Notes, cautions, and warnings

**NOTE**: A NOTE indicates important information that helps you make better use of your product.

**CAUTION**: A CAUTION indicates either potential damage to hardware or loss of data and tells you how to avoid the problem.

**WARNING**: A WARNING indicates a potential for property damage, personal injury, or death.

### 39 Object Tracking

**IPv4 Object Tracking Commands**
- debug track
- delay
- description
- show running-config track
- show track
- threshold metric
- track interface ip routing
- track interface line-protocol
- track ip host reachability
- track ip route metric threshold
- track ip route reachability
- track resolution ip route

**IPv6 Object Tracking Commands**
- show track ipv6 route
- track interface ipv6 routing
- track ipv6 route metric threshold
- track ipv6 route reachability
- track resolution ipv6 route

### 40 Open Shortest Path First (OSPFv2 and OSPFv3)

**OSPFv2 Commands**
- area default-cost
- area nssa
- area range
- area stub
- auto-cost
- clear ip ospf
- clear ip ospf statistics
- debug ip ospf
- default-information originate
- default-metric
- description
- distance
- distance ospf
- distribute-list in

**OSPFv3 Commands**

About this Guide

This guide provides information about the Dell EMC Networking operating system (OS) command line interface (CLI). This book also includes information about the protocols and features supported in Dell EMC Networking OS.

References

For more information about your system, go to the Dell EMC Networking Support page and refer to the following documents:

- Dell EMC Networking OS Configuration Guide
- Dell EMC Networking OS Installation Guide
- Dell EMC Networking OS Quick Start Guide
- Dell EMC Networking OS Release Notes

Topics:

- Objectives
- Audience
- Conventions
- Information Icons

Objectives

This information is intended as a reference guide for the Dell EMC Networking OS CLI commands, with detailed syntax statements, along with usage information and sample output.

**NOTE:** For more information about when to use the CLI commands, see the Dell EMC Networking OS Configuration Guide for your specific system.

Audience

The Dell EMC Networking OS CLI Guide is intended for system administrators with an understanding of Layer 2 and Layer 3 networking technologies, who are responsible for configuring or maintaining networks.

Conventions

This guide uses the following conventions to describe command syntax:

- **Keyword**
  - Keywords are in Courier font and must be entered in the CLI as listed.
- **parameter**
  - Parameters are in italics and require a number or word to be entered in the CLI.
- **(X)**
  - Keywords and parameters within braces must be entered in the CLI.
- **[X]**
  - Keywords and parameters within brackets are optional.
Information Icons

This guide uses the following information symbols:

⚠️ NOTE: The Note icon signals important operational information.
⚠️ CAUTION: The Caution icon signals information about situations that could result in equipment damage or loss of data.
⚠️ WARNING: The Warning icon signals information about hardware handling that could result in injury.
This chapter describes the command line interface (CLI) structure and command modes. The Dell EMC Networking operating software commands are in a text-based interface that allows you to use the launch commands, change command modes, and configure interfaces and protocols.

Topics:
- Accessing the Command Line
- Multiple Configuration Users
- Obtaining Help
- Navigating the CLI
- Using the no Command
- Filtering show Commands
- Enabling Software Features on Devices Using a Command Option
- Command Modes

Accessing the Command Line

Access the CLI through a serial console port or a Telnet session. When the system successfully boots, enter the command line in EXEC mode.

**NOTE:** You must have a password configured on a virtual terminal line before you can Telnet into the system. Therefore, you must use a console connection when connecting to the system for the first time.

**Example**
```
telnet 172.31.1.53
Trying 172.31.1.53...
Connected to 172.31.1.53.
Escape character is '^]'.
Login: username
Password: DellEMC>
```

After you log in to the switch, the prompt provides you with the current command-level information. For example:

<table>
<thead>
<tr>
<th>Prompt</th>
<th>CLI Command Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>DellEMC&gt;</td>
<td>EXEC</td>
</tr>
<tr>
<td>DellEMC#</td>
<td>EXEC Privilege</td>
</tr>
<tr>
<td>DellEMC(conf)#</td>
<td>CONFIGURATION</td>
</tr>
</tbody>
</table>

**NOTE:** For a list of all the command mode prompts, refer to the Command Modes section.

Multiple Configuration Users

When a user enters CONFIGURATION mode and another user is already in CONFIGURATION mode, the Dell EMC Networking operating software generates an alert warning message similar to the following:

```
DellEMC#conf
```
% Warning: The following users are currently configuring the system:

User "" on line console0
User "admin" on line vty0 (123.12.1.123)
User "admin" on line vty1 (123.12.1.123)
User "Irene" on line vty3 (123.12.1.321)

DellEMC(conf)

When another user enters CONFIGURATION mode, Dell EMC Networking OS sends a message similar to the following:

% Warning: User "admin" on line vty2 "172.16.1.210" is in configuration

In this case, the user is "admin" on vty2.

