRF related information in the Option 82. This configuration enables the relay agent to include VRF related information when it forwards the broadcasts from client to DHCP server.

Defaults

Disabled.

Usage Information

When enabled, no learning takes place until you enable snooping on a VLAN. After disabling DHCP Snooping, the binding table is deleted and Option 82, IP Source Guard, and Dynamic ARP Inspection are disabled.

Related Commands

- `ip dhcp snooping vlan` — enable DHCP Snooping on one or more VLANs.

ip dhcp snooping binding

Create a static entry in the DHCP binding table.

Syntax

```
[no] ip dhcp snooping binding mac address vlan-id vlan-id ip ip-address
interface type slot/port lease number
```

Parameters

- `mac address` Enter the keyword mac then the MAC address of the host to which the server is leasing the IP address.
- `vlan-id vlan-id` Enter the keywords vlan-id then the VLAN to which the host belongs. The range is from 2 to 4094.
- `ip ip-address` Enter the keyword ip then the IP address that the server is leasing.
- `interface type` Enter the keyword interface then the type of interface to which the host is connected.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.

**slot/port**
Enter the slot and port number of the interface.

**lease time**
Enter the keyword `lease` then the amount of time the IP address is leased. The range is from 1 to 4294967295.

**Defaults**
none

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**

</tbody>
</table>
When enabled, the system begins creating entries in the binding table for the specified VLANs.

**NOTE:** Learning only happens if there is a trusted port in the VLAN.

**Related Commands**

- `ip dhcp snooping trust` — configure an interface as trusted.

### show ip dhcp snooping

Display the contents of the DHCP binding table.

**Syntax**

```
show ip dhcp snooping binding
```

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.1)
- 9.10(0.0)
- 9.10(0.0)
- 9.8(2.0)
- 9.8(1.0)
- 9.8(0.0P5)
- 9.8(0.0P2)
- 9.7(0.0)
- 9.2(1.0)
- 9.0(2.0)

**Description**

- Introduced on the S6010-ON and S4048T-ON.
- Introduced on the S3148.
- Introduced on the S6100-ON.
- Introduced on the S3100 series.
- Introduced on the Z9100-ON.
- Introduced on the S4048-ON.
- Introduced on the S3048-ON.
- Introduced on the S6000-ON.
- Introduced on the S6000.
- Introduced on the Z9500.
- Introduced on the C-Series and S-Series.

**Usage Information**

The `show ip dhcp snooping binding` command displays the DHCP binding table.

**Related Commands**

- `ip dhcp snooping trust` — configure an interface as trusted.
**Role-Based Access Control Commands**

With Role-Based Access Control (RBAC), access and authorization is controlled based on a user’s role. Users are granted permissions based on their user roles, not on their individual user ID. User roles are created for job functions and through those roles they acquire the permissions to perform their associated job function.

This section describes the syntax and usage of RBAC-specific commands. You can find information on other related security commands in this chapter:

- `aaa accounting`
- `aaa authentication login`
- `aaa authorization commands`
- `authorization`
- `show accounting`
- `show users`
- `username`

### aaa authorization role-only

Configure authentication to use the user’s role only when determining if access to commands is permitted.

**Syntax**

```
aaa authorization role-only
```

To return to the default setting, use the `no aaa authentication role-only` command.

**Parameters**

- `name`:
  
Enter a text string for the name of the user up to 63 characters. It cannot be one of the system defined roles (sysadmin, secadmin, netadmin, netoperator).

- `inherit existing-role-name`:
  
Enter the `inherit` keyword then specify the system defined role to inherit permissions from (sysadmin, secadmin, netadmin, netoperator).

**Defaults**

`none`

**Command Modes**

`CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>
### enable

Enter EXEC Privilege mode or any other privilege level configured. After entering this command, you may need to enter a password.

**Syntax**

`enable [level]`

**Parameters**

- `level` (OPTIONAL) Enter a number for a privilege level of Dell EMC Networking OS. The range is from 0 to 15.

**Defaults**

15

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

#### Version

- **9.10(0.1)**
  
  Introduced on the S6010-ON and S4048T-ON.

- **9.10(0.0)**
  
  Introduced on the S3148.

- **9.10(0.0)**
  
  Introduced on the S6100-ON.

- **9.8(2.0)**
  
  Introduced on the S3100 series.

- **9.8(1.0)**
  
  Introduced on the Z9100-ON.

- **9.8(0.0P5)**
  
  Introduced on the S4048-ON.

- **9.8(0.0P2)**
  
  Introduced on the S3048-ON.

- **9.7(0.0)**
  
  Introduced on the S6000-ON.

- **9.5(0.0)**
  
  Added support for roles on the Z9000, S6000, S4820T, S4810, and MXL.

---

**Usage Information**

By default, access to commands are determined by the user’s role (if defined) or by the user’s privilege level. If the `aaa authorization role-only` command is enabled, then only the user’s role is used.

Before you enable role-based only AAA authorization:

1. Locally define a system administrator user role. This will give you access to login with full permissions even if network connectivity to remote authentication servers is not available.

2. Configure login authentication on the console. This ensures that all users are properly identified through authentication no matter the access point.

3. Specify an authentication method (RADIUS, TACACS+, or Local).

4. Specify authorization method (RADIUS, TACACS+ or Local).

5. Verify the configuration has been applied to the console or VTY line.

**Related Commands**

login authentication, password, radius-server host, tacacs-server host

---

**enable**

Enter EXEC Privilege mode or any other privilege level configured. After entering this command, you may need to enter a password.

**Syntax**

`enable [level]`

**Parameters**

- `level` (OPTIONAL) Enter a number for a privilege level of Dell EMC Networking OS. The range is from 0 to 15.

**Defaults**

15

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- **9.10(0.1)**
  
  Introduced on the S6010-ON and S4048T-ON.

- **9.10(0.0)**
  
  Introduced on the S3148.

- **9.10(0.0)**
  
  Introduced on the S6100-ON.

- **9.8(2.0)**
  
  Introduced on the S3100 series.

- **9.8(1.0)**
  
  Introduced on the Z9100–ON.

- **9.8(0.0P5)**
  
  Introduced on the S4048-ON.

- **9.8(0.0P2)**
  
  Introduced on the S3048-ON.

- **9.7(0.0)**
  
  Introduced on the S6000-ON.

- **9.5(0.0)**
  
  Added support for roles on the Z9000, S6000, S4820T, S4810, and MXL.
**Usage Information**

Users entering EXEC Privilege mode or any other configured privilege level can access configuration commands. To protect against unauthorized access, use the **enable password** command to configure a password for the enable command at a specific privilege level. If no privilege level is specified, the default is privilege level 15.

**NOTE:** If you are authorized for the EXEC Privilege mode by your role, you do not need to enter an enable password.

**Related Commands**

- **enable password** — configures a password for the enable command and to access a privilege level.

---

**role**

Changes command permissions for roles.

**Syntax**

```
role mode [{ { addrole | deleterole } role-name } | reset] command
```

To delete access to a command, use the `no role mode role-name`

**Parameters**

- **mode**

  Enter one of the following keywords as the mode for which you are controlling access:

  - `configure` for CONFIGURATION mode
  - `exec` for EXEC mode
  - `interface` for INTERFACE modes
  - `line` for LINE mode
  - `route-map` for Route-map mode
  - `router` for Router mode

- **addrole**

  Enter the keyword `addrole` to add permission to the command. You cannot add or delete rights for the sysadmin role.

- **deleterole**

  Enter the keyword `deleterole` to remove access to the command. You cannot add or delete rights for the sysadmin role.
role-name

Enter a text string for the name of the user role up to 63 characters. These are 3 system defined roles you can modify: secadmin, netadmin, and netoperator.

reset

Enter the keyword reset to reset all roles back to default for that command.

command

Enter the command’s keywords to assign the command to a certain access level. You can enter one or more keywords.

Defaults

none

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.0) Introduced on the Z9000, S6000, S4820T, S4810, and MXL.

Related Commands

- userrole — creates user roles.

show role

Display information on permissions assigned to a command, including user role and/or permission level.

Syntax

```
show role mode {mode} {command}
```

Parameters

- **command**
  Enter the command’s keywords to assign the command to a certain access level. You can enter one or all of the keywords.

- **mode mode**
  Enter keyword then one of the following modes.

  - configure
  - exec
  - interface
  - line
  - route-map
  - router

Defaults

none
**Command Modes**  EXEC Privilege

**Command History**  This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
---|---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.

9.5(0.1) | Introduced on the Z9500.
9.5(0.0) | Introduced on the Z9000, S6000, S4820T, S4810, MXL

**Examples**

```
DellEMC# show role mode configure username
Role access: sysadmin

DellEMC# show role mode configure management route
Role access: netadmin, sysadmin

DellEMC# show role mode configure management crypto-policy
Role access: secadmin, sysadmin
```

**Related Commands**

- `userrole` — create user roles.

---

**show userroles**

Display information on all defined user roles.

**Syntax**

```
show userroles
```

**Example**

```
DellEMC# show userroles
Role          Inheritance  Modes
netoperator                Exec
netadmin                   Exec Config Interface Line Router IP
secadmin                   Exec Config
sysadmin                   Exec Config Interface Line Router IP
netoperator                Exec Config Interface Line Router IP
netadmin                   Exec Config Interface Line Router IP
secadmin                   Exec Config Interface Line Router IP
sysadmin                   Exec Config Interface Line Router IP
```

9.5(0.1) | Introduced on the Z9500.
9.5(0.0) | Introduced on the Z9000, S6000, S4820T, S4810, MXL.

Example

```
DellEMC# show userroles
Role          Inheritance  Modes
netoperator                Exec
netadmin                   Exec Config Interface Line Router IP
                        Route-map Protocol MAC
secadmin                   Exec Config
sysadmin                   Exec Config Interface Line Router IP
                        Route-map Protocol MAC
netoperator
netoperator
netadmin                   Exec Config Interface Line Router IP
                        Route-map Protocol MAC
```

Related Commands

- `userrole` — create user roles.

**userrole**

Create user roles for the role-based security model.

**Syntax**

```
userrole name inherit existing-role-name
```

To delete a role name, use the no userrole name command. Note that the reserved role names may not be deleted.

**Parameters**

- `name` Enter a text string for the name of the user up to 63 characters. It cannot be one of the system defined roles (sysadmin, secadmin, netadmin, netoperator).

- `inherit existing-role-name` Enter the `inherit` keyword then specify the system defined role to inherit permissions from (sysadmin, secadmin, netadmin, netoperator).

**Defaults**

- none

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### Usage Information

Instead of using the system defined user roles, you can create a new user role that best matches your organization. When you create a new user role, you first inherit permissions from one of the system defined roles. Otherwise you would have to create a user role from scratch. You then restrict commands or add commands to that role. For information about this topic, see **Modifying Command Permissions for Roles**.

**NOTE:** You can change user role permissions on system pre-defined user roles or user-defined user roles.

### Important Points to Remember

Consider the following when creating a user role:

- Only the system administrator and user-defined roles inherited from the system administrator can create roles and usernames. Only the system administrator, security administrator, and roles inherited from these can use the `role` command to modify command permissions. The security administrator and roles inherited by security administrator can only modify permissions for commands they already have access to.
- Make sure you select the correct role you want to inherit.

**NOTE:** If you inherit a user role, you cannot modify or delete the inheritance. If you want to change or remove the inheritance, delete the user role and create it again. If the user role is in use, you cannot delete the user role.

```
role mode { { addrole | deleterole } role-name } | reset }
```

- **Modifies (adds or deletes) command permissions for newly created user roles and system defined roles.

### Related Commands

- **role mode { { addrole | deleterole } role-name } | reset }
  — modifies (adds or deletes) command permissions for newly created user roles and system defined roles.

---

### ICMP Vulnerabilities

The internet control message protocol (ICMP) is a network-layer internet protocol that provides message packets to report errors and other information regarding IP packet processing back to the source. Dell EMC Networking OS mainly addresses the following ICMP vulnerabilities:

- ICMP Mask Reply
- ICMP Timestamp Request
• ICMP Replies
• IP ID Values Randomness

You can configure the Dell EMC Networking OS to drop ICMP reply messages. When you configure the `drop icmp` command, the system drops the ICMP reply messages from the front end and management interfaces. By default, the Dell EMC Networking OS responds to all the ICMP messages. You can configure the Dell EMC Networking OS to suppress the following ICMPv4 and ICMPv6 message types:

**Table 6. Suppressed ICMPv4 message types**

<table>
<thead>
<tr>
<th>ICMPv4 Message Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Echo reply (0)</td>
</tr>
<tr>
<td>All sub types of destination unreachable (3)</td>
</tr>
<tr>
<td>Source quench (4)</td>
</tr>
<tr>
<td>Redirect (5)</td>
</tr>
<tr>
<td>Router advertisement (9)</td>
</tr>
<tr>
<td>Router solicitation (10)</td>
</tr>
<tr>
<td>Time exceeded (11)</td>
</tr>
<tr>
<td>IP header bad (12)</td>
</tr>
<tr>
<td>Timestamp request (13)</td>
</tr>
<tr>
<td>Timestamp reply (14)</td>
</tr>
<tr>
<td>Information request (15)</td>
</tr>
<tr>
<td>Information reply (16)</td>
</tr>
<tr>
<td>Address mask request (17)</td>
</tr>
<tr>
<td>Address mask reply (18)</td>
</tr>
</tbody>
</table>

**NOTE:** The Dell EMC Networking OS does not suppress the ICMPv4 message type **Echo request (8)**.

**Table 7. Suppressed ICMPv6 message types**

<table>
<thead>
<tr>
<th>ICMPv6 Message Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination unreachable (1)</td>
</tr>
<tr>
<td>Time exceeded (3)</td>
</tr>
<tr>
<td>IPv6 header bad (4)</td>
</tr>
<tr>

</tr>
<tr>
<td>Who are you reply (140)</td>
</tr>
<tr>
<td>Mtrace response (200)</td>
</tr>
<tr>
<td>Mtrace messages (201)</td>
</tr>
</tbody>
</table>
NOTE:
The Dell EMC Networking OS does not suppress the following ICMPv6 message types:

- Packet too big (2)
- Echo request (128)
- Multicast listener query (130)
- Multicast listener report (131)
- Multicast listener done (132)
- Router solicitation (133)
- Router advertisement (134)
- Neighbor solicitation (135)
- Neighbor advertisement (136)
- Redirect (137)
- Router renumbering (138)
- MLD v2 listener report (143)
- Duplicate Address Request (157)
- Duplicate Address Confirmation (158)

### drop icmp

Drops the ICMPv4 and ICMPv6 packets.

**Syntax**

```
drop {icmp | icmp6}
```

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other Platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11.0.0</td>
<td>Introduced on the S4810, S4820T, S3048–ON, S3100 Series, S4048–ON, S5000, S6000, S6000–ON, Z9500, Z9100–ON, S6100–ON, S6010–ON, S4048T–ON, C9000, and MXL.</td>
</tr>
</tbody>
</table>

**Usage Information**

When the `drop icmp` feature is configured, the system drops the ICMP reply messages on the front end and management interfaces. By default, the Dell EMC Networking OS responds to all the ICMP messages.

**NOTE:** There is no separate CLI to enable IP ID randomness. By default, the IP ID in the kernel is randomized.

For more information on the ICMP message types, see the [ICMP Commands section](#).

### System Security Commands

The following section lists the system security commands.
boot-access password

Set a password for the boot loader.

Syntax

boot-access password [encryption-type] boot-password

To remove the GRUB access password, use the no boot-access password command.

Parameters

encryption-type  (OPTIONAL) Enter an encryption type for the boot password.

- 0 directs the system to store the password as clear text.
- 7 directs the system to store the password with a dynamic salt.

boot-password  Enter the boot access password.

Defaults

None

Command Modes

CONFIGURATION.

Command History

Version  Description
9.14(0.0)  Introduced on the S5048F-ON.
9.13(0.0)  Introduced on the S3048-ON, S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON.

Usage Information

If you enable the boot access password, the system prompts for a password when you access the GRUB interface.

When you configure the boot access password, ensure that your password meets the following criteria:

- A minimum of eight characters in length
- A minimum of one lower case letter (a to z)
- A minimum of one upper case letter (A to Z)
- A minimum of one numeric character (0 to 9)
- A minimum of one special character including a space (" !#$%&'()*+,-./:;<=>?@[\]^_`{|}~")

If your password does not meet the criteria, the system does not accept your password.

When you upgrade the Dell EMC Networking OS image, ensure that you upgrade the boot loader.

⚠️ **CAUTION:** After configuring the boot access password, save it to a secure location. If you forget it, you will not be able to access the options in the startup menu. If you forget both the boot access password and the enable password, the system may become inaccessible.

Example

```
DellEMC(conf)#boot-access password 7 Hg$7^5HMoiY%
***********************************************************************
*  Warning - boot-access password will enable password protection in *
*  GRUB. Keep it safe. Forgetting this password and the CLI password *
*  may result in switch becoming inaccessible.                        *
***********************************************************************
Do you want to configure boot-access password? Proceed [yes/no]:yes
DellEMC(conf)#
```
generate hash

Generate a hash checksum for the given file or the startup configuration using the MD5, SHA1, or SHA256 algorithm.

Syntax

```
generate hash {md5 | sha1 | sha256} {flash://filename | startup-config}
```

Parameters

- **md5 | sha1 | sha256**: Enter the keyword md5, sha1, or sha256 to generate.
- **flash://filename**: Enter the keyword flash: and enter the filename to generate the hash checksum for any file in the flash drive using the MD5, SHA1, or SHA256 algorithm.
- **startup-config**: Enter the keyword startup-config to generate the hash checksum for the startup configuration using the MD5, SHA1, or SHA256 algorithm.

Defaults

None

Command Modes

EXEC Privilege

Command History

- **Version 9.14(0.0)**: Introduced on the S5048F-ON.
- **Version 9.13(0.0)**: Introduced on the S3100 series, S3048-ON, S4048-ON, S4048T-ON, S5000, S6000, S6000-ON, S6010-ON, S6100-ON, Z9100-ON, Z9500, C9010, MXL, and FN-IOM.

Usage Information

Use the `generate hash` command to generate a hash checksum for your startup configuration, and use the hash to verify using the `verified boot hash` command.

Example

```
DellEMC#generate hash md5 startup-config
MD5SUM(/f10/flash/startup-config) : f81812a64eea202c5b2ef782639bafc3
```

root-access password

Configure the root access password.

Syntax

```
root-access password [encryption-type] root-password
```

To reset to the default password, use the `no root-access password` command.

Parameters

- **encryption-type** *(OPTIONAL)*: Enter an encryption type for the root password that you enter.
  - 0 directs the system to store the password as clear text.
  - 7 directs the system to store the password with a dynamic salt.
  - 9 directs the system to encrypt the clear text password and store the encrypted password in an inaccessible location.
- **root-password**: Enter the root password.

Defaults

Not configured
### secure-cli

**Command Modes**

CONFIGURATION

**Command History**

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.14(0.0)</td>
<td>Introduced on the S5048F–ON.</td>
</tr>
<tr>
<td>9.13(0.0)</td>
<td>Introduced on the S3100 series, S3048–ON, S4048–ON, S4048T-ON, S5000, S6000,</td>
</tr>
<tr>
<td></td>
<td>S6000–ON, S6010–ON, S6100–ON, Z9100–ON, Z9500, C9010, MXL, and FN-IOM.</td>
</tr>
</tbody>
</table>

**Usage Information**

If you configure the `secure-cli` command on the system, the Dell EMC Networking OS resets any previously-configured root access password to the default root password without displaying any warning message. With the `secure-cli` command enabled on the system, the CONFIGURATION mode does not display the root access password option.

When you configure the root access password, ensure that your password meets the following criteria:

- A minimum of eight characters in length
- A minimum of one lower case letter (a to z)
- A minimum of one upper case letter (A to Z)
- A minimum of one numeric character (0 to 9)
- A minimum of one special character including a space (" !#$%&'()*+,-./:;<=>?@\^_`{|}~")

If your password does not meet the criteria, the system does not accept your password.

If you use encryption type 9, the system stores the clear text password in an inaccessible location on the system. The `show running-configuration` command does not display the password. This configuration is not portable between different systems.

**Example**

```bash
DellEMC)# show running-config | g root
root-access password 7
f4dc0cb9787722dd1084d17f417f164cc7f730d4f03d4f0215294cbd899614e3
```

### verified boot

Enable OS image hash validation during system startup.

**Syntax**

```plaintext
verified boot
```

To disable OS image hash validation, use the `no verified boot` command.

**Defaults**

Not configured

**Command Modes**

CONFIGURATION

**Command History**

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.14(0.0)</td>
<td>Introduced on the S5048F–ON.</td>
</tr>
<tr>
<td>9.13(0.0)</td>

</tr>
</tbody>
</table>
When you reboot the system using the `reload` command, the system performs OS image verification on the primary boot image. You can enable boot image hash validation only for images on local flash partitions such as A: or B:.

Example

```
DellEMC(config)# verified boot
```

**verified boot hash**

Verify and store the hash value of the startup configuration.

**Syntax**

```
verified boot hash {system-image {A: | B:} | startup-config} hash value
```

**Parameters**

- `system-image {A: | B:}`: Enter the keyword `system-image` and A: or B:, depending on where the image is stored and then the hash value that is present on the iSupport page for your image.
- `startup-config`: Enter the keyword `startup-config` and then the hash value for the startup configuration. You can get the hash value for the startup configuration using the `generate hash` command.
- `hash value`: Enter the MD5, SHA1, or SHA256 hash.

**Defaults**
None

**Command Modes**
EXEC Privilege

```
Service Provider Bridging

Service provider bridging is composed of virtual local area network (VLAN) Stacking, Layer 2 Protocol Tunneling, and Provider Backbone Bridging as described in the Dell EMC Networking OS Configuration Guide Service Provider Bridging section. This section includes command line information (CLI) for the Dell EMC Networking OS Layer 2 Protocol Tunneling (L2PT). L2PT enables protocols to tunnel through an 802.1q tunnel.

Dell EMC Networking OS supports L2PT on Dell EMC Networking OS.

For more information, see VLAN Stacking, Spanning Tree Protocol (STP), and GARP VLAN Registration (GVRP).

Important Points to Remember

- L2PT is enabled at the interface VLAN-Stack VLAN level. For more information about Stackable VLAN (VLAN-Stacking) commands, see VLAN Stacking.
- The default behavior is to disable protocol packet tunneling through the 802.1q tunnel.
- Rate-limiting is required to protect against bridge protocol data units (BPU) attacks.
- A port channel (including through link aggregation control protocol [LACP]) can be configured as a VLAN-Stack access or trunk port.
- Address resolution protocol (ARP) packets work as expected across the tunnel.
- Far-end failure detection (FEFD) works the same as with Layer 2 links.
- Protocols that use Multicast MAC addresses (for example, open shortest path first [OSPF]) work as expected and carry over to the other end of the VLAN-Stack VLAN.

Topics:
- debug protocol-tunnel
- protocol-tunnel
- protocol-tunnel destination-mac
- protocol-tunnel enable
- protocol-tunnel rate-limit
- show protocol-tunnel

debug protocol-tunnel

Enable debugging to ensure incoming packets are received and rewritten to a new MAC address.

Syntax

deploy protocol-tunnel interface {in | out | both} [vlan vlan-id] [count value]

To disable debugging, use the no debug protocol-tunnel interface {in | out | both} [vlan vlan-id] [count value] command.

Parameters

- interface
  - Enter one of the following interfaces and the interface information:
For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[subport] information.

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.

```
in | out | both
```
Enter the keyword `in`, `out`, or `both` to debug incoming interfaces, outgoing interfaces, or both incoming and outgoing interfaces.

```
vlan vlan-id
```
Enter the keyword `vlan` then the VLAN ID. The range is from 1 to 4094.

```
count value
```
Enter the keyword `count` then the number of debug outputs. The range is from 1 to 100.

**Defaults**
Debug disabled.

**Command Modes**
EXEC Privilege

**Command History**

---

**protocol-tunnel**

Enable protocol tunneling on a stacked (Q-in-Q) VLAN for specified protocol packets.

**Syntax**
```
protocol-tunnel (rate-limit rate| stp)
```

**Description**
Protocol tunneling on a stacked (Q-in-Q) VLAN for specified protocol packets.
To disable protocol tunneling for a Layer 2 protocol, use the `no protocol-tunnel` command.

**Parameters**

- `rate-limit rate` Enter the keyword `rate-limit` followed by a number for the rate-limit for tunneled packets on the VMAN. The range is from 64 to 320.

- `stp` Enter the keyword `stp` to enable protocol tunneling on a spanning tree, including STP, MSTP, RSTP, and PVST.

**Defaults**

- `none`

**Command Modes**

- `CONF-IF-VLAN`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Example**

```
DellEMC# conf
DellEMC(conf)#interface vlan 2
DellEMC(conf-if-vl-2)#vlan-stack compatible
DellEMC(conf-if-vl-2)#member Te 1/2-3
DellEMC(conf-if-vl-2)#protocol-tunnel stp
DellEMC(conf-if-vl-2)#protocol-tunnel enable
```

**Related Command**

- `show protocol-tunnel` — displays tunneling information for all VLANs.

---

**protocol-tunnel destination-mac**

Overwrite the BPDU destination MAC address with a specific value.

**Syntax**

```
protocol-tunnel destination-mac xstp address
```
<table>

**Usage Information**
When you enable VLAN-Stacking, no protocol packets are tunneled.

**Related Command**
- `show protocol-tunnel` — displays tunneling information for all VLANs.

---

**protocol-tunnel enable**

Enable protocol tunneling globally on the system.

**Syntax**
```
protocol-tunnel enable
```

To disable protocol tunneling, use the `no protocol-tunnel enable` command.

**Defaults**
Disabled.

**Command Modes**
CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Dell EMC Networking OS must have the default CAM profile with the default microcode before you enable L2PT.

**protocol-tunnel rate-limit**

Enable traffic rate limiting per box.

```
protocol-tunnel rate-limit rate
```

To reset the rate limit to the default, use the no protocol-tunnel rate-limit rate command.

**Syntax**

```
protocol-tunnel rate-limit rate
```

**Parameters**

- **rate**
  
Enter the rate in frames per second. The range is from 75 to 3000. The default is 75.

**Defaults**

- 75 frames per second.

**Command Modes**

- CONF-IF-VLAN-STACK

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

show protocol-tunnel

Display protocol tunnel information for all or a specified VLAN-Stack VLAN.

Syntax

```
show protocol-tunnel [vlan vlan-id]
```

Parameters

- `vlan vlan-id` (OPTIONAL) Enter the keyword `vlan` then the VLAN ID to display information for the one VLAN. The range is from 1 to 4094.

Defaults

none

Command Modes

EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version | Description
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
### Example

DellEMC# show protocol-tunnel
System Rate-Limit: 75 frames/second
VLAN  Protocols   Interface
1000  STP, PVST   Te 5/7, Te 5/6
1001  LLDP, GVRP  Te 5/7, Te 5/6
1002  MMRP, MVRP  Te 5/7, Te 5/6
1003  LACP, DO1X  Te 5/7, Te 5/6
1004  OAM, PAUSE  Te 5/7, Te 5/6
1005  E-LMI       Te 5/7, Te 5/6

### Example (Specific VLAN)

DellEMC# show protocol-tunnel vlan 2
System Rate-Limit: 1000 Frames/second
Interface  Vlan  Protocol(s)
Te1/2       2     STP, PVST

DellEMC#

### Related Commands

- `show running-config` — displays the current configuration.
The Dell EMC Networking OS supports sFlow commands.
The Dell EMC Networking OS sFlow monitoring system includes an sFlow Agent and an sFlow Collector.

- The sFlow Agent combines the flow samples and interface counters into sFlow datagrams and forwards them to the sFlow Collector.
- The sFlow Collector analyses the sFlow Datagrams received from the different devices and produces a network-wide view of traffic flows.

**Important Points to Remember**

- Dell EMC Networking recommends that the sFlow Collector be connected to the Dell EMC Networking chassis through a line card port rather than the route processor module (RPM) Management Ethernet port.
- Dell EMC Networking OS exports all sFlow packets to the sFlow Collector. A small sampling rate can equate to many exported packets. A backoff mechanism is automatically applied to reduce this amount. Some sampled packets may be dropped when the exported packet rate is high and the backoff mechanism is about to or is starting to take effect. The dropEvent counter, in the sFlow packet, is always zero.
- sFlow sampling is done on a per-port basis.
- Community list and local preference fields are not filled up in the extended gateway element in the sFlow datagram.
- The 802.1P source priority field is not filled up in the extended switch element in the sFlow datagram.
- Only Destination and Destination Peer AS numbers are packed in the dst-as-path field in the extended gateway element.
- If the packet being sampled is redirected using policy-based routing (PBR), the sFlow datagram may contain incorrect extended gateway/router information.
- sFlow does not support packing extended information for IPv6 packets. Only the first 128 bytes of the IPv6 packet is shipped in the datagram.
- The source virtual local area network (VLAN) field in the extended switch element is not packed if there is a routed packet.
- The destination VLAN field in the extended switch element is not packed if there is a multicast packet.
- The sFlow sampling functionality is supported only for egress traffic and not for ingress traffic.
- The maximum number of packets that can be sampled and processed per second is:
  - 7500 packets when no extended information packing is enabled.
  - 7500 packets when only extended-switch information packing is enabled (see sflow extended-switch enable).

**Topics:**

- sflow collector
- sflow enable (Global)
- sflow ingress-enable
- sflow extended-switch enable
- sflow max-header-size extended
- sflow polling-interval (Global)
- sflow polling-interval (Interface)
- sflow sample-rate (Global)
- sflow sample-rate (Interface)
- show sflow
sflow collector

Configure a collector device to which sFlow datagrams are forwarded.

Syntax

sflow collector {ip-address | ipv6-address} agent-addr {ip-address | ipv6-address} [number [max-datagram-size number]] | [max-datagram-size number] [vrf management]

To delete a configured collector, use the no sflow collector {ip-address | ipv6-address} agent-addr {ipv4-address | ipv6-address} [number [max-datagram-size number]] | [max-datagram-size number] [vrf management] command.

Parameters

sflow collector ip-address | ipv6-address

Enter the IP address of the collector in dotted decimal format for IPv4 or x:x:x::x format for IPv6.

NOTE: The :: notation specifies successive hexadecimal fields of zeros.

agent-addr ip-address | ipv6-address

Enter the keyword agent-addr followed by the sFlow agent IP address in dotted decimal format for IPv4 or x:x:x::x format for IPv6.

NOTE: The :: notation specifies successive hexadecimal fields of zeros.

number

(OPTIONAL) Enter the user datagram protocol (UDP) port number. The range is from 0 to 65535. The default is 6343.

max-datagram-size number

(OPTIONAL) Enter the keyword max-datagram-size then the size number in bytes. The range is from 400 to 1500. The default is 1400.

vrf management

(OPTIONAL) Enter the keyword vrf followed by the keyword management to configure the collector device corresponding to the default VRF and the management VRF respectively.

Defaults

Not configured.

</table>

Usage Information

You can configure up to two sFlow collectors (IPv4 or IPv6). If two collectors are configured, traffic samples are sent to both.

The sFlow agent address is carried in a field in SFlow packets and is used by the collector to identify the sFlow agent.

In sFlow, the agent address is a single invariant IPv4 or IPv6 address used to identify the agent to the collector. It is usually assigned the address of a loopback interface on the agent, which provides invariance. The agent address is carried as a field in the payload of the sFlow packets.

As part of the sFlow-MIB, if the SNMP request originates from a configured collector, Dell EMC Networking OS returns the corresponding configured agent IP in the MIB requests. Dell EMC Networking OS checks to ensure that two entries are not configured for the same collector IP with a different agent IP. Should that happen, Dell EMC Networking OS generates the following error: %Error: Different agent-addr attempted for an existing collector.

Example

DellEMC(conf)# sflow collector 10.1.1.25 agent-addr 10.1.1.10 vrf management

sflow enable (Global)

Enable sFlow globally.

Syntax

```
sflow enable
```

To disable sFlow, use the no sflow enable command.

Defaults

Disabled.

Command Modes

CONFIGURATION
sFlow

sflow ingress-enable

Enable sFlow ingress on interfaces.

Syntax

sflow ingress-enable

To disable sFlow, use the no sflow ingress enable command.

Defaults

Disabled.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Usage Information

sFlow is disabled by default. In addition to this command, sFlow needs to be enable on individual interfaces where sFlow sampling is desired.

Related Commands

• sflow enable (Interface) — enable sFlow on interfaces.
When you enable ingress sFlow on an interface, flow sampling is done on any incoming traffic.

**NOTE:** After a physical port is a member of a LAG, it inherits the sFlow configuration from the LAG port.

### Related Commands
- sflow enable (Global) — turn sFlow globally.

## sflow extended-switch enable

Enable packing information on a switch only.

**Syntax**

```plaintext
sflow extended-switch enable
```

To disable packing information, use the `no sflow extended-switch [enable]` command.

**Parameters**

- **enable**
  
  Enter the keyword `enable` to enable global extended information.

**Defaults**

Disabled.

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Usage Information

Dell EMC Networking OS enhances the sflow implementation for real time traffic analysis on the E-Series to provide extended gateway information in cases where the destination IP addresses are learned by different routing protocols and for cases where the destination is reachable over ECMP.

Related Commands

- show sflow — displays the sFlow configuration.

sflow max-header-size extended

Set the maximum header size of a packet to 256 bytes.

Syntax

sflow max-header-size extended

To reset the maximum header size of a packet, use the [no] sflow max-header-size extended command.

Parameters

- extended

  Enter the keyword extended to copy 256 bytes from the sample packets to sFlow datagram.

Defaults

128 bytes

Example

DellEMC(conf)# sflow max-header-size extended

**sflow polling-interval (Global)**

Set the sFlow polling interval at a global level.

Syntax

```
sflow polling-interval interval value
```

To return to the default, use the `no sflow polling-interval interval command` command.

Parameters

- **interval value**: Enter the interval value in seconds. The range is from 15 to 86400 seconds. The default is 20 seconds.

Defaults

20 seconds

Version | Description
---|---
7.7.1.0 | Introduced on the S-Series.
7.6.1.0 | Introduced on the C-Series.
7.4.1.0 | Introduced on the E-Series.

Usage Information
The polling interval for an interface is the maximum number of seconds between successive samples of counters sent to the collector. This command changes the global default counter polling (20 seconds) interval. You can configure an interface to use a different polling interval.

Related Commands
- `sflow polling-interval (Interface)` — sets the polling interval for an interface.

sflow polling-interval (Interface)

Set the sFlow polling interval at an interface (overrides the global-level setting.)

Syntax
```
sflow polling-interval interval value
```
To return to the default, use the `no sflow polling-interval interval` command.

Parameters
- `interval value` Enter the interval value in seconds. The range is from 15 to 86400 seconds. The default is the global counter polling interval.

Defaults
The same value as the current global default counter polling interval.

Command Modes
- INTERFACE

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version | Description
---|---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.

8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.2.1.0 | Introduced on S-Series Stacking.
This command sets the counter polling interval for an interface.

Related Commands

- `sflow polling-interval (Global)` — globally sets the polling interval.

### sflow sample-rate (Global)

Change the global default sampling rate.

**Syntax**

```plaintext
sflow sample-rate value
```

To return to the default sampling rate, use the `no sflow sample-rate` command.

**Parameters**

- `value` Enter the sampling rate value. For the C-Series and S-Series, the range is from 256 to 8388608 packets. Enter values in powers of 2 only; for example, 4096, 8192, 16384, and so on. The default is **32768 packets**.

**Defaults**

**32768 packets**

**Command Modes**

- `CONFIGURATION`

</tbody>
</table>
Usage Information

Sample-rate is the average number of packets skipped before the sample is taken. This command changes the global default sampling rate. You can configure an interface to use a different sampling rate than the global sampling rate. If the value entered is not a correct power of 2, the command generates an error message with the previous and next power of 2 value. Select one of these two packet numbers and re-enter the command.

Related Commands

- `sflow sample-rate (Interface)` — changes the interface sampling rate.

sflow sample-rate (Interface)

Change the interface default sampling rate.

Syntax

```
sflow sample-rate value
```

To return to the default sampling rate, use the `no sflow sample-rate` command.

Parameters

- `value` Enter the sampling rate value. For the C-Series and S-Series, the range is from 256 to 8388608 packets. Enter values in powers of 2 only; for example, 4096, 8192, 16384, etc. The default is 32768 packets.

Defaults

The Global default sampling.

Command Modes

- CONFIGURATION

Command History

Version | Description
--- | ---
8.3.7.0 | Introduced on the S4810.
8.2.1.0 | Introduced on S-Series Stacking.
8.1.1.0 | Introduced on the E-Series.
7.7.1.0 | Introduced on the S-Series.
7.6.1.0 | Introduced on the C-Series.
6.2.1.1 | Introduced on the E-Series.

Usage Information
This command changes the sampling rate for an interface. By default, the sampling rate of an interface is set to the same value as the current global default sampling rate. If the value entered is not a correct power of 2, the command generates an error message with the previous and next power-of-2 value. Select one of these two number and re-enter the command.

Related Commands
- **sflow sample-rate (Global)** — changes the sampling rate globally.

### show sflow

Display the current sFlow configuration.

**Syntax**
```
show sflow [interface]
```

**Parameters**
- **interface** (OPTIONAL) Enter the following keywords and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
  - For the Management interface on the, enter the keyword ManagementEthernet then the slot/port information.
  - For a port-channel interface, enter the keywords port-channel then the port-channel ID.

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
### Version Description

- **9.8(1.0)**
  - Introduced on the Z9100-ON.

- **9.8(0.0P5)**
  - Introduced on the S4048-ON.

- **9.8(0.0P2)**
  - Introduced on the S3048-ON.

- **9.7(0.0)**
  - Introduced on the S6000-ON.

- **9.2(1.0)**
  - Introduced on the Z9500.

- **9.0.2.0**
  - Introduced on the S6000.

- **8.3.19.0**
  - Introduced on the S4820T.

- **8.3.11.1**
  - Introduced on the Z9000.

- **8.3.7.0**
  - Introduced on the S4810.

- **8.2.1.0**
  - Introduced on S-Series Stacking.

- **8.1.1.0**
  - Introduced on the E-Series.

- **7.7.1.0**
  - Introduced on the S-Series.

- **7.6.1.0**
  - Introduced on the C-Series.

- **6.2.1.1**
  - Introduced on the E-Series.

### Usage Information

The dropEvent counter (sFlow samples dropped due to sub-sampling) shown in the following example always displays a value of zero.

### Example

```text
DellEMC#show sflow
sFlow services are enabled
Egress Management Interface sFlow services are disabled
Global default sampling rate: 32768
Global default counter polling interval: 20
Global default extended maximum header size: 128 bytes
Global extended information enabled: none
1 collectors configured
Collector IP addr: 100.1.1.1, Agent IP addr: 1.1.1.2, UDP port: 6343 VRF: Default
0 UDP packets exported
0 UDP packets dropped
0 sFlow samples collected

stack-unit 1 Port set 1
  Te 1/1: configured rate 16384, actual rate 16384 <<< sampling rate based on line speed if global sampling rate is default
DellEMC#
```
Simple Network Management Protocol (SNMP) and Syslog

This section contains commands to configure and monitor the simple network management protocol (SNMP) v1/v2/v3 and Syslog. Both features are supported on Dell EMC Networking OS.

Topics:
- SNMP Commands
- Syslog Commands

SNMP Commands

The following SNMP commands are available in the Dell EMC Networking OS.
The simple network management protocol (SNMP) is used to communicate management information between the network management stations and the agents in the network elements. Dell EMC Networking OS supports SNMP versions 1, 2c, and 3, supporting both read-only and read-write modes. Dell EMC Networking OS sends SNMP traps, which are messages informing an SNMP management system about the network. Dell EMC Networking OS supports up to 16 SNMP trap receivers.

Important Points to Remember

- Typically, 5-second timeout and 3-second retry values on an SNMP server are sufficient for both LAN and WAN applications. If you experience a timeout with these values, the recommended best practice on Dell EMC Networking switches (to accommodate their high port density) is to increase the timeout and retry values on your SNMP server to the following:
  - SNMP Timeout — greater than 3 seconds.
  - SNMP Retry count — greater than 2 seconds.
- If you want to query an E-Series switch using SNMP v1/v2/v3 with an IPv6 address, configure the IPv6 address on a non-management port on the switch.
- If you want to send SNMP v1/v2/v3 traps from an E-Series using an IPv6 address, use a non-management port.
- SNMP v3 informs are not currently supported with IPv6 addresses.
- If you are using access control lists (ACLs) in an SNMP v3 configuration, group ACL overrides user ACL if the user is part of that group.
- SNMP operations are not supported on a virtual local area network (VLAN).

show snmp

Display the status of SNMP network elements.

Syntax

    show snmp

Command Modes

  - EXEC
  - EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

8.3.7.0 Introduced on the S4810.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.

E-Series legacy command

Usage Information

The following Example displays a group named ngroup. The ngroup has a security model of version 3 (v3) with authentication (auth), the read and notify name is nview with no write view name specified, and finally the row status is active.

Example

```
DellEMC# show snmp group
groupname: v1v2creadg security model: v1
readview : v1v2cdefault writeview: no write view specified
notifyview: v1v2cdefault context: no context specified
row status: active
DellEMC#
```

Related Commands

- **snmp-server group** — configures an SNMP server group.
show snmp supported-mibs

Display the list of SNMP MIBs supported by the platform.

Syntax

```
show snmp supported-mibs
```

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

```
Version Description

### snmp context

Enables you to map a bgp vrf instance within a SNMP context through community mapping, in SNMPv2c and SNMPv3.

**Syntax**

```
[no] snmp context [context name]
```

**Parameters**

- `context name`: Enter a unique name for the context.

**Defaults**

None

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.13(0.0)
  - Introduced on all DNOS platforms.

**Usage Information**

This command is used for mapping SNMP context to a VRF instance within a community, in SNMPv2c and SNMPv3. The no version of this command turns off this feature.

### snmp ifmib ifalias long

Display the entire description string through the Interface MIB, which would be truncated otherwise to 63 characters.

**Syntax**

```
snmp ifmib ifalias long
```
Defaults
Interface description truncated beyond 63 characters.

snmp-server community

Configure a new community string access for SNMPv1 v2 and v3.

Syntax

```
snmp-server community community-name {ro | rw} [ipv6 ipv6-access-list-name [ipv6 ipv6-access-list-name | access-list-name | security-name name] |
```

Simple Network Management Protocol (SNMP) and Syslog 1737
security-name name [ipv6 ipv6-access-list-name | access-list-name | security-name name] | access-list-name [ipv6 ipv6-access-list-name | access-list-name | security-name name]]

To remove access to a community, use the no snmp-server community community-string {ro | rw} [security-name name [access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]] command.

Parameters

- **community-name**: Enter a text string (up to 20 characters long) to act as a password for SNMP.
- **ro**: Enter the keyword ro to specify read-only permission.
- **rw**: Enter the keyword rw to specify read-write permission.
- **ipv6 access-list-name**: (Optional) Enter the keyword ipv6 then an IPv6 ACL name (a string up to 16 characters long).
- **security-name name**: (Optional) Enter the keywords security-name then the security name as defined by the community MIB.
- **access-list-name**: (Optional) Enter a standard IPv4 access list name (a string up to 16 characters long).

Defaults

- none

Usage Information

The following example configures a community named public that is mapped to the security named guestuser with Read Only (ro) permissions.
The `snmp-server contact` command is used to configure contact information for troubleshooting this SNMP node.

**Syntax**
```
snmp-server contact text
```

To delete the SNMP server contact information, use the `no snmp-server contact` command.

**Parameters**
- **text**: Enter an alphanumeric text string, up to 55 characters long.

**Defaults**
- None

**Command Modes**
- `CONFIGURATION`
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**E-Series legacy command**

**snmp-server enable traps**

Enable SNMP traps.

**Syntax**

```plaintext
snmp-server enable traps [notification-type] [notification-option]
```

To disable traps, use the `no snmp-server enable traps [notification-type] [notification-option]` command.

**Parameters**

- **notification-type**
  - Enter the type of notification from the following list:

- **notification-option**
  - For the `envmon` notification-type, enter one of the following optional parameters:
    - cam-utilization
    - fan
    - supply
    - temperature
  - For the `snmp` notification-type, enter one of the following optional parameters:
    - authentication
    - coldstart
Simple Network Management Protocol (SNMP) and Syslog

- linkdown
- linkup
- syslog-reachable
- syslog-unreachable

**Defaults**
Not enabled.

</tbody>
</table>

**E-Series legacy command**

**Usage Information**
Dell EMC Networking OS supports up to 16 SNMP trap receivers.

If you do not configure this command, traps that controlled by this command are not sent. If you do not specify a notification-type and notification-option, all traps are enabled.
snmp-server engineID

Configure the name for both the local and remote SNMP engines on the router.

Syntax

```
snmp-server engineID [local engineID] [remote ip-address vrf vrf-name udp-port port-number engineID]
```

To return to the default, use the `no snmp-server engineID [local engineID] [remote ip-address vrf vrf-name udp-port port-number engineID]` command.

Parameters

- **local engineID**
  - Enter the keyword `local` followed by the engine ID number that identifies the copy of the SNMP on the local device.
  - Format (as specified in RFC 3411): 12 octets.
  - The first four octets are set to the private enterprise number.
  - The remaining eight octets are the MAC address of the chassis.

- **remote ip-address**
  - Enter the keyword `remote` followed by the IP address that identifies the copy of the SNMP on the remote device.

- **vrf vrf-name**
  - Enter the keyword `vrf` followed by the name of the VRF that is used to reach the device.
  - **NOTE:** Use this attribute to specify the VRF that is used by the SNMP engine to reach the device. If no VRF is specified, then the default VRF is used.

- **udp-port port-number engineID**
  - Enter the keywords `udp-port` followed by the user datagram protocol (UDP) port number on the remote device. The range is from 0 to 65535. The default is 162.

Defaults

As above.

Related Commands

- `snmp-server community` — enables SNMP and sets the community string.
### Version Description

- **9.2(1.0)**: Introduced on the Z9500.
- **9.0.2.0**: Introduced on the S6000.
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.11.1**: Introduced on the Z9000.
- **8.3.7.0**: Introduced on the S4810.
- **7.6.1.0**: Introduced on the S-Series.
- **7.5.1.0**: Introduced on the C-Series.

**E-Series legacy command**

### Usage Information

Changing the value of the SNMP Engine ID has important side effects. A user’s password (entered on the command line) is converted to a message digest algorithm (MD5) or secure hash algorithm (SHA) security digest. This digest is based on both the password and the local Engine ID. The command line password is then destroyed, as required by RFC 2274. Because of this deletion, if the local value of the Engine ID changes, the security digests of SNMPv3 users is invalid and the users will have to be reconfigured.

For the remote Engine ID, the host IP and UDP port are the indexes to the command that are matched to either overwrite or remove the configuration.

### Related Commands
- `show snmp engineID` — displays the SNMP engine and all the remote engines that are configured on the router.
- `show running-config snmp` — displays the SNMP running configuration.

### snmp-server group

Configure a new SNMP group or a table that maps SNMP users to SNMP views.

**Syntax**

```
snmp-server group [group_name {1 | 2c | 3 {auth | noauth | priv}}] [read name] [write name] [notify name] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]
```

To remove a specified group, use the `no snmp-server group [group_name {v1 | v2c | v3 {auth | noauth | priv}}] [read name] [write name] [notify name] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]` command.

**Parameters**

- **group_name**: Enter a text string (up to 20 characters long) as the name of the group. The following groups are created for mapping to read/write community/security-names (defaults):
  - `v1v2creadg` — maps to a community/security-name with ro permissions.
  - `v1v2cwriteg` — maps to a community/security-name rw permissions.
- **1 | 2c | 3**: (OPTIONAL) Enter the security model version number (1, 2c, or 3):
  - 1 is the least secure version.
  - 3 is the most secure of the security modes.
• 2c allows transmission of informs and counter 64, which allows for integers twice the
width of what is normally allowed.

The default is 1.

auth (OPTIONAL) Enter the keyword auth to specify authentication of a packet without
encryption.

noauth (OPTIONAL) Enter the keyword noauth to specify no authentication of a packet.

priv (OPTIONAL) Enter the keyword priv to specify both authentication and then scrambling
of the packet.

read name (OPTIONAL) Enter the keyword read then a name (a string of up to 20 characters long)
as the read view name. The default is GlobalView and is assumed to be every object
belonging to the internet (1.3.6.1) OID space.

write name (OPTIONAL) Enter the keyword write then a name (a string of up to 20 characters
long) as the write view name.

notify name (OPTIONAL) Enter the keyword notify then a name (a string of up to 20 characters
long) as the notify view name.

access access-list-name (Optional) Enter the standard IPv4 access list name (a string up to 16 characters long).

ipv6 access-list-name (Optional) Enter the keyword ipv6 then the IPv6 access list name (a string up to 16
characters long).

access-list-name ipv6 access-list-name (Optional) Enter both an IPv4 and IPv6 access list name.

Defaults
As above.

### Version Description

- **8.3.10.2**  Added support for the `access` parameter.
- **8.3.7.0**  Introduced on the S4810.
- **7.6.1.0**  Introduced on the S-Series.
- **7.5.1.0**  Introduced on the C-Series.

#### E-Series legacy command

**Usage Information**

The following example specifies the group named `harig` as a version 3 user requiring both authentication and encryption and read access limited to the read named `rview`.

**NOTE:** The number of configurable groups is limited to 16 groups.

**Example**

```
DellEMC# conf
DellEMC(conf)# snmp-server group harig 3 priv read rview
DellEMC#
```

**Related Commands**

- `show snmp group` — displays the group name, security model, view status, and storage type of each group.
- `show running-config` — displays the SNMP running configuration.

### snmp-server host

Configure the recipient of an SNMP trap operation.

**Syntax**

```
snmp-server host ip-address | ipv6-address [vrf vrf-name] traps | informs [version 1 | 2c | 3] [auth | no auth | priv] [community-string] [udp-port port-number] [notification-type]
```

To remove the SNMP host, use the `no snmp-server host ip-address | ipv6-address [vrf vrf-name] traps | informs [version 1 | 2c | 3] [auth | no auth | priv] [community-string] [udp-port port-number] [notification-type]` command.

**Parameters**

- `ip-address`
  - Enter the keyword `host` then the IP address of the host (configurable hosts is limited to 16).

- `ipv6-address`
  - Enter the keyword `host` then the IPv6 address of the host in the `x:x:x:x::x` format.

  **NOTE:** The `::` notation specifies successive hexadecimal fields of zero.

- `vrf vrf-name`
  - Enter the keyword `vrf` and then the name of the VRF that the SNMP server uses to connect to the host.

  **NOTE:** You can use this attribute to inform the SNMP engine about the VRF instance to be used to reach the corresponding remote host to send Trap or Inform message. If no VRF is specified, then the default VRF is used.

- `traps`
  - (OPTIONAL) Enter the keyword `traps` to send trap notifications to the specified host. The default is `traps`.

- `informs`
  - (OPTIONAL) Enter the keyword `informs` to send inform notifications to the specified host. The default is `traps`.
version 1 | 2c | 3 (OPTIONAL) Enter the keyword version to specify the security model then the security model version number 1, 2c, or 3:

- Version 1 is the least secure version.
- Version 3 is the most secure of the security modes.
- Version 2c allows transmission of informs and counter 64, which allows for integers twice the width of what is normally allowed.

The default is version 1.

auth (OPTIONAL) Enter the keyword auth to specify authentication of a packet without encryption.

noauth (OPTIONAL) Enter the keyword noauth to specify no authentication of a packet.

priv (OPTIONAL) Enter the keyword priv to specify both authentication and then scrambling of the packet.

community-string Enter a text string (up to 20 characters long) as the name of the SNMP community.

NOTE: For version 1 and version 2c security models, this string represents the name of the SNMP community. The string can be set using this command; however, Dell EMC Networking OS recommends setting the community string using the snmp-server community command before executing this command. For version 3 security model, this string is the USM user security name.

udp-port port-number (OPTIONAL) Enter the keywords udp-port followed by the port number of the remote host to use. The range is from 0 to 65535. The default is 162.

notification-type (OPTIONAL) Enter one of the following keywords for the type of trap to be sent to the host:

- bgp — Enable BGP state change traps.
- ecfm — Enable ECFM state change traps.
- entity — Enable entity change traps.
- envmon — Enable SNMP environmental monitor traps.
- eoam — Enable EOAM state change traps.
- ets — Enable ets traps
- fips — Enable FIP Snooping state change traps
- lacp — Enable LACP state change traps.
- mac — Enable MAC address notification traps.
- isis — Enable ISIS adjacency change traps.
- pfc — Enable pfc traps.
- snmp — Enable SNMP trap.
- stp — Enable 802.1d state change traps.
- vlt — Enable VLT traps.
- vrrp — Enable VRRP state change traps.
- xstp — Enable 802.1s, 802.1w, and PVST+ state change traps.

The default is all trap types are sent to host.

Defaults As above.
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>

### Usage Information

To configure the router to send SNMP notifications, enter at least one `snmp-server host` command. If you enter the command with no keywords, all trap types are enabled for the host. If you do not enter an `snmp-server host` command, no notifications are sent.

In order to enable multiple hosts, issue a separate `snmp-server host` command for each host. You can specify multiple notification types in the command for each host.

When multiple `snmp-server host` commands are given for the same host and type of notification (trap or inform), each succeeding command overwrites the previous command. Only the last `snmp-server host` command will be in effect. For example, if you enter an `snmp-server host inform` command for a host and then enter another `snmp-server host inform` command for the same host, the second command replaces the first command.

The `snmp-server host` command is used with the `snmp-server enable` command. Use the `snmp-server enable` command to specify which SNMP notifications are sent globally. For a host to receive most notifications, at least one `snmp-server enable command and the `snmp-server host` command for that host must be enabled.
NOTE: For v1 / v2c trap configuration, if the community-string is not defined using the `snmp-server community` command prior to using this command, the default form of the `snmp-server community` command automatically is configured with the community-name the same as specified in the `snmp-server host` command.

**Configuring Informs**

To send an inform, use the following steps:

1. Configure a remote engine ID.
2. Configure a remote user.
3. Configure a group for this user with access rights.
4. Enable traps.
5. Configure a host to receive informs.

**Related Commands**

- `snmp-server enable traps` — enables SNMP traps.
- `snmp-server community` — configures a new community SNMPv1 or SNMPv2c.

### snmp-server location

Configure the location of the SNMP server.

**Syntax**

```
snmp-server location text
```

To delete the SNMP location, use the `no snmp-server location` command.

**Parameters**

- `text` Enter an alpha-numeric text string, up to 55 characters long.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

**snmp-server packetsize**

Set the largest SNMP packet size permitted. When the SNMP server is receiving a request or generating a reply, use the `snmp-server packetsize` global configuration command.

**Syntax**

```
snmp-server packetsize byte-count
```

**Parameters**

- `byte-count`: Enter one of the following values 8, 16, 24 or 32. Packet sizes are 8000 bytes, 16000 bytes, 32000 bytes, and 64000 bytes.

**Defaults**

8

**snmp-server trap-source**

Configure a specific interface as the source for SNMP traffic.

**Syntax**

```plaintext
snmp-server trap-source interface
```

To disable sending traps out a specific interface, use the `no snmp trap-source` command.

**Parameters**

- `interface`  
  Enter the following keywords and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a Null interface, enter the keyword `null` then the Null interface number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

The IP address assigned to the management interface is the default.

**Command Modes**

E-Series legacy command

**snmp-server user**

Configure a new user to an SNMP group.

**Syntax**

```
snmp-server user name {group_name remote ip-address vrf vrf-name udp-port port-number} [1 | 2c | 3] [encrypted] [auth {md5 | sha} auth-password] [priv {des56 | aes128} priv password] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]
```

To remove a user from the SNMP group, use the no snmp-server user name {group_name remote ip-address udp-port port-number} [1 | 2c | 3] [encrypted] [auth {md5 | sha} auth-password] [priv {des56 | aes128} priv password] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name] command.

**Parameters**

- `name` (Required): Enter the name of the user (not to exceed 20 characters), on the host that connects to the agent.

- `group_name` (Required): Enter a text string (up to 20 characters long) as the name of the group. The following groups are created for mapping to read/write community/security-names (defaults):
  - `v1v2creadu` — maps to a community with ro permissions.
  - `v1v2writeu` — maps to a community rw permissions.

- `remote ip-address` (Required): Enter the keywords `udp-port` then the user datagram protocol (UDP) port number on the remote device. The range is from 0 to 65535. The default is 162.

- `vrf vrf-name` (Required): Enter the keywords `vrf` and then the name of the VRF this is used to connect to the SNMP server.

  **NOTE:** Use this attribute to specify a VRF name that is used to connect to the remote host. If no VRF is specified, then the default VRF is used.

- `udp-port port-number` (Required): Enter the keywords `udp-port` then the UDP (User Datagram Protocol) port number on the remote device. The range is from 0 to 65535. The default is 162.

- `1 | 2c | 3` (Optional): Enter the security model version number (1, 2c, or 3):
  - 1 is the least secure version.
  - 3 is the most secure of the security modes.
2c allows transmission of informs and counter 64, which allows for integers twice the width of what is normally allowed. The default is 1.

encrypted  (OPTIONAL) Enter the keyword encrypted to specify the password appear in encrypted format (a series of digits, masking the true characters of the string).

auth  (OPTIONAL) Enter the keyword auth to specify authentication of a packet without encryption.

md5 | sha  (OPTIONAL) Enter the keyword md5 or sha to designate the authentication level.

- md5 — Message Digest Algorithm
- sha — Secure Hash Algorithm

auth-password  (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the agent to receive packets from the host. Minimum: eight characters long.

priv  (OPTIONAL) Enter the keywords priv to initiate a privacy authentication level setting.

des56 | aes128  (OPTIONAL) Enter the keyword des56 or aes128 to specify the encryption mode.

- aes128 — Use 128 bit AES algorithm in CFB mode for encryption.
- des56 — Use 56 bit DES algorithm in CBC mode for encryption.

priv password  (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the host to encrypt the contents of the message it sends to the agent. Minimum: eight characters long.

access access-list-name  (Optional) Enter the standard IPv4 access list name (a string up to 16 characters long).

ipv6 access-list-name  (Optional) Enter the keyword ipv6 then the IPv6 access list name (a string up to 16 characters long).

access-list-name ipv6 access-list-name  (Optional) Enter both an IPv4 and IPv6 access list name.

Defaults  As above.

Command Modes  CONFIGURATION

</tbody>
</table>
### Usage Information

**NOTE:** For IPv6 ACLs, only IPv6 and UDP types are valid for SNMP. TCP and ICMP rules are not valid for SNMP. In IPv6 ACLs port rules are not valid for SNMP.

No default values exist for authentication or privacy algorithms and no default password exists. If you forget a password, you cannot recover it; the user must be reconfigured. You can specify either a plain-text password or an encrypted cypher-text password. In either case, the password is stored in the configuration in an encrypted form and displayed as encrypted in the `show running-config` command.

If you have an encrypted password, you can specify the encrypted string instead of the plain-text password. The following command is an Example of how to specify the command with an encrypted string.

**NOTE:** The number of configurable users is limited to 16.

**Example**
```
DellEMC# snmp-server user privuser v3group v3 encrypted auth md5 9fc53d9d908118b2804fe80e3ba8763d priv des56 d0452401a8c3ce42804fe80e3ba8763d
```

**Example**
```
DellEMC# conf
DellEMC(conf)# snmp-server user authuser v3group v3 auth md5 authpasswd
```

**Example**
```
DellEMC# conf
DellEMC(conf)# snmp-server user n3user ngroup remote 172.31.1.3 udp-port 5009 3 auth md5 authpasswd
```

**Related Commands**

- `show snmp user` — displays the information configured on each SNMP user name.

### snmp-server user (for AES128-CFB Encryption)

Specify that AES128-CFB encryption algorithm needs to be used for transmission of SNMP information. The Advanced Encryption Standard (AES) Cipher Feedback (CFB) 128-bit encryption algorithm is in compliance with RFC 3826. RFCs for SNMPv3 define two authentication hash algorithms, namely, HMAC-MD5-96 and HMAC-SHA1-96. These are the full forms or editions of the truncated versions, namely, HMAC-MD5 and HMAC-SHA1 authentication algorithms.
Syntax

```
snmp-server user name {group_name remote ip-address udp-port port-number} [1 | 2c | 3] [encrypted] [auth {md5 | sha} auth-password] [priv {des56 | aes128-cfb} priv-password] [access access-list-name | ipv6 access-list-name] ipv6 access-list-name
```

To remove a user from the SNMP group, use the `no snmp-server user name {group_name remote ip-address udp-port port-number} [1 | 2c | 3] [encrypted] [auth {md5 | sha} auth-password] [priv {des56 | aes128-cfb} priv-password] [access access-list-name | ipv6 access-list-name] ipv6 access-list-name` command.

Parameters

- **auth-password** (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the agent to receive packets from the host and to send packets to the host. Minimum: eight characters long.
- **aes128** (OPTIONAL) Enter the keyword `aes128` to initiate the AES128-CFB encryption algorithm for transmission of SNMP packets.
- **priv-password** (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the host to encrypt the contents of the message it sends to the agent and to decrypt the contents of the message it receives from the agent. Minimum: eight characters long.

Defaults

If no authentication or privacy option is configured, then the messages are exchanged (attempted anyway) without any authentication or encryption.

<td>9.3(0.0)</td>
<td>Added support for the AES128-CFB encryption algorithm on the S4820T, S4810, S6000 and Z-Series platforms</td>
</tr>
</tbody>
</table>

Usage Information

To enable robust, effective protection and security for SNMP packets transferred between the server and the client, you can use the `snmp-server user username group groupname 3 auth authentication-type auth-password priv aes128 priv-password` to specify that AES128-CFB encryption algorithm needs to be used.
You cannot modify the FIPS mode if SNMPv3 users are already configured and present in the system. An error message is displayed if you attempt to change the FIPS mode by using the `fips mode enable` command in Global Configuration mode. You can enable or disable FIPS mode only if SNMPv3 users are not previously set up. Otherwise, you must remove the previously configured users before you change the FIPS mode.

**Example**

```
DellEMC# snmp-server user privuser v3group v3 encrypted auth md5 9fc53d9d908118b2804fe80e3ba8763d priv aes128 d0452401a8c3ce42804fe80e3ba8763d
```

**Related Commands**

- `show snmp user` — Displays the information configured on each SNMP user name.

### snmp-server view

Configure an SNMPv3 view.

**Syntax**

```
snmp-server view view-name oid-tree {included | excluded}
```

To remove an SNMPv3 view, use the `no snmp-server view view-name oid-tree {included | excluded}` command.

**Parameters**

- `view-name` 
  Enter the name of the view (not to exceed 20 characters).
- `oid-tree` 
  Enter the OID sub tree for the view (not to exceed 20 characters).
- `included` 
  (OPTIONAL) Enter the keyword included to include the MIB family in the view.
- `excluded` 
  (OPTIONAL) Enter the keyword excluded to exclude the MIB family in the view.

**Defaults**

none

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
### Usage Information

The `oid-tree` variable is a full sub-tree starting from `1.3.6` and cannot specify the name of a sub-tree or a MIB. The following Example configures a view named `rview` that allows access to all objects under `1.3.6.1`.

```plaintext
Example

DellEMC# conf
DellEMC#(conf) snmp-server view rview 1.3.6.1 included
```

### Related Commands

- `show running-config snmp` — displays the SNMP running configuration.

---

### snmp-server vrf

Configures an SNMP agent to bind to a specific VRF.

**Syntax**

```
snmp-server vrf vrf-name
```

To undo the SNMP agent configuration, use the `no snmp-server vrf vrf-name` command.

**Parameters**

- `vrf vrf-name`  
  Enter the keyword `vrf` and then the name of the VRF to associate an SNMP agent with that VRF.

**Defaults**

Not Enabled.

Usage Information

Use this command to bind an SNMP agent to a VRF. The SNMP agent processes the requests from the interfaces that belong to the specified VRF. If no VRF is specified, then the default VRF is used.

Related Commands

- `show snmp user` — display the information configured on each SNMP user name.

**snmp trap link-status**

Enable the interface to send SNMP link traps, which indicate whether the interface is up or down.

**Syntax**

```
snmp trap link-status
```

To disable sending link trap messages, use the `no snmp trap link-status` command.

**Defaults**

Enabled.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

E-Series legacy command

Related Commands

    • logging trap — limit messages logged to the Syslog servers based on severity.
logging

Configure an IP address or host name of a Syslog server where logging messages are sent. Multiple logging servers of both IPv4 and/or IPv6 can be configured.

**Syntax**

logging {ip-address | ipv6-address | hostname} {{udp {port}} | {tcp {port}}} [vrf vrf-name]

To disable logging, use the **no logging** command.

**Parameters**

- **ip-address**
  - Enter the IPv4 address in dotted decimal format.

- **ipv6-address**
  - Enter the IPv6 address in the x::x::x::x format.
  
  **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

- **hostname**
  - Enter the name of a host already configured and recognized by the switch.

- **udp**
  - Enter the keyword udp to enable transmission of log message over UDP followed by port number. The default port is 514.

- **tcp**
  - Enter the keyword tcp to enable transmission of log message over TCP followed by port number.

- **vrf vrf-name**
  - (Optional) Enter the keyword vrf and then the name of the VRF to enable the logging process in VRF mode.

  **NOTE:** Use this attribute to specify the VRF that is used to contact the host. By default, the default VRF is used.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.1)  
  - Introduced on the S6010-ON and S4048T-ON.

- 9.10(0.0)  
  - Introduced on the S3148.

- 9.10(0.0)  
  - Introduced on the S6100–ON.

- 9.8(2.0)  
  - Introduced on the S3100 series.

- 9.8(1.0)  
  - Introduced on the Z9100–ON.

- 9.8(0.0P5)  
  - Introduced on the S4048-ON.

- 9.8(0.0P2)  
  - Introduced on the S3048-ON.

- 9.7(0.0)  
  - Introduced on the S6000-ON.

- 9.5(0.1)  
  - Added **udp** and **tcp** keywords for the Z9500.

- 9.5(0.0)  
  - Added **udp** and **tcp** keywords for the S4810, S4820T, S6000, Z9000, and MXL.

- 9.4(0.0)  
  - Added support for VRF.
Usage Information

Multiple logging servers of both IPv4 and/or IPv6 can be configured.

Related Commands

- `logging on` — enables the logging asynchronously to logging buffer, console, Syslog server, and terminal lines.
- `logging trap` — enables logging to the Syslog server based on severity.

**logging buffered**

Enable logging and specify which messages are logged to an internal buffer. By default, all messages are logged to the internal buffer.

**Syntax**

```
logging buffered [level] [size]
```

To return to the default values, use the `default logging buffered` command.

To disable logging stored to an internal buffer, use the `no logging buffered` command.

**Parameters**

- `level` (OPTIONAL) Indicate a value from 0 to 7 or enter one of the following equivalent words: `emergencies`, `alerts`, `critical`, `errors`, `warnings`, `notifications`, `informational`, or `debugging`. The default is 7 or `debugging`.

- `size` (OPTIONAL) Indicate the size, in bytes, of the logging buffer. The number of messages buffered depends on the size of each message. The range is from 40960 to 524288. The default is **40960 bytes**.

**Defaults**

- `level = 7`
- `size = 40960 bytes`

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the S3148.</td>
</tr>
</tbody>
</table>
**Version** | **Description**
---|---
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.

**E-Series legacy command**

**Usage Information**
When you decrease the buffer size, all messages stored in the buffer are lost. Increasing the buffer size does not affect messages stored in the buffer.

**Related Commands**
- `clear logging` — clears the logging buffer.
- `default logging buffered` — returns the logging buffered parameters to the default setting.
- `show logging` — displays the logging setting and system messages in the internal buffer.

---

## logging console

Specify which messages are logged to the console.

**Syntax**

```
logging console [level]
```

To return to the default values, use the `default logging console` command.

To disable logging to the console, use the `no logging console` command.

**Parameters**

- `level` (OPTIONAL) Indicate a value from 0 to 7 or enter one of the following parameters: `emergencies`, `alerts`, `critical`, `errors`, `warnings`, `notifications`, `informational`, or `debugging`. The default is 7 or `debugging`.

**Defaults**

- `level = 7; size = debugging`

**Command Modes**

E-Series legacy command

Related Commands

- `clear logging` — clears the logging buffer.
- `default logging console` — returns the logging console parameters to the default setting.
- `show logging` — displays the logging setting and system messages in the internal buffer.

logging extended

Logs security and audit events to a system log server.

Syntax

```
logging extended
```

Defaults

none

Command Modes

`CONFIGURATION`

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S6010-ON and S4048T-ON.</td>

</tbody>
</table>
Version | Description
---|---
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5(0.1) | Introduced on the Z9500.
9.5(0.0) | Introduced on the S4810, S4820T, S6000, Z9000, and MXL.

Usage Information
This command is available with or without RBAC enabled. When RBAC is enabled you can restrict access to audit and security logs based on the CLI sessions’ user roles. If extended logging is disabled, you can only view system events, regardless of RBAC user role.

When you enabled RBAC and extended logging:

- Only the system administrator role can execute this command.
- The system administrator and system security administrator roles can view security events and system events.
- The system administrator role can view audit, security, and system events.
- The network administrator and network operator roles can view system events.

Examples
```
DellEMC(conf)#logging extended
```

Related Commands
- `show logging auditlog` — display the audit log.
- `clear logging auditlog` — clear the audit log.

**logging facility**

Configure the Syslog facility used for error messages sent to Syslog servers.