Obtaining Help

As soon as you are in a Command mode, there are several ways to access help:

To obtain a list of keywords at any command mode:
Type a ? at the prompt or after a keyword. There must always be a space before the ?.

To obtain a list of keywords with a brief functional description:
Type help at the prompt.

To obtain a list of available options:
Type a keyword, and then enter a space and a ?.

To obtain a list of partial keywords using a partial keyword:
Type a partial keyword, and then enter a ?.

Example

DellEMC(conf)#ip ?
access-list Named access-list
as-path BGP autonomous system path filter
community-list Add a community list entry
control-plane Control plane configuration
dhcp DHCP configuration commands
domain-list Domain name to complete unqualified host name
domain-lookup Enable IP Domain Name System hostname translation
domain-name Define the default domain name
ecmp Weighted Ecmp Configuration
ecmp-group ECMP Group Configuration
extcommunity-list Add a Extended community list entry
ftp FTP configuration commands
helper-address DHCP relay agent configuration
host Add an entry to the ip hostname table
http HTTP configuration commands
icmp ICMP configuration commands
igmp Internet Group Management Protocol
max-frag-count Max. fragmented packets allowed in IP re-assembly
mroute Multicast routes and counters
msdp Multicast source discovery protocol
multicast-limit Max entries in Multicast TIB
multicast-mdscp Enable IP multicast MSDP protocol
multicast-routing Enable IP multicast forwarding
name-server Specify address of name server to use
pim Protocol Independent Multicast
prefix-list Build a prefix list
radius Interface configuration for RADIUS
redirect-list Named redirect-list
route Establish static routes
route-export Export routes
route-import Import routes
scp SCP configuration commands
source-route Process packets with source routing header options
ssh SSH configuration commands
tacacs Interface configuration for TACACS+
When entering commands, you can take advantage of the following timesaving features:

- Commands are not case-sensitive.
- Enter partial (truncated) command keywords. For example, you can enter `int teng 1/1/1` for the `interface tengigabitethernet 1/1/1` command.
- Use the TAB key to complete keywords in commands.
- Use the up Arrow key to display the last enabled command.
- Use either the Backspace key or Delete key to erase the previous character.
- Use the left and right Arrow keys to navigate left or right in the Dell EMC Networking OS command line.

The shortcut key combinations at the Dell EMC Networking OS command line are as follows:

<table>
<thead>
<tr>
<th>Key Combination</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTL-A</td>
<td>Moves the cursor to the beginning of the command line.</td>
</tr>
<tr>
<td>CNTL-B</td>
<td>Moves the cursor back one character.</td>
</tr>
<tr>
<td>CNTL-D</td>
<td>Deletes the character at the cursor.</td>
</tr>
<tr>
<td>CNTL-E</td>
<td>Moves the cursor to the end of the line.</td>
</tr>
<tr>
<td>CNTL-F</td>
<td>Moves the cursor forward one character.</td>
</tr>
<tr>
<td>CNTL-I</td>
<td>Completes a keyword.</td>
</tr>
<tr>
<td>CNTL-K</td>
<td>Deletes all the characters from the cursor to the end of the command line.</td>
</tr>
<tr>
<td>CNTL-L</td>
<td>Re-enters the previous command.</td>
</tr>
<tr>
<td>CNTL-N</td>
<td>Returns to the more recent commands in the history buffer after recalling commands with Ctrl-P or the up Arrow key.</td>
</tr>
<tr>
<td>CNTL-P</td>
<td>Recalls commands, beginning with the last command.</td>
</tr>
<tr>
<td>CNTL-R</td>
<td>Re-enters the previous command.</td>
</tr>
<tr>
<td>CNTL-U</td>
<td>Deletes the line.</td>
</tr>
<tr>
<td>CNTL-W</td>
<td>Deletes the previous word.</td>
</tr>
<tr>
<td>CNTL-X</td>
<td>Deletes the line.</td>
</tr>
<tr>
<td>CNTL-Z</td>
<td>Ends continuous scrolling of the command outputs.</td>
</tr>
<tr>
<td>Esc B</td>
<td>Moves the cursor back one word.</td>
</tr>
<tr>
<td>Esc F</td>
<td>Moves the cursor forward one word.</td>
</tr>
<tr>
<td>Esc D</td>
<td>Deletes all the characters from the cursor to the end of the word.</td>
</tr>
</tbody>
</table>

**Navigating the CLI**

The Dell EMC Networking OS displays a CLI prompt comprised of the host name and CLI mode.

- Host name is the initial part of the prompt and is “Dell” by default. You can change the host name with the `hostname` command.
- CLI mode is the second part of the prompt and reflects the current CLI mode. For a list of the Dell EMC Networking OS command modes, see the `command mode list` in Accessing the Command Line.
The CLI prompt changes as you move up and down the levels of the command structure. Starting with CONFIGURATION mode, the command prompt adds modifiers to further identify the mode. For more information about command modes, see Command Modes.

**Using the no Command**

To disable, delete or return to default values, use the `no` form of the commands.

For most commands, if you type the keyword `no` in front of the command, you disable that command or delete it from the running configuration. In this guide, the `no` form of the command is described in the Syntax portion of the command description.

**Filtering show Commands**

You can filter commands using the `show` command to find specific information, display certain information only, or begin the command output at the first instance of a regular expression or phrase.

Execute a `show` command and a pipe ( | ), and one of the following parameters and a regular expression to show output that either excludes or includes the specified parameters.

| NOTE: The Dell EMC Networking OS accepts a space before or after the pipe, no space before or after the pipe, or any combination. For example: command | grep gigabit |except regular-expression | find regular-expression.

- **except** Displays only the text that does not match the pattern (or regular expression).
- **find** Searches for the first occurrence of a pattern.
- **grep** Displays text that matches a pattern.

The `grep` command option has an ignore-case suboption that makes the search case-insensitive. For example, the commands:

- `show run | grep Ethernet` Returns a search result with instances containing a capitalized `Ethernet`, such as `interface TenGigabitEthernet 1/1`.
- `show run | grep ethernet` Does not return the previous search result because it only searches for instances containing a noncapitalized `ethernet`.
- `show run | grep Ethernet ignore-case` Returns instances containing both `Ethernet` and `ethernet`.

- **no-more** Does not paginate the display output.
- **save** Copies the output to a file for future use.

**Displaying All Output**

Use the `no-more` option after the pipe to display all output at once — not one screen at a time. This operation is similar to `terminal length screen-length` except that the `no-more` option affects the output of just the specified command. For example: `show running-config|no-more.`
Filtering the Command Output Multiple Times

You can filter a single command output multiple times. To filter a command output multiple times, place the save option as the last filter. For example: `command | grep regular-expression | except regular-expression | grep other-regular-expression | find regular-expression | no-more | save.

Enabling Software Features on Devices Using a Command Option

The capability to activate software applications or components on a device using a command is supported on this platform. Starting with Release 9.4(0.0), you can enable or disable specific software features or applications that need to run on a device by using a command attribute in the CLI interface. This enables effective, streamlined management and administration of applications and utilities that run on a device. You can employ this capability to perform an on-demand activation, or turn-off a software component or protocol. A feature configuration file generated for each image contains feature names, and denotes if this enabling or disabling method is available. You can enable or disable the VRF application globally across the system by using this capability.

Activate the VRF application on a device by using the `feature vrf` command in CONFIGURATION mode.

**NOTE:** The `no feature vrf` command is not supported on any of the platforms.

To enable the VRF feature and cause all VRF-related commands to be available or viewable in the CLI interface, use the following command. You must enable the VRF feature before you can configure its related attributes.

DellEMC(conf)# feature vrf

Based on if the VRF feature is identified as supported in the Feature Configuration file, configuration command `feature vrf` becomes available for usage. This command is stored in the running-configuration and precedes all other VRF-related configurations.

To display the state of Dell EMC Networking OS features:

DellEMC# show feature

**Example of show feature output**

For a particular target where VRF is enabled, the show output is similar to the following:

<table>
<thead>
<tr>
<th>Feature</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>VRF</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

**feature vrf**

Enable the VRF application on a switch. Once enabled, you cannot deactivate the VRF application.

**Syntax**

`feature vrf`

**Defaults**

Disabled

**Command Modes**

CONFIGURATION
show feature

Verify the status of software applications, such as VRF, that are activated and running on a device.

Syntax

```
show feature
```

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Usage Information

You can activate VRF application on a device by using the `feature vrf` command in CONFIGURATION mode. The `no feature vrf` command is not supported on any of the platforms.

Example

```
DellEMC# show feature
Feature   State
----------
------------
```
Command Modes

To navigate and launch various CLI modes, use specific commands. Navigation to these modes is described in the following sections.

BGP ADDRESS-FAMILY Mode

To enable or configure IPv4 for BGP, use BGP ADDRESS-FAMILY mode. For more information, see Border Gateway Protocol IPv4 (BGPv4).

To enter BGP ADDRESS-FAMILY mode:

1. Verify that you are logged in to ROUTER BGP mode.
2. Enter the address-family command.
3. Enter the protocol type:
   • For IPv4, enter the ipv4 multicast command. The prompt changes to include conf-router_bgp_af for IPv4.

CLASS-MAP Mode

To create or configure a class map, use CLASS-MAP mode. For more information, see Policy-Based QoS Commands.

To enter CLASS-MAP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the class-map command, and then enter the class map name. The prompt changes to include config-class-map.

You can return to CONFIGURATION mode by using the exit command.

CONFIGURATION Mode

In EXEC Privilege mode, use the configure command to enter CONFIGURATION mode and configure routing protocols and access interfaces.