**Syntax**

```
logging facility [facility-type]
```

To return to the default values, use the `no logging facility` command.

**Parameters**

- `facility-type`  
  
  (OPTIONAL) Enter one of the following parameters:
  - `auth` (authorization system)
  - `cron` (Cron/at facility)
  - `deamon` (system deamons)
  - `kern` (kernel)
  - `local0` (local use)
  - `local1` (local use)
  - `local2` (local use)
• local3 (local use)
• local4 (local use)
• local5 (local use)
• local6 (local use)
• local7 (local use)
• lpr (line printer system)
• mail (mail system)
• news (USENET news)
• sys9 (system use)
• sys10 (system use)
• sys11 (system use)
• sys12 (system use)
• syslog (Syslog process)
• user (user process)
• uucp ( Unix to Unix copy process)

The default is local7.

</tbody>
</table>
logging history

Specify which messages are logged to the history table of the switch and the SNMP network management station (if configured).

Syntax

logging history level

To return to the default values, use the no logging history command.

Parameters

- **level**: Indicate a value from 0 to 7 or enter one of the following equivalent words: emergencies, alerts, critical, errors, warnings, notifications, informational, or debugging. The default is 4 or warnings.

Defaults

warnings or 4

---|---
E-Series legacy command | 

Usage Information

When you configure the `snmp-server trap-source` command, the system messages logged to the history table are also sent to the SNMP network management station.

Related Commands

- `show logging` — displays information logged to the history buffer.

logging history size

Specify the number of messages stored in the Dell EMC Networking logging history table.

Syntax

```
logging history size size
```

To return to the default values, use the `no logging history size` command.

Parameters

- `size` 
  Indicate a value as the number of messages to be stored. The range is from 0 to 500. The default is 1 message.

Defaults

1 message

When the number of messages reach the limit you set with the `logging history size` command, older messages are deleted as newer ones are added to the table.

**Related Commands**

- `show logging` — displays information logged to the history buffer.

---

### logging monitor

Specify which messages are logged to Telnet applications.

**Syntax**

```
logging monitor [level]
```

To disable logging to terminal connections, use the `no logging monitor` command.

**Parameters**

- `level`
  
  Indicate a value from 0 to 7 or enter one of the following parameters: `emergencies`, `alerts`, `critical`, `errors`, `warnings`, `notifications`, `informational`, or `debugging`. The default is 7 or `debugging`.

**Defaults**

7 or `debugging`

E-Series legacy command

Related Commands
- `default logging monitor` — returns the logging monitor parameters to the default setting.

logging on

Specify that debug or error messages are asynchronously logged to multiple destinations, such as the logging buffer, Syslog server, or terminal lines.

**Syntax**

```plaintext
logging on
```

To disable logging to logging buffer, Syslog server and terminal lines, use the `no logging on` command.

**Defaults**

Enabled.

E-Series legacy command
Usage Information
When you use the no logging on command, messages are logged only to the console.

Related Commands
- logging — enable logging to the Syslog server.
- logging buffered — set the logging buffered parameters.
- logging console — set the logging console parameters.
- logging monitor — set the logging parameters for the terminal connections.

logging source-interface

Specify that the IP address of an interface is the source IP address of Syslog packets sent to the Syslog server.

Syntax
logging source-interface interface

To disable this command and return to the default setting, use the no logging source-interface command.

Parameters
- interface
  Enter the following keywords and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
  - For the Management interface, enter the keyword ManagementEthernet then the slot/port information.
  - For a port-channel interface, enter the keywords port-channel then the port-channel ID.
  - For a Null interface, enter the keyword null then the Null interface number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Defaults
Not configured.

Command Modes

### Version Description
- **9.2(1.0)**: Introduced on the Z9500.
- **9.2(0.0)**: Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
- **9.0.2.0**: Introduced on the S6000.
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.11.1**: Introduced on the Z9000.
- **8.3.7.0**: Introduced on the S4810.
- **8.5.1.0**: Added support for 4-port 40G line cards on the E-Series.
- **7.6.1.0**: Introduced on the S-Series.
- **7.5.1.0**: Introduced on the C-Series.

### Usage Information
Syslog messages contain the IP address of the interface used to egress the router. By configuring the `logging source-interface` command, the Syslog packets contain the IP address of the interface configured.

### Related Commands
- `logging` — enables logging to the Syslog server.

### logging synchronous

Synchronize unsolicited messages and Dell EMC Networking OS output.

**Syntax**
```
logging synchronous [level level | all] [limit number-of-buffers]
```

To disable message synchronization, use the `no logging synchronous [level level | all] [limit number-of-buffers]` command.

**Parameters**
- **all**: Enter the keyword `all` to ensure that all levels are printed asynchronously.
- **level level**: Enter the keyword `level` then a number as the severity level. A high number indicates a low severity level and vice versa. The range is from 0 to 7. The default is 2.
- **all**: Enter the keyword `all` to turn off all.
- **limit number-of-buffers**: Enter the keyword `limit` then the number of buffers to be queued for the terminal after which new messages are dropped. The range is from 20 to 300. The default is 20.

**Defaults**
Disabled. If enabled without the `level` or `number-of-buffers` options specified, `level = 2` and `number-of-buffers = 20` are the defaults.

**Command Modes**
- LINE

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** **Description**
- **9.10(0.1)**: Introduced on the S6010-ON and S4048T-ON.

</tr>
</tbody>
</table>

E-Series legacy command

Usage Information

When you enable `logging synchronous`, unsolicited messages appear between software prompts and outputs. Only the messages with a severity at or below the set level are sent to the console.

If the message queue limit is reached on a terminal line and messages are discarded, a system message appears on that terminal line. Messages may continue to appear on other terminal lines.

Related Commands

- `logging on` — enables logging.

logging trap

Specify which messages are logged to the Syslog server based on the message severity.

Syntax

```
logging trap [level]
```

To return to the default values, use the `default logging trap` command.

To disable logging, use the `no logging trap` command.

Parameters

- `level`
  
  Indicate a value from 0 to 7 or enter one of the following parameters: emergencies, alerts, critical, errors, warnings, notifications, informational, or debugging. The default is 6 or informational.

Defaults

- 6 or informational

Command Modes

CONFIGURATION

Simple Network Management Protocol (SNMP) and Syslog 1775
Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

E-Series legacy command

Usage Information

To block a type of message parameter, set the logging trap level to a lower number. For example, to block severity messages at level 6, set the level to 5.

Related Commands

- `logging` — enables the logging to another device.
- `logging on` — enables logging.

logging version

Displays syslog messages in a RFC 3164 or RFC 5424 format.

Syntax

```
logging version {0|1}
```

Defaults

0

</tbody>
</table>

**Usage Information**

To display syslog messages in a RFC 3164 or RFC 5424 format, use the `log version` command in configuration mode. By default, the system log version is set to 0.

The following describes the two supported log messages formats:

- 0 – Displays syslog messages format as described in RFC 3164, The BSD syslog Protocol
- 1 – Displays SYSLOG message format as described in RFC 5424, The Syslog Protocol

**Example**

```plaintext
DellEMC(conf)#logging version ?
<0-1> Select syslog version (default = 0)
DellEMC(conf)#logging version 1
```

**show logging**

Display the logging settings and system messages logged to the internal buffer of the switch.

**Syntax**

```plaintext
show logging [number | history [reverse][number] | reverse [number] | summary]
```

**Parameters**

- `number` (OPTIONAL) Enter the number of messages displayed in the output. The range is from 1 to 65535.
- `history` (OPTIONAL) Enter the keyword history to view only information in the Syslog history table.
- `reverse` (OPTIONAL) Enter the keyword reverse to view the Syslog messages in FIFO (first in, first out) order.
- `summary` (OPTIONAL) Enter the keyword summary to view a table showing the number of messages per type and per slot. Slots *7* and *8* represent RPMs.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Example  
DellEMC(conf)# show logging auditlog

Related Commands  
- clear logging auditlog — clear the audit log.

show logging driverlog stack-unit

Display the driver log for the specified hardware component.

Syntax  
show logging driverlog stack-unit stack-unit-number
Parameters

stack-unit stack-unit-number

Enter the keywords stack-unit followed by the stack member ID of the switch for which you want to display the driver log.

defaults

none

Command Modes

• EXEC
• EXEC Privilege

Usage Information

This command displays internal software driver information, which may be useful during troubleshooting switch initialization errors, such as a downed Port-Pipe.

**terminal monitor**

Configure the Dell EMC Networking OS to display messages on the monitor/terminal.

**Syntax**

```plaintext
terminal monitor
```

To return to default settings, use the `terminal no monitor` command.

**defaults**

Disabled.

**Command Modes**

- EXEC
- EXEC Privilege

</table>
The error trap indicates that the sending agent has encountered the protocol error indicated by `vrrpTrapProtoErrorReason`.

The BGP Established event is generated when the BGP FSM enters the ESTABLISHED state.

The BGP Backward Transition Event is generated when the BGP FSM moves from a higher numbered state to a lower numbered state.

A MEP has a persistent defect condition. A notification (fault alarm) is sent to the management entity with the OID of the MEP that has detected the fault. Whenever a MEP has a persistent defect, it may or may not generate a Fault Alarm to warn the system administrator of the problem, as controlled by the MEP Fault Notification Generator State Machine and associated Managed Objects. If a defect with a higher priority is raised after a Fault Alarm has been issued, another Fault Alarm is issued. The management entity receiving the notification can identify the system from the network source address of the notification, and can identify the MEP reporting the defect by the indices in the
OID of the dot1agCfmMepHighStPrDefect variable in the notification:
dot1agCfmMdIndex
- Also the index of the MEPs Maintenance Domain table entry (dot1agCfmMdTable).
dot1agCfmMaIndex
- Also an index (with the MD table index) of the MEPs Maintenance Association table entry (dot1agCfmMaTable).
dot1agCfmMepIdentifier - MEP Identifier and final index into the MEP table (dot1agCfmMepTable).

62
TR_EOAM_THRSHLD_EVT 1.3.6.1.2.1.158.0.1
dot3OamThresholdEvent

"A dot3OamThresholdEvent notification is sent when a local or remote threshold crossing event is detected. A local threshold crossing event is detected by the local entity, while a remote threshold crossing event is detected by the reception of an Ethernet OAM Event Notification OAMPDU that indicates a threshold event. This notification should not be sent more than once per second. The OAM entity can be derived from extracting the ifIndex from the variable bindings. The objects in the notification correspond to the values in a row instance in the dot3OamEventLogTable. The management entity should periodically check dot3OamEventLogTable."

</tbody>
</table>
| 132         | TR_VLT_ICL_BW_THRESHOLD_EXCEEDED | The IFM agent generates this notification to denote the change in Bandwidth usage of ICL Link, when it crosses the threshold above 80%. The possible states are as follows:
   0. Below threshold
   1. Above threshold

| 133         | TR_VLT_DOMAIN_CONFIG_ERROR | The agent generates this notification to denote there is an error/conflict in the VLT domain config parameters (either locally or in remote node which prevent the peer up. The mismatch can be domain Id, unitld,version or system MAC. The notification contains information on the error/mismatch type.

| 134         | TR ISIS_ADJ_CHANGE        | This notification is generated when adjacency relate changes take place.

| 135         | TR_LACP_STATE_CHANGE      | The dot3adAggLacpStateChange indicates that the agent has detected a change in the Lacp state for one of the member ports of the aggregation link. This notification contains the information on the port which has gone through the state change and the oper state information of the actor and its partner.
An entConfigChange notification is generated when the value of entLastChangeTime changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls. An agent should not generate more than one entConfigChange 'notification-event' in a given time interval (five seconds is the suggested default). A 'notification-event' is the transmission of a single trap or inform PDU to a list of notification destinations. If additional configuration changes occur within the throttling period, then notification-events for these changes should be suppressed by the agent until the current throttling period expires. At the end of a throttling period, one notification-event should be generated if any configuration changes occurred since the start of the throttling period. In such a case, another throttling period is started right away. An NMS should periodically check the value of entLastChangeTime to detect any missed entConfigChange notification-events, e.g., due to throttling or transmission loss.

Trap generated when a stack unit's role in a stack changes to management/standby/member.
TR_CHM_VERSION_MISMATCH
1.3.6.1.4.1.6027.3.26.1.5.1.23 DELL-NETWORKING-CHASSIS-MIB.mib
Trap generated when the stack unit software version is not compatible.

TR_PROD_STATUS_CHANGE
1.3.6.1.4.1.674.10895.3.000.2.1.0.1 Dell_ITA.Rev_1_1.mib
This trap is sent when the product global status changes.

TR_CHM_UNSUPORTED_OPTS
1.3.6.1.4.1.6027.3.26.1.5.1.24 DELL-NETWORKING-CHASSIS-MIB.mib
The Interface Agent generate this trap when an unsupported optic is inserted in a port.

TR_HGLBM_IMBALANCE
1.3.6.1.4.1.6027.3.24.3.1 bpLinkBundleImbalance DELL-NETWORKING-BPSTATS-MIB.mib
Trap generated when traffic imbalance observed in BP Link Bundles.

TR_HGLBM_IMBALANCE_CLEAR
1.3.6.1.4.1.6027.3.24.3.1 bpLinkBundleImbalanceClear DELL-NETWORKING-BPSTATS-MIB.mib
Trap generated when traffic imbalance is no longer observed on Bp Link bundles.

TR_BRM_PE_UP
1.3.6.1.4.1.6027.3.26.1.5.1.27 DELL-NETWORKING-CHASSIS-MIB.mib
The driver/agent generate this trap when a PE operational status is up. Applicable for C9010.

TR_BRM_PE_DOWN
1.3.6.1.4.1.6027.3.26.1.5.1.28 DELL-NETWORKING-CHASSIS-MIB.mib
The driver/agent generate this trap when a PE operational status is down.

TR_BRM_PE_UNIT_UP
1.3.6.1.4.1.6027.3.26.1.5.1.29 DELL-NETWORKING-CHASSIS-MIB.mib
The driver/agent generate this trap when a PE Unit operational status is up.

TR_BRM_PE_UNIT_DOWN
1.3.6.1.4.1.6027.3.26.1.5.1.30 DELL-NETWORKING-CHASSIS-MIB.mib
The driver/agent generate this trap when a PE Unit operational status is down.

TR_SYSLOG_SERVER_CONNECTION_SUCCESSFUL
1.3.6.1.4.1.6027.3.30.1.1.2 Not Available
Connecting to server with Valid configuration.

TR_SYSLOG_SERVER_CONNECTION_FAILURE
1.3.6.1.4.1.6027.3.30.1.1.1 Not Available
Not able to connecting with server with invalid configuration.
All commands in this chapter are specific to the Dell EMC Networking OS.
You can use the commands to pre-configure a switch, so that the configuration settings are invoked when the switch is attached to other S-Series units.

For information about using the S-Series stacking feature, see the Stacking S-Series Switches section in the Dell EMC Networking OS Configuration Guide.

⚠️ **CAUTION:** You cannot enable stacking simultaneously with virtual link trunking (VLT). If you enable both at the same time, unexpected behavior occurs.

The Dell EMC Networking OS commands for data center bridging features include 802.1Qbb priority-based flow control (PFC), 802.1Qaz enhanced transmission selection (ETS), and the data center bridging exchange (DCBX) protocol.

Topics:

- mixed-mode-stacking
- redundancy disable-auto-reboot
- redundancy force-failover stack-unit
- redundancy protocol
- reset stack-unit
- show redundancy
- show system stack-ports
- stack-unit priority
- stack-unit provision
- stack-unit stack-group
- upgrade system stack-unit

### mixed-mode-stacking

Enables the mixed-mode stacking feature on the S4048T-ON and the S4048-ON. This feature allows a S4048-ON to join a S4048T-ON stack. Similarly, this feature also allows a S4048T-ON to join a S4048-ON stack.

#### S4048-ON

**Syntax**

mixed-mode-stacking enable

To remove the current stack group configuration, use the no mixed-mode-stacking enable command.

**Parameters**

- **enable**
  
Enter the keyword enable to enable mixed-mode stacking on the switch.

**Defaults**

Disabled
Command Modes

- **CONFIGURATION**

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S4048T-ON and S4048-ON.</td>
</tr>
</tbody>
</table>

Usage Information

- To form a mixed-mode stack, use only the 40G ports between the range 49 to 54.
- You cannot form a mixed-mode stack using the 10G ports. Because, the 10G ports on the S4048T are copper ports; where as, the 10G ports on the S4048-ON are SFP ports.
- It is mandatory to enable mixed-mode stacking on the S4048-ON and S4048T-ON switches before joining a mixed-mode stack.
- Stack election is based on the priority or the MAC address of the stack units as in homogenous stacking. The stack-unit with the highest priority or MAC address is chosen as the master.
- TDR is a feature that is supported only on the S4048T-ON but not on the S4048-ON. If TDR is configured on the S4048T-ON, then mixed-mode stacking can be enabled only on the S4048T-ON switches.
- The `hardware watchdog` command is enabled only when the S4048T-ON act as master. As a single image runs on both the S4048T-ON as well as the S4048-ON, the `hardware watchdog` command is retained on the S4048-ON also. However, this command remains ineffective and does not perform any function when the S4048-ON acts as master.
- When the S4048T-ON is the master and mixed-mode stacking is disabled, the S4048-ON remains in the card problem state due to type mismatch.
- When the S4048-ON is the master and mixed-mode stacking is disabled, the S4048T-ON remains in the card problem state due to type mismatch.

After you issue this command, the following message appears prompting you to confirm the configuration:

Enabling mixed-mode-stacking requires configuration save and reload to operate in compatible with S4048-ON. Do you want to reload? Proceed[confirm yes/no]:

To make the S4048T-ON work like the S4048-ON, enter `yes` at this prompt and press the return key. The following message appears prompting you to save the configuration:

System configuration has been modified. Save? [yes/no]:

Enter `yes` again and press the return key.

Example (S4048T-ON)

```
Dell(conf)#mixed-mode-stacking enable
Enabling Mixed-mode stacking requires config save and reload to operate in compatible to S4048.
Do you want to reload? Proceed[confirm yes/no]:yes
System configuration has been modified. Save? [yes/no]: yes
Apr 10 19:16:38: %STKUNIT2-M:CP %FILEMGR-5-FILESAVED: Copied running-config to startup-config in flash by default

Example (S4048-ON)
Dell#conf t
Dell(conf)#mixed-mode-stacking enable
Dell#conf t
Dell(conf)#no mixed-mode-stacking enable

redundancy disable-auto-reboot

Prevent the S-Series stack management unit, stack member unit, and standby unit from rebooting if they fail.

Syntax redundancy disable-auto-reboot stack-unit [1-6 | members]
To return to the default, use the no redundancy disable-auto-reboot stack-unit command.

Parameters

stack-unit Enter the stack-unit number. The range is from 1 to 6.
members Enter the keyword members for all stack-units.

Defaults Disabled (the failed switch is automatically rebooted).
Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>8.3.1.0</td>
<td>Added the members option.</td>
</tr>
</tbody>
</table>

Usage Information

Enabling this command keeps the failed switch in the Failed state. The switch does not reboot until it is manually rebooted. When enabled, it is not displayed in the running-config. When disabled, it is displayed in the running-config.

Related Commands

- `show redundancy` — displays the current redundancy status.

**redundancy force-failover stack-unit**

Force the standby unit in the stack to become the management unit.

**Syntax**

redundancy force-failover stack-unit

**Defaults**

Not enabled.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tr>
<td>8.3.1.0</td>
<td>Added the members option.</td>
</tr>
</tbody>
</table>

**Usage Information**

Executing this command on the master unit reboots the master unit and the standby unit becomes the new master. A new standby unit is elected depending on the priority and MAC address.
Example

DellEMC#redundancy force-failover stack-unit
System configuration has been modified. Save? [yes/no]: yes

Apr 20 11:44:03: %STKUNIT1-M:CP %FILEMGR-5-FILESAVED: Copied running-config to
startup-config in flash by default
Synchronizing data to peer stack-unit
!

Proceed with stack-unit hot failover [confirm yes/no]:yes

redundancy protocol

Enable hitless failover for a protocol.

Syntax redundancy protocol

Protocols

- lacp Enter the LACP protocol
- xstp Enter one of the following protocols: STP, RSTP, MSTP, PVST.

Defaults Not enabled.

Command Modes CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.7.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
8.3.1.0 Added the hard reset option.

Usage Information
Resetting the management unit is not allowed, and an error message displays if you try to do so. Resetting is a soft reboot, including flushing the forwarding tables.

Starting with Dell EMC Networking OS version 7.8.1.0, you can run this command directly on the stack standby unit (standby master) to reset the standby. You cannot reset any other unit from the standby unit.

Example
DellEMC#reset stack-unit 4
DellEMC#00:15:00: %STKUNIT1-M:CP %CHMGR-5-STACKUNIT_RESET: stack-unit 4 being reset
00:15:01: %STKUNIT1-M:CP %CHMGR-2-STACKUNIT_DOWN: stack-unit 4 down - reset
00:15:01: %STKUNIT1-M:CP %IFMGR-1-DEL_PORT: Removed port: Te 4/1-4/48, Fo 4/51-4/52,
DellEMC#00:15:01: %STKUNIT2-S:CP %IFMGR-1-DEL_PORT: Removed port: Te 4/1-4/48, Fo 4/51-4/52,
DellEMC#00:15:08: %S4048-ON:1 %IFAGT-5-STACK_PORT_LINK_DOWN: Changed stack port state to down: 1/49
00:15:08: %STKUNIT1-M:CP %CHMGR-2-STACKUNIT_DOWN: stack-unit 4 down - card removed
DellEMC#

Related Commands
- reload — reboots Dell EMC Networking OS.

show redundancy

Display the current redundancy configuration (status of automatic reboot configuration on stack management unit).

Syntax
show redundancy

Command Modes
- EXEC
- EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Version | Description
---|---
9.8(2.0) | Introduced on the S3100 series.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.7.0 | Introduced on the S4810.
8.3.11.1 | Introduced on the Z9000.

Usage Information
To modify your results, use the `show redundancy [pipe]` command, as follows:

- `except` — show only text that does not match a pattern.
- `find` — search for the first occurrence of a pattern.
- `grep` — show only text that matches a pattern.
- `no-more` — do not paginate the output.
- `save` — save the output to a file.

Example
```
DellEMC#show redundancy
-- Stack-unit Status --
-----------------------------------------
Mgmt ID:                          1

```
**show system stack-ports**

Display information about the stacking ports on all switches in the stack.

**Syntax**

```
show system stack-ports [status | topology]
```

**Parameters**

- **status**  
  (OPTIONAL) Enter the keyword status to display the command output without the Connection field.

- **topology**  
  (OPTIONAL) Enter the keyword topology to limit the table to just the Interface and Connection fields.

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Usage Information**

The following describes the `show system stack-ports` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Topology</td>
<td>Lists the topology of stack ports connected: Ring, Daisy chain, or Standalone.</td>
</tr>
<tr>
<td>Interface</td>
<td>The unit/port ID of the connected stack port on this unit.</td>
</tr>
<tr>
<td>Link Speed</td>
<td>Link Speed of the stack port (12 or 42) in Gb/s.</td>
</tr>
<tr>
<td>Admin Status</td>
<td>The only currently listed status is Up.</td>
</tr>
<tr>
<td>Connection</td>
<td>The stack port ID to which this unit’s stack port is connected.</td>
</tr>
</tbody>
</table>

**Example**

```
DellEMC#show system stack-ports
Topology: Ring
Interface  Connection    Link Speed   Admin Status  Link Status
---------------------------------------------------------------
```

Stacking 1807
### Example (Status)

**DellEMC# show system stack-ports status**

**Topology: Daisy chain**

</tr>
<tr>
<td>6/54</td>
<td>5/54</td>
</tr>
</tbody>
</table>

**Related Commands**

- `reset stack-unit` – resets the designated stack member.
- `show hardware stack-unit` – displays the data plane or management plane input and output statistics of the designated component of the designated stack member.
• **show system** – displays the current status of all stack members or a specific member.

---

### stack-unit priority

Configure the ability of a switch to become the management unit of a stack.

**Syntax**

```
stack-unit stack-number priority priority-value
```

**Parameters**

- `stack-number` : Enter the stack member unit identifier.
- `priority-value` : This preference parameter allows you to specify the management priority of one backup switch over another, with 1 as the lowest priority and 14 being the highest. The switch with the highest priority value is chosen to become the management unit if the active management unit fails or on the next reload.

**Defaults**

1

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<table>

</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

**Related Commands**

- **reload** – reboots Dell EMC Networking OS.

---

### stack-unit provision

Preconfigure a logical stacking ID of a switch that joins the stack. This is an optional command that is executed on the management unit.

**Syntax**

```
stack-unit [stack-number] provision {model-identifier}
```

**Parameters**

- `stack-number` : Enter a stack member identifier of the switch that you want to add to the stack.
- `model-identifier` : Enter the model identifier of the switch to be added as a stack member. This identifier is also referred to as the provision type.

**Defaults**

When this value is not set, a switch joining the stack is given the next available sequential stack member identifier.

**Command Modes**

CONFIGURATION
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

**Related Commands**

- `reload` — reboot the Dell EMC Networking OS.
- `show system` — display the status of all stack members or a specific member.

### stack-unit stack-group

Configure the stacking unit and stacking group by specifying an ID when adding units to a stack to ensure the unit is assigned to the correct group.

**Syntax**

```
stack-unit unit-id stack-group stack-group-id
```

To remove the current stack group configuration, use the `no stack-unit unit-id stack-group stack-group-id` command.

**Parameters**

- `unit-id` Enter the stack unit ID.
- `stack-group-id` Enter the stack group ID.

**Defaults**

none

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S6100-ON.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.7(0.0)</td>
<td>Introduced on the S6000.</td>
</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.7.1</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.12.0</td>
<td>Reset command mode from EXEC to CONFIGURATION.</td>
</tr>
</tbody>
</table>
The following message displays to confirm the command:

Setting ports Fo 1/60 as stack group will make their interface configs obsolete after a reload. [confirm yes/no]: If “y” is entered, all non-default configurations on any member ports of the current stack group will be removed when the unit is rebooted.

**NOTE:** Any scripts used to streamline the stacking configuration process must be updated to reflect the Command Mode change from EXEC Privilege to CONFIGURATION to allow the scripts to work correctly.

### upgrade system stack-unit

Copy the boot image or Dell EMC Networking OS from the management unit to one or more stack members.

**Syntax**

```plaintext
upgrade {boot | system} stack-unit {all | stack-unit-number | A | B}
```

**Parameters**

- **boot**
  - Enter the keyword `boot` to copy the boot image from the management unit to the designated stack members.

- **system**
  - Enter the keyword `system` to copy the Dell EMC Networking OS image from the management unit to the designated stack members.

- **stack-unit**
  - Enter the stack-unit number. The range is from 1 to 6.

- **all**
  - Enter the keyword `all` to copy the designated image to all stack members.

- **A**
  - Enter the keyword `A` to upgrade all stacked units in System A (only).

- **B**
  - Enter the keyword `B` to upgrade all stacked units in System B (only).

**Defaults**

- none

**Command Modes**

- EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**

To reboot using the new image, use the `upgrade boot system stack-unit` command.

**Related Commands**

- `reload` — reboots Dell EMC Networking OS.
- `reset stack-unit` — resets the designated stack member.
- `show system` — displays the status of all stack members or a specific member.
- `show version` — displays the current Dell EMC Networking OS version information on the system.
The Dell EMC Networking OS storm control feature allows you to limit or suppress traffic during a traffic storm (Broadcast/Unknown Unicast Rate Limiting or Multicast on the C-Series and S-Series).

Storm control is supported on Dell EMC Networking OS.

### Important Points to Remember

- Interface commands can only be applied on physical interfaces (virtual local area networks [VLANs] and link aggregation group [LAG] interfaces are not supported).
- An INTERFACE-level command only supports storm control configuration on ingress.
- An INTERFACE-level command overrides any CONFIGURATION-level ingress command for that physical interface, if both are configured.
- You can apply the CONFIGURATION-level storm control commands at ingress or egress and are supported on all physical interfaces.
- When storm control is applied on an interface, the percentage of storm control applied is calculated based on the advertised rate of the line card. It is not based on the speed setting for the line card.
- Do not apply per-VLAN quality of service (QoS) on an interface that has storm control enabled (either on an interface or globally).
- When you enable broadcast storm control on an interface or globally on ingress, and DSCP marking for a DSCP value 1 is configured for the data traffic, the traffic goes to queue 1 instead of queue 0.
- Similarly, if you enable unicast storm control on an interface or globally on ingress, and DSCP marking for a DSCP value 2 is configured for the data traffic, the traffic goes to queue 2 instead of queue 0.

**NOTE:** Bi-directional traffic (unknown unicast and broadcast) along with egress storm control causes the configured traffic rates split between the involved ports. The percentage of traffic that each port receives after the split is not predictable. These ports can be in the same/different port pipes or the same/different line cards.

**NOTE:** The policy discard drop counters are common across storm-control drops, ACL drops and QoS drops. If your configuration includes ACL and QoS, those drops are also computed and displayed in the policy discard drops counter field along with storm-control drops. The packets dropped by the storm control feature can be monitored by viewing the value of the Policy Discard Drops field of the output of the `show hardware stack-unit stack-unit-number drops` command.

show storm-control broadcast

Display the storm control broadcast configuration.

Syntax
show storm-control broadcast [interface]

Parameters

interface  (OPTIONAL) Enter one of the following interfaces to display the interface-specific storm control configuration:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

Defaults
none

Command Modes
- EXEC
- EXEC Privilege

</table>
show storm-control multicast

Display the storm control multicast configuration.

Syntax

```
show storm-control multicast [interface]
```

Parameters

- `interface` (OPTIONAL) Enter one of the following interfaces to display the interface specific storm control configuration:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Command History

Example

```
DellEMC# show storm-control multicast TenGigabitethernet 1/1
Multicast storm control configuration
```
show storm-control unknown-unicast

Display the storm control unknown-unicast configuration.

Syntax

show storm-control unknown-unicast [interface]

Parameters

interface (OPTIONAL) Enter one of the following interfaces to display the interface specific storm control configuration:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version  Description

9.10(0.1)   Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)   Introduced on the S3148.
9.10(0.0)   Introduced on the S6100–ON.
9.8(2.0)    Introduced on the S3100 series.
9.8(1.0)    Introduced on the Z9100–ON.
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)    Introduced on the S6000-ON.
9.2(1.0)    Introduced on the Z9500.
9.0.2.0      Introduced on the S6000.
9.2(0.0)    Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
8.3.19.0    Introduced on the S4820T.
8.3.11.1    Introduced on the Z9000.
8.5.1.0     Added support for 4-port 40G line cards on the E-Series.
storm-control broadcast (Configuration)

Configure the percentage of broadcast traffic allowed in the network.

Syntax

```
storm-control broadcast [packets_per_second in]
```

To disable broadcast rate-limiting, use the `no storm-control broadcast [packets_per_second in]` command.

```
storm-control broadcast [percentage decimal_value in | out] | [wred-profile name] [packets_per_second in]
```

To disable broadcast rate-limiting, use the `storm-control broadcast [percentage decimal_value in | out] | [wred-profile name] [packets_per_second in]` command.

Parameters

- `percentage` _decimal_value_ in | out
  - Enter the percentage of broadcast traffic allowed in or out of the network. Optionally, you can designate a decimal value percentage, for example, 55.5%. The decimal range is from .1 to .9.

- `wred-profile name`
  - Enter the keyword `wred-profile` followed by the profile name to designate a wred-profile.

- `packets_per_second in`
  - Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368.

Defaults

none

Command Modes

CONFIGURATION (conf)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

```
Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
```
Version | Description
---|---
9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-MUX (PMUX) mode only.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
7.4.1.0 | E-Series Only: Added the percentage decimal value option.
6.5.1.0 | Introduced on the E-Series.

Usage Information
Broadcast storm control is valid on Layer 2/Layer 3 interfaces only. Layer 2 broadcast traffic is treated as unknown-unicast traffic.

**storm-control broadcast (Interface)**

Configure the percentage of broadcast traffic allowed on an interface (ingress only).

Syntax
```
storm-control broadcast [packets_per_second in]
```

To disable broadcast storm control on the interface, use the `no storm-control broadcast [packets_per_second in]` command.

Parameters
- `packets_per_second in` Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368.

Defaults
none

Command Modes
- INTERFACE (conf-if-
- interface-slot/port)

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version | Description

9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
storm-control multicast (Configuration)

Configure the packets per second (pps) of multicast traffic allowed into the C-Series and S-Series networks only.

Syntax

```
storm-control multicast packets_per_second in
```

To disable storm-control for multicast traffic into the network, use the no storm-control multicast packets_per_second in command.

Parameters

- `packets_per_second in` Enter the packets per second of multicast traffic allowed into the network. The range is from 0 to 33554368.

Defaults

none

Command Modes

CONFIGURATION (conf)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the S6100-ON.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100-ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000-ON.

9.2(1.0) Introduced on the Z9500.

9.0.2.0 Introduced on the S6000.

9.2(0.0) Introduced on the M I/O Aggregator. This command is supported in Programmable-MUX (PMUX) mode only.

8.3(19.0) Introduced on the S4820T.

8.3.11.1 Introduced on the Z9000.
storm-control multicast (Interface)

Configure the percentage of multicast traffic allowed on an C-Series or S-Series interface (ingress only) network only.

Syntax

storm-control multicast packets_per_second in

To disable multicast storm control on the interface, use the no storm-control multicast packets_per_second in command.

Parameters

packets_per_second in

Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368.

Defaults

none

Command Modes

INTERFACE (conf-if-interface-slot/port)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the S6100–ON.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100–ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000-ON.

9.2(1.0) Introduced on the Z9500.

9.0.2.0 Introduced on the S6000.

8.3.19.0 Introduced on the S4820T.

8.3.11.1 Introduced on the Z9000.

8.3.7.0 Introduced on the S4810.

7.6.1.0 Introduced on the C-series and S-Series.
**storm-control PFC/LLFC**

Shut down the port if it receives the PFC/LLFC frames more than the configured rate.

Syntax

```
storm-control pfc-llfc [pps] in shutdown
```

Parameters

- `pfc-llfc in` Enter the keyword `pfc-llfc` to get the flow control traffic. The range is from 0 to 33554368 packets per second.
- `shutdown` Enter the keyword `shutdown` to shut down the port when the rate exceeds.

Defaults

- none

Command Modes

- INTERFACE (conf-if-interface-slot/port)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

- 9.9(0.0) Introduced on the C9010, S4810, S4820T, S5000, S6000, Z9500, S3048-ON, S4048-ON, and S6000-ON.

Usage Information

- **NOTE**: PFC/LLFC storm control enabled interfaces disable the interfaces if it receives continuous PFC/LLFC packets. It can be a result of a faulty NIC/Switch that sends spurious PFC/LLFC packets.

**storm-control unknown-unicast (Configuration)**

Configure the percentage of unknown-unicast traffic allowed in or out of the network.

Syntax

```
storm-control unknown-unicast [packets_per_second in]
```

To disable storm control for unknown-unicast traffic, use the `no storm-control unknown-unicast [packets_per_second in]` command.

Parameters

- `packets_per_second in` Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368.

Defaults

- none

Command Modes

- CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

- 9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
- 9.10(0.0) Introduced on the S3148.
- 9.10(0.0) Introduced on the S6100–ON.
- 9.8(2.0) Introduced on the S3100 series.
Usage Information
Unknown Unicast Storm-Control is valid for Layer 2 and Layer 2/Layer 3 interfaces.

```
storm-control unknown-unicast (Interface)
```

Configure percentage of unknown-unicast traffic allowed on an interface (ingress only).

**Syntax**
```
storm-control unknown-unicast [percentage decimal_value in] | [wred-profile name]] [packets_per_second in]
```

To disable unknown-unicast storm control on the interface, use the `no storm-control unknown-unicast [percentage decimal_value in] | [wred-profile name]] [packets_per_second in]` command.

**Parameters**
- `percentage decimal_value [in | out]`
  - E-Series Only: Enter the percentage of broadcast traffic allowed in or out of the network. Optionally, you can designate a decimal value percentage, for example, 55.5%.
  - The percentage is from 0 to 100:
    - 0% blocks all related traffic.
    - 100% allows all traffic into the interface.
  - The decimal range is from 0.1 to 0.9.

- `wred-profile name`
  - E-Series Only: (Optionally) Enter the keywords `wred-profile` followed by the profile name to designate a wred-profile.

- `packets_per_second in`
  - C-Series and S-Series Only: Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554431.

**Defaults**
- none

**Command Modes**
- INTERFACE (conf-if-interface-slot/port)
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Spanning Tree Protocol (STP)

The commands in this section configure and monitor the IEEE 802.1d spanning tree protocol (STP) and are supported on the Dell EMC Networking switch/routing platform.

Topics:
- bridge-priority
- bpdu-destination-mac-address
- debug spanning-tree
- description
- disable
- forward-delay
- hello-time
- max-age
- protocol spanning-tree
- show config
- show spanning-tree 0
- spanning-tree

bridge-priority

Set the bridge priority of the switch in an IEEE 802.1D spanning tree.

Syntax
bridge-priority {priority-value | primary | secondary}

To return to the default value, use the no bridge-priority command.

Parameters

  priority-value
    Enter a number as the bridge priority value. The range is from 0 to 65535. The default is 32768.

  primary
    Enter the keyword primary to designate the bridge as the root bridge.

  secondary
    Enter the keyword secondary to designate the bridge as a secondary root bridge.

Defaults

  priority-value = 32768

Command Modes

  SPANNING TREE (The prompt is “config-stp”.)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>
Use the Provider Bridge Group address in Spanning Tree or GVRP PDUs.

**Syntax**

```
bpdu-destination-mac-address [stp | gvrp] provider-bridge-group
```

**Parameters**

- `xstp`  
  Force STP, RSTP, and MSTP to use the Provider Bridge Group address as the destination MAC address in its BPDUs.

- `gvrp`  
  Forces GVRP to use the Provider Bridge GVRP Address as the destination MAC address in its PDUs.

**Defaults**

The destination MAC address for BPDUs is the Bridge Group Address.

debug spanning-tree

Enable debugging of the spanning tree protocol and view information on the protocol.

Syntax
```
debug spanning-tree {stp-id [all | bpdu | config | events | exceptions | general | root] | protocol}
```

Parameters

- **stp-id**
  - Enter zero (0). The switch supports one spanning tree group with a group ID of 0.

- **protocol**
  - Enter the keyword for the type of STP to debug, either mstp, pvst, or rstp.
  - **all** (OPTIONAL) Enter the keyword all to debug all spanning tree operations.
  - **bpdu** (OPTIONAL) Enter the keyword bpdu to debug bridge protocol data units.
  - **config** (OPTIONAL) Enter the keyword config to debug configuration information.
  - **events** (OPTIONAL) Enter the keyword events to debug STP events.
  - **general** (OPTIONAL) Enter the keyword general to debug general STP operations.
  - **root** (OPTIONAL) Enter the keyword root to debug STP root transactions.

Command Modes

- EXEC Privilege

Command History

- This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version

- 9.10(0.1)
  - Introduced on the S6010-ON and S4048T-ON.
- 9.10(0.0)
  - Introduced on the S3148.
- 9.10(0.0)
  - Introduced on the S6100-ON.
- 9.8(2.0)
  - Introduced on the S3100 series.
- 9.8(1.0)
  - Introduced on the Z9100-ON.
- 9.8(0.0P5)
  - Introduced on the S4048-ON.
- 9.8(0.0P2)
  - Introduced on the S3048-ON.
- 9.7(0.0)
  - Introduced on the S6000-ON.
- 9.2(1.0)
  - Introduced on the Z9500.
### Description

Enter a description of the spanning tree.

**Syntax**

```plaintext
description {description}
```

To remove the description from the spanning tree, use the `no description {description}` command.

**Parameters**

- **description**
  - Enter a description to identify the spanning tree (80 characters maximum).

**Defaults**

- none

**Command Modes**

- SPANNING TREE (The prompt is “config-stp”)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Usage Information**

When you enable `debug spanning-tree bpdus` for multiple interfaces, the software only sends information on BPDUs for the last interface specified.

**Related Commands**

- `protocol spanning-tree` — enters SPANNING TREE mode on the switch.
### disable

Disable the spanning tree protocol globally on the switch.

**Syntax**

```
disable
```

To enable Spanning Tree Protocol, use the `no disable` command.

**Defaults**

Enabled (that is, the spanning tree protocol is disabled.)

**Command Modes**

SPANNING TREE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Related Commands**

- `protocol spanning-tree` — enter SPANNING TREE mode on the switch.
forward-delay

The amount of time the interface waits in the Listening state and the Learning state before transitioning to the Forwarding state.

Syntax

forward-delay seconds

To return to the default setting, use the no forward-delay command.

Parameters

seconds

Enter the number of seconds the Dell EMC Networking OS waits before transitioning STP to the Forwarding state. The range is from 4 to 30. The default is 15 seconds.

Defaults

15 seconds

Command Modes

SPANNING TREE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.7.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
6.2.1.1 Introduced on the E-Series.

Related Commands

- max-age — changes the wait time before STP refreshes protocol configuration information.
- hello-time — changes the time interval between BPDUs.
**hello-time**

Set the time interval between generation of the spanning tree bridge protocol data units (BPDUs).

**Syntax**

```
hello-time seconds
```

To return to the default value, use the `no hello-time` command.

**Parameters**

- `seconds` 
Enter a number as the time interval between transmission of BPDUs. The range is from 1 to 10. The default is **2 seconds**.

**Defaults**

- **2 seconds**

**Command Modes**

- SPANNING TREE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Related Commands**

- `forward-delay` — changes the wait time before STP transitions to the Forwarding state.
- `max-age` — changes the wait time before STP refreshes protocol configuration information.
max-age

To maintain configuration information before refreshing that information, set the time interval for the spanning tree bridge.

Syntax

```plaintext
max-age seconds
```

To return to the default values, use the `no max-age` command.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>Enter a number of seconds the Dell EMC Networking OS waits before refreshing configuration information. The range is from 6 to 40. The default is 20 seconds.</td>
</tr>
</tbody>
</table>

Defaults

20 seconds

Command Modes

SPANNING TREE

Related Commands

- `forward-delay` — changes the wait time before STP transitions to the Forwarding state.
- `hello-time` — changes the time interval between BPDUs.
**protocol spanning-tree**

To enable and configure the spanning tree group, enter SPANNING TREE mode.

**Syntax**

```
protocol spanning-tree stp-id
```

To disable the Spanning Tree group, use the `no protocol spanning-tree stp-id` command.

**Parameters**

- **stp-id**
  
Enter zero (0). Dell EMC Networking OS supports one spanning tree group, group 0.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

  Introduced on the E-Series.

**Usage Information**

STP is not enabled when you enter SPANNING TREE mode. To enable STP globally on the switch, use the `no disable` command from SPANNING TREE mode.

**Example**

```
DellEMC(conf)# protocol spanning-tree 0
DellEMC(config-stp)#
```

**Related Commands**

- `disable` — disables spanning tree group 0. To enable spanning tree group 0, use the `no disable` command.
**show config**

Display the current configuration for the mode. Only non-default values display.

**Syntax**

```
show config
```

**Command Modes**

SPANNING TREE

**Example**

```
DellEMC(config-stp)# show config
protocol spanning-tree 0
no disable
DellEMC(config-stp)#
```

**show spanning-tree 0**

Display the spanning tree group configuration and status of interfaces in the spanning tree group.

**Syntax**

```
show spanning-tree 0 [active | brief | guard | interface interface | root | summary]
```

**Parameters**

- `0` Enter 0 (zero) to display information about that specific spanning tree group.
active  (OPTIONAL) Enter the keyword active to display only active interfaces in spanning tree group 0.

brief  (OPTIONAL) Enter the keyword brief to display a synopsis of the spanning tree group configuration information.

guard  (OPTIONAL) Enter the keyword guard to display the type of guard enabled on an STP interface and the current port state.

interface interface  (OPTIONAL) Enter the keyword interface and the type slot/port of the interface you want displayed. Type slot/port options are the following:

  - For a port-channel interface, enter the keywords port-channel then the port-channel ID.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

root  (OPTIONAL) Enter the keyword root to display configuration information on the spanning tree group root.

summary  (OPTIONAL) Enter the keyword summary to only the number of ports in the spanning tree group and their state.

<td>Bpduguard</td>
</tr>
</tbody>
</table>

Spanning Tree Protocol (STP)
spanning-tree

Assigns a Layer 2 interface to STP instance 0 and configures a port cost or port priority, or enables loop guard, root guard, or the Portfast feature on the interface.

**Syntax**

```
spanning-tree stp-id {cost cost | {loopguard | rootguard} | portfast [bpduguard [shutdown-on-violation]] | priority priority}
```

To disable Spanning Tree group on an interface, use the `no spanning-tree stp-id {cost cost | {loopguard | rootguard} | portfast [bpduguard [shutdown-on-violation]] | priority priority}` command.

**Parameters**

- **stp-id**
  - Enter the STP instance ID. The range is 0.

- **cost cost**
  - Enter the keyword `cost` then a number as the cost. The range is from 1 to 65535. The defaults are:
    - 1-Gigabit Ethernet interface = 4.
    - 10-Gigabit Ethernet interface = 2.
    - Port Channel interface with 100 Mb/s Ethernet = 18.
    - Port Channel interface with 1 Gigabit Ethernet = 3.
    - Port Channel interface with 10 Gigabit Ethernet = 1.

- **loopguard**
  - Enter the keyword `loopguard` to enable STP loop guard on a port or port-channel interface.

- **rootguard**
  - Enter the keyword `rootguard` to enable STP root guard on a port or port-channel interface.

- **portfast [bpduguard [shutdown-on-violation]]**
  - Enter the keyword `portfast` to enable Portfast to move the interface into Forwarding mode immediately after the root fails.
  - Enter the optional keyword `bpduguard` to disable the port when it receives a BPDU.
  - Enter the optional keyword `shutdown-on-violation` to hardware disable an interface when a BPDU is received and the port is disabled.

- **priority priority**
  - Enter keyword `priority` then a number as the priority. The range is from zero (0) to 15. The default is 8.

**Defaults**

```
cost = depends on the interface type; priority = 8
```

**Command Modes**

```
INTERFACE
```

<tr>
<td>6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

If you enable `portfast bpduguard` on an interface and the interface receives a BPDU, the software disables the interface and sends a message stating that fact. The port is in ERR_DISABLE mode, yet appears in the `show interface` commands as enabled. If you do not enable `shutdown-on-violation`, BPDDUs are still sent to the RPM CPU.

STP loop guard and root guard are supported on a port or port-channel enabled in any Spanning Tree mode: Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and Per-VLAN Spanning Tree Plus (PVST+).

Root guard is supported on any STP-enabled port or port-channel except when used as a stacking port. When enabled on a port, root guard applies to all VLANs configured on the port.

STP root guard and loop guard cannot be enabled at the same time on a port. For example, if you configure loop guard on a port on which root guard is already configured, the following error message is displayed: % Error: RootGuard is configured. Cannot configure LoopGuard.

Do not enable Portfast BPDU guard and loop guard at the same time on a port. Enabling both features may result in a port that remains in a blocking state and prevents traffic from flowing through it. For example, when Portfast BPDU guard and loop guard are both configured:

- If a BPDU is received from a remote device, BPDU guard places the port in an Err-Disabled Blocking state and no traffic is forwarded on the port.
- If no BPDU is received from a remote device, loop guard places the port in a Loop-Inconsistent Blocking state and no traffic is forwarded on the port.

To display the type of STP guard (Portfast BPDU, root, or loop guard) enabled on a port, enter the `show spanning-tree 0` command.
SupportAssist

SupportAssist sends troubleshooting data securely to Dell. SupportAssist in this Dell EMC Networking OS release does not support automated email notification at the time of hardware fault alert, automatic case creation, automatic part dispatch, or reports. SupportAssist requires Dell EMC Networking OS 9.9(0.0) and SmartScripts 9.7 or later to be installed on the Dell EMC Networking device. For more information on SmartScripts, see Dell EMC Networking Open Automation guide.

**NOTE:** SupportAssist is enabled by default on the system. To disable SupportAssist, enter the `eula-consent support-assist reject` command in Global Configuration mode and save the configuration.

Topics:
- `eula-consent`
- `support-assist`
- `support-assist activate`
- `support-assist activity`
- SupportAssist Commands
- SupportAssist Activity Commands
- SupportAssist Company Commands
- SupportAssist Person Commands
- SupportAssist Server Commands
- `show eula-consent`
- `show running-config`
- `show support-assist status`

### eula-consent

Accept or reject the end user license agreement (EULA).

**Syntax**
```
 eula-consent {support-assist} {accept | reject}
```

**Parameters**
- `support-assist` Enter the keywords `support-assist` to either accept or reject the EULA for the specified service.
- `accept` Enter the keyword `accept` to accept the EULA for the specified service.
- `reject` Enter the keyword `reject` to reject the EULA for the specified service.

**Defaults**
None

**Command Modes**
`CONFIGURATION`

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Version | Description

9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.
9.9(0.0) | Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Usage Information

- When you run the command, the system displays a message with the information directing to the URL for further information.
- Even before you accept or reject the EULA, the configuration data is sent to the default centrally deployed SupportAssist Server. If you reject the EULA, the configuration data is not transmitted to the SupportAssist server.
- If there is an existing SupportAssist configuration, the configuration is not removed and the feature is disabled.

Example

Accept the EULA:

```
DellEMC(conf)# eula-consent support-assist accept
I accept the terms of the license agreement. You can reject the license agreement by configuring this command 'eula-consent support-assist reject'.

By installing SupportAssist, you allow Dell to save your contact information (e.g. name, phone number and/or email address) which would be used to provide technical support for your Dell products and services. Dell may use the information for providing recommendations to improve your IT infrastructure.

Dell SupportAssist also collects and stores machine diagnostic information, which may include but is not limited to configuration information, user supplied contact information, names of data volumes, IP addresses, access control lists, diagnostics & performance information, network configuration information, host/server configuration & performance information and related data ("Collected Data") and transmits this information to Dell. By downloading SupportAssist and agreeing to be bound by these terms and the Dell end user license agreement, available at: www.dell.com/privacypolicycountrypecific, you agree to allow Dell to provide remote monitoring services of your IT environment and you give Dell the right to collect the Collected Data in accordance with Dells Privacy Policy, available at: www.dell.com/privacypolicycountrypecific, in order to enable the performance of all of the various functions of SupportAssist during your entitlement to receive related repair services from Dell. You further agree to allow Dell to transmit and store the Collected Data from SupportAssist in accordance with these terms. You agree that the provision of SupportAssist may involve international transfers of data from you to Dell and/or to Dells affiliates, subcontractors or business partners. When making such transfers, Dell shall ensure appropriate protection is in place to safeguard the Collected Data being transferred in connection with SupportAssist. If you are downloading SupportAssist on behalf of a company or other legal entity, you are further certifying to Dell that you have appropriate authority to provide this consent on behalf of that entity. If you do not consent to the collection,
```
transmission and/or use of the Collected Data, you may not download, install or otherwise use SupportAssist.

Reject the EULA:

DellEMC(conf)#eula-consent support-assist reject
Aug 24 22:35:38: %STKUNIT1-M:CP %SUPPORT_ASSIST-6-SUPASSIST_EVT: Event monitor service stopped
I do not accept the terms of the license agreement. The SupportAssist feature has been deactivated and can no longer be used.
To enable SupportAssist configurations, accept the terms of the license agreement by configuring this command 'eula-consent support-assist accept'.
DellEMC(conf)#
DellEMC(conf)#
DellEMC(conf)#

Related Commands

- `support-assist` — moves to the SupportAssist Configuration mode.

**support-assist**

Move to the SupportAssist configuration mode.

**Syntax**

```
support-assist
```

To remove all the configuration of the SupportAssist service, use the `no support-assist` command.

</tbody>
</table>

**Usage Information**

You are guided through a series of queries to configure SupportAssist. The generated commands are added to the running configuration, including the DNS resolve commands, if configured.

This command starts the configuration wizard for the SupportAssist. At any time, you can exit by entering Ctrl-C. If necessary, you can skip some data entry.

Once you exit the wizard, the Dell EMC Networking OS starts a full transfer.

**support-assist activity**

Trigger an activity event immediately.

**Syntax**

```
support-assist activity {full-transfer | core-transfer} start now
```

</tr>
</tbody>
</table>

**Usage Information**

Use the command to trigger the activity that enables transfer of information. You can choose a full transfer that includes all the details or core transfer that includes only the core files.
NOTE: The full transfer includes the core files as well in the information sent. The core transfer does not send core files that are older than 30 days.

SupportAssist Commands

Dell EMC Networking OS supports the following SupportAssist mode commands.

activity

Move to the SupportAssist Activity mode for an activity. Allow the user to configure customized details for a specific activity.

Syntax

activity {activity-name}

To remove all customized detail for a specific activity, use the no activity {activity-name} command.

Parameters

activity-name

Enter one of the following keywords:

- Enter the keyword full-transfer to enable or disable full transfer. You can create a custom file to transfer the outputs from a set of show commands. By default, the full transfer runs once in every 30 days.
- Enter the keyword core-transfer to enable or disable core transfer.
- Enter the keyword event-transfer to enable or disable event transfer. You can create a custom file to monitor a set of events.

Command Modes

SUPPORTASSIST

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.11(0.0) Introduced on the M I/O Aggregator and FN IOM.

Introduced the core-transfer and event-transfer parameters.

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.

9.9(0.0) Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Usage Information

By default, each activity follows a set of default actions using a default schedule. Using this command, you can customize the set of actions and disable a certain activity.
**contact-company**

Configure the contact information for the company.

**Syntax**

```plaintext
contact-company name {company-name}[company-next-name] ... [company-next-name]
```

To remove the contact company information, use the `no contact-company` command.

**Parameters**

- **company-name**
  - Enter the name for the company. If there are multiple words in the name, use optional additional fields.

- **company-next-name**
  - (OPTIONAL) Enter the next components of the company name, up to 5 components are allowed.

**Command Modes**

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.11(0.0) | Introduced on the M I/O Aggregator and FN IOM.
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.
9.9(0.0) | Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

**Usage Information**

You can configure only one contact-company.

It is not possible to remove the components of the company name. The no form of the command removes the entire contact-company entry.

This command is optional for SupportAssist service configuration.

---

**contact-person**

Configure the contact name for an individual.

**Syntax**

```plaintext
contact-person [first <first-name>] last <last-name>
```

To remove the contact person and all their details, use the `no contact-person [first <first-name>] last <last-name>` command.

**Parameters**

- **first-name**
  - (Optional) Enter the first name for the contact person. This is optional provided each contact person name is unique. To include a space, enter a space within double quotes.

- **last-name**
  - Enter the last name for the contact person. To include a space, enter a space within double quotes.

</tbody>
</table>

Usage Information

Each contact person must be unique by their name.

You can configure only one contact person.

It is not possible to remove the first name or last name. The no form of the command removes the entire contact-person entry.

This command is optional for SupportAssist service configuration.

enable

Enable all activities and servers for the SupportAssist service.

Syntax

```
enable all
```

To disable the SupportAssist activities temporarily, use the `no enable all` command.

Parameters

- `all` Enter the keyword `all` to enable all SupportAssist service activities.

Defaults

Enabled or All Enabled

Command Modes

</tr>
</tbody>
</table>
server

Configure the name of the remote SupportAssist Server and move to SupportAssist Server mode.

Syntax

server {default | server-name}

To delete a server, use the no server server-name command.

Parameters

default Enter the keyword default for the default server.

server-name Enter the name of the custom server to which the logs would be transferred. To include a space, enter a space within double quotes.

Defaults

Default server has URL stor.g3.ph.dell.com

Command Modes

SUPPORTASSIST

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.11(0.0) Introduced on the M I/O Aggregator and FN IOM.

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.

9.9(0.0) Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Usage Information

The server-name is used as a reference only and is not required to be used as part of a URL definition.

There is a reserved name of default for the default server at stor.g3.ph.dell.com. You can customize the defaults for this server by entering the server default command and use the custom commands.

You can configure one additional server.

SupportAssist Activity Commands

Dell EMC Networking OS supports the following SupportAssist Activity mode commands.

action-manifest get

Copy an action-manifest file for an activity to the system.

Syntax

action-manifest get tftp | ftp | flash <file-specification> <local-file-name>
Parameters

- **file-specification**: Enter the full file specification for the action-manifest file. For example:
  - tftp://hostip/filepath
  - ftp://userid:password@hostip/filepath
  - scp://userid:password@hostip/filepath

- **local-file-name**: Enter the name of the local action-manifest file, up to 32 characters long. Allowable characters are: a to z, A to Z, 0 to 9, -, _, and space.

Command Modes

- SUPPORTASSIST ACTIVITY FULL-TRANSFER
- SUPPORTASSIST ACTIVITY EVENT-TRANSFER

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Usage Information

The remote file specification for full transfer includes the protocol that is used to copy the file from the remote system.

The default Manifest-file for full transfer includes records like alarms, logs, operational, and configuration data.

Related Commands

- **action-manifest install** — configure the action-manifest to use for a specific activity.
- **action-manifest show** — view the list of action-manifest for a specific activity.
- **action-manifest remove** — remove the action-manifest file for an activity.

**action-manifest install**

Configure action-manifest to transfer a set of customized records for full transfer and to monitor a set of specified events for event transfer.

**Syntax**

```
action-manifest install {default | <local-file-name>}
```

To revert to the default action-manifest file, use the `action-manifest install default` command.

**Parameters**

- **default**: Enter the keyword `default` to revert back to the default set of actions for an activity.
- **local-file-name**: Enter the name of the local action-manifest file. Allowable characters are: a to z, A to Z, 0 to 9, -, _, and space.
Defaults

Command Modes

SUPPORTASSIST ACTIVITY FULL-TRANSFER
SUPPORTASSIST ACTIVITY EVENT-TRANSFER

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.11(0.0) Introduced on the M I/O Aggregator and FN IOM.
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.
9.9(0.0) Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Usage Information

To replace the default action-manifest with a customized one, copy the action-manifest file to the system using the action-manifest get command and then use the action-manifest install command. To revert to the default action-manifest file, use the action-manifest install default command.

Related Commands

- action-manifest get — copy an action-manifest file for an activity to the system.
- action-manifest show — view the list of action-manifest for a specific activity.
- action-manifest remove — remove the action-manifest file for an activity.

action-manifest remove

Remove the action-manifest file from Dell EMC Networking OS.

Syntax

```
action-manifest remove <local-file-name>
```n

Parameters

- `<local-file-name>`: Enter the name of the local action-manifest file. Allowable characters are: a to z, A to Z, 0 to 9, -, _, and space.

Command Modes

SUPPORTASSIST ACTIVITY FULL-TRANSFER
SUPPORTASSIST ACTIVITY EVENT-TRANSFER

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

Enter the specific SupportAssist activity mode and then enable it.

**NOTE:** By default, the full transfer includes the core files. When you disable the core transfer activity, the full transfer excludes the core files.

**Related Commands**

- `activity` — move user to the SupportAssist Activity mode for that activity.

---

**SupportAssist Company Commands**

Dell EMC Networking OS supports the following SupportAssist Company mode commands.

### address

Configure the address information for the company.

**Syntax**

```
address [city company-city] [(province | region | state) name] [country
country company-country] [(postal code | zipcode) company-code]
```

To remove a portion of the company address information, use the `no address [city | province | region | state | country | postal code | zipcode] command. For example, to remove the city alone, use the `no address city` command.

To remove the complete company contact information, use the `no address` command.

**Parameters**

- `city company-city` (OPTIONAL) Enter the keyword `city` then the city or town for the company site. To include a space, enter a space within double quotes.
province | region | state name
OPTIONAL) Enter the keyword province, region or state then the name of province, region or state for the company site. To include a space, enter a space within double quotes.

country company-
country
OPTIONAL) Enter the keyword country then the country for the company site. To include a space, enter a space within double quotes.

postalcode | zipcode company-
code
OPTIONAL) Enter the keyword postalcode or zipcode then the postal code or zip code for the company site, as one string with no spaces.

Command Modes SUPPORTASSIST COMPANY

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.11(0.0) Introduced on the M I/O Aggregator and FN IOM.
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.
9.9(0.0) Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Usage Information
The optional parameters must be provided in the following order: city state country postalcode. If specified in a different order, the command returns an error as follows:

DellEMC(conf-supportassist-cmpy-test)# address city Minneapolis postalcode 55344 country USA state Minnesota
^%
Error: Invalid input at "^^" marker.

This command is optional for SupportAssist service configuration.

Example
DellEMC(conf-supportassist-cmpy-test)# address city Minneapolis state Minnesota
country USA postalcode 55344

street-address

Configure the street address information for the company.

Syntax
street-address {address1} [address2]...[address8]

To remove the street address, use the no street-address command.

Parameters
address1 Enter the street address for the company.
address2..address8 (OPTIONAL) Enter the street address of the company site. Up to 8 fields are allowed.

Command Modes SUPPORTASSIST COMPANY

</tr>
</tbody>
</table>

Usage Information

This command is optional for SupportAssist service configuration.

**territory**

Configure the territory and set the coverage for the company site.

**Syntax**

territory company-territory

To remove the company territory information, use the no territory command.

**Parameters**

country-territory

Enter the territory name for the company. To include a space, enter a space within double quotes. Use three-letter country codes like USA, IND, FRA, GER and so on.

**Command Modes**

SUPPORTASSIST COMPANY

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Usage Information

This command is optional for SupportAssist service configuration.

**SupportAssist Person Commands**

Dell EMC Networking OS supports the following SupportAssist Person mode commands.
email-address

Configure the email addresses to reach the contact person.

Syntax    
email-address primary email-address [alternate email-address]

To remove an email address, use the no email-address command. To remove the primary and the alternate email addresses, use the no email-address primary and no email-address alternate commands respectively.

Parameters
primary email-address
    Enter the keyword primary then the primary email address for the person.

alternate email-address
    Enter the keyword alternate then the alternate email address for the person.

Command Modes
SUPPORTASSIST PERSON

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version            Description
9.11(0.0)           Introduced on the M I/O Aggregator and FN IOM.
9.10(0.1)           Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)           Introduced on the S3148.
9.10(0.0)           Introduced on the C9010, Z9100–ON, S6100–ON, and S3100 series.
9.9(0.0)            Introduced on the S4810, S4820T, S3048–ON, S4048–ON, S5000, S6000, S6000–ON, Z9500, MXL.

Usage Information
The email addresses must have the standard form of <username>@<email system> to be considered valid.

This command is optional for SupportAssist service configuration.

Related Commands
preferred-method — configure the preferred method for contacting the person.

phone

Configure phone numbers to reach the contact person.

Syntax    
phone primary phone [alternate phone]

To remove a phone number, use the no phone command. To remove the primary and alternate phone numbers, use the no phone primary and no phone alternate commands respectively.

Parameters
primary phone
    Enter the keyword primary then the primary phone number for the person.
**alternate phone**

Enter the keyword `alternate` then the alternate phone number for the person.

**Command Modes**

SUPPORTASSIST PERSON

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Usage Information**

The phone numbers may contain country codes, area codes and extensions, if necessary. Allowable characters are 0 to 9, x, (, ), - and +.

This command is optional for SupportAssist service configuration.

**Related Commands**

- `preferred-method` — configure the preferred method for contacting the person.

---

**preferred-method**

Configure the preferred method for contacting the person.

**Syntax**

```plaintext
preferred-method {email | no-contact | phone}
```

**Parameters**

- `email` Enter the keyword `email` to specify email as preferred method.
- `no-contact` Enter the keywords `no-contact` to specify that there is no preferred method.
- `phone` Enter the keyword `phone` to specify phone as preferred method.

**Defaults**

no-contact

**Usage Information**
This command is optional for SupportAssist service configuration.

**SupportAssist Server Commands**

Dell EMC Networking OS supports the following SupportAssist Server mode commands.
proxy-ip-address

Configure a proxy for reaching the SupportAssist remote server.

Syntax

```
proxy-ip-address {ipv4-address | ipv6-address} port port-number [ username userid password [encryption-type] password ]
```

To remove the proxy, use the no proxy-ip-address command.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4-address</td>
<td>Enter the IP address of the proxy server in a dotted decimal format (A.B.C.D).</td>

Related Commands

- server — configure the name of the remote SupportAssist server.

url

Configure the URL to reach the SupportAssist remote server.

Syntax

url uniform-resource-locator

To delete the URL for the server, use the no url command.

Parameters

uniform-resource-locator

Enter a text string for the URL using one of the following formats:

- http://[username:password@]<hostip>:<portNum>/<filepath>
- https://[username:password@]<hostip>:<portNum>/<filepath>

NOTE: The host IP for the server may be specified as an IPv4 address, an IPv6 address or as a DNS hostname. If using the DNS hostname, the DNS resolver will need to be configured and enabled.

Command Modes

**Example**

```
DellEMC# show eula-consent support-assist

SupportAssist EULA has been: Accepted

Additional information about the SupportAssist EULA is as follows:

By installing SupportAssist, you allow Dell to save your contact information (e.g. name, phone number and/or email address) which would be used to provide technical support for your Dell products and services. Dell may use the information for providing recommendations to improve your IT infrastructure.

Dell SupportAssist also collects and stores machine diagnostic information, which may include but is not limited to configuration information, user supplied contact information, names of data volumes, IP addresses, access control lists, diagnostics & performance information, network configuration information, host/server configuration
```
& performance information and related data (Collected Data) and transmits this information to Dell. By downloading SupportAssist and agreeing to be bound by these terms and the Dell end user license agreement, available at: www.dell.com/aeula, you agree to allow Dell to provide remote monitoring services of your IT environment and you give Dell the right to collect the Collected Data in accordance with Dell's Privacy Policy, available at: www.dell.com/privacypolicycountryspecific, in order to enable the performance of all of the various functions of SupportAssist during your entitlement to receive related repair services from Dell. You further agree to allow Dell to transmit and store the Collected Data from SupportAssist in accordance with these terms. You agree that the provision of SupportAssist may involve international transfers of data from you to Dell and/or to Dell's affiliates, subcontractors or business partners. When making such transfers, Dell shall ensure appropriate protection is in place to safeguard the Collected Data being transferred in connection with SupportAssist. If you are downloading SupportAssist on behalf of a company or other legal entity, you are further certifying to Dell that you have appropriate authority to provide this consent on behalf of that entity. If you do not consent to the collection, transmission and/or use of the Collected Data, you may not download, install or otherwise use SupportAssist.

The commands in this section configure time values on the system, either using the Dell EMC Networking OS, or the hardware, or using the network time protocol (NTP). With NTP, the switch can act only as a client to an NTP clock host.

For more information, see “Network Time Protocol” of the Management section in the Dell EMC Networking OS Configuration Guide.

The commands in this chapter are generally supported on Dell EMC Networking OS with some exceptions, as notes in the Command History fields.

Topics:
- clock summer-time date
- clock summer-time recurring
- clock timezone
- debug ntp
- ntp authenticate
- ntp authentication-key
- ntp broadcast client
- ntp control-key-passwd
- ntp disable
- ntp master <stratum>
- ntp offset-threshold
- ntp server
- ntp source
- ntp trusted-key
- show clock
- show ntp associations
- show ntp vrf associations
- show ntp status

**clock summer-time date**

Set a date (and time zone) on which to convert the switch to daylight saving time on a one-time basis.

**Syntax**
```
clock summer-time time-zone date start-month start-day start-year start-time end-month end-day end-year end-time [offset]
```

To delete a daylight saving time zone configuration, use the no clock summer-time command.

**Parameters**

- **time-zone**
  - Enter the three-letter name for the time zone. This name is displayed in the show clock output.

- **start-month**
  - Enter the name of one of the 12 months in English. You can enter the name of a day to change the order of the display to time day month year.
**start-day**

Enter the number of the day. The range is from 1 to 31. You can enter the name of a month to change the order of the display to time day month year.

**start-year**

Enter a four-digit number as the year. The range is from 1993 to 2035.

**start-time**

Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.

**end-day**

Enter the number of the day. The range is from 1 to 31. You can enter the name of a month to change the order of the display to time day month year.

**end-month**

Enter the name of one of the 12 months in English. You can enter the name of a day to change the order of the display to time day month year.

**end-time**

Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.

**end-year**

Enter a four-digit number as the year. The range is from 1993 to 2035.

**offset**

(Optional) Enter the number of minutes to add during the summer-time period. The range is from 1 to 1440. The default is 60 minutes.

**Defaults**

Not configured.

**Command Modes**

**Related Commands**

- `clock summer-time recurring` — sets a date (and time zone) on which to convert the switch to daylight saving time each year.
• `show clock` — displays the current clock settings.

**clock summer-time recurring**

Set the software clock to convert to daylight saving time on a specific day each year.

**Syntax**

```
clock summer-time time-zone recurring [start-week start-day start-month start-time end-week end-day end-month end-time [offset]]
```

To delete a daylight saving time zone configuration, use the `no clock summer-time` command.

**Parameters**

- **time-zone**
  Enter the three-letter name for the time zone. This name is displayed in the show clock output. You can enter up to eight characters.

- **start-week**
  (OPTIONAL) Enter one of the following as the week that daylight saving begins and then enter values for `start-day` through `end-time`:
  - `week-number`: Enter a number from 1 to 4 as the number of the week in the month to start daylight saving time.
  - `first`: Enter this keyword to start daylight saving time in the first week of the month.
  - `last`: Enter this keyword to start daylight saving time in the last week of the month.

- **start-day**
  Enter the name of the day that you want daylight saving time to begin. Use English three letter abbreviations; for example, Sun, Sat, Mon, and so on. The range is from Sun to Sat.

- **start-month**
  Enter the name of one of the 12 months in English.

- **start-time**
  Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.

- **end-week**
  Enter the one of the following as the week that daylight saving ends:
  - `week-number`: Enter a number from 1 to 4 as the number of the week to end daylight saving time.
  - `first`: Enter the keyword `first` to end daylight saving time in the first week of the month.
  - `last`: Enter the keyword `last` to end daylight saving time in the last week of the month.

- **end-day**
  Enter the weekday name that you want daylight saving time to end. Enter the weekdays using the three letter abbreviations; for example Sun, Sat, Mon, and so on. The range is from Sun to Sat.

- **end-month**
  Enter the name of one of the 12 months in English.

- **end-time**
  Enter the time in hours:minutes:seconds. For the hour variable, use the 24-hour format; example, 17:15:00 is 5:15 pm.

- **offset**
  (OPTIONAL) Enter the number of minutes to add during the summer-time period. The range is from 1 to 1440. The default is **60 minutes**.

**Defaults**

Not configured.

Related Commands

- `ntp trusted-key` — configures a trusted key.
- `clock summer-time date` — sets a date (and time zone) on which to convert the switch to daylight saving time on a one-time basis.
- `show clock` — displays the current clock settings.