To enter CONFIGURATION mode:

1. Verify that you are logged in to EXEC Privilege mode.
2. Enter the configure command. The prompt changes to include conf.

From this mode, you can enter INTERFACE mode by using the interface command.

CONTROL-PLANE Mode

To manage control-plane traffic, use CONTROL-PLANE mode. For more information, see Control Plane Policing (CoPP).

To enter CONTROL-PLANE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the control-plane-cpuqos command. The prompt changes to include conf-control-cpuqos.

You can return to CONFIGURATION mode by using the exit command.
**DHCP Mode**

To enable and configure Dynamic Host Configuration Protocol (DHCP), use DHCP mode. For more information, see Dynamic Host Configuration Protocol (DHCP).

To enter DHCP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip dhcp server` command. The prompt changes to include `config-dhcp`.

You can return to CONFIGURATION mode by using the `exit` command.

**DHCP POOL Mode**

To create an address pool, use DHCP POOL mode. For more information, see Dynamic Host Configuration Protocol (DHCP).

To enter DHCP POOL mode:

1. Verify that you are logged in to DHCP mode.
2. Enter the `pool` command then the pool name. The prompt changes to include `config-dhcp-pool-name`.

You can return to DHCP mode by using the `exit` command.

**ECMP GROUP Mode**

To enable or configure traffic distribution monitoring on an ECMP link bundle, use ECMP GROUP mode. For more information, see ECMP Overview.

To enter ECMP GROUP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ecmp-group` command then enter the ECMP group ID. The prompt changes to include `conf-ecmp-group-ecmp-group-id`.

You can return to CONFIGURATION mode by using the `exit` command.

**EIS Mode**

To enable or configure Egress Interface Selection (EIS), use EIS mode.

To enter EIS mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `management egress-interface-selection` command. The prompt changes to include `conf-mgmt-eis`.

You can return to CONFIGURATION mode by using the `exit` command.

**EXEC Mode**

When you initially log in to the switch, by default, you are logged in to EXEC mode. This mode allows you to view settings and enter EXEC Privilege mode, which is used to configure the device.
When you are in EXEC mode, the > prompt is displayed following the host name prompt, which is “DellEMC” by default. You can change the host name prompt using the hostname command.

**NOTE:** Each mode prompt is preceded by the host name.

**EXEC Privilege Mode**

The enable command accesses EXEC Privilege mode. If an administrator has configured an “Enable” password, you are prompted to enter it.

EXEC Privilege mode allows you to access all the commands accessible in EXEC mode, plus other commands, such as to clear address resolution protocol (ARP) entries and IP addresses. In addition, you can access CONFIGURATION mode to configure interfaces, routes and protocols on the switch. While you are logged in to EXEC Privilege mode, the # prompt is displayed.

**EXTENDED COMMUNITY LIST Mode**

To enable and configure a BGP extended community, use EXTENDED COMMUNITY LIST mode.

To enter EXTENDED COMMUNITY LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the ip extcommunity-list command then a community list name. The prompt changes to include conf-ext-community-list.

You can return to CONFIGURATION mode by using the exit command.

**FRRP Mode**

To enable or configure Force10 Resilient Ring Protocol (FRRP), use FRRP mode. For more information, see Force10 Resilient Ring Protocol (FRRP).

To enter FRRP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the protocol frrp command then the ring ID. The prompt changes to include conf-frrp-ring-id.

You can return to CONFIGURATION mode by using the exit command.

**INTERFACE Mode**

Use INTERFACE mode to configure interfaces or IP services on those interfaces. An interface can be physical (for example, a Gigabit Ethernet port) or virtual (for example, the Null interface).

To enter INTERFACE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the interface command and then enter an interface type and interface number that is available on the switch.

**NOTE:** In Dell EMC Networking OS, the stack unit number and interfaces start from 0. But in Dell EMC Networking OS Open Networking platforms, the stack unit number and interfaces start from 1.

The prompt changes to include the designated interface and slot/port[/subport] number. For example:
<table>
<thead>
<tr>
<th>Prompt</th>
<th>Interface Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>DellEMC(conf-if-1) #</td>
<td>INTERFACE mode</td>
</tr>
<tr>
<td>DellEMC(conf-if-te-1/1)#</td>
<td>Ten-Gigabit Ethernet interface then slot/port information</td>
</tr>
<tr>
<td>DellEMC(conf-if-fo-1/1)#</td>
<td>Forty-Gigabit Ethernet interface then slot/port information</td>
</tr>
<tr>
<td>DellEMC(conf-if-lo-0)#</td>
<td>Loopback interface number</td>
</tr>
<tr>
<td>DellEMC(conf-if-nu-0)#</td>
<td>Null Interface then zero</td>
</tr>
<tr>
<td>DellEMC(conf-if-po-0)#</td>
<td>Port-channel interface number The range is from 1 to 128.</td>
</tr>
<tr>
<td>DellEMC(conf-if-vl-0)#</td>
<td>VLAN Interface then VLAN number (range 1–4094)</td>
</tr>
<tr>
<td>DellEMC(conf-if-ma-1/1)#</td>
<td>Management Ethernet interface then slot/port information</td>
</tr>
<tr>
<td>DellEMC(conf-if-tu-0)#</td>
<td>Tunnel interface then tunnel ID.</td>
</tr>
<tr>
<td>DellEMC(conf-if-range)#</td>
<td>Designated interface range (used for bulk configuration).</td>
</tr>
</tbody>
</table>

**IP ACCESS LIST Mode**

To enter IP ACCESS LIST mode and configure either standard or extended access control lists (ACLs), use the `ip access-list standard` command or the `ip access-list extended` command.