```
clock timezone
```

Configure a timezone for the switch.

```
Syntax

clock timezone timezone-name offset

Parameters

- `timezone-name` Enter the name of the timezone. You cannot use spaces.
- `offset` Enter one of the following:
  - a number from 1 to 23 as the number of hours in addition to universal time coordinated (UTC) for the timezone.

To delete a timezone configuration, use the `no clock timezone` command.
• a minus sign (-) then a number from 1 to 23 as the number of hours.

Defaults
Not configured.

Usage Information
Coordinated universal time (UTC) is the time standard based on the International Atomic Time standard, commonly known as Greenwich Mean time. When determining system time, include the differentiator between UTC and your local timezone. For example, San Jose, CA is the Pacific Timezone with a UTC offset of -8.

debug ntp

Display Network Time Protocol (NTP) transactions and protocol messages for troubleshooting.

Syntax
debug ntp {level level-number}

To disable debugging of NTP transactions, use the no debug ntp {level level-number} command.

Parameters
level

Enter the keyword level then the level-number to display information about NTP logs. The log level range is from 1 to 6.

- 1 is the most important log level.
- 6 is the least important log level.
Command Modes

EXEC Privilege

**Usage Information**

You also must configure an authentication key for NTP traffic using the **ntp authentication-key** command.
**ntp authentication-key**

Specify a key for authenticating the NTP server.

**Syntax**

```
ntp authentication-key number md5 [0 | 7] key
```

**Parameters**

- **number**
  
  Specify a number for the authentication key. The range is from 1 to 65534. This number must be the same as the `number` parameter configured in the `ntp trusted-key` command.

- **md5**
  
  Specify that the authentication key is encrypted using MD5 encryption algorithm.

- **0**
  
  Specify that authentication key is entered in an unencrypted format (default).

- **7**
  
  Specify that the authentication key is entered in DES encrypted format.

- **key**
  
  Enter the authentication key in the previously specified format.

**Defaults**

NTP authentication is not configured by default. If you do not specify the option [0 | 7], 0 is selected by default.

**Command Modes**

</tr>
</tbody>
</table>

**Usage Information**

After configuring the `ntp authentication-key` command, configure the `ntp trusted-key` command to complete NTP authentication.
Dell EMC Networking OS versions 8.2.1.0 and later use an encryption algorithm to store the authentication key that is different from previous Dell EMC Networking OS versions; beginning in version 8.2.1.0, Dell EMC Networking OS uses DES encryption to store the key in the startup-config when you enter the ntp authentication-key command. Therefore, if your system boots with a startup-configuration from an Dell EMC Networking OS versions prior to 8.2.1.0 in which you have configured ntp authentication-key, the system cannot correctly decrypt the key, and cannot authenticate NTP packets. In this case you must re-enter this command and save the running-config to the startup-config.

**Related Commands**

- `ntp authenticate` — enables NTP authentication.
- `ntp trusted-key` — configures a trusted key.

### ntp broadcast client

Set up the interface to receive NTP broadcasts from an NTP server.

**Syntax**

```markdown
ntp broadcast client
```

To disable broadcast, use the `no ntp broadcast client` command.

**Defaults**

Disabled.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.

8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
6.1.1.0 | Introduced on the E-Series.
ntp control-key-passwd

Configure control key password for NTPQ authentication. NTP control key supports encrypted and unencrypted option.

**Syntax**

```plaintext
ntp control-key-passwd [encryption-type] password
To delete the control key, use the no ntp control-key-passwd [encryption-type] password command.
```

**Parameters**

- `encryption-type` (OPTIONAL) Enter one of the following numbers:
  - 0 (zero) directs the system to store the password as clear text. It is the default encryption type when using the password option.
  - 7 (seven) indicates that a password is encrypted using a DES hashing algorithm. It specifies a hidden authentication data.
  - `WORD` is the un-encrypted (cleartext) authentication data.
- `password` Enter a string up to 32 characters as the password.

**Defaults**

NTPQ

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

NTP control key is not configured by default. If the encryption-type (0 or 7) is not specified, then 0 is selected by default.

**ntp disable**

Prevent an interface from receiving NTP packets.

**Syntax**

```plaintext
ntp disable
To re-enable NTP on an interface, use the no ntp disable command.
```

**Defaults**

Disabled (that is, if you configure an NTP host, all interfaces receive NTP packets)

**Command Modes**

</table>
ntp offset-threshold

Configure the threshold time interval before which the system generates an NTP audit log message if the time difference from the NTP server is greater than a threshold value (offset-threshold).

Syntax

```
ntp offset-threshold threshold-value
```

To disable the threshold value, use the `no ntp offset-threshold` command.

Parameters

- `offset-threshold` (Optional) Enter the keyword `offset-threshold` and then the threshold value. The range is from 0 to 999.
- `threshold-value`

Defaults

Zero (0).

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S3038–ON, S4048-ON, S3100 Series, S4810P, S4820T, S5000, S6000, S6000–ON, S6100–ON, Z9500, and Z9100–ON.

Usage Information

The `ntp offset-threshold` command does not time synchronization.

Example

```
DellEMC(config)# ntp offset-threshold 4
```

ntp server

Configure an NTP time-serving host.

Syntax

```
ntp server[vrf vrf-name] {hostname | ipv4-address | ipv6-address} [key keyid] [prefer] [version number] [minpoll] [maxpoll]
```

Parameters

- `vrf vrf-name` (Optional) Enter the keyword `vrf` and then the name of the VRF to configure an NTP time-serving host corresponding to that VRF.
- `ipv4-address | ipv6-address` Enter an IPv4 address (A.B.C.D) or IPv6 address (X:X::X) of NTP server.
- `hostname` Enter the host name of the server.
key keyid

(OPTIONAL) Enter the keyword key and a number as the NTP peer key. The range is from 1 to 65534.

prefer

(OPTIONAL) Enter the keyword prefer to indicate that this peer has priority over other servers.

version number

(OPTIONAL) Enter the keyword version and a number to correspond to the NTP version used on the server. The range is from 1 to 4.

minpoll polling-interval

(OPTIONAL) Enter the keyword minpoll then the polling-interval. The polling interval range is from 4 to 16.

maxpoll polling-interval

(OPTIONAL) Enter the keyword maxpoll then the polling-interval. The polling interval range is from 4 to 16.

Defaults

Not configured.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.14(0.0) The trusted-key range value is increased from 1 to 65534. Also, introduced the minpoll and maxpoll polling interval options.

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the S6100-ON.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100-ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000-ON.

9.6(0.0) Added support for VRF.

9.4.(0.0) Added support for VRF.

9.2(1.0) Introduced on the Z9500.

9.0.2.0 Introduced on the S6000.

8.3.11.1 Introduced on the Z9000.

8.4.1.0 Added IPv6 support.

7.6.1.0 Introduced on the S-Series.

7.5.1.0 Introduced on the C-Series.

6.1.1.0 Introduced on the E-Series.

Usage Information

You can configure multiple time-serving hosts. From these time-serving hosts, the Dell EMC Networking OS chooses one NTP host with which to synchronize. To determine which server is selected, use the show ntp associations command.
Because many polls to NTP hosts can affect network performance, Dell EMC Networking recommends limiting the number of hosts configured.

By default, the system performs a time synchronization if the time difference from the time source is greater than one second.

When the Dell EMC Networking OS NTP client receives inconsistent timestamp in the origin timestamp field, it logs the syslog message. It is due to the older versions of NTPD server implementation. Upgrade the system to the latest NTPD package in the NTP server and the system logs the following NTP syslog message:

```
Dell EMC# May 30 13:27:46 %STKUNIT2-:CP %ntp-6-: receive: Unexpected origin timestamp 0xdeb95bee.06ba346e does not match aorg 0000000000.00000000 from server@10.16.151.117 xmt 0xdeb95bee.30907a87
```

In general, the packet denied services are dropped with no further action except incrementing the statistics counters. In certain cases, a more proactive response is required to cause the client to slow down the process. A special packet is created to serve this purpose, and it is called the kiss-o-Death (KoD) packet. When the Dell EMC Networking OS client receives KoD packets, it logs the following syslog message:

```
Dell EMC# May 27 14:32:13 %STKUNIT1-:CP %ntp-6-: receive: KoD packet from 300::2 has inconsistent xmt/org/rec timestamps. Ignoring.
```

Related Commands

- `show ntp associations` — displays the NTP servers that are configured and their status.

### ntp source

Specify an interface’s IP address to be included in the NTP packets.

**Syntax**

```
ntp source interface
```

To delete the configuration, use the `no ntp source` command.

**Parameters**

- `interface` Enter the following keywords and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For the Management interface, enter the keyword `ManagementEthernet` then slot/port information.
  - For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.
  - For VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

- `CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
ntp trusted-key

Set a key to authenticate the system to which NTP synchronizes.

Syntax

```
ntp trusted-key number
```

To delete the key, use the `no ntp trusted-key number` command.

Parameters

- **number**: Enter a number as the trusted key ID. The range is from 1 to 65534.

Defaults

Not configured.

9.0.2.0 | Introduced on the S6000.
8.3.11.1 | Introduced on the Z9000.
8.5.1.0 | Added support for 4-port 40G line cards.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
6.1.1.0 | Introduced on the E-Series.

Usage Information

The number parameter in the ntp trusted-key command must be the same number as the number parameter in the ntp authentication-key command. If you change the ntp authentication-key command, you must also change the ntp trusted-key command.

Related Commands

- ntp authentication-key—sets an authentication key for NTP.
- ntp authenticate—enables the NTP authentication parameters you set.

show clock

Display the current clock settings.

Syntax

```
show clock [detail]
```

Parameters

detail  (OPTIONAL) Enter the keyword detail to view the source information of the clock.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Version Description

- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **6.1.1.0** Introduced on the E-Series.

### Usage Information

The following describes the `show ntp associations` command shown in the Example below.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote</td>
<td>Displays the remote IP address of the NTP peer.</td>
</tr>
<tr>
<td>ref clock</td>
<td>Displays the IP address of the remote peer's reference clock.</td>
</tr>
<tr>
<td>st</td>
<td>Displays the peer’s stratum, that is, the number of hops away from the external time source. A 16 in this column means the NTP peer cannot reach the time source.</td>
</tr>
<tr>
<td>when</td>
<td>Displays the last time the switch received an NTP packet.</td>
</tr>
<tr>
<td>poll</td>
<td>Displays the polling interval (in seconds).</td>
</tr>
<tr>
<td>reach</td>
<td>Displays the reachability to the peer (in octal bitstream).</td>
</tr>
<tr>
<td>delay</td>
<td>Displays the time interval or delay for a packet to complete a round-trip to the NTP time source (in milliseconds).</td>
</tr>
<tr>
<td>offset</td>
<td>Displays the relative time of the NTP peer’s clock to the switch clock (in milliseconds).</td>
</tr>
<tr>
<td>disp</td>
<td>Displays the dispersion.</td>
</tr>
<tr>
<td>LOCAL(0)</td>
<td>Indicates that the local machine has synced with itself. Generally, only a NTP master syncs with itself. Synchronization of the local machine takes place to this peer.</td>
</tr>
<tr>
<td>LOCL.</td>
<td>Indicates the reference clock of the NTP master.</td>
</tr>
</tbody>
</table>

### Example (without ntp master configuration)

```
DellEMC# show ntp associations
remote   vrf-Id    ref clock   st when poll reach  delay  offset  disp
*10.16.151.117   0      45.127.112.2   3   8   16   17   1.383 362.704  0.008
* master (synced), # backup, + selected, - outlier, x falseticker
```
Example (with ntp master configuration)

<table>
<thead>
<tr>
<th>remote</th>
<th>vrf-id</th>
<th>ref clock</th>
<th>st</th>
<th>when</th>
<th>poll</th>
<th>reach</th>
<th>delay</th>
<th>offset</th>
<th>disp</th>
</tr>
</thead>
<tbody>
<tr>
<td>*LOCAL(0)</td>
<td>0</td>
<td>.LOCL.</td>
<td>7</td>
<td>6</td>
<td>16</td>
<td>377</td>
<td>0.000</td>
<td>0.000</td>
<td></td>
</tr>
<tr>
<td>10.16.127.86</td>
<td>0</td>
<td>10.16.127.26</td>
<td>5</td>
<td>9</td>
<td>16</td>
<td>1</td>
<td>65.292</td>
<td>13829.9</td>
<td>0.002</td>
</tr>
<tr>
<td>10.16.127.144</td>
<td>0</td>
<td>10.16.127.26</td>
<td>5</td>
<td>6</td>
<td>16</td>
<td>1</td>
<td>0.829</td>
<td>13795.2</td>
<td>0.002</td>
</tr>
<tr>
<td>10.16.127.44</td>
<td>0</td>
<td>10.16.127.26</td>
<td>5</td>
<td>-</td>
<td>16</td>
<td>1</td>
<td>0.799</td>
<td>13791.5</td>
<td>0.002</td>
</tr>
</tbody>
</table>

* master (synced), # backup, + selected, - outlier, x falseticker

In the above example,

- *LOCAL(0) indicates that the local machine synchronizes with itself.
- .LOCL. indicates reference clock of the NTP master.

Related Commands

- `show ntp status` — displays the current NTP status.

show ntp vrf associations

Displays the NTP servers configured for the VRF instance <vrf-name>.

Syntax

```
show ntp [vrf] <vrf-name> associations.
```

Command Modes

EXEC

EXEC Privilege

Command History

#### Usage Information

The following describes the `show ntp status` command shown in the Example below.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Clock is...&quot;</td>
<td>States whether or not the switch clock is synchronized, which NTP stratum the system is assigned and the IP address of the NTP peer.</td>
</tr>
<tr>
<td>&quot;frequency is...&quot;</td>
<td>Displays the frequency (in ppm), stability (in ppm) and precision (in Hertz) of the clock in this system.</td>
</tr>
<tr>
<td>&quot;reference time is...&quot;</td>
<td>Displays the reference time stamp.</td>
</tr>
</tbody>
</table>

System Time and Date  1879
### Field Description

- **“clock offset is...”** Displays the system offset to the synchronized peer and the time delay on the path to the NTP root clock.

- **“root dispersion is...”** Displays the root and path dispersion.

- **“peer mode is...”** State what NTP mode the switch is. This should be Client mode.

### Example

```plaintext
DellEMC#> show ntp status
Clock is synchronized, stratum 4, reference is 10.16.151.117, vrf-id is 0
frequency is 0.000 ppm, stability is 0.000 ppm, precision is -18
reference time  dec0e68a.07b308ac [Wed, Apr 07 09:42:34.030 UTC] UTC
clock offset is 0.000000 msec, root delay is 152.003 msec
root dispersion is 1381.293 msec, peer dispersion is 937.690 sec
peer mode is client
DellEMC#
```

### Related Commands

- `show ntp associations` — displays information on the NTP master and peer configurations.
Tunneling is supported on Dell EMC Networking OS.

Topics:

- `ip unnumbered`
- `ipv6 unnumbered`
- `tunnel allow-remote`
- `tunnel destination`
- `tunnel dscp`
- `tunnel flow-label`
- `tunnel hop-limit`
- `tunnel keepalive`
- `tunnel-mode`
- `tunnel source`

**ip unnumbered**

Configure a tunnel interface to operate without a unique IPv4 address and select the interface from which the tunnel borrows its address.

**Syntax**

```
ip unnumbered interface-type
```

To set the tunnel back to default logical address use the `no ip unnumbered` command. If the tunnel was previously operational, the tunnel interface is operationally down unless you also configure the tunnel IPv6 address.

**Parameters**

- `interface-type` Enter the interface type, followed by a slot/port/subport number.

**Defaults**

None

**Command Modes**

INTERFACE TUNNEL

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S6010-ON and S4048T-ON.</td>
</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>

<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100-ON.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
</tbody>
</table>
### Version Description
- **9.10(0.1)**: Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)**: Introduced on the S3148.
- **9.10(0.0)**: Introduced on the S6100-ON.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100-ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Introduced on the S6000-ON.

### Usage Information
The `ip unnumbered` command fails in two conditions:

- If the logical ip address is configured.
- If Tunnel mode is ipv6ip (where ip address over tunnel interface is not possible).

To ping the unnumbered tunnels, the logical address route information must be present at both the ends.

### NOTE
The `ip unnumbered` command can specify an interface name that does not exist or does not have a configured IPv6 address. The tunnel interface is not changed to operationally up until the logical IP address is identified from one of the address family.

### ipv6 unnumbered
Configure a tunnel interface to operate without a unique IPv6 address and select the interface from which the tunnel borrows its address.

#### Syntax
```plaintext
ipv6 unnumbered {interface-type interface-number}
```

To set the tunnel back to default logical address use the `no ipv6 unnumbered` command. If the tunnel was previously operational, the tunnel interface is operationally down unless you also configure the tunnel IPv4 address.

#### Parameters
- **interface-type interface-number**: Enter the interface type, followed by the type, and then the slot/port/subport information.

#### Defaults
None.

#### Command Modes
INTERFACE TUNNEL

#### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

#### Version Description
- **9.10(0.1)**: Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)**: Introduced on the S3148.
- **9.10(0.0)**: Introduced on the S6100-ON.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100-ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Introduced on the S6000-ON.
The `ipv6 unnumbered` command fails in two conditions:

- If the logical IP address is configured.
- If Tunnel mode is ipv6ip (where ip address over tunnel interface is not possible).

To ping the unnumbered tunnels, the logical address route information must be present at both the ends.

**NOTE:** The `ipv6 unnumbered` command can specify an interface name that does not exist or does not have a configured IPv6 address. The tunnel interface is not changed to operationally up until the logical IP address is identified from one of the address family.

### tunnel allow-remote

Configure an IPv4 or IPv6 address or prefix whose tunneled packets are accepted for decapsulation. If you do not configure allow-remote entries, tunneled packets from any remote peer address is accepted.

This feature is supported on Dell EMC Networking OS.

**Syntax**

```
tunnel allow-remote {ip-address | ipv6-address} [mask]
```

To delete a configured allow-remote entry use the `no tunnel allow-remote` command. Any specified address/mask values must match an existing entry for the delete to succeed. If the address and mask are not specified, this command deletes all allow-remote entries.

**Parameters**

- `ip-address`  
  Enter the source IPv4 address in A.B.C.D format.

- `ipv6-address`  
  Enter the source IPv6 address in X:XX:XX::X format.

- `mask`  
  (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D to match a range of remote addresses. The default mask is /32 for IPv4 addresses and /128 for IPv6 addresses, which match only the specified address.

**Defaults**

If you do not configure tunnel allow remote , all traffic which is destined to tunnel source address is decapsulated.

**Command Modes**

INTERFACE TUNNEL

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
### tunnel destination

Set a destination endpoint for the tunnel.

**Syntax**

```
tunnel destination {ip-address | ipv6-address}
```

To delete a tunnel destination address, use the `no tunnel destination {ip-address | ipv6-address}` command.

**Parameters**

- **ip-address**: Enter the destination IPv4 address for the tunnel.
- **ipv6-address**: Enter the destination IPv6 address for the tunnel.

**Defaults**

none

**Command Modes**

INTERFACE TUNNEL (conf-if-tu)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the S6000-ON.</td>
</tr>
<tr>
<td>9.5(0.1)</td>
<td>Introduced on the Z9500.</td>
</tr>
</tbody>
</table>

**Usage Information**

You can configure up to eight allow-remote entries on any multipoint receive-only tunnel.

This command fails if the address family entered does not match the outer header address family of the tunnel mode, tunnel source, or any other tunnel allow-remote.

If you configure any allow-remote, the tunnel source or tunnel mode commands fail if the outer header address family does not match that of the configured allow-remote.
tunnel dscp

Configure the method to set the DSCP in the outer tunnel header.

C9000 Series

Syntax
tunnel dscp {mapped | value}

To use the default tunnel mapping behavior, use the no tunnel dscp value command.

Parameters
mapped
value

Enter the keyword mapped to map the original packet DSCP (IPv4)/Traffic Class (IPv6) to the tunnel header DSCP (IPv4)/Traffic Class (IPv6) depending on the mode of tunnel.
Enter a value to set the DSCP value in the tunnel header. The range is from 0 to 63. The default value of 0 denotes mapping of original packet DSCP (IPv4)/Traffic Class (IPv6) to the tunnel header DSCP (IPv4)/Traffic Class (IPv6) depending on the mode of tunnel.

Defaults
0 (Mapped)

Command Modes INTERFACE TUNNEL (conf-if-tu)

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.9(0.0) Introduced on the C9010.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.3(0.0) Introduced on the S6000, S4810, S4820T, Z9000.
This command configures the method used to set the high 6 bits (the differentiated services codepoint) of the IPv4 TOS or the IPv6 traffic class in the outer IP header.

A value of 0 copies original packet DSCP (IPv4)/Traffic Class (IPv6) to the tunnel header DSCP (IPv4)/Traffic Class (IPv6) depending on the mode of tunnel.

**tunnel flow-label**

Configure the method to set the IPv6 flow label value in the outer tunnel header.

**Syntax**

```
tunnel flow-label value
```

To return to the default value of 0, use the `no tunnel flow-label value` command.

**Parameters**

- `value` Enter a value to set the IPv6 flow label value in the tunnel header. The range is from 0 to 1048575. The default value is 0.

**Defaults**

0 (Mapped original packet flow-label value to tunnel header flow-label value)

**Command Modes**

INTERFACE TUNNEL (conf-if-tu)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tr>
<td>9.3(0.0)</td>
<td>Introduced on the S6000, S4810, S4820T, Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**

This command is only valid for tunnel interfaces with an IPv6 outer header.

**tunnel hop-limit**

Configure the method to set the IPv4 time-to-live or the IPv6 hop limit value in the outer tunnel header.

**Syntax**

```
tunnel hop-limit value
```

To restore the default `tunnel hop-limit`, use the `no tunnel hop-limit` command.
Parameters

**value**
Enter the hop limit (ipv6) or time-to-live (ipv4) value to include in the tunnel header. The range is from 0 to 255. The default is **64**.

Defaults

**64** (Time-to-live for IPv4 outer tunnel header or hop limit for IPv6 outer tunnel header)

Command Modes

INTERFACE TUNNEL (conf-if-tu)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information

A value of 0 copies the inner packet hop limit (ipv6) or time-to-live (ipv4) in the encapsulated packet to the tunnel header hop limit (ipv6) or time-to-live (ipv4) value.

**tunnel keepalive**

Configure the tunnel keepalive target, interval and attempts.

**Syntax**

```
tunnel keepalive {ip-address | ipv6-address}[interval {seconds}] [attempts {count | unlimited}]
```

To disable the tunnel keepalive probes use the **no tunnel keepalive** command.

**Parameters**

**ip-address ipv6 address**
Enter the IPv4 or IPv6 address of the peer to which the keepalive probes will be sent.

**interval seconds**
Enter the keyword **interval** then the interval time, in seconds, after which the restart process to keepalive probe packets.

The range is from 5 to 255. The default is 5.

**count**

(Optional) Enter the keyword **count** to count packets processed by the filter.

The range is from 3 to 10. The default is 3.
Enter the keyword `unlimited` to specify the unlimited number of keepalive probe packets.

**Defaults**
Tunnel keepalive is disabled.

**Command Modes**
INTERFACE TUNNEL

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S4810, S4820T, S6000 and Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**
Enabling tunnel keepalive causes ICMP echo packets to be sent to the keepalive target. The ICMP echo will be sourced from the tunnel interface logical IPv4 or IPv6 address and will be tunnel encapsulated. The response will be accepted whether it returns tunnel encapsulated or not.

When configuring tunnel keepalive at both end points of a tunnel interface it is recommended to set the tunnel keepalive target to the logical IPv4 or IPv6 address of the far end tunnel peer, rather than to the tunnel destination. This reduces the chance of both ends of the tunnel staying in keepalive down state. If both ends get into a keepalive down state that does not clear in a few seconds, then performing shutdown - no shutdown sequence on one end should bring both ends back to up.

**tunnel-mode**

Enable a tunnel interface.

**Syntax**
```
tunnel mode {ipip | ipv6 | ipv6ip}[decapsulate-any]
```

To disable an active tunnel interface, use the `no tunnel mode` command.

**Parameters**
- `ipip` Enable tunnel in RFC 2003 mode and encapsulate IPv4 and/or IPv6 datagrams inside an IPv4 tunnel.
- `ipv6` Enable tunnel in RFC 2473 mode and encapsulate IPv4 and/or IPv6 datagrams inside an IPv6 tunnel.
- `ipv6ip` Enable tunnel in RFC 4213 mode and encapsulate IPv6 datagrams inside an IPv4 tunnel.
**decapsulate-any**  (Optional) Enable tunnel in multipoint receive-only mode.

**Defaults**
There is no default tunnel mode.

**Command Modes**
INTERFACE TUNNEL

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tr>
<td>9.4(0.0)</td>
<td>Added the decapsulate-any command.</td>
</tr>
<tr>
<td>9.3(0.1)</td>
<td>Introduced on the S6000 and Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**
To enable a tunnel interface, use this command. You must define a tunnel mode for the tunnel to function. If you previously defined the tunnel destination or source address, the tunnel mode must be compatible.

Including the decapsulate-any option causes the command to fail if any of the following tunnel transmit options are configured: tunnel destination, tunnel dscp, tunnel flow-label, tunnel hop-limit, or tunnel keepalive. Conversely, if you configure any tunnel allow-remote entries, the tunnel-mode command fails unless the decapsulate-any option is included.

Configuration of IPv6 commands over decapsulate-any tunnel causes an error.

---

**tunnel source**

Set a source address for the tunnel.

**Syntax**
`tunnel source {ip-address | ipv6-address | interface-type-number | anylocal}`

To delete the current tunnel source address, use the `no tunnel source` command.

**Parameters**
- `ip-address`  
  Enter the source IPv4 address in A.B.C.D format.
- `ipv6-address`  
  Enter the source IPv6 address in X::X::X::X format.
- `interface-type-number`  
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.

```
anylocal
```

Enter the `anylocal` command to allow the multipoint receive-only tunnel to decapsulate tunnel packets destined to any local IP address.

| Defaults   | none                               |
| Command Modes | INTERFACE TUNNEL (conf-if-tu) |

</tr>
<tr>
<td>9.3(0.0)</td>
<td>Introduced on the S4810, S4820T, S6000 and Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**

Added an optional keyword “anylocal” to the tunnel source command. The anylocal argument can be used in place of the IP address or interface, but only with the multipoint receive-only mode tunnels. The tunnel source anylocal command allows the multipoint receive-only tunnel to decapsulate tunnel packets addressed to any IPv4 or IPv6 (depending on the tunnel mode) address configured on the switch that is operationally Up.
Uplink Failure Detection (UFD)

Uplink failure detection (UFD) provides detection of the loss of upstream connectivity and, if you use this with NIC teaming, automatic recovery from a failed link.

Topics:
- clear ufd-disable
- debug uplink-state-group
- description
- downstream
- downstream auto-recover
- downstream disable links
- enable
- show running-config uplink-state-group
- show uplink-state-group
- uplink-state-group
- upstream

clear ufd-disable

Re-enable one or more downstream interfaces on the switch/router that are in a UFD-Disabled Error state so that an interface can send and receive traffic.

Syntax

```
clear ufd-disable {interface interface | uplink-state-group group-id}
```

Parameters

- **interface interface**
  Specify one or more downstream interfaces. For interface, enter one of the following interface types:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] | slot/port[/subport]-range
  - 40-Gigabit Ethernet: fortyGigE [slot/port]
  - Port channel: port-channel {1-128 | port-channel-range}

  Where port-range and port-channel-range specify a range of ports separated by a dash (-) and/or individual ports/port channels in any order; for example: gigabitethernet 1/1-2,5,9,11-12 port-channel 1-3,5. A comma is required to separate each port and port-range entry.

  If a 40G port is fanned-out into 10G ports, the range is entered as slot/sort/subport-slot/subport.

- **uplink-state-group group-id**
  Re-enables all UFD-disabled downstream interfaces in the group. The valid group-id values are from 1 to 16.
A downstream interface in a UFD-disabled uplink-state group is also disabled and is in a UFD-Disabled Error state.

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Version Description

- **9.10.0.2**
  - Introduced on the Z9100-ON.
- **9.8(2.0)**
  - Introduced on the S3100 series.
- **9.10(0.0)**
  - Introduced on the S3148.
- **9.8(0.0P5)**
  - Introduced on the S4048-ON.
- **9.8(0.0P2)**
  - Introduced on the S3048-ON.
- **9.2(1.0)**
  - Introduced on the Z9500.
- **9.2(0.0)**
  - Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
- **8.3.19.0**
  - Introduced on the S4820T.
- **8.3.12.0**
  - Introduced on the S4810.
- **8.4.2.3**
  - Introduced on the S-Series S50.

**Related Commands**

- `downstream` — assigns a port or port-channel to the uplink-state group as a downstream interface.
- `uplink-state-group` — creates an uplink-state group and enables the tracking of upstream links.

### debug uplink-state-group

Enable debug messages for events related to a specified uplink-state group or all groups.

**Syntax**

ddebug uplink-state-group [group-id]

To turn off debugging event messages, enter the no debug uplink-state-group [group-id] command.

**Parameters**

- **group-id**
  - Enables debugging on the specified uplink-state group. The valid group-id values are from 1 to 16.

**Defaults**

- **none**

**Command Modes**

- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
description

Enter a text description of an uplink-state group.

Syntax
description text

Parameters
  text  Text description of the uplink-state group. The maximum length is 80 alphanumeric
         characters.

Defaults
  none

Command Modes
  UPLINK-STATE-GROUP

Command History
  This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC

Version   Description
  9.10.0.2  Introduced on the Z9100–ON.
  9.8(2.0)  Introduced on the S3100 series.
  9.10(0.0) Introduced on the S3148.
  9.8(0.0P5) Introduced on the S4048-ON.
  9.8(0.0P2) Introduced on the S3048-ON.
  9.2(1.0)  Introduced on the Z9500.
  9.2(0.0)  Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux
            (PMUX) mode only.
  8.3.19.0  Introduced on the S4820T.
  8.3.12.0  Introduced on the S4810.
  8.4.2.3  Introduced on the S-Series S50.

Related Commands
  • clear ufd-disable — re-enable downstream interfaces that are in a UFD-Disabled Error state.
**downstream**

Assign a port or port-channel to the uplink-state group as a downstream interface.

**Syntax**

```plaintext
downstream interface
```

To delete an uplink-state group, enter the `no downstream interface` command.

**Parameters**

- `interface`  
  
  Enter one of the following interface types:
  
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the `slot/port/subport/subport` | `slot/port/subport/subport-range`
  - 40-Gigabit Ethernet: `fortyGigE {slot/port}`
  - Port channel: `port-channel {1–128 | port-channel-range}`

  Where `port-range` and `port-channel-range` specify a range of ports separated by a dash (-) and/or individual ports/port channels in any order; for example: `gigabitethernet 1/1-2,5,9,11-12 port-channel 1-3,5`. A comma is required to separate each port and port-range entry.

  If a 40G port is fanned-out into 10G ports, the range is entered as `slot/sort/subport-slot/port/subport`.

**Defaults**

`none`

**Command Modes**

- `UPLINK-STATE-GROUP`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Version**

- **9.10.0.2**  
  Introduced on the Z9100–ON.
- **9.8(2.0)**  
  Introduced on the S3100 series.
- **9.10(0.0)**  
  Introduced on the S3148.
- **9.8(0.0P5)**  
  Introduced on the S4048-ON.
- **9.8(0.0P2)**  
  Introduced on the S3048-ON.
- **9.2(1.0)**  
  Introduced on the Z9500.
- **9.2(0.0)**  
  Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
**Uplink Failure Detection (UFD)**

### Version Description

- **8.3.19.0**: Introduced on the S4820T.
- **8.3.12.0**: Introduced on the S4810.
- **8.4.2.3**: Introduced on the S-Series S50.

### Usage Information

You can assign physical port or port-channel interfaces to an uplink-state group.

You can assign an interface to only one uplink-state group. Configure each interface assigned to an uplink-state group as either an upstream or downstream interface, but not both.

You can assign individual member ports of a port channel to the group. An uplink-state group can contain either the member ports of a port channel or the port channel itself, but not both.

### Related Commands

- `upstream` — assigns a port or port-channel to the uplink-state group as an upstream interface.
- `uplink-state-group` — creates an uplink-state group and enables the tracking of upstream links.

### downstream auto-recover

Enable auto-recovery so that UFD-disabled downstream ports in an uplink-state group automatically come up when a disabled upstream port in the group comes back up.

**Syntax**

```
downstream auto-recover
```

To disable auto-recovery on downstream links, use the `no downstream auto-recover` command.

**Defaults**

The auto-recovery of UFD-disabled downstream ports is enabled.

**Command Modes**

UPLINK-STATE-GROUP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant [Dell EMC Networking OS Command Line Reference Guide](https://www.dell.com/support).

downstream disable links

Configure the number of downstream links in the uplink-state group that are disabled if one upstream link in an uplink-state group goes down.

Syntax

```plaintext
downstream disable links {number | all}
```

To revert to the default setting, use the `no downstream disable links` command.

Parameters

- **number**: Enter the number of downstream links the UFD brings down. The range is from 1 to 1024.
- **all**: Brings down all downstream links in the group.

Defaults

No downstream links are disabled when an upstream link in an uplink-state group goes down.

Command Modes

- **UPLINK-STATE-GROUP**

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Usage Information

When one upstream interface in an uplink-state group goes down, you can configure the number of downstream interfaces in an uplink-state group are put into a link-down state with an UFD-Disabled error message.

If all upstream interfaces in an uplink-state group go down, all downstream interfaces in the same uplink-state group are put into a link-down state.

Related Commands

- **downstream** — assigns a port or port-channel to the uplink-state group as a downstream interface.
- **uplink-state-group** — creates an uplink-state group and enables the tracking of upstream links.
enable

Enable uplink state group tracking for a specific UFD group.

Syntax

```
enable
```

To disable upstream-link tracking without deleting the uplink-state group, use the no enable command.

Defaults

Upstream-link tracking is automatically enabled in an uplink-state group.

Command Modes

UPLINK-STATE-GROUP

```

Related Commands

- `show uplink-state-group` — displays the status information on a specified uplink-state group or all groups.
- `uplink-state-group` — creates an uplink-state group and enables the tracking of upstream links.

### show uplink-state-group

Display status information on a specified uplink-state group or all groups.

```
Syntax

show uplink-state-group [group-id] [detail]

Parameters

group-id

Displays status information on a specified uplink-state group or all groups. The valid group-id values are from 1 to 16.

detail

Displays additional status information on the upstream and downstream interfaces in each group.

Defaults

none

Command Modes

Related Commands
- `show running-config uplink-state-group` — displays the current configuration of one or more uplink-state groups.
- `uplink-state-group` — creates an uplink-state group and enables the tracking of upstream links.

**uplink-state-group**

Create an uplink-state group and enable the tracking of upstream links on a switch or router.

**Syntax**

```
uplink-state-group group-id
```

To delete an uplink-state group, enter the `no uplink-state-group group-id` command.

**Parameters**

- `group-id` Enter the ID number of an uplink-state group. The range is from 1 to 16.

**Defaults**

`none`

**Command Modes**

`CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.10.0.2
- 9.8(2.0)

**Description**

- Introduced on the Z9100-ON.
- Introduced on the S3100 series.
### Usage Information

After you enter the command, to assign upstream and downstream interfaces to the group, enter Uplink-State-Group Configuration mode.

An uplink-state group is considered operationally up if at least one upstream interface in the group is in the Link-Up state.

An uplink-state group is considered operationally down if no upstream interfaces in the group are in the Link-Up state. No uplink-state tracking is performed when a group is disabled or in an operationally down state.

To disable upstream-link tracking without deleting the uplink-state group, use the `no enable` command in uplink-state-group configuration mode.

### Example

```
DellEMC(conf)# uplink-state-group 16
DellEMC(conf)#
02:23:17: %RPM0-P:CP %IFMGR-5-ASTATE_UP: Changed uplink state group Admin state to up: Group 16
DellEMC(conf)#
```

### Related Commands

- `show running-config uplink-state-group` — displays the current configuration of one or more uplink-state groups.
- `show uplink-state-group` — displays the status information on a specified uplink-state group or all groups.

### upstream

Assign a port or port-channel to the uplink-state group as an upstream interface.

**Syntax**

```
upstream interface
```

To delete an uplink-state group, use the `no upstream interface` command.

**Parameters**

- `interface`

  Enter one of the following interface types:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] | slot/port[/subport]-range
  - 40-Gigabit Ethernet: `fortyGigE [slot/port]`
  - Port channel: `port-channel (1-128 | port-channel-range)`

  Where `port-range` and `port-channel-range` specify a range of ports separated by a dash (-) and/or individual ports/port channels in any order; for example:
gigabitethernet 1/1-2,5,9,11-12 port-channel 1-3,5. A comma is required to separate each port and port-range entry.

If a 40G port is fanned-out into 10G ports, the range is entered as slot/sort/subport-slot/subport.

Defaults
none

Command Modes
UPLINK-STATE-GROUP

</tbody>
</table>

Usage Information
You can assign physical port or port-channel interfaces to an uplink-state group.

You can assign an interface to only one uplink-state group. Configure each interface assigned to an uplink-state group as either an upstream or downstream interface, but not both.

You can assign individual member ports of a port channel to the group. An uplink-state group can contain either the member ports of a port channel or the port channel itself, but not both.

Example
DellEMC(conf-uplink-state-group-16)# upstream tengigabitethernet 1/10-15
DellEMC(conf-uplink-state-group-16)#

Related Commands
- downstream — assigns a port or port-channel to the uplink-state group as a downstream interface.
- uplink-state-group — creates an uplink-state group and enables the tracking of upstream links.
VLAN Stacking

With the virtual local area network (VLAN)-stacking feature (also called stackable VLANs and QinQ), you can “stack” VLANs into one tunnel and switch them through the network transparently.

The Dell EMC Networking OS supports this feature.

For more information about basic VLAN commands, see the Virtual LAN (VLAN) Commands section in Layer 2.

Important Points to Remember

- If you do not enable the spanning tree protocol (STP) across the stackable VLAN network, STP bridge protocol data units (BPDUs) from the customer’s networks are tunneled across the stackable VLAN network.
- If you do enable STP across the stackable VLAN network, STP BPDUs from the customer’s networks are consumed and not tunneled across the stackable VLAN network unless you enable protocol tunneling.
  
  **NOTE:** For more information about protocol tunneling on the E-Series, see Service Provider Bridging.
- Layer 3 protocols are not supported on a stackable VLAN network.
- Assigning an IP address to a stackable VLAN is supported when all the members are only stackable VLAN trunk ports. IP addresses on a stackable VLAN-enabled VLAN are not supported if the VLAN contains stackable VLAN access ports. This facility is provided for the simple network management protocol (SNMP) management over a stackable VLAN-enabled VLAN containing only stackable VLAN trunk interfaces. Layer 3 routing protocols on such a VLAN are not supported.
- Dell EMC Networking recommends that you do not use the same MAC address, on different customer VLANs, on the same stackable VLAN.
- Interfaces configured using stackable VLAN access or stackable VLAN trunk commands do not switch traffic for the default VLAN. These interfaces are switch traffic only when they are added to a non-default VLAN.
- Starting with Dell EMC Networking OS version 7.8.1 for C-Series and S-Series (Dell EMC Networking OS version 7.7.1 for E-Series, 8.2.1.0 for E-Series ExaScale), a vlan-stack trunk port is also allowed to be configured as a tagged port and as an untagged port for single-tagged VLANs. When the vlan-stack trunk port is also a member of an untagged vlan, the port must be in Hybrid mode. For more information, see portmode hybrid.

**Usage Information**
When packets are colored green; no packets are dropped.

**dei honor**

Honor the incoming DEI value by mapping it to a Dell EMC Networking OS drop precedence. Enter the command once for 0 and once for 1.

**Syntax**
```
dei honor {0 | 1} {green | red | yellow}
```

**Parameters**
- **0 | 1**
  - Enter the bit value you want to map to a color.
- **green | red | yellow**
  - Choose a color:
    - **Green**: High priority packets that are the least preferred to be dropped.
    - **Yellow**: Lower priority packets that are treated as best-effort.
    - **Red**: Lowest priority packets that are always dropped (regardless of congestion status).

**Defaults**
Disabled; Packets with an unmapped DEI value are colored green.

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### dei mark

Set the DEI value on egress according to the color currently assigned to the packet.

**S4048-ON**

**Syntax**

```
dei mark {green | yellow} {0 | 1}
```

**Parameters**

- `0 | 1` Enter the bit value you want to map to a color.
- `green | red | yellow` Choose a color:
  - `green`: High priority packets that are the least preferred to be dropped.
  - `yellow`: Lower priority packets that are treated as best-effort.

**Defaults**

All the packets on egress are marked with DEI 0.

</tbody>
</table>

**Usage Information**
Enable DEI before using this command.

### member

Assign a stackable VLAN access or trunk port to a VLAN. The VLAN must contain the `vlan-stack compatible` command in its configuration.

**Syntax**

```
member interface
```

To remove an interface from a Stackable VLAN, use the `no member interface` command.

**Parameters**

- `interface` Enter the following keywords and the interface information:
  - For a Port Channel interface, enter the keywords `port-channel`, and then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults**
Not configured.

**Command Modes**
CONF-IF-VLAN

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
Usage Information

Enable the stackable VLAN (using the `vlan-stack compatible` command) on the VLAN prior to adding a member to the VLAN.

Related Commands

- `vlan-stack compatible` — enables stackable VLAN on a VLAN.

### stack-unit stack-group

Configure a stacking group specified by an ID.

**Syntax**

```
[no] stack-unit unit-id stack-group stack-group-id
```

To remove the current stack group configuration, use the `no stack-unit unit-id stack-group stack-id` command.

**Parameters**

- `unit-id` 
  - Enter the stack unit ID.
- `stack-group-id` 
  - Enter the stack group ID. The range is from 0 to 16.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

#### Version Description

- **9.10(0.1)**
  - Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)**
  - Introduced on the S3148.
- **9.10(0.0)**
  - Introduced on the S6100–ON.
- **9.8(2.0)**
  - Introduced on the S3100 series.
- **9.8(1.0)**
  - Introduced on the Z9100–ON.
- **9.8(0.0P5)**
  - Introduced on the S4048-ON.
- **9.8(0.0P2)**
  - Introduced on the S3048-ON.
- **9.7(0.0)**
  - Introduced on the S6000-ON.

  - Introduced on the S6000.
- **8.3.11.1**
  - Introduced on the Z9000.
- **8.2.1.0**
  - Introduced on the E-Series.
- **7.6.1.0**
  - Introduced on the C-Series and S-Series.
vlan-stack access

Specify a Layer 2 port or port channel as an access port to the stackable VLAN network.

Syntax

```
vlan-stack access
```

To remove access port designation, use the `no vlan-stack access` command.

Defaults

Not configured.

</tbody>
</table>
Usage Information

Prior to enabling this command, to place the interface in Layer 2 mode, enter the switchport command.

To remove the access port designation, remove the port (using the no member interface command) from all stackable VLAN-enabled VLANs.

**vlan-stack compatible**

Enable the stackable VLAN feature on a VLAN.

**Syntax**

```
vlan-stack compatible
```

To disable the Stackable VLAN feature on a VLAN, use the no vlan-stack compatible command.

**Defaults**

Not configured.

**Command Modes**

CONF-IF-VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

Prior to disabling the stackable VLAN feature, remove the members.

To view the stackable VLANs, use the show vlan command in EXEC Privilege mode. Stackable VLANs contain members, designated by the M in the Q column of the command output.

If you enabled VRF, you cannot enable the stacked VLAN feature using this command.
If you enabled IGMP snooping, you cannot enable the stacked VLAN feature using this command.

Example

```
DellEMC# show vlan
Codes: * - Default VLAN, G - GVRP VLANs
NUM  Status    Q Ports
*  1    Inactive
  2    Active    M Te 1/13
       M Te 1/1-3
  3    Active    M Po1(Te 1/14-15)
       M Te 1/18
       M Te 1/4
  4    Active    M Po1(Te 1/14-15)
       M Te 1/18
       M Te 1/5
  5    Active    M Po1(Te 1/14-15)
       M Te 1/18
       M Te 1/6
DellEMC#
```

**vlan-stack dot1p-mapping**

Map C-Tag dot1p values to an S-Tag dot1p value.

**Syntax**

```
vlan-stack dot1p-mapping c-tag-dot1p values sp-tag-dot1p value
```

**Parameters**

- **c-tag-dot1p value**
  - Enter the keyword `c-tag-dot1p` then the customer dot1p value that is mapped to a service provider dot1p value. The range is from 0 to 7.

- **sp-tag-dot1p value**
  - Enter the keyword `sp-tag-dot1p` then the service provider dot1p value. The range is from 0 to 7.

**Defaults**

none

**Command Modes**

INTERFACE

```
### vlan-stack protocol-type

Define the stackable VLAN tag protocol identifier (TPID) for the outer VLAN tag (also called the VMAN tag). If you do not configure this command, the Dell EMC Networking OS assigns the value 0x9100.

**Syntax**

```plaintext
vlan-stack protocol-type number
```

**Parameters**

- `number`  
  Enter the hexadecimal number as the stackable VLAN tag.

  You may specify both bytes of the 2-byte S-Tag TPID. The range is from 0 to FFFF. The default is **9100**.

**Defaults**

0x9100

**Command Modes**

### Version Description

- **8.3.19.0**:Introduced on the S4820T.
- **8.3.11.1**:Introduced on the Z9000.
- **8.3.7.0**:Introduced on the S4810.
- **8.2.1.0**:Introduced on the E-Series. C-Series and S-Series accept both bytes of the 2-byte S-Tag TPID.
- **7.8.1.0**:Functionality augmented for C-Series and S-Series to enable multi-purpose use of the port.
- **7.7.1.0**:Functionality augmented for E-Series to enable multi-purpose use of the port.
- **7.6.1.0**:Introduced on the C-Series and S-Series.

### E-Series original Command

**Usage Information**

Prior to using this command, to place the interface in Layer 2 mode, use the `switchport` command.

To remove the trunk port designation, first remove the port (using the no member interface command) from all stackable VLAN-enabled VLANs.

In Example 1, a VLAN-Stack trunk port is configured and then made part of a single-tagged VLAN.

In Example 2, the tag protocol identifier (TPID) is set to 88A8. The Te 3/10 port is configured to act as a VLAN-Stack access port; the Te 5/1 port acts as a VLAN-Stack trunk port, switching stackable VLAN traffic for VLAN 10, while also switching untagged traffic for VLAN 30 and tagged traffic for VLAN 40. (To allow VLAN 30 traffic, you need the native VLAN feature. Use the `portmode hybrid` command. For more information, see the `portmode hybrid` command.

#### Example 1

```
DellEMC(conf-if-te-1/42)# switchport
DellEMC(conf-if-te-1/42)# vlan-stack trunk
DellEMC(conf-if-te-1/42)# show config

- show ip vrf
- show run vrf

**ip vrf**

Create or delete a customer VRF.

**Syntax**

```
ip vrf {vrf-name | management} [vrf_id]
```

To delete a customer VRF, use the `no ip vrf {vrf-name | management} [vrf_id]` command.

**Parameters**

- **vrf-name**: Enter the name of the VRF that you create.
- **management**: Enter the keyword management to create the management VRF.
- **vrf_id**: (Optional) Enter the ID of the VRF that you create.

**Defaults**

Available by default for management VRF. For creating other customer VRFs, enable the `feature vrf` option in Configuration mode.

**Command Modes**

CONFIGURATION

**Command History**

### ip http vrf

Configure an HTTP client with a VRF used to connect to the HTTP server.

**Syntax**

```
ip http vrf {management | vrf-name}
```

To undo the HTTP client configuration, use the `ip http vrf` command.

**Parameters**

- **management**: Enter the keyword `management` for configuring the management VRF that uses an HTTP client.
- **vrf-name**: Enter a VRF name that the HTTP client uses. If you do not specify a VRF name, the HTTP client uses the default VRF.

**Defaults**

Disabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>
Usage Information

To make the HTTP clients VRF-aware, use the `ip http vrf` command. The HTTP client uses the VRF name that you specify to reach the HTTP server. If you do not specify a VRF name, the HTTP client uses the default VRF.

**description**

Specify a name for a customer VRF.

**Syntax**

```plaintext
description string
```

To delete the descriptive name for a customer VRF, use the `no description string` command.

**Parameters**

- `string`: Enter a descriptive name for the VRF.

**Defaults**

None.

**Command Modes**

VRF MODE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**ip vrf forwarding**

Attach an interface to a VRF.

**Syntax**

```plaintext
ip vrf forwarding {vrf-name | management}
```

To delete an interface associated with a configured VRF, use the `no ip vrf forwarding {vrf-name | management}` command.

**Parameters**

- `vrf-name`: Enter name of the VRF that you want to associate the interface to.
- `management`: Enter the keyword `management` to associate an interface to the management VRF.

**Defaults**

none
Command Modes

</tr>
</tbody>
</table>

Usage Information

You can attach an interface to either a nondefault VRF or a management VRF. To assign a port-back to a default VRF, remove the VRF association from the interface. You can use this only if there is no IP address configured on the interface.

There must be no prior Layer 3 configuration on the interface when configuring VRF.

You must enable VRF before using this command.

You can configure an IP subnet or address on a physical or VLAN interface that overlaps the same IP subnet or address configured on another interface only if the interfaces are assigned to different VRFs. If you assign two interfaces to the same VRF, you cannot configure overlapping IP subnets or the same IP address to them.

Example

DellEMC# configure terminal
DellEMC(conf)# ip vrf red
DellEMC(conf-vrf)# description "Red Network"
DellEMC(conf-vrf)# show config
!
ip vrf red 4
    description "Red Network"
DellEMC(conf-vrf)#

DellEMC(conf-if-te-1/45)# int te 7/46
DellEMC(conf-if-te-1/46)# no shut
DellEMC(conf-if-te-1/46)# ip vrf forwarding red
DellEMC(conf-if-te-1/46)# ip add 100.1.1.1/24
DellEMC(conf-if-te-1/46)#
DellEMC(conf-if-te-1/46)# show config
!
interface TenGigabitEthernet 1/46
    ip vrf forwarding red
    ip address 100.1.1.1/24
    no shutdown
DellEMC(conf-if-te-1/46)#
**ip route-export**

Enables route leaking between VRFs. This command exports or shares IPv4 routes corresponding to one VRF with other nondefault VRFs.

**Syntax**

```
ip route-export tag [route-map-name]
```

**Parameters**

- `route-export` Enter the keywords `route-export` to leak or share routes between VRFs.
- `tag` Enter a tag (export route target) to expose routes to other VRFs. This tag acts as an identifier for exported routes. Use this identifier while importing these routes into another nondefault VRF.
- `route-map-name` (Optional) Enter the name of the route-map to filter the exported routes.

You can leak global routes to VRFs. As the global RTM usually contains a large pool of routes, when the destination VRF imports global routes, these routes are duplicated into the VRF's RTM. It is mandatory to use route-maps to filter out leaked routes while sharing global routes with VRFs.

**Command Modes**

- VRP mode
- CONFIGURATION mode

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>

<td>Introduced on the S4810, S4820T, S5000, S6000, S6000–ON, and Z9500.</td>
</tr>
</tbody>
</table>

**Usage Information**

To export all the routes corresponding to a source VRF, you can use the `ip route-export tag` command without specifying the route-map attribute. This action exposes source VRF routes to various other VRFs, which then import these routes using the `ip route-import tag` command.

In Dell EMC Networking OS, you can configure one route-export per VRF as you can only expose one set of routes for leaking. However, you can configure multiple route-import targets because a VRF can accept routes from multiple VRFs.

You can expose a unique set of routes from the source VRF for leaking to other VRFs. When two VRFs leak or export routes, there is no option to discretely filter leaked routes from each source VRF. For example, you cannot import one set of routes from one VRF and another set of routes from another VRF.
Only active routes are eligible for leaking. For example, if one VRF has two routes corresponding to BGP and OSPF, in which the BGP route is not active, the OSPF route takes precedence over BGP. Even though the target VRF has specified filtering options to match BGP, the BGP route is not leaked as that route is not active in the Source VRF.

Related Commands

- `ip route-import` — imports routes from another VRF.

**ip route-import**

Imports IPv4 routes that another VRF leaks using the VRF tag during the export of these routes.

**Syntax**

```
ip route-import tag [route-map-name]
```

**Parameters**

- `route-import` Enter the keywords `route-import` to import routes into the VRF.
- `tag` Enter a tag (ASN number) to specify an import route target for importing routes from another VRF.
  
  To import leaked routes from another VRF, use the same ASN number that is specified as the export route target at the source VRF.
  
  - `route-map-name` Enter the name of the route-map to filter the imported routes.

**NOTE:** Use the `route-map` attribute while importing routes from the global RTM. Route-maps allow you to filter routes at the import end based on the matching criteria that you define in the `route-map`.

**Command Modes**

- `CONFIGURATION`
- `VRF mode`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500.</td>
</tr>
</tbody>
</table>

**Usage Information**

It is possible to configure multiple import conditions per VRF depending on the exporting VRF. The export-target and import-target support only the match protocol and match prefix-list options. Other options that are configured in the route-maps are ignored.
ipv6 route-export

Enables route leaking between VRFs. This command exports or shares IPv6 routes corresponding to one VRF with other nondefault VRFs.

Syntax
ipv6 route-export tag [route-map-name]

Parameters
- route-export: Enter the keywords route-export to leak or share routes between VRFs.
- tag: Enter a tag (ASN number) as the export route target to expose routes to other VRFs. This tag acts as an identifier for exported routes. Use this identifier while importing these routes into another nondefault VRF.
- route-map-name: (Optional) Enter the name of the route-map to filter the exported routes. You can leak global routes to be made available to VRFs. As the global RTM usually contains a large pool of routes, when the destination VRF imports global routes, these routes are duplicated into the VRF’s RTM. It is mandatory to use route-maps to filter out leaked routes while sharing global routes with VRFs.

Defaults
N/A

Command Modes
- VRF mode
- CONFIGURATION mode

<td>Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500.</td>
</tr>
</tbody>
</table>

Usage Information
To export all the routes corresponding to a source VRF, use the ip route-export tag command without specifying the route-map attribute. This action exposes source VRF routes to other VRFs, which then import these routes using the ip route-import tag command.

In Dell EMC Networking OS, you can configure one route-export per VRF as you can only expose one set of routes for leaking. However, you can configure multiple route-import targets because a VRF can accept routes from multiple VRFs.
You can expose a unique set of routes from the source VRF for leaking to other VRFs. When two VRFs leak or export routes, there is no option to discretely filter leaked routes from each source VRF. For example, you cannot import one set of routes from one VRF and another set of routes from another VRF.

Only active routes are eligible for leaking. For example, if one VRF has two routes corresponding to BGP and OSPF, in which the BGP route is not active, the OSPF route takes precedence over BGP. Even though the target VRF has specified filtering options to match BGP, the BGP route is not leaked as that route is not active in the source VRF.

Related Commands

- ipv6 route-import – imports IPv6 routes from another VRF.

**ipv6 route-import**

Imports IPv6 routes that another VRF leaks using the tag that VRF specifies during export of these routes.

**Syntax**

ipv6 route-import tag [route-map-name]

**Parameters**

- `route-import` Enter the keywords `route-import` to import IPv6 routes into the VRF.
- `tag` Enter a tag (ASN number) to specify an import route target for importing routes from another VRF. To import leaked routes from another VRF, use the same ASN number that is specified as the export route target at the source VRF.
- `route-map-name` Enter the name of the route-map to filter the imported routes.

**NOTE:** Use the `route-map` attribute while importing routes from the global RTM. Route-maps allow you to filter routes at the import end based on the matching criteria that you define in the `route-map`.

**Defaults**

N/A

**Command Modes**

- VRF mode
- CONFIGURATION mode

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
It is possible to configure multiple import conditions per VRF depending on the exporting VRF.

The export-target and import-target support only the match the protocol and prefix-list options. Other options that you configure in the route-maps are ignored.

Related Commands

- ipv6 route-export — exports IPv6 routes to another VRF.

match source-protocol

Specify matching source-protocol criteria while exporting or importing routes.

Syntax

```
match source-protocol {bgp | isis | ospf | connected | static}
```

Parameters

bgp
Enter the keyword bgp to leak or share routes corresponding to the BGP protocol.

isis
Enter the keyword isis to leak or share routes corresponding to the ISIS protocol.

ospf
Enter the keyword ospf to leak or share routes corresponding to the OSPF protocol.

connected
Enter the keyword connected to leak or share connected routes corresponding to the VRF.

static
Enter the keyword static to leak or share static routes corresponding to the VRF.

Command Modes

ROUTE MAP MODE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information

Specify the matching criteria only after defining a route-map. Before using this command, you must enter Route Map mode using the route-map route-map-name command. The match criteria that you specify is associated with the route-map that you define.

The export-target and import-target options support only the match protocol and match prefix-list options. Other options that you configure in the route-maps are ignored.

Related Commands

- ipv6 route-import — imports IPv6 routes from another VRF.
**redistribute**

Redistributes leaked or exported routes corresponding to specific protocols.

**Syntax**

```
redistribute {imported-bgp | import-ospf | import-isis}
```

**Parameters**

- **imported-bgp**
  - Enter the keywords `imported-bgp` to redistribute leaked routes that are learned using the BGP protocol.

- **imported-ospf**
  - Enter the keywords `imported-ospf` to redistribute leaked routes that are learned using the OSPF protocol.

- **imported-isis**
  - Enter the keywords `imported-isis` to redistribute leaked routes that are learned using the ISIS protocol.

- **route-map**
  - Enter the name of the route-map to specify the filtering criteria for imported routes.

**Command Modes**

`CONFIGURATION`

</tbody>
</table>

### Usage Information

When you use this command, the management ports corresponding to both the active unit and the standby unit are associated with the management VRF.

### maximum dynamic-routes

Specify the maximum number of dynamic (protocol) routes a VRF can have.

#### Syntax

```
maximum dynamic-routes limit {warn-threshold threshold-value | warning-only}
```

To remove the limit on the maximum number of routes used, use the `no maximum dynamic-routes` command.

#### Parameters

- **limit**
  - Maximum number of routes allowed in a VRF. The valid range is from 1 to 16,000 (or maximum allowable for that platform if a smaller value).

- **warn-threshold**
  - The warning threshold value is a percentage of the limit value. When the number of routes reaches the specified percentage of the limit, a warning message appears. The valid range is from 1 to 100.
  - After the limit is reached, additional dynamic routes are not allowed.

- **warning-only**
  - When you use the `warning-only` option, when the maximum number of dynamic routes reaches the limit, a warning message appears.
  - After the limit is reached, additional dynamic routes are still allowed.

#### Defaults

No limit is set on the maximum number of dynamic routes for a VRF.

#### Command Modes

- CONFIGURATION-VRF
**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

If you do not specify the maximum route limit for a VRF, the VRF has unlimited space that extends to the maximum number of entries allowed for the system.

**show ip vrf**

Displays information corresponding to the VRFs that you configure in the system.

**Syntax**

```plaintext
show ip [vrf vrf-name]
```

**Parameters**

- **vrf vrf-name** Enter the keyword `vrf` then the name of the VRF to display information corresponding to that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the S-Series and Z9000.</td>
</tr>
</tbody>
</table>

### Usage Information

This command displays information from the running-config corresponding to either a specific VRF or all the VRFs in the system.

### Example

```
DellEMC# show run vrf test3
!
ip vrf test3
description "Banking Customer Chennai"
DellEMC#
```
VLT Proxy Gateway

The virtual link trucking (VLT) proxy gateway feature allows a VLT domain to locally terminate and route L3 packets that are destined to a Layer 3 (L3) endpoint in another VLT domain. Enable the VLT proxy gateway using the link layer discover protocol (LLDP) method or the static configuration. For more information, see the Command Line Reference Guide.

Topics:
- proxy-gateway lldp
- proxy-gateway static
- remote-mac-address exclude-vlan
- peer-domain-link port-channel exclude-vlan
- proxy-gateway peer-timeout
- vlt-peer-mac transmit
- show vlt-proxy-gateway

proxy-gateway lldp

Enables the proxy-gateway feature using the LLDP protocol.

Syntax

[no] proxy-gateway lldp

Command Modes

VLT DOMAIN

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version | Description
---|---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.4(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000.

Usage Information

The configuration is cached and sent to LLDP only in one of the following conditions:

1. The port-channel connecting the two VLT domains, across the DC, is a VLT LAG.
2. The `protocol lldp` command is globally enabled.
The proxy-gateway LLDP configuration is applied.

Example

DellEMC(conf)# vlt-domain 1
DellEMC(conf-vlt-domain)# proxy-gateway lldp
DellEMC(conf-vlt-domain)#

proxy-gateway static

Enables the proxy-gateway feature using static configurations.

Syntax

[no] proxy-gateway static

Command Modes

VLT DOMAIN

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S4810, S4820T, S6000, Z9000.</td>
</tr>
</tbody>
</table>

Usage Information

When you add a proxy-gateway static configuration, the setting is saved in the Layer 2 module. When you remove the static proxy gateway configuration, each proxy-gateway static MAC configured is deleted from the Layer 2 module.

Example

DellEMC(conf)# vlt-domain 1
DellEMC(conf-vlt-domain)# proxy-gateway static
DellEMC(conf-vlt-domain)#

remote-mac-address exclude-vlan

Configure the proxy-gateway static entry and exclude a VLAN or a range of VLANs from proxy routing.

Syntax

[no] remote-mac-address mac-address [exclude-vlan vlan-range]

Parameters

- remote-mac-address: Specify the mac-addresses of the VLT peers which are in the remote VLT domain.
Enter the VLAN IDs in which proxy gateway is not needed. The VLANs are excluded from doing proxy gateway. The value can be a single VLAN ID, comma-separated VLAN IDs, a range of VLAN IDs, or a combination. For example:

Comma-separated: 3, 4, 6
Range: 5-10
Combination: 3, 4, 5-10, 8

**Command Modes**
- VLT DOMAIN PROXY GW STATIC

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S4810, S4820T, S6000, and Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**
You can configure the MAC address of a VLT peer in a remote VLT domain to associate with the static VLT proxy gateway and exclude a VLAN, or a range of VLANs, from proxy routing.

**Example**
```
DellEMC(conf)# vlt-domain 1
DellEMC(conf-vlt-domain)# proxy-gateway static
DellEMC(conf-vlt-domain-proxy-gw-static)# remote-mac-address 00:01:e8:06:95:ac
DellEMC(conf-vlt-domain-proxy-gw-static)# exclude-vlan 3
DellEMC(conf-vlt-domain-proxy-gw-static)#
```

**peer-domain-link port-channel exclude-vlan**

Configure the VLT port channel, which is connected to the remote VLT domain, for the proxy gateway or configure the VLANs you want to exclude from VLT proxy gateway.

**S4048-ON**

**Syntax**
```
[no] peer-domain-link port-channel interface-identifier exclude-vlan vlan-range
```

**Parameters**
- **port-channel**: Configure the proxy-gateway interface port-channel.
- **interface-identifier**: Enter the interface type.
**vlan-range**

Enter the VLAN IDs that you want to exclude from the proxy gateway. The value can be a single VLAN ID, comma-separated VLAN IDs, a range of VLAN IDs, or a combination. For example:

- Comma-separated: 3, 4, 6
- Range: 5-10
- Combination: 3, 4, 5-10, 8

**Command Modes**

VLT DOMAIN PROXY GW LLDP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S4810, S4820T, S6000, and Z9000.</td>
</tr>
</tbody>
</table>

**Usage Information**

You must configure the VLT port channel interface which is connecting to the remote VLT domain as peer-domain-link. You can also configure the VLANs you want to exclude from the VLT proxy gateway.

**Example**

```
DellEMC(conf)#vlt-domain 1
DellEMC(conf-vlt-domain)#proxy-gateway lldp
DellEMC(conf-vlt-domain-proxy-gw-lldp)#peer-domain-link port-channel 20
DellEMC(conf-vlt-domain-proxy-gw-lldp)#exclude-vlan 3
```

**proxy-gateway peer-timeout**

Enables the VLT node to timeout the transmission of the peer MAC address when the VLT peer is down.

**Syntax**

```
[no] peer-timeout value
```

**Parameters**

value

Enter the timeout value (in seconds). The range is from 1 to 65535. The default is `infinity`.

**Default**

Infinity

**Command Modes**

VLT DOMAIN PROXY GW LLDP
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Removed the default value on the S-Series and Z-Series.</td>
</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S4810, S4820T, S6000, Z9000, and MXL Switch.</td>
</tr>
</tbody>
</table>

### Usage Information

When a VLT peer goes down, the local VLT node stops sending its peer's MAC address. If you configure this timeout, the local VLT node sends its peer's MAC address until the timer expires.

Use this timer when you enable `vlt-peer-mac transmit`. A typical use example is a square VLT topology with a single link connecting to the remote peers.

### Example

```
DellEMC(conf-vlt-domain-proxy-gw-lldp)# peer-timeout 5
```

---

**vlt-peer-mac transmit**

Enables the device to transmit the peer MAC address along with its own MAC address in LLDP TLV packets to the remote VLT domain.

---

**S4048-ON**

### Syntax

```
[no] vlt-peer-mac transmit
```

### Command Modes

VLT DOMAIN PROXY GW LLDP

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**show vlt-proxy-gateway**

Displays the VLT proxy gateway configuration.

**S4048–ON**

**Syntax**

```
show vlt-proxy-gateway [info] {lldp | static}
```

**Parameters**

- `lldp` Enter the keyword `lldp` to display details about the LLDP VLT proxy gateway configuration.
- `static` Enter the keyword `static` to display details about the static VLT proxy gateway configuration.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.4(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000.
The proxy-gateway feature may go operationally down for any of the following reasons:

- LLDP is globally disabled.
- LDP is disabled per port.
- VLT port-channel is down.
- LLDP neighbor is down.

If any of these conditions is true, the proxy-gateway feature could be operationally down. If so, it is shown in the `show` command output.

When more than one VLT port-channel terminates on the same ToR, the `show VLT proxy-gateway info lldp` command output may show the port-channel ID incorrectly.

### Example

```plaintext
DellEMC#show vlt proxy-gateway
VLT Proxy Gateway Brief
-------------------------
Config Mode:                  LLDP
Global LLDP Config Status:    Enabled

-----------           ------------
00:01:e8:8a:e8:f7     3,7-8
00:01:e8:8b:1c:c0     3,7-8

DellEMC#show vlt proxy-gateway info lldp
LagId Mac Address     Exclude Vlan
----- -----------     ------------
Po 55 00:01:e8:8a:e8:f7 3,7-8 << Macs learnt via port-channel 55
Po 55 00:01:e8:8b:1c:c0 3,7-8
```
Virtual Link Trunking (VLT)

Virtual link trunking (VLT) allows physical links between two chassis to appear as a single virtual link to the network core. VLT eliminates the requirement for Spanning Tree protocols by allowing link aggregation group (LAG) terminations on two separate distribution or core switches, and by supporting a loop-free topology.

VLT provides Layer 2 multipathing, creating redundancy through increased bandwidth and enabling multiple parallel paths between nodes and load-balancing traffic where alternative paths exist.

**NOTE:** When you launch the VLT link, the VLT peer-ship is not established if any of the following is TRUE:

- The VLT System-MAC configured on both the VLT peers do not match.
- The VLT Unit-Id configured on both the VLT peers are identical.
- The VLT System-MAC or Unit-Id is configured only on one of the VLT peers.
- The VLT domain ID is not the same on both peers.

If the VLT peer-ship is already established, changing the System-MAC or Unit-Id does not cause VLT peer-ship to go down.

Also, if the VLT peer-ship is already established and the VLT Unit-Id or System-MAC are configured on both peers, then changing the CLI configurations on the VLT Unit-Id or System-MAC is rejected if any of the following become TRUE:

- After making the CLI configuration change, the VLT Unit-Id becomes identical on both peers.
- After making the CLI configuration change, the VLT System-MAC do not match on both peers.

When the VLT peer-ship is already established, you can remove the VLT Unit-Id or System-MAC configuration from either or both peers. However, removing configuration settings can cause the VLT ports to go down if you configure the Unit-Id or System-MAC on only one of the VLT peers.

Topics:

- back-up destination
- clear vlt statistics
- delay-restore
- delay-restore abort-threshold
- lacp ungroup member-independent
- multicast peer-routing timeout
- peer-link port-channel
- peer-routing
- peer-routing-timeout
- primary-priority
- show vlt brief
- show vlt backup-link
- show vlt counters
- show vlt detail
- show vlt inconsistency
- show vlt mismatch
back-up destination

Configure the IPv4 or IPv6 address of the management interface on the remote VLT peer used as the VLT backup link endpoint for sending out-of-band (OOB) hello messages.