To enter IP ACCESS LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter either the `ip access-list standard` command or the `ip access-list extended` command. Include a name for the ACL. The prompt changes to include `conf-std-nacl` or `conf-ext-nacl`.

You can return to CONFIGURATION mode by using the `exit` command.

**ISIS ADDRESS-FAMILY Mode**

To enable or configure IPv6 for ISIS, use ISIS ADDRESS-FAMILY mode. For more information, see Intermediate System to Intermediate System (IS-IS).

To enter ISIS ADDRESS-FAMILY mode:

1. Verify that you are logged in to ROUTER ISIS mode.
2. Enter the `address-family ipv6 unicast` command. The prompt changes to include `conf-router_isis-af_ipv6`.
LLDP Mode

To enable and configure Link Layer Discovery Protocol (LLDP), use LLDP mode. For more information, see Link Layer Discovery Protocol (LLDP).

To enter LLDP mode:
1. To enable LLDP globally, verify that you are logged in to CONFIGURATION mode. To enable LLDP on an interface, verify that you are logged in to INTERFACE mode.
2. Enter the protocol lldp command. The prompt changes to include conf-lldp or conf-if-interface-lldp.

LLDP MANAGEMENT INTERFACE Mode

To enable and configure Link Layer Discovery Protocol (LLDP) on management interfaces, use LLDP MANAGEMENT INTERFACE mode.

To enter LLDP MANAGEMENT INTERFACE mode:
1. Verify that you are logged in to LLDP mode.
2. Enter the management-interface command. The prompt changes to include conf-lldp-mgmtIf.

LINE Mode

To configure the console or virtual terminal parameters, use LINE mode.

To enter LINE mode:
1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the line command. Include the keywords console or vty and their line number available on the switch. The prompt changes to include config-line-console or config-line-vty.

You can exit this mode by using the exit command.

MAC ACCESS LIST Mode

To enter MAC ACCESS LIST mode and configure either standard or extended access control lists (ACLs), use the mac access-list standard or mac access-list extended command.

To enter MAC ACCESS LIST mode:
1. Verify that you are logged in to CONFIGURATION mode.
2. Use the mac access-list standard command or the mac access-list extended command. Include a name for the ACL. The prompt changes to include conf-std-macl or conf-ext-macl.

You can return to CONFIGURATION mode by using the exit command.

MONITOR SESSION Mode

To enable and configure a traffic monitoring session using port monitoring, use MONITOR SESSION mode. For more information, see Port Monitoring.

To enter MONITOR SESSION mode:
MULTIPLE SPANNING TREE (MSTP) Mode

To enable and configure MSTP, use MULTIPLE SPANNING TREE mode. For more information, see Multiple Spanning Tree Protocol (MSTP).

To enter MULTIPLE SPANNING TREE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `monitor session` command, and then the session ID. The prompt changes to include `conf-mon-sess-sessionID`.

OPENFLOW INSTANCE Mode

To enable and configure OpenFlow instances, use OPENFLOW INSTANCE mode.

To enter OPENFLOW INSTANCE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `openflow of-instance` command, and then the OpenFlow ID number of the instance you want to create or configure. The prompt changes to include `conf-of-instance of-id`.

Per-VLAN SPANNING TREE (PVST+) Plus Mode

To enable and configure the Per-VLAN Spanning Tree (PVST+) protocol, use PVST+ mode. For more information, see Per-VLAN Spanning Tree Plus (PVST+).

| NOTE: The protocol name is PVST+, but the plus sign is dropped at the CLI prompt. |

To enter PVST+ mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree pvst` command. The prompt changes to include `conf-pvst`.

You can return to CONFIGURATION mode by using the `exit` command.

PORT-CHANNEL FAILOVER-GROUP Mode

To configure shared LAG state tracking, use PORT-CHANNEL FAILOVER-GROUP mode. For more information, see Port Channel Commands.

To enter PORT-CHANNEL FAILOVER-GROUP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `port-channel failover-group` command. The prompt changes to include `conf-po-failover-grp`.

You can return to CONFIGURATION mode by using the `exit` command.
**PREFIX-LIST Mode**

To configure a prefix list, use PREFIX-LIST mode.