Syntax
back-up destination {{ipv4-address} | [ipv6 ipv6-address] [interval seconds] vrf [management vrf-name | vrf-name]}

Parameters
- **ipv4-address**: Enter the IPv4 address of the backup destination.
- **ipv6**: Enter the keyword ipv6 then an IPv6 address in the X:X::X format.
- **interval seconds**: Enter the keyword interval to specify the time interval to send hello messages. The range is from 1 to 5 seconds. The default is 1 second.
- **vrf management vrf-name** (OPTIONAL): Configures the management VRF instance for the backup IPv4 or IPv6 address.
- **vrf vrf-name** (OPTIONAL): Enter the keyword vrf and then the name of the VRF.

Defaults
**1 second**

Command Modes
VLT DOMAIN

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S6010-ON and S4048T-ON.</td>
</tr>
<tr>

</tr>
<tr>
<td>9.2(0.2)</td>
<td>Added support for IPv6.</td>
</tr>
</tbody>
</table>
Following example shows that the VRF management is configured:

```
DellEMC#show ip vrf
VRF-Name                         VRF-ID Interfaces
default                          0      Vl 1
management                       512    Ma 1/1
```

Hence, the back-up destination command must be configured as:

```
DellEMC(conf-vlt-domain)#back-up destination <ip address> vrf management vrf-name
```

clear vlt statistics

Clear the VLT operation statistics.

**Syntax**

```
clear vlt statistics [arp | domain | igmp-snoop | mac | multicast | ndp]
```

**Parameters**

- **domain**: Clear the VLT statistics for the domain.
- **multicast**: Clear the VLT statistics for multicast.
- **mac**: Clear the VLT statistics for the MAC address.
- **arp**: Clear the VLT statistics for ARP.
- **igmp-snoop**: Clear the VLT statistics for IGMP snooping.
- **ndp**: Clear the VLT statistics for NDP.

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### delay-restore

Configure the delay in bringing up VLT ports after reload or peer-link restoration between the VLT peer switches.

**Syntax**

```
delay-restore
```

**Parameters**

- `delay-restore`  
  
  Enter the amount of time, in seconds, to delay bringing up the VLT ports after the VLT device reloads or after the peer-link restores between VLT peer switches. The range from 1 to 1200. The default is **90 seconds**.

**Defaults**

Not configured.

**Command Modes**

- VLT DOMAIN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Related Commands**

- `show vlt statistics` — displays statistics on VLT operations.
### delay-restore abort-threshold

Increase the boot up timer to a value greater than 60 seconds.

**Syntax**  
delay-restore abort-threshold <interval>

To remove the boot up timer value, use the no delay-restore abort-threshold command.

**Parameters**

- **interval**  
  Enter the interval value (in seconds) for the delay restore timer to abort. The range is from 1 to 1800 seconds. The default is **60 seconds**.

This delay restore timer applies only during reload/boot-up and not in other scenarios (for example, during ICL flap).

**Defaults**  
60 seconds

lacp ungroup member-independent

Prevent possible loop during the VLT peer switch bootup or on a device that accesses the VLT domain.

Syntax

lacp ungroup member-independent {vlt | port-channel}

Parameters

- **vlt**
  - Force all VLT LACP members to become switchports.

- **port-channel**
  - Force all LACP port-channel members to become switchports.

Defaults

Not configured.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.2(0.0) Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0 Introduced on the S6000.
9.0.0.0 Introduced on the Z9000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Added port-channel parameter on the S4810.
8.3.8.0 Introduced on the S4810.
Usage Information

LACP on the VLT ports (on a VLT switch or access device), which are members of the VLT, are not brought up until the VLT domain is recognized on the access device.

During boot-up in a stacking configuration, the system must be able to reach the DHCP server with the boot image and configuration image. To receive an offer on static LAGs between switches, only untagged DHCP requests are sent to the DHCP server. Configure the DHCP server to start in BMP mode.

If the switches are connected using LACP port-channels (for example, the VLT peer and top of rack [ToR]), use the port-channel option on the ToR-side configuration to allow member ports of an ungrouped LACP port-channel to inherit VLAN membership of that port channel. This ensures untagged VLT peer device packets reach the DHCP server on the ToR.

To ungroup the VLT and port-channel configurations, use the no lacp ungroup member independent command on a VLT port channel.

If you reboot both VLT peers in BMP mode with static VLT LAGs, the DHCP server reply to the DHCP discover offer may not be forwarded by the ToR to the correct node. To avoid this issue, configure the VLT LAGs to the ToR and the ToR port channel to the VLT peers with LACP.

If supported by the ToR, enable the lacp-ungroup feature on the ToR using the lacp ungroup member-independent port-channel command.

If the lacp-ungroup feature is not supported on the ToR, reboot the VLT peers one at a time. After rebooting, verify that VLTi (ICL) is active before attempting DHCP connectivity.

Ensure that you configure all port channels as hybrid ports and as untagged members of a VLAN where the LACP ungroup option is applicable.

BMP uses untagged dynamic host configuration protocol (DHCP) packets to communicate with the DHCP server.

To disable this feature on VLT and port channels, use no lacp ungroup member-independent {vlt | port-channel} command under the configuration mode.

Example

DellEMC(conf)#lacp ungroup member-independent ?

port-channel  LACP port-channel members become switchports
vlt  All VLT LACP members become switchports

multicast peer-routing timeout

To retain synced multicast routes or synced multicast outgoing interface (OIF) after a VLT peer node failure, configure the timeout value for a VLT node.

Syntax

multicast peer-routing timeout value

To restore the default value, use the no multicast peer-routing timeout command.

Parameters

value  Enter the timeout value (in seconds). The range is from 1 to 1200. The default is 150.

Command Modes  VLT DOMAIN (conf-vlt-domain)
peer-link port-channel

Configure the specified port channel as the chassis interconnect trunk between VLT peers in the domain.

**Syntax**

```
peer-link port-channel port-channel-number {peer-down-vlan vlan id}
```

**Parameters**

- `port-channel-number`
  - Enter the port-channel number that acts as the interconnect trunk. The range is from 1 to 128.
- `peer-down-vlan`
  - Enter the keywords `peer-down-vlan` then a VLAN ID to configure the VLAN that the VLT peer link uses when the VLT peer is down.

**Defaults**

Not configured.

**Command Modes**

VLT DOMAIN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>9.0.2.0</td>
<td>Introduced on the S6000.</td>
</tr>
</tbody>
</table>
Usage Information

To configure the VLAN from where the VLT peer forwards packets received over the VLTi from an adjacent VLT peer that is down, use the peer-down-vlan option. When a VLT peer with bare metal provisioning (BMP) is booting up, it sends untagged DHCP discover packets to its peer over the VLTi. To ensure that the DHCP discover packets are forwarded to the VLAN that has the DHCP server, use this configuration.

**peer-routing**

Enable Layer 3 (L3) VLT peer-routing. This command is applicable for both IPv6 and IPv4 interfaces.

**Syntax**

```
peer-routing
```

To disable L3 VLT peer-routing, use the `no peer-routing` command.

**Defaults**

Disabled.

**Command Modes**

VLT DOMAIN (conf-vlt-domain)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
### peer-routing-timeout

Configure the delay after which peer routing disables when the peer is unavailable. This command is applicable for both IPv6 and IPv4.

**Syntax**
```
peer-routing-timeout value
```

To restore the default value, use the `no peer-routing-timeout` command.

**Parameters**
- **value**: Enter the timeout value (in seconds). The range is from 1 to 65535. The default value is `infinity`.

**Command Modes**
- `VLT DOMAIN (conf-vlt-domain)`

**Default**
Infinity

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

</tr>
</tbody>
</table>

**Usage Information**
When the timer expires, the software checks to see if the VLT peer is available. If the VLT peer is not available, peer-routing disables on that peer.
If you do not configure this delay value, peer-routing is not disabled even when the peer is unavailable.
primary-priority

Assign the priority for master election among VLT peers.

Syntax

[no] primary-priority

Parameters

value

To configure the primary role on a VLT peer, enter a lower value than the priority value of the remote peer. The range is from 1 to 65535. The default value is 32768.

Default

32768

Command Modes

</tbody>
</table>

Usage Information

After you configure a VLT domain on each peer switch and connect (cable) the two VLT peers on each side of the VLT interconnect, the system elects a primary and secondary VLT peer device. To configure the primary and secondary roles before the election process, use the primary-priority command. Enter a lower value on the primary peer and a higher value on the secondary peer.

If the primary peer fails, the secondary peer (with the higher priority) takes the primary role. If the primary peer (with the lower priority) later comes back online, it is assigned the secondary role (there is no preemption).

show vlt brief

Displays summarized status information about VLT domains configured on the switch.

Syntax

show vlt brief
Default
Not configured.

Command Modes
EXEC

Command History
For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information
The version shown in the `show vlt brief` output command displays the VLT version number which is different from the Dell EMC Networking OS version number. VLT version numbers begin with odd numbers.

Example (Brief)
```
DellEMC#show vlt brief
VLT Domain Brief
------------------
Domain ID                     : 1
Role                          : Secondary
Role Priority                 : 32768
ICL Link Status               : Up
HeartBeat Status              : Up
VLT Peer Status               : Up
Version                       : 6(3)
Local System MAC address      : 00:01:e8:8a:e9:91
Remote System MAC address     : 00:01:e8:8a:e9:76
Remote system version         : 6(3)
Delay-Restore timer           : 90 seconds
Delay-Restore Abort Threshold : 60 seconds
Peer-Routing                  : Disabled
Peer-Routing-Timeout timer    : 0 seconds
Multicast peer-routing timeout: 150 seconds
DellEMC#
```

**show vlt backup-link**

Displays information about the backup link operation.

Syntax
```
show vlt backup-link
```
show vlt backup-link

Displays counter information.

Syntax
show vlt counters [arp | igmp-snoop | interface | mac | ndp]

Parameters
arp
Enter the keyword arp to display the ARP counter information for the VLT.

igmp-snoop
Enter the keywords igmp-snoop to display the igmp-snooping counter information for the VLT.

interface
Enter the keyword interface to display the interface counter information for the VLT.

mac
Enter the keyword mac to display the MAC address counter information for the VLT.

ndp
Enter the keyword ndp to display the VLT counter information for NDP.
Default
Not configured.

Command Modes
EXEC

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information
If you do not add a parameter such as `arp` or `mac`, the output displays all the counters.

Example
```
DellEMC# show vlt counter
Total VLT counters
-------------------------
L2 Total MAC-Address Count :
IGMP MRouter Vlans count :
IGMP Mcast Groups count :
ARP entries count :
```

Example (igmp-snoopy)
```
DellEMC# show vlt counter igmp-snoopy
Total IGMP VLT counters
----------------------
IGMP MRouter Vlans count : 1
IGMP Mcast Groups count : 5
```

Example (igmp-snoopy interface port-channel)
```
DellEMC# show vlt counter igmp-snoopy interface port-channel 2
VLT Port-ID: 2 IGMP Counter
----------------------
IGMP MRouter Vlans count : 0
IGMP Mcast Groups count : 5
```

Example (NDP and Non-VLT ARP)
```
DellEMC# show vlt counters
Total VLT Counters
```
show vlt detail

Displays detailed status information about VLT domains configured on the switch.

Syntax

    show vlt detail

Default

Not configured.

Command Modes

    EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

System MAC address: 00:01:e8:8a:df:bc
System Role Priority: 32768
Local System MAC address: 00:01:e8:8a:df:e6
Local System Role Priority: 32768
```

**show vlt statistics**

Displays VLT operations statistics.

**Syntax**

```
show vlt statistics [arp | domain | igmp-snoop | mac | multicast | ndp]
```

**Parameters**

- **arp**
  Enter the keyword arp to display the ARP VLT statistics.

- **domain**
  Enter the keyword domain to display the domain VLT statistics.
Enter the keywords `igmp-snoop` to display the IGMP snooping VLT statistics.

Enter the keyword `mac` to display the VLT MAC addresses VLT statistics.

Enter the keyword `multicast` to display the multicast VLT statistics.

Enter the keyword `ndp` to display the NDP VLT statistics.

Default

Not configured.

</tr>
</tbody>
</table>
When you create a VLT domain on a switch, the Dell EMC Networking OS automatically creates a VLT-system MAC address used for internal system operations.

To reconfigure the default MAC address for the domain, use the `system-mac` command. The MAC address must be in the `nn:nn:nn:nn:nn:nn` format. Also reconfigure the same MAC address on the VLT peer switch.

### unit-id

Configure the default unit ID of a VLT peer switch.

**Syntax**

```
unit-id [0 | 1]
```

**Parameters**

- `0 | 1` Configure the default unit ID of a VLT peer switch. Enter 0 for the first peer. Enter 1 for the second peer.

**Defaults**

Automatically assigned based on the MAC address of each VLT peer. The peer with the lower MAC address is assigned unit 0; the peer with the higher MAC address is assigned unit 1.

**Command Modes**

VLT DOMAIN

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tr>
<td>8.3.8.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

When you create a VLT domain on a switch, the Dell EMC Networking OS automatically assigns a unique unit ID (0 or 1) to each peer switch. The unit IDs are used for internal system operations. To explicitly configure the unit ID of a VLT peer, use the `unit-id` command. Configure a different unit ID (0 or 1) on each peer switch.

This command minimizes the time required for the VLT system to determine the unit ID assigned to each peer switch when one peer reboots.
vlt domain

Enable VLT on a switch, configure a VLT domain, and enter VLT-Domain Configuration mode.

Syntax

vlt domain domain-id

Parameters
domain-id

Enter the domain ID number. Configure the same domain ID on the peer switch. The range of domain IDs is from 1 to 1000.

Command Modes
CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.2(0.0) Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.
9.0.2.0 Introduced on the S6000.
9.0.0.0 Introduced on the Z9000.
8.3.19.0 Introduced on the S4820T.
8.3.8.0 Introduced on the S4810.

Usage Information
The VLT domain ID must be the same between the two VLT devices. If the domain ID is not the same, a syslog message generates and VLT does not launch.

Related Commands
• show vlt brief — display the delay-restore value.

vlt-peer-lag port-channel

Associate the port channel to the corresponding VLT peer port channel for the VLT connection to an attached device.

Syntax

vlt-peer-lag port-channel id-number

Parameters
id-number

Enter the respective VLT port-channel number of the peer device. The range is from 1 to 128.

Defaults
Not configured.
show vlt private-vlan

Display the private VLAN (PVLAN) associated with the VLT LAG for VLT peer nodes.

Syntax: show vlt private-vlan

Command Modes: EXEC

Command History: This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Usage Information: If you add an ICL or VLTi link as a member of a primary VLAN, the ICL becomes a part of the primary VLAN and its associated secondary VLANs, similar to the behavior for normal trunk ports. VLAN symmetry is not validated if you associate an ICL to a PVLAN.
Similarly, if you dissociate an ICL from a PVLAN, although the PVLAN symmetry exists, ICL is removed from that PVLAN. The **ICL Status** field displays the type of VLAN port of the VLTi link configured in a PVLAN.

**clear mac-address-table dynamic**

Clear the MAC address table of specific or all MAC address learned dynamically.

**Syntax**

```
clear mac-address-table dynamic {vxlan {interface interface-type | remote-vtep-ip ip-address | vnid vnid} | all | interface | vlan | vxlan}
```
clear vxlan vxlan-instance statistics

Clear the remote VTEP and access port statistics.

Syntax

    clear vxlan vxlan-instance instance ID statistics

Parameters

    instance ID  Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.

Command Modes

    EXEC Privilege

Command History

    This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide

    Version  Description
    --  -------------------------------------------------
    9.11(0.0)  Introduced on the S4048–ON, S4048T-ON, S6000–ON, S6010–ON, S6100–ON, and Z9100–ON.

Usage Information

    Use this command to clear the remote VTEP and access port statistics.
**controller**

Configures controller for the VXLAN instance on the platform.

**Syntax**

```plaintext
controller controller ID ip address port port-number tcp|ssl
```

**Parameters**

- **controller ID**
  - Enter the controller ID.

- **ip address**
  - Enter the IP address of the controller.

- **port port-number**
  - (OPTIONAL) Enter the keyword `port` and the port number.
  - The range is from 1 to 6632. The default port number is 6632.

- **tcp**
  - (OPTIONAL) Enter the keyword `tcp` to configure tcp connection to controller.

- **ssl**
  - (OPTIONAL) Enter the keyword `ssl` to configure ssl connection to controller (Default).

**Defaults**

Disabled

**Command Modes**

VXLAN INSTANCE

fail-mode

Configures fail-mode on the platform.

Syntax
fail-mode secure

To disable the fail-mode secure, use the no fail-mode secure command.

Parameters
secure

Enter the keyword secure to delete all its database and hardware flows/resources, when the VTEP loses connectivity with the controller.

Defaults
non secure

**Related Commands**

- `vxlan-instance` — Enable VXLAN Instance configuration on the platform.

**local-vtep-ip**

Set the local IP Address to be used as the source IP for VXLAN tunnels.

**Syntax**

```
local-vtep-ip IP Address
```

To disable the settings, use the `no local-vtep-ip` command.
Parameters

**IP Address**
Enter the local IP Address to be used as a source for VXLAN tunnels.

Defaults

None.

Command Modes

VXLAN INSTANCE

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Usage Information

Use the **local-vtep-ip IP Address** command to set the local IP Address that would be used as source for VXLAN tunnels.

**max_backoff**

Configures time to wait between connection attempts with controller.

**Syntax**

```
max_backoff time
```

**Parameters**

- **time**
  - Enter the time in milliseconds. The range is from 1000-180000. The default value is 30000.

**Defaults**

30000

**Command Modes**

VXLAN INSTANCE

**Command History**

</tbody>
</table>

**Usage Information**

The retry interval value caps at the value configured on the max-backoff.

**Related Commands**

- `vxlan-instance` — Enable VXLAN Instance configuration on the platform.

**peer-ovsdbserver-ip**

Specify the IP address of the peer OVSDB server in a VLT setup.

**Syntax**

```
peer-ovsdbserver-ip peer-ip-address
```
To remove the configuration, use the `no peer-ovsdbserver-ip` command.

**Parameters**

- **peer-ip-address**: Enter the peer OVSDB server IP address. This is usually the management IP address of the peer VLT device.

**Defaults**

Not configured

**Command Modes**

VXLAN-INSTANCE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**remote-vtep-ip**

Create a remote VTEP and associate it to specified VNIDs.

**Syntax**

```
remote-vtep-ip IP Address vni-profile profile name
```

To delete the remote VTEP, use the `no remote-vtep-ip` command.

**Parameters**

- **IP Address**: Enter the IP Address of the remote VTEP.
- **vni-profile**: Enter the keyword `vni-profile` followed by the `profile name` to which the remote VTEP has to be associated.

**Defaults**

None.

**Command Modes**

VXLAN-INSTANCE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

Use this command to associate a specific VNID to a remote VTEP. Provide a valid profile name while associating to the remote VTEP.

**NOTE**: The remote VTEP IP Address cannot be any of the local IP Addresses configured in the switch.

**vnid**

Associate a range of VNID numbers to a specific VNI profile.

**Syntax**

```
vnid VNID-Range
```
To remove the association, use the `no vnid` command.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>

</table>

Introduced on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON.

**Usage Information**

Use this command to create a VNI profile with a unique profile name to associate with remote VTEP. You can create a maximum of 1024 VNI profiles and remote VTEP IPs.

You can use this command only when you configure static VXLAN.

---

**vxlan-instance**

Enable VXLAN Instance configuration on the platform.

**Syntax**

```
vxlan-instance instance ID [nsx | nuage | static]
```

---

Virtual Extensible LAN (VXLAN) 1969
To delete vxlan-instance from the system, use no vxlan-instance instance ID command.

**Parameters**

- **instance ID**
  - Enter the VXLAN instance ID. The platform supports only the instance ID 1.

- **nsx**
  - Enter the keyword nsx to connect to an NSX controller.

  **NOTE:** When no keyword is specified, the nsx option is applied.

- **nuage**
  - Enter the keyword nuage to connect to a Nuage controller.

- **static**
  - Enter the keyword static to configure static VXLANs.

**Defaults**

Disabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>

<td>Introduced on the S6000-ON.</td>
</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S6000.</td>
</tr>
</tbody>
</table>

**Usage Information**

You must configure VXLAN globally before using VXLAN-instance. Use the no shutdown command to enable the VXLAN instance.

**Example**

Enable VXLAN instance:

```
DellEMC(conf)#int 1/5/1
DellEMC(conf-if-te-1/5/1)#vxlan-instance 1
DellEMC(conf-if-te-1/5/1-vxlan-inst-1)#no shutdown
```

Disable VXLAN instance:

```
DellEMC(conf)#no vxlan-instance 1
```

**Related Commands**

- **feature vxlan** — Enable VXLAN configuration globally on the platform.

**vxlan-instance (VAP)**

To configure a VXLAN-Access Port (VAP) in to VXLAN-instance

**Syntax**

```
vxlan-instance instance ID
```

1970  Virtual Extensible LAN (VXLAN)
To unconfigure VAP, use the no vxlan-instance 1 command.

**Parameters**

- **instance ID**
  
  Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.

**Defaults**

- Disabled

**Command Modes**

- INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S6000.</td>
</tr>
</tbody>
</table>

**Usage Information**

You must disable vxlan-instance before unconfiguring VAP.

**Related Commands**

- feature vxlan — Enable VXLAN configuration globally on the platform.

---

### vxlan-instance loopback

Provision VXLAN and non-VXLAN loopback ports that support routing in and out of VXLAN tunnels and enable MAC level loopback on all these ports.

**Syntax**

```plaintext
vxlan-instance instance ID loopback [port-channel id]
```

**Parameters**

- **instance ID**
  
  Enter the VXLAN instance ID. The platform supports only the instance ID 1.

- **port-channel id**
  
  (Optional) Enter the keyword port-channel and the port-channel ID to provision VXLAN and non-VXLAN loopback ports that support routing in and out of VXLAN tunnels.

**Defaults**

- Disabled.

**Command Modes**

- PORT CHANNEL CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.14(0.0)</td>
<td>Updated to enable MAC level loopback.</td>
</tr>
<tr>
<td>9.13(0.0)</td>
<td>Introduced on the S4048T-ON, S4048-ON, S6010-ON, S6000-ON, S6100-ON, S6000, and Z9100-ON.</td>
</tr>
</tbody>
</table>

**Usage Information**

You must configure VXLAN globally before using VXLAN-instance. Use the no shutdown command to enable the VXLAN instance.
Example

External Loopback:

DellEMC(conf-if-po-127)#sho c
! interface Port-channel 127
   vxlan-instance 1 loopback

Internal Loopback:

DellEMC(conf-if-te-1/2/2/3)#sho c
! interface TenGigabitEthernet 1/2/2/3
description connected IXIA card 1 port 14
   vxlan-instance 1

Disable VXLAN Instance:

DellEMC(conf)#no vxlan-instance 1

Related Commands

feature vxlan — Enable VXLAN configuration globally on the platform.

vnid

Associate a range of VNID numbers to a specific VNI profile.

Syntax

vnid VNID-Range

To remove the association, use the no vnid command.

Parameters

VNID-Range Enter the range of VNIDs that need to be members of the specific VNI profile. The range is from 1 to 16777215.

Defaults

None.

Command Modes

VNI-PROFILE

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.11(0.0) Introduced on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON.

Usage Information

Use this command to associate the specified range of VNIDs to a VNI profile.

vni-profile

Create a VNI profile to associate with remote VTEP configuration.

Syntax

vni-profile profile name

To delete the VNI profile, use the no vni-profile command.
### Parameters

| **profile name** | Enter a valid and unique profile name. The profile name can have a maximum of 32 characters. |

### Defaults

None

### Command Modes

VXLAN-INSTANCE

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<table>
<thead>
<tr>
<th><strong>Version</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11(0.0)</td>
<td>Introduced on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON.</td>
</tr>
</tbody>
</table>

### Usage Information

Use this command to create a VNI profile with a unique profile name to associate with remote VTEP. You can create a maximum of 1024 VNI profiles and remote VTEP IPs.

You can use this command only when you configure static VXLAN.

---

### vxlan-instance static

Enable VXLAN instance configuration to be static on the platform.

**Syntax**

```
vxlan-instance instance ID [static]
```

To delete VXLAN instance from the system, use `no vxlan-instance instance ID` command.

**Parameters**

- **instance ID**: Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.
- **static**: Enter the keyword `static` to set the VXLAN instance in static mode.

**Defaults**

Controller mode.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<table>
<thead>
<tr>
<th><strong>Version</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11(0.0)</td>
<td>Introduced on the S4048-ON, S4048T-ON, S6000-ON, S6010-ON, S6100-ON, and Z9100-ON.</td>
</tr>
</tbody>
</table>

**Usage Information**

By default, VXLAN instance is created in controller mode. You need a controller to configure VTEP. When you create VXLAN instance in static mode, you can configure VTEP through CLIs.

Use the `no shutdown` command to enable the VXLAN instance.

Only one VXLAN instance can exist in a system.
You cannot modify a VXLAN instance mode. If you need to change the mode, you can delete the existing VXLAN instance and create a new instance with the required mode.

Example

Enable VXLAN instance:

DellEMC(conf)#feature vxlan
DellEMC(conf)#vxlan-instance 1 static
DellEMC(conf-vxlan-inst-1)#no shutdown

Disable VXLAN instance:

DellEMC(conf)#no vxlan-instance 1 static

vxlan-vnid

Associate VNID to VLAN.

Syntax

vxlan-vnid VNID

To remove the association, use the no vxlan-vnid command.

Parameters

VNID

Enter the logical network identifier.

Defaults

None

Command Modes

INTERFACE VLAN

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11(0.0)</td>
<td>Introduced on the S4048, S4048T, S6000, S6010, S6100, and Z9100.</td>
</tr>
</tbody>
</table>

Usage Information

Use this command to associate a VNID to specific VLAN. Each VLAN is mapped to a single VNID.

show running-config vxlan

Displays the VXLAN configuration information from running configuration.

Syntax

show running-config vxlan

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>
### show vxlan vxlan-instance

Displays information related to Network Virtualization Overlay (NVO) Gateway.

**Syntax**

```
show vxlan vxlan-instance instance ID
```

**Parameters**

- **instance ID**
  
  Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

### Related Commands

- `vxlan-instance` - Enable VXLAN Instance configuration on the platform.

### Example

#### Static Mode:

```
DellEMC#show running-config vxlan
!
feature vxlan
!
vxlan-instance 1 static
local-vtep-ip 1.1.1.1
no shutdown
vni-profile nil
vnid 1
remote-vtep-ip 2.2.2.2 vni-profile nil
``` 

#### Controller Mode:

```
DellEMC#show running-config vxlan
!
feature vxlan
!
vxlan-instance 1
gateway-ip 3.3.3.3
fail-mode secure
controller 1 192.168.122.6 port 6632 ssl
no shutdown
``` 

### Version Description

- **9.10(0.1)**
  
  Introduced on the S6010-ON and S4048T-ON.

- **9.10(0.0)**
  
  Introduced on the S6100-ON.

- **9.10(0.1P10)**
  
  Introduced on the Z9100-ON.

- **9.8(0.0)**
  
  Introduced on the S4048-ON.

- **9.7(0.0)**
  
  Introduced on the S6000-ON.

- **9.4(0.0)**
  
  Introduced on the S6000.
**Example**

```bash
DellEMC# show vxlan vxlan-instance 1
Instance : 1
Admin State : enabled
Management IP : 192.168.200.200
Gateway IP : 3.3.3.3
MAX Backoff : 30000
Controller 1 : 192.168.122.6:6632 ssl (connected)
Fail Mode : secure
Port List :
  Fo 1/49    Te 1/16   Te 1/20   Po 2
```

**Related Commands**

- `vxlan-instance` - Enable VXLAN Instance configuration on the platform.

---

**show vxlan vxlan-instance logical-network**

Displays logical network information related to Network Virtualization Overlay (NVO) Gateway.

**Syntax**

```bash
show vxlan vxlan-instance instance ID logical-network [name name]
```

**Parameters**

- `instance ID`  
  Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.

- `name name`  
  (OPTIONAL) Enter the keyword `name` and enter the name of VXLAN logical network up to a length of maximum 30 characters.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

### show vxlan vxlan-instance physical-locator

Displays physical locators related to Network Virtualization Overlay (NVO) Gateway.

**Syntax**

```
show vxlan vxlan-instance instance ID physical-locator [vtep-ip A.B.C.D]
```

**Parameters**

- **instance ID**
  - Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.
- **A.B.C.D**
  - Enter the IP address of the VTEP.

**Defaults**

Disabled

**Command Modes**

VXLAN INSTANCE

**Command History**

Virtual Extensible LAN (VXLAN)

### show vxlan vxlan-instance statistics interface

Displays the port VLAN statistics information related to Network Virtualization Overlay (NVO) Gateway.

**Syntax**

```plaintext
show vxlan vxlan-instance instance ID statistics interface interface VLAN-ID
```

**Parameters**

- **instance ID**
  
  Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.

- **interface**
  
  Enter the following keywords and the interface information:
  
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a Port Channel, enter the keywords port-channel.

- **VLAN-ID**
  
  Enter the VLAN ID.

**Defaults**

Enabled

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Example**

```
DellEMC#show vxlan vxlan-instance 1 statistics interface fortyGigE 1/49 100
Port : Fo 1/49 Vlan : 100
Rx Packets : 13
Rx Bytes : 1317
Tx Packets : 13
```
show vxlan vxlan-instance statistics remote-vtep-ip

Displays VXLAN statistics for a specific VXLAN tunnel.

Syntax

```
show vxlan vxlan-instance instance ID statistics remote-vtep-ip IP Address
```

Parameters

- **instance ID**
  - Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.
- **remote-vtep-ip**
  - Enter the keyword `remote-vtep-ip` followed by the `IP Address` of the remote VTEP.

Command Modes

- EXEC
- EXEC Privilege

Example

```
DellEMC# show vxlan vxlan-instance 1 statistics remote-vtep-ip 1.1.1.1
Statistics for Remote-vtep-ip : 1.1.1.1
Unicast:
Rx Packets : 0
Rx Bytes : 0
Tx Packets : 0
Tx Bytes : 0
Non-Unicast:
Tx Packets : 0
Tx Bytes : 0
```

show vxlan vxlan-instance unicast-mac-local

Displays the information of the local unicast MAC associated with the logical network related to Network Virtualization Overlay (NVO) Gateway.

Syntax

```
show vxlan vxlan-instance instance ID unicast-mac-local [logical-network name | vnid VNID]
```

Parameters

- **instance ID**
  - Enter the VXLAN instance ID. The platform supports only the instance ID 1 in the initial release.
- **name**
  - (Optional) Enter the name of VXLAN logical network with a maximum length of 30 characters.
vnid VNID  (Optional) Enter the keyword vnid and enter the ID of the VXLAN. The range is from 1 to 16777215.

Command Modes  
• EXEC 
• EXEC Privilege

Virtual Router Redundancy Protocol (VRRP)

Virtual router redundancy protocol (VRRP) is supported by the Dell EMC Networking OS.

Topics:
- IPv4 VRRP Commands
- IPv6 VRRP Commands

IPv4 VRRP Commands

The following are IPv4 VRRP commands.

advertise-interval

Set the time interval between VRRP advertisements.

Syntax

advertise-interval {seconds | centisecs centisecs }

To return to the default settings, use the no advertise-interval command.

Parameters

seconds

Enter the number of seconds. The range is from 1 to 255. The default is 1 second.

centisecs centisecs

Enter the keyword centisecs then the number of centisecs in multiples of 25 centisecs. The range is 25 to 4075 centisecs in multiples of 25 centisecs.

Defaults

1 second or 100 centisecs.

Command Modes

INTERFACE-VRRP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>

<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Dell EMC Networking recommends keeping the default setting for this command. If you do change the time interval between VRRP advertisements on one router, change it on all routers.

### authentication-type

Enable authentication of VRRP data exchanges.

**Syntax**

```
authentication-type simple [encryption-type] password
```

To delete an authentication type and password, use the `no authentication-type` command.

**Parameters**

- **simple**
  - Enter the keyword `simple` to specify simple authentication.

- **encryption-type** (OPTIONAL)
  - Enter one of the following:
    - 0 (zero) specifies an unencrypted authentication data follows.
    - 7 (seven) specifies a hidden authentication data follows.
    - `LINE` is the unencrypted (cleartext) authentication data.

- **password**
  - Enter a character string up to eight characters long as a password. If you do not enter an encryption-type, the password is stored as clear text.

**Defaults**

Not configured.

**Command Modes**

VRRP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>

<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**
The system encrypts the password and the `show config` command displays the encrypted text string.

### clear counters vrrp
Clear the counters maintained on VRRP operations.

**Syntax**
clear counters vrrp [vrrp-id] [ipv6]

**Parameters**
- **vrrp-id** (OPTIONAL) Enter the number of the VRRP group ID to clear the group's counters. The range is from 1 to 255.
- **ipv6** (OPTIONAL) Enter the keyword ipv6 to clear counters from the IPv6 VRRP group.

**Command Modes**
EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
</tbody>
</table>
### debug vrrp

Enable VRRP debugging.

**Syntax**

```
debug vrrp [vrrp-id] {all | bfd | database | interface | ipv6 | packets | state | timer}
```

To disable debugging, use the `no debug vrrp [vrrp-id] {all | bfd | database | interface | ipv6 | packets | state | timer}` command.

**Parameters**

- **vrrp-id**
  
  (OPTIONAL) Enter a number from 1 to 255 as the VRRP group ID.

- **all**
  
  Enter the keyword all to enable debugging of all VRRP groups.

- **bfd**
  
  Enter the keyword bfd to enable debugging of VRRP BFD interactions.

- **database**
  
  Enter the keyword database to enable debugging of configuration changes.

- **interface**
  
  Enter the following keywords and the interface information:

  - For Port Channel interface types, enter the keywords `port-channel` then the number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then the VLAN ID. The VLAN ID range is from 1 to 4094.

```
interface
```

Enter the keyword `interface` to enable debugging of interface state changes.

```
ipv6
```

Enter the keyword `ipv6` to enable debugging for IPv6.

```
packets
```

Enter the keyword `packets` to enable debugging of VRRP control packets.

```
state
```

Enter the keyword `state` to enable debugging of VRRP state changes.