To enter PREFIX-LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip prefix-list` command and the name for the prefix list. The prompt changes to include `conf-nprefixl`.

You can return to CONFIGURATION mode by using the `exit` command.

**PROTOCOL GVRP Mode**

To enter PROTOCOL GVRP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol gvrp` command. The prompt changes to include `config-gvrp`.

You can return to CONFIGURATION mode by using the `exit` command.

**RAPID SPANNING TREE (RSTP) Mode**

To enter RSTP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree rstp` command. The prompt changes to include `conf-rstp`.

You can return to CONFIGURATION mode by using the `exit` command.

**ROUTE-MAP Mode**

To configure a route map, use ROUTE-MAP mode.

To enter ROUTE-MAP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `route-map` `map-name` [permit | deny] `[sequence-number]` command. The prompt changes to include `config-route-map`.

You can return to CONFIGURATION mode by using the `exit` command.

**ROUTER BGP Mode**

To enter ROUTER BGP mode:
Verify that you are logged in to CONFIGURATION mode.

Use the `router bgp` command, and then enter the AS number. The prompt changes to include `conf-router_bgp`.

You can return to CONFIGURATION mode by using the `exit` command.

**ROUTER ISIS Mode**

To enable and configure Intermediate System to Intermediate System (ISIS), use ROUTER ISIS mode. For more information, see Intermediate System to Intermediate System (ISIS).

To enter ROUTER ISIS mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Use the `router isis` command. The prompt changes to include `conf-router_isis`.

You can return to CONFIGURATION mode by using the `exit` command.

**ROUTER OSPF Mode**

To configure OSPF, use ROUTER OSPF mode. For more information, see Open Shortest Path First (OSPFv2).

To enter ROUTER OSPF mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `router ospf {process-id}` command. The prompt changes to include `conf-router_ospf-id`.

You can switch to INTERFACE mode by using the `interface` command or you can switch to ROUTER RIP mode by using the `router rip` command.

**ROUTER OSPFV3 Mode**

To configure OSPF for IPv6, use ROUTER OSPFV3 mode.

To enter ROUTER OSPFV3 mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ipv6 router ospf {process-id}` command. The prompt changes to include `conf-ipv6-router_ospf`.

You can return to CONFIGURATION mode by using the `exit` command.

**ROUTER RIP Mode**

To enable and configure Router Information Protocol (RIP), use ROUTER RIP mode. For more information, see Routing Information Protocol (RIP).

To enter ROUTER RIP mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `router rip` command. The prompt changes to include `conf-router_rip`.

You can return to CONFIGURATION mode by using the `exit` command.
**SPANNING TREE Mode**

To enable and configure the Spanning Tree protocol, use SPANNING TREE mode. For more information, see Spanning Tree Protocol (STP).

To enter SPANNING TREE mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `protocol spanning-tree stp-id` command. The prompt changes to include `conf-stp`.

You can return to CONFIGURATION mode by using the `exit` command.

**SupportAssist Mode**

To enable and configure the SupportAssist, use SupportAssist mode. For more information, see SupportAssist.

To enter SUPPORT ASSIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `support-assist` command. The prompt changes to include `conf-supportassist`.

You can return to CONFIGURATION mode by using the `exit` command.

**TRACE-LIST Mode**

To configure a Trace list, use TRACE-LIST mode.

To enter TRACE-LIST mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `ip trace-list` command, and the name of the Trace list. The prompt changes to include `conf-trace-acl`.

You can exit this mode by using the `exit` command.

**VLT DOMAIN Mode**

To enable and configure the VLT domain protocol, use VLT DOMAIN mode. For more information, see Virtual Link Trunking (VLT).

To enter VLT DOMAIN mode:

1. Verify that you are logged in to CONFIGURATION mode.
2. Enter the `vlt domain` command, and then the VLT domain number. The prompt changes to include `conf-vlt-domain`.

You can return to CONFIGURATION mode by entering the `exit` command.

**VRRP Mode**

To enable and configure Virtual Router Redundancy Protocol (VRRP), use VRRP mode. For more information, see Virtual Router Redundancy Protocol (VRRP).

To enter VRRP mode:

1. To enable VRRP globally, verify that you are logged in to CONFIGURATION mode.
2. Enter the `vrrp-group` command, and then enter the VRRP group ID. The prompt changes to include `conf-if-interface-type-slot/port-vrid-vrrp-group-id`. 
This section contains command line interface (CLI) commands needed to manage the configuration files, as well as other file management commands.

Topics:

- boot system
- cd
- HTTP Copy via CLI
- copy
- delete
- dir
- format
- fsck flash
- mkdir
- mount nfs
- rmdir
- HTTP Copy via CLI
- rename
- restore factory-defaults
- show boot system
- show bootvar
- show file-systems
- show os-version
- show running-config
- show startup-config
- show version
- upgrade
- upgrade system

### boot system

Specify the location where the Dell EMC Networking OS image used to boot the system is stored.

**Syntax**

```
boot system {gateway ip-address | stack-unit {stack-unit-number | all} {default | primary | secondary} {ftp: | nfsmount: | system: {A: | B: | bmp-boot} | tftp: | usbflash:})
```

To return to the default boot sequence, use the `no boot system` command.

**Parameters**

- **gateway**
  - Enter the IP address of the default next-hop gateway for the management subnet.

- **ip-address**
  - Enter an IP address in dotted decimal format.
stack-unit Enter the keywords stack-unit to specify the stack unit number.
all Enter the keyword all for all the stack units.
stack-unit-number Enter the stack-unit number. The range is from 1 to 6.
default Enter the keyword default to specify the default Dell EMC Networking OS image.
primary Enter the keyword primary to specify the primary Dell EMC Networking OS image.
secondary Enter the keyword secondary to specify the secondary Dell EMC Networking OS image.
system: Enter the keyword system: to use the system image file URL (system).
ftp: Enter the keyword FTP: to retrieve the image from an FTP server. ftp://userid:password@hostip/filepath.
nfsmount Enter the keyword nfsmount: to retrieve the image from a mounted NFS file system.
nfsmount://filepath
system: Enter the keyword system: to retrieve the image from the system.
usbfash Enter the keyword usbfash: to retrieve the image from the USB flash memory.
usbfash://filename
TFTP: Enter the keyword TFTP: to retrieve the image from a TFTP server. tftp://hostip/filepath.
A: | B: Enter A: or B: to boot one of the system partitions.
bmp-boot Enter the keywords bmp-boot to boot the system from the image present in the DHCP offer.

**NOTE:** In normal-reload, this keyword is not enabled.

**Defaults**
Not configured.

**Command Modes**
CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S6010-ON and S4048T-ON.</td>
</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S6100-ON.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>

<td>Introduced the support for bmp-boot on the S-Series and Z-Series switches.</td>
</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>
Usage Information

To display these changes in the `show bootvar` command output, save the running configuration to the startup configuration (using the `copy` command) and reload system.

Use the `bmp-boot` keyword only when the device boots up from bare metal provisioning (BMP). For an industrial standard upgraded device, the Dell EMC Networking OS stores the image partition upgraded from the DHCP offer in the `bmp-boot` option.

**cd**

Change to a different working directory.

**Syntax**

```plaintext
cd [flash: | usbflash:] <directory name and path>
```

**Parameters**

- **flash:** Use the keyword `flash:` to change the current directory to internal flash and its sub directories.
- **usbflash:** Use the keyword `usbflash:` to change the current directory to the inserted USB.
- **directory name and path** Enter the directory name and path as follows: `directory name ([flash://]directory_path)`

**NOTE:** The `cd` command without any arguments will change the current directory to `flash:`

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- **9.10(0.1)** Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)** Introduced on the S3148.
- **9.10(0.0)** Introduced on the S6100-ON.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100–ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Added NFS mount support. Introduced on the S6000-ON.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
HTTP Copy via CLI

Copy one file to another location. Dell Networking OS supports IPv4 and IPv6 addressing for FTP, TFTP, and SCP (in the hostip field).

Syntax

```
```

You can copy from the server to the switch and vice-versa.

Parameters

```
copy http:
    Address or name of remote host [10.16.206.77]: 
    Port number of the server [80]: 
    Source file name [sample_file]: 
    User name to login remote host: x
    Password to login remote host: 
    Destination file name [sample_file]: 
```

Defaults

None.

Command Modes

EXEC Privilege

Command History

Version Description
10.2.0 Introduced on the M1000E.
9.8(1.0) Introduced on the S3148.
9.8(0.0P2) Introduced on the S3048-ON.
9.3.(0.0) Introduced on the S6000, S4810, S4820T, S6010, and Z9500.

Example

```
copy http://admin:admin123@10.16.206.77/sample_file flash://sample_file
```
ftp: Enter the keyword ftp: to copy from the remote file system, IPv4, or IPv6, (ftp://userid:password@hostip/filepath).

http: Enter the keyword http: to copy from the remote file system, IPv4, or IPv6, (http://hostip/filepath).

nfsmount: Enter the keyword nfsmount: to copy from the nfs mount file system (nfsmount://<mount-point>/filepath).

running-config Enter the keywords running-config to copy from the current system configuration.

scp: Enter the keyword scp: to copy from the remote file system, IPv4, or IPv6, (scp://userid:password@hostip/filepath).

startup-config Enter the keywords startup-config to copy from the startup configuration.

tftp: Enter the keyword tftp: to copy from the remote file system, IPv4, or IPv6, (tftp://hostip/filepath).

usbflash: Enter the keyword usbflash: to copy the file to or from the external USB flash.