```
timer
```

Enter the keyword `timer` to enable debugging of the VRRP timer.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

If you do not specify an option, debug is active on all interfaces and all VRRP groups.

description

Configure a short text string describing the VRRP group.

**Syntax**

```
description text
```

To delete a VRRP group description, use the `no description` command.

**Parameters**

- **text** Enter a text string up to 80 characters long.
disable

Disable a VRRP group.

Syntax
disable

To re-enable a disabled VRRP group, use the no disable command.

Command Modes VRRP

Command History

Version | Description
---|---
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
6.2.1.1 | Introduced on the E-Series.

Usage Information
To enable VRRP traffic, assign an IP address to the VRRP group using the `virtual-address` command and enter `no disable`.

Related Commands
- `virtual-address` — specify the IP address of the virtual router.

**hold-time**

Specify a delay (in seconds) before a switch becomes the MASTER virtual router. By delaying the initialization of the VRRP MASTER, the new switch can stabilize its routing tables.

**Syntax**

```
hold-time {seconds | centisecs centisecs}
```

To return to the default value, use the `no hold-time` command.

**Parameters**

- **seconds**
  - Enter the number of seconds. The range is from 0 to 65535. The default is zero (0) seconds.

- **centisecs centisecs**
  - Enter the keyword `centisecs` then the number of `centisecs` in units of 25 centisecs. The range is from 0 to 65525 in units of 25 centisecs.

**Defaults**

zero (0) seconds or (0) centiseconds

**Command Modes**

`VRRP`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
---|---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
Virtual Router Redundancy Protocol (VRRP)

**Version**
- 9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
- 9.10(0.0) Introduced on the S6100–ON.
- 9.10(0.0) Introduced on the S3148.
- 9.8(2.0) Introduced on the S3100 series.
- 9.8(1.0) Introduced on the Z9100–ON.
- 9.8(0.0P5) Introduced on the S4048-ON.
- 9.8(0.0P2) Introduced on the S3048-ON.
- 9.7(0.0) Introduced on the S6000-ON.
- 9.5(0.0) Added support for centiseconds on the Z9000, S6000, S4820T, S4810, and MXL.
- 9.2(1.0) Introduced on the Z9500.
- 9.0.2.0 Introduced on the S6000.
- 8.3.19.0 Introduced on the S4820T.
- 8.3.11.1 Introduced on the Z9000.
- 8.3.7.0 Introduced on the S4810.
- 7.6.1.0 Introduced on the S-Series.
- 7.5.1.0 Introduced on the C-Series.
- 6.2.1.1 Introduced on the E-Series.

**Usage Information**
If a switch is a MASTER and you change the hold timer, disable and re-enable VRRP for the new hold timer value to take effect.

**Related Commands**
- disable — disables a VRRP group.

```
preempt
```

To preempt or become the MASTER router, configure a BACKUP router with a higher priority value.

**Syntax**
preempt

To prohibit preemption, use the `no preempt` command.

**Defaults**
Enabled (that is, a BACKUP router can preempt the MASTER router).

**Command Modes**
VRRP

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>

</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
</tbody>
</table>
**priority**

Specify a VRRP priority value for the VRRP group. The VRRP protocol uses this value during the MASTER election process.

**Syntax**

`priority priority`

To return to the default value, use the `no priority` command.

**Parameters**

- `priority`
  Enter a number as the priority. Enter 255 only if the router’s virtual address is the same as the interface’s primary IP address (that is, the router is the OWNER). The range is from 1 to 255. The default is **100**.

**Defaults**

**100**

**Command Modes**

- VRRP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- **9.10(0.1)**
  Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)**
  Introduced on the S3148.
- **9.10(0.0)**
  Introduced on the S6100–ON.
- **9.8(2.0)**
  Introduced on the S3100 series.
- **9.8(1.0)**
  Introduced on the Z9100–ON.
- **9.8(0.0P6)**
  Introduced on the S4048-ON.
- **9.8(0.0P2)**
  Introduced on the S3048-ON.
- **9.7(0.0)**
  Introduced on the S6000-ON.
- **9.2(1.0)**
  Introduced on the Z9500.
To guarantee that a VRRP group becomes MASTER, configure the VRRP group’s virtual address with same IP address as the interface’s primary IP address and change the priority of the VRRP group to 255.

If you set the priority command to 255 and the virtual-address is not equal to the interface’s primary IP address, an error message appears.

**show config**

View the non-default VRRP configuration.

**Syntax**

```
show config [verbose]
```

**Parameters**

- `verbose` (OPTIONAL) Enter the keyword `verbose` to view all the VRRP group configuration information, including default information.

**Command Modes**

- VRRP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

1992  Virtual Router Redundancy Protocol (VRRP)
**show vrrp**

View the VRRP groups that are active. If no VRRP groups are active, the Dell EMC Networking OS returns No Active VRRP group.

### Syntax

```plaintext
show vrrp [vrrp-id] [brief] [interface type] [ipv6] [interface type] [vrf vrf-name]
```

### Parameters

- **vrrp-id** (OPTIONAL) Enter the virtual router identifier for the VRRP group to view only that group. The range is from 1 to 255.
- **brief** (OPTIONAL) Enter the keyword `brief` to view a table of information about the VRRP groups.
- **interface type** (OPTIONAL) Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a VLAN interface, enter the keyword `vlan` then the VLAN ID. The VLAN ID range is from 1 to 4094.
- **ipv6** (OPTIONAL) Enter the keyword `ipv6` to view only VRRP IPv6 groups.
- **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to view active VRRP groups corresponding to that VRF.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
</tbody>
</table>
### Version Description
- **9.10(0.0)** Introduced on the S6100–ON.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100–ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.4(0.0)** Added support for VRF.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **6.2.1.1** Introduced on the E-Series.

### Usage Information
The following describes the `show vrrp brief` command.

#### Item Description
- **Interface**
  - Lists the interface type, slot, and port of the configured VRRP group.
- **Grp**
  - Displays the VRRP group ID.
- **Pri**
  - Displays the priority value assigned to the interface. If you configured the `track` command to track that interface and you disable the interface, the cost is subtracted from the priority value assigned to the interface.
- **Pre**
  - States whether preempt is enabled on the interface:
    - **Y** = Preempt is enabled.
    - **N** = Preempt is not enabled.
- **State**
  - Displays the operational state of the interface using one of the following:
    - **NA/IF** (the interface is not available).
    - **MASTER** (the interface associated with the MASTER router).
    - **BACKUP** (the interface associated with the BACKUP router).
- **Master addr**
  - Displays the IP address of the MASTER router.
- **Virtual addr(s)**
  - Displays the virtual IP addresses of the VRRP routers associated with the interface.

### Example (Brief)
```
DellEMC> Interface Grp Pri Pre State Master addr Virtual addr(s)
Description--------------------------------------------------
Te 1/37 1 100 Y Master 200.200.200.200 200.200.200.201
DellEMC>
```

DellEMC#

track

Monitor an interface and lower the priority value of the VRRP group on that interface if it is disabled.

Syntax

track interface [priority-cost cost]

To disable monitoring, use the no track interface command.

Parameters

- interface (OPTIONAL) Enter the following keywords and the interface information:
For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan`, and then the VLAN ID. The VLAN ID range is from 1 to 4094.

**priority-cost**

(Optional) Enter a number as the amount to subtract from the priority value. The range is from 1 to 254. The default is 10.

```
priority cost = 10
```

**Defaults**

```
priority cost = 10
```

**Command Modes**

```
VRRP
```

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

If you disable the interface, the cost value is subtracted from the priority value and forces a new MASTER election if the priority value is lower than the priority value in the BACKUP virtual routers.

### virtual-address

Configure up to 12 virtual router IP addresses in the VRRP group. To start sending VRRP packets, set at least one virtual IP address for the VRRP group.

**Syntax**

```
virtual-address ip-address1 [... ip-address12]
```

To delete one or more virtual IP addresses, use the `no virtual-address ip-address1 [... ip-address12]` command.

**Parameters**

- `ip-address1` Enter an IP address of the virtual router in dotted decimal format. The IP address must be on the same subnet as the interface’s primary IP address.
(OPTIONAL) Enter up to 11 additional IP addresses of virtual routers in dotted decimal format. Separate the IP addresses with a space. The IP addresses must be on the same subnet as the interface's primary IP address.

Defaults
Not configured.

Command Modes
VRRP

Command History

<tr>
<td>6.2.1.1</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information
The VRRP group only becomes active and sends VRRP packets when you configure a virtual IP address. When you delete the virtual address, the VRRP group stops sending VRRP packets.

A system message appears after you enter or delete the `virtual-address` command.

To guarantee that a VRRP group becomes MASTER, configure the VRRP group’s virtual IP address with the same address as the interface’s primary IP address and change the priority of the VRRP group to 255.

You can ping the virtual IP addresses configured in all VRRP groups.

vrrp delay minimum

Set the delay time for VRRP initialization after an interface comes up.

Syntax
```
vrrp delay minimum seconds
```
vrrp delay reload

Set the delay time for VRRP initialization after a system reboot.

Syntax
vrrp delay reload seconds

Parameters
seconds Enter the number of seconds for the delay. The range is from 0 to 900 (0 indicates no delay).

Defaults
0

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.0.2.0 Introduced on the S6000.
9.0.0.0 Introduced on the Z9000.
8.3.19.0 Introduced on the S4820T.
8.3.8.0 Introduced on the S4810.

Usage Information
This command applies to a single interface. When you use this command with the vrrp delay reload command, the later timer rules VRRP enabling. For example, if vrrp delay reload is 600 and vrrp delay minimum is 300:

• When the system reloads, VRRP waits 600 seconds (10 minutes) to bring up VRRP on all interfaces that are up and configured for VRRP.
• When an interface comes up, whether as part of a system reload or an interface reload, the system waits 300 seconds (5 minutes) to bring up VRRP on that interface.

Related Command
• vrrp delay reload — sets the delay time for VRRP initialization after a system reboot.

</tbody>
</table>

### Usage Information

This command applies to all the VRRP interfaces on a system. When you use this command with the `vrrp delay minimum` command, the later timer rules VRRP enabling. For example, if `vrrp delay reload` is 600 and `vrrp delay minimum` is 300:

- When the system reboots, VRRP waits 600 seconds (10 minutes) to bring up VRRP on all interfaces that are up and configured for VRRP.
- When an interface comes up, whether as part of a system reload or an interface reload, the system waits 300 seconds (5 minutes) to bring up VRRP on that interface.

For the delay timers to take effect, save the configuration and reload the system.

### Related Command

- `vrrp delay minimum` — sets the delay time for VRRP initialization after a line card reboot.

### vrrp-group

Assign a VRRP ID to an interface. You can configure up to 12 VRRP groups per interface.

**Syntax**

```
vrrp-group vrrp-id
```

**Parameters**

- `vrrp-id` Enter a number as the group ID. The range is from 1 to 255.

**Defaults**

Not configured.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

2000 Virtual Router Redundancy Protocol (VRRP)
The VRRP group only becomes active and sends VRRP packets when you configure a virtual IP address. When you delete the virtual IP address, the VRRP group stops sending VRRP packets.

Related Command

- `virtual-address` — assigns up to 12 virtual IP addresses per VRRP group.

**version**

Set the VRRP protocol version for the IPv4 group.

**Syntax**

```
version {2 | 3 | both}
```

To return to the default setting, use the `no version` command.

**Parameters**

- **2**
  
  Enter the keyword 2 to specify VRRP version 2 as defined by RFC 3768, Virtual Router Redundancy Protocol.

- **3**
  
  Enter the keyword 3 to specify VRRP version 3 as defined by RFC 5798, Virtual Router Redundancy Protocol.

- **both**
  
  Enter the keyword both for in-service migration from VRRP version 2 to VRRP version 3.

**Defaults**

2

**Command Modes**

VRRP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tr>
<td>9.5(0.0)</td>
<td>Introduced on the Z9000, S6000, S4820T, S4810, and MXL.</td>
</tr>
</tbody>
</table>

### Usage Information

You can use the `both` command to migrate from VRRPv2 to VRRPv3. When you set the VRRP protocol version to `both`, the switch sends only VRRPv3 advertisements but can receive either VRRPv2 or VRRPv3 packets. To migrate an IPv4 VRRP group from VRRPv2 to VRRPv3:

1. Set the switches with the lowest priority to `both`.
2. Set the switch with the highest priority to version 3.
3. Set all the switches from `both` to version 3.

**NOTE:** Do not run VRRP version 2 and version 3 in the same group for an extended period of time.

### Example

```bash
DellEMC(conf-if-te-1/1-vrid-100)# version ?
2       VRRPv2
3       VRRPv3
both    Interoperable, send VRRPv3 receive both

DellEMC(conf-if-te-1/1-vrid-100)# version 3
```

### IPv6 VRRP Commands

The following are IPv6 VRRP commands.

- clear counters vrrp ipv6
- debug vrrp ipv6
- show vrrp ipv6
- vrrp-ipv6-group

The following commands apply to IPv4 and IPv6:

- advertise-interval
- description
- disable
- hold-time
- preempt
- priority
- show config
- virtual-address
clear counters vrrp ipv6

Clear the counters recorded for IPv6 VRRP groups.

Syntax

```
clear counters vrrp ipv6 [vrid | vrf vrf-name]
```

Parameters

- **vrid** (OPTIONAL) Enter the number of an IPv6 VRRP group; range is from 1 to 255.
- **vrf vrf-name** (OPTIONAL) Enter the name of a VRF instance to clear the counters of all IPv6 VRRP groups in the specified VRF. The maximum is 32 characters.

Command Modes

EXEC Privilege

Command History

<td>Introduced on E-Series, C-Series, and S-Series. Support was added for IPv6 VRRP groups in nondefault VRF instances.</td>
</tr>
<tr>
<td>8.3.2.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

**NOTE:** You can also clear the port configurations corresponding to a range of ports. For Open Networking (ON) platforms, the notation for specifying the port range in the command is different from how you specify the port range in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `clear counters interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port/ [subport] - slot/port/ [subport]`. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `clear counters interfaces interface-type 1/1/1 - 1/1/4`.

Virtual Router Redundancy Protocol (VRRP) 2003
debug vrrp ipv6

Enable VRRP debugging.

Syntax

depug vrrp ipv6 interface [vrid] {all | packets | state | timer}

Parameters

- **interface**: Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a Port Channel interface, enter the keywords port-channel, and then a number.
  - For a VLAN interface, enter the keyword vlan, and then the VLAN ID. The VLAN ID range is from 1 to 4094.

- **vrid**: (OPTIONAL) Enter a number from 1 to 255 as the VRRP group ID.

- **all**: Enter the keyword all to enable debugging of all VRRP groups.

- **bfd**: Enter the keyword bfd to enable debugging of all VRRP BFD interactions.

- **database**: Enter the keyword database to display changes related to group, prefix, and interface entries in the VRRP table.

- **packets**: Enter the keyword packets to enable debugging of VRRP control packets.

- **state**: Enter the keyword state to enable debugging of VRRP state changes.

- **timer**: Enter the keyword timer to enable debugging of the VRRP timer.

Command Modes

**EXEC Privilege**

Command History

2004 Virtual Router Redundancy Protocol (VRRP)
Version          Description
8.4.1.0          Introduced on E-Series, C-Series, and S-Series. Support was added for IPv6 VRRP
groups in nondefault VRF instances.
8.3.2.0          Introduced on the E-Series.

Usage Information
If you do not specify an option, debugging is active on all interfaces and all VRRP groups.

show vrrp ipv6

View the active IPv6 VRRP groups. If no VRRP groups are active, the Dell EMC Networking OS returns No Active VRRP group.

Syntax
show vrrp ipv6 [vrid] [interface] [brief] [vrf vrf-name]

Parameters

vrid          (OPTIONAL) Enter the virtual router identifier for the VRRP group to view only that
group. The range is from 1 to 255.

interface     Enter the following keywords and the number information:

  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then
    the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/
    port information.
  - For a port channel interface, enter the keywords port-channel, and then a
    number.
  - For a VLAN interface, enter the keyword vlan, and then a number from 1 to 4094.

brief          (OPTIONAL) Enter the keyword brief to view a table of information on the VRRP
groups.

vrf vrf-name    Enter the keyword vrf then the name of the VRF to view IPv6 VRRP groups
                corresponding to that VRF.

Command Modes

  - EXEC
  - EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC

Version     Description
9.10(0.1)   Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)   Introduced on the S3148.
9.10(0.0)   Introduced on the S6100–ON.
9.8(2.0)    Introduced on the S3100 series.
9.8(1.0)    Introduced on the Z9100–ON.
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)    Added support for VRF. Introduced on the S6000-ON.
## Usage Information

The following describes the `show vrrp ipv6` command.

<table>
<thead>
<tr>
<th>Line starting with</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GigabitEthernet...</td>
<td>Displays the interface, VRRP group ID, and network address. If the interface is not sending VRRP packets, 0.0.0.0 appears as the network IP address.</td>
</tr>
<tr>
<td>VRF</td>
<td>VRF instance to which the VRRP group interface belongs.</td>
</tr>
</tbody>
</table>
| State: master... | Displays the interface’s state:  
  - Na/If (not available)  
  - master (MASTER virtual router)  
  - backup (BACKUP virtual router)  
  Also displays the interface’s priority and IP address of the MASTER. |
| Hold Down:... | Displays additional VRRP configuration information:  
  - Hold Down displays the hold down timer interval in seconds.  
  - Preempt displays TRUE if preempt is configured and FALSE if preempt is not configured.  
  - AdvInt displays the Advertise Interval in seconds. |
| Adv rcvd:... | Displays counters for the following:  
  - Adv rcvd displays the number of VRRP advertisements received on the interface.  
  - Adv sent displays the number of VRRP advertisements sent on the interface.  
  - Bad pkts rcvd displays the number of invalid packets received on the interface. |
| Virtual MAC address | Displays the virtual MAC address of the VRRP group. |
| Virtual IP address | Displays the virtual IP address of the VRRP router to which the interface is connected. |
| Tracking states... | Displays information on the tracked interfaces or objects configured for a VRRP group (track command), including:  
  - UP or DOWN state of the tracked interface or object (Up or Dn).  
  - Interface type and slot/port[/subport] or object number, description, and time since the last change in the state of the tracked object.  
  - Cost subtracted from the VRRP group priority if the state of the tracked interface/object goes DOWN. |

## Example

```
DellEMC# show vrrp ipv6
------------------
```
vrrp-ipv6-group

Assign an interface to a VRRP group.

Syntax

vrrp-ipv6-group vrid

Parameters

vrid

Enter the virtual-router ID number of the VRRP group. The VRID range is from 1 to 255.

Defaults

Not configured.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
8.4.2.1 The range of valid VRID values on the E-Series when VRF microcode is loaded in CAM changed from 1 to 15.
8.4.1.0 Introduced on the E-Series, C-Series, and S-Series.
8.3.19.0 Introduced on the S4820T.
8.3.7.0 Introduced on the S4810.
8.3.2.0 Introduced on the E-Series.

Usage Information

The VRRP group only becomes active and sends VRRP packets when you configure a link-local virtual IP address. When you delete the virtual address, the VRRP group stops sending VRRP packets.

- When you do not load the VRF microcode in the CAM, the VRID for a VRRP group is the same as the VRID number configured with the vrrp-group or vrrp-ipv6-group commands.
- When you load the VRF microcode in the CAM, the VRID for a VRRP group equals 16 times the vrrp-group or vrrp-ipv6-group vrid number, plus the ip vrf vrf-id number. For example, if you load the VRF
microcode and you configure the VRRP group as 10 in VRF 2, the VRID for the VRRP group is \((16 \times 10) + 2\), or 162. This VRID value is used in the lowest byte of the virtual MAC address of the VRRP group and is also used for VRF routing.

**NOTE:** For all routers to interoperate, configure the same VRID on neighboring routers (Dell EMC Networking or non-Networking) in the same VRRP group.

Related Commands

- `virtual-address` — assigns up to 12 virtual IP addresses per VRRP group.
X.509v3 is a standard for public key infrastructure (PKI) to manage digital certificates and public key encryption. This standard specifies a format for public-key certificates or digital certificates. Dell EMC Networking OS supports X.509v3 standards.

- ocsp-server prefer
- show crypto ca-cert
- show crypto cert

crypto ca-cert delete

Deletes a CA certificate.

Syntax

crypto ca-cert delete [index]

Parameters

index (Optional) Enter the keyword index to specify the index of the CA certificate. If index is not specified, the system deletes all of the installed CA certificates.

Defaults

NA.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command:

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11.0.0</td>
<td>Introduced the command.</td>
</tr>
</tbody>
</table>
Usage Information

The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

Before deleting a CA certificate, the system checks whether that certificate is an issuer of other installed certificate on the system. If so, the system informs you to delete other installed certificates first.

Related Commands

crypto ca-cert install
crypto cert generate
crypto ca-cert install

crypto ca-cert install

Downloads and installs the certificate of a Certificate Authority (CA) on to the device.

Syntax

crypto ca-cert install path

Parameters

path

Enter the path where the CA certificate is available for download. The format that you use to specify the location of the CA certificate also includes the protocol that is used to contact the CA. You can use the following options that you can use to download and install a certificate from the CA:

- tftp — tftp://ca-ip-address/tftp/CAcert.pem
- usbflash: — usbflash:/certs/CAcert.pem
- ftp — ftp://userid:password@ca-ip-address/certs/CAcert.pem
- scp — scp://userid:password@ca-ip-address/certs/CAcert.pem
- http — http://192.168.1.100/certs/CAcert.pem
- flash — flash://filepath/filename

Defaults

NA.

Command Modes

EXEC Privilege

Command History

<td>9.11.0.0</td>
<td>Introduced the command.</td>
</tr>
</tbody>
</table>

Usage Information  
The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

The certificate matching the current FIPS state is deleted. If the system is in FIPS mode, the FIPS certificate is deleted. If the system is in non-FIPS mode, the non-FIPS certificate is deleted.

Before deleting the system’s trusted certificate, the system prompts you to specify whether to proceed with deletion. If you proceed, the system deletes the certificate and also the private key.

Related Commands  
- crypto ca-cert install
- crypto cert generate

---

crypto cert generate

Generates a Certificate Signing Request (CSR) or a self-signed certificate.

Syntax  
crypto cert generate {self-signed | request} [cert-file cert-path key-file 
{private | key-path}] [country 2-letter code] [state state] [locality city] 
[organization organization-name] [orgunit unit-name] [cname common-name] [email 
email-address] [validity days] [length length] [altname alt-name]

Parameters  
- self-signed  
Enter the keyword self-signed to create a self-signed certificate.

- request  
Enter the keyword request to create a certificate signing request.

- cert-file  
Enter the keyword cert-file to specify that the certificate needs to be created.

NOTE: If the cert-file option is not specified in the command, then the system interactively prompts you to fill in rest of the fields of the certificate signing request (CSR).
cert-path
Enter the path to locally store the self-signed certificate or CSR. The path can be a full path or a relative path. If the system accepts this path, a notification is sent indicating the location where the CSR file is stored. You can then export the CSR to a CA using the “copy” command. Following is an example of a path that you can specify: flash://certs/s4810-001-request.csr.

key-file
Enter the keyword key-file to specify the private key.

private
Enter the keyword private to specify that the key is stored in a hidden location in the NVRAM. Only one private key can exist in a hidden location at any given point in time.

key-path
Enter the absolute or relative location on the device where the key is stored.

country 2-letter-code
(OPTIONAL) Enter the keyword country followed by the two letter code that is used to identify the country name.

state
(OPTIONAL) Enter the keyword state followed by the name of the state.

locality city
(OPTIONAL) Enter the keyword locality followed by the name of the city.

organization
(OPTIONAL) Enter the keyword organization followed by the name of the organization.

orgunit unit-name
(OPTIONAL) Enter the keyword orgunit followed by the name of the unit.

cname common-name
Enter the keyword cname followed by the common name that you want to assign.

NOTE: Common Name is an important attribute while creating a CSR or a self-signed certificate. Common name is the main identity presented to connecting entities. By default, the device’s host name acts as the common name. However, you can still configure a different common name for the device. For example, you can specify an IP address to act as a Common Name for the device. If the Common Name does not match the device's presented identity, then even a properly signed certificate does not validate correctly.

e-mail email-address
(OPTIONAL) Enter the keyword email followed a valid email address used for communication with the organization.

validity days
(OPTIONAL) Enter the keyword validity followed by the number of days for which the certificate is valid.

NOTE: For CSRs, validity has no effect. For self-signed certificates, if validity is not specified, it defaults to 3650 days, or 10 years.

length length
(OPTIONAL) Enter the keyword length followed by a bit length value. The default key length for both FIPS and non-FIPS mode is 2048. Minimum key length value for FIPS mode is 2048. The range is from 2048 to 4096. Minimum key length value for non-FIPS mode is 1024. The range is from 1024 to 4096.

altname altname
(OPTIONAL) Enter the keyword altname followed by the subject alternate name for the organization. For example, altname IP:192.168.1.100.

Defaults
NA.

Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command:
Version Description
9.11.0.0 Introduced the command.

Usage Information
The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

If the cert-file option is not specified in the command, then the system interactively prompts you to fill in various fields of the certificate signing request (CSR). You are prompted to fill out some metadata information for the certificate. The following example shows the fields that you are prompted to fill:

```
You are about to be asked to enter information that will be incorporated into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank.
For some fields there will be a default value; if you enter '.', the field will be left blank.
-----
Country Name (2 letter code) [US]:
State or Province Name (full name) [Some-State]:California
Locality Name (eg, city) [San Francisco]
Organization Name (eg, company) [Starfleet Command]
Organizational Unit Name (eg, section) [NCC-1701A]
Common Name (eg, YOUR name) [S4810-001]:
Email Address [scotty@starfleet.com]
```

You can enter only 256 characters per command. If you have field values that are larger than 256 characters in length, use the interactive mode of the command.

Related Commands
- crypto ca-cert install

crypto cert install

Installs a trusted certificate on a device.

Syntax
crypto cert install cert-file cert-path key-file {key-path | private} [password passphrase]

Parameters
cert-file Enter the keyword cert-file to specify that the certificate needs to be downloaded.
cert-path Enter the path where the certificate is locally stored. The path can be a full path or a relative path. If the system accepts this path, a notification is sent indicating the location where the certificate file is stored. Following are example of a path that you can specify:
flash:/certs/s4810-001-request.crt and usbflash:/certs/s4810-001-cert.pem

**NOTE:** Before installing a trusted certificate, you first need to download it from a remote CA using the copy command.

disable
key-file Enter the keyword key-file to specify the private key.
private Enter the keyword private to specify that the key is stored in a hidden location in the NVRAM. Only one private key can exist in a hidden location at any given point in time.
key-path Enter the absolute or relative location on the device where the key is stored.
NOTE: After the certificate is successfully installed, the private key is deleted from the specified location and copied to the hidden location in NVRAM.

password

(Optional) Enter the keyword password followed by the password phrase used to decrypt the private key.

NOTE: You can generate the private key and certificate on another host. While doing so, you must keep the private key encrypted with a passphrase so that the private key is not compromised during transport. The password phrase acts a facility to decrypt the private key before installing it on the switch.

Defaults

NA.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11.0.0</td>
<td>Introduced the command.</td>
</tr>
</tbody>
</table>

Usage Information

The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

Certain parameters must be met in order for this command to succeed:

- The downloaded certificate should be formatted properly.
- In order for verification to work, the CA certificate must be installed on the system before running this command.
- The downloaded certificate’s public key must correspond to the private key.
- If the certificate is not self-signed, then the CA certificate (from the CA that has signed the certificate) must be installed on the system prior to running this command for verification to work.

NOTE: It is possible for the switch to store two types of certificates: one for the FIPS mode and one for the non-FIPS mode. If the system is in FIPS mode, the certificate is installed as the FIPS certificate. If the system is in non-FIPS mode, the certificate is installed as the non-FIPS certificate. When FIPS mode is enabled or disabled, the certificates (and keys) are switched by the system.

NOTE: For the switch, there are two possible certificates stored - one for FIPS mode, one for non-FIPS mode. If the system is in FIPS mode, the certificate will be installed as the FIPS certificate. If the system is in non-FIPS mode, the certificate will be installed as the non-FIPS certificate. When FIPS mode is enabled/disabled, the certificates (and keys) are switched by the system.

Related Commands

- crypto ca-cert install
crypto x509 ocsp

Configures the OCSP behavior.

Syntax

```
crypto x509 ocsp [nonce] [sign-requests]
```

Parameters

- **nonce**: Enter the keyword `nonce` to use the nonce feature for the OCSP requests to OCSP responder communication. This is a one-time value that must be returned in the OCSP response. If the OCSP responder is using precomputed responses, then it does not reply with the nonce. The nonce feature is off by default. The no version of the command disables the nonce feature.

- **sign-requests**: Enter the keyword `sign-requests` to sign the OCSP requests to OCSP responder communication with the system’s own certificate so that the OCSP responder may verify the requestor. The sign-requests feature is off by default. The no version of the command disables signing of requests.

Defaults

NA.

- `crypto cert generate`
- `crypto cert install`

crypto x509 revocation

Configure the revocation check behavior for the certificate.

Syntax

```
crypto x509 revocation ocsp {accept | reject}
```

Parameters

- **ocsp**: Enter the method used to check certificate revocation details. In this release, OCSP is the only option that is supported. So, you can specify OCSP as the method-list value.

- **accept**: Enter the keyword `accept` to accept the presented certificate and log in if OCSP retrieval fails.
reject

Enter the keyword reject to reject the presented certificate and log in if OCSP retrieval fails.

Defaults

crypto x509 revocation ocsp accept

Related Commands

• crypto x509 ocsp

debug crypto

This command allows you to test a certificate chain file for validity and checking revocation outside of its use in TLS communication.

Syntax
debug crypto {flash://path}

Parameters

path

Enter the path to a local file where a certificate chain is stored in PEM format.

Defaults

None.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Usage Information

The following RBAC roles are allowed to issue this command:

• sysadmin
• secadmin

You can use this command to verify an X509 certificate outside of use with Syslog over TLS.

Related Commands

• crypto cert install
• crypto cert generate
• crypto ca-cert install
logging secure

Creates a log file for various events related to X.509v3 certificates.

Syntax

logging {hostname} {secure | tcp | udp} [vrf vrf-name] [sha1 fingerprint] [port port-number]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Enter the name of the host or device for which you wish to record logs corresponding to the certificates.</td>
</tr>
<tr>
<td>secure</td>
<td>Enter the keyword secure to enable the Syslog feature to communicate with a compatible Syslog server using the secure TLS protocol over the default port (6514). The range is from 1024 to 65535.</td>
</tr>
<tr>
<td>tcp</td>
<td>Enter the keyword tcp to enable TCP.</td>
</tr>
<tr>
<td>udp</td>
<td>Enter the keyword udp to enable UDP.</td>
</tr>
<tr>
<td>vrf vrf-name</td>
<td>Enter the keyword vrf followed by the name of the VRF.</td>
</tr>
<tr>
<td>sha1 fingerprint</td>
<td>Enter the keyword sha1 followed by the fingerprint. This option is only available when the secure option is configured. This new option enables the Syslog feature to compare the received certificate's sha-1 fingerprint against this configured sha-1 fingerprint. If present, only the fingerprint is used for certificate revocation validation.</td>
</tr>
<tr>
<td>port port-number</td>
<td>Enter the keyword port followed by the port number. The default port number is 6514 for secure logging.</td>
</tr>
</tbody>
</table>

Defaults

None.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.11.0.0</td>
<td>Introduced this command.</td>
</tr>
</tbody>
</table>

Usage Information

The following RBAC roles are allowed to issue this command:

-  sysadmin
-  secadmin

Following are the pre-requisites to configure logging:

- The logging command must be configured to enable event logging.
- A certificate must be installed on the switch. This certificate is only used for secure logging.
- At least one CA certificate must be installed on the switch so that the logging server’s certificate can be verified. If a SHA1 fingerprint is present, only the fingerprint is used for certificate revocation validation.
crypto x509 ca-keyid

Creates a per-certificate configuration context using the specified subject key identifier.

Syntax
crypto x509 ca-keyid subject-key-identifier

Use to the no crypto x509 ca-keyid command to remove this configuration.

Parameters

subject-key-identifier

Enter the content of the SubjectKeyIdentifier field from the CA certificate.

NOTE: To get the subject key identifier details, enter the show crypto ca-cert command. This command displays the CA certificate details.

Defaults
None.

Command Modes
- CONFIGURATION Mode

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command:

Version Description
9.11.0.0 Introduced this command.

Usage Information
The following RBAC roles are allowed to issue this command:
- sysadmin
- secadmin

When you use this command, the device maps the current certificate context in the certificate store to a CA certificate through the subject key identifier field. The subject key identifier field contains the SHA-1 hash of the CA's public key. This configuration provides a way to uniquely identify a CA and associate it with any CA-specific settings.

This context is used to store certificate-specific settings such as alternate CRL and OCSP locations. Incoming X.509 certificates whose AuthorityKeyIdentifier extensions match the configured subject key identifier have these settings applied to them.

The crypto x509 ca-keyid command when used with the ocsp-server command in the global configuration mode creates a per-certificate configuration context under which the remaining commands are entered.

Related Commands
- ocsp-server
- crypto x509 ocsp
ocsp-server

Configures OCSP server on a CA.

Syntax

    ocsp-server url [nonce] [sign-requests]

Parameters

url

Enter the URL for the OCSP responder using standard URI format. Either http or https protocol can be used. For example, http://[1100::101]:8888.

nonce

Enter the keyword nonce to use the nonce feature for the OCSP requests to OCSP responder communication. This number is a one-time value that must be returned in the OCSP response. If the OCSP responder is using precomputed responses, then it does not reply with the nonce. The nonce feature is off by default. The no version of the command disables the nonce feature.

sign-requests

Enter the keyword sign-requests to sign the OCSP requests to OCSP responder communication with the system's own certificate so that the OCSP responder may verify the requestor. The sign-requests feature is off by default. The no version of the command disables signing of requests.

Defaults

None.

</thead>
<tbody>
<tr>
<td>9.11.0.0</td>
<td>Introduced this command.</td>
</tr>
</tbody>
</table>

Usage Information

The following RBAC roles are allowed to issue this command:

- sysadmin
- secadmin

Multiple OCSP responders may be configured per CA. The system tries each one until it gets a valid response. No priority may be specified or guaranteed; the system tries them in the order in which they were configured.

Related Commands

- crypto x509 ocsp

ocsp-server prefer

Configures OCSP responder preference. You can configure the preference or order that the CA or a device should follow while contacting multiple OCSP responders.

Syntax

    ocsp-server prefer

Defaults

None.

Command Modes

CERTIFICATE
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

When this command is specified, the system checks the configured OCSP URLs before checking the URL of the OCSP server in the authorityInfoAccess extension of the certificate. If this command is not specified, then the system checks the OCSP server in the authorityInfoAccess extension of the certificate before checking the configured OCSP servers.

This show command should display the index, the certificate's subject field in plaintext, not-before and not-after dates, and the fingerprint in hexadecimal format. The index assigned to each CA certificate is used by the crypto cert delete certificate-authority command to allow the user to specify which certificate authority to remove.

crypto x509 ocsp

crypto ca-cert install
**show crypto cert**

Displays the certificate information that is specified.

**Syntax**

```plaintext
show crypto cert {path}
```

**Parameters**

- `path` (OPTIONAL) Enter the path to a local file where a certificate chain is stored in PEM format. If a path is not specified, display the certificate that is currently installed on the system.

**Defaults**

None.