Command Modes EXEC Privilege

<tr>
<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.2.1.0</td>
<td>Added usbflash and rpm0usbflash commands on E-Series.</td>
</tr>
<tr>
<td>7.6.1.0</td>
<td>Introduced on the S-Series and added the SSH port number to the SCP prompt sequence on all systems.</td>
</tr>
<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>
Dell EMC Networking OS supports a maximum of 100 files at the root directory level on both the internal and external flash.

When copying a file to a remote location (for example, using Secure Copy [SCP]), enter only the keywords and Dell EMC Networking OS prompts you for the rest of the information. For example, when using SCP, you can enter `copy running-config scp:` where `running-config` is the source and the target is specified in the ensuing prompts. Dell EMC Networking OS prompts you to enter any required information for the named destination — remote destination, destination filename, user ID, password, and so forth.

When you use the `copy running-config startup-config` command to copy the running configuration to the startup configuration file, Dell EMC Networking OS creates a backup file on the internal flash of the startup configuration.

When you load the startup configuration or a configuration file from a network server such as TFTP to the running configuration, the configuration is added to the running configuration. This does not replace the existing running configuration. Commands in the configuration file has precedence over commands in the running configuration. Dell EMC Networking OS supports copying the running-configuration to a TFTP server, an FTP server, or a remote NFS file system. For example:

- `copy running-config tftp:
- `copy running-config ftp:
- `copy running-config nfsmount://<mount-point>/filepath

You can compress the running configuration by grouping all the VLANs and the physical interfaces with the same property. You can store the operating configuration to the startup config in Compressed mode and perform an image downgrade without any configuration loss.

### Example

```
DellEMC#copy running-config scp:
Address or name of remote host []: 192.168.1.1
Port number of the server [22]: 22
Destination file name [startup-config]:
User name to login remote host: username
Password to login remote host:
4080 bytes successfully copied
DellEMC#
```

In this `copy scp: flash:` example, specifying SCP in the first position indicates that you need to specify the target in the ensuing prompts. Entering `flash:` in the second position indicates that the target is the internal flash. The source is on a secure server running secure shell (SSH), so you are prompted for the user datagram protocol (UDP) port of the SSH server on the remote host.

```
DellEMC# copy running-config nfsmount://<mount-point>/filepath
Destination file name [test.txt]:
User name to login remote host: usename
Password to login remote host:
DellEMC#
```

```
DellEMC# copy scp: flash:
Address or name of remote host []: 10.11.199.134
Port number of the server [22]: 99
Source file name []: test.cfg
User name to login remote host: admin
```

File Management
Password to login remote host:
Destination file name [test.cfg]: test1.cfg
DellEMC#

Example

DellEMC# copy compressed-config compressed-config
6655 bytes successfully copied
DellEMC#
DellEMC# copy compressed-config ftp:
Address or name of remote host []: 10.11.8.12
Destination file name [startup-config]:
User name to login remote host: spbalaji
Password to login remote host:
6655 bytes successfully copied
DellEMC#

Example

DellEMC# copy http://admin:admin123@10.16.206.77/sample_file flash://
sample_file
DellEMC#

Related Commands

- cd – changes the working directory.

**delete**

Delete a file from the flash. After deletion, files cannot be restored.

**Syntax**

```
delete {flash: | nfsmount: | usbflash:} [no-confirm]
```

**Parameters**

- `flash:`
  
  To delete a file or directory on the internal flash, enter `flash://` then the filename or directory name (`[flash://]filepath`).

- `nfsmount:`
  
  To delete a file or directory on the NFS-mounted file system, enter `nfsmount://` then the mount point and the file path (`nfsmount://filepath`).
  
  **NOTE:** While deleting a file directory on a remote NFS file system, you must specify the mount-point that indicates the working directory on the NFS file system. You cannot delete the root directory of the remote NFS file system.

- `usbflash:`
  
  To delete a file or directory on the external USB flash, enter `usbflash://` then the filename or directory name (`[usbflash://]filepath`).

- `no-confirm`
  
  (OPTIONAL) Enter the keywords `no-confirm` to specify that the Dell EMC Networking OS does not require user input for each file prior to deletion.

**Command Modes**

- EXEC Privilege

**Command History**

</tbody>
</table>
## dir

Display the files in a file system. The default is the current directory.

**Syntax**

```
dir [flash: | nfsmount: | usbflash:]
```

**Parameters**

- **flash:** For a directory on the internal Flash, enter `flash://` directory name.
- **nfsmount:** For a file or directory on an NFS-mounted file system, enter `nfsmount://` then the mount point and file path.

**NOTE:** While displaying a file directory on a remote NFS file system, it is mandatory to specify the mount-point that indicates the working directory on the NFS file system. You cannot display details corresponding to the root directory of the remote NFS file system.

- **usbflash:** For a directory on the external USB flash, enter `usbflash://` directory name.

7 drwx 4096 Nov 06 2014 06:57:06 +00:00  CONFIG_TEMPLATE
8 drwx 4625 Nov 06 2014 06:58:28 +00:00 startup-config
9 drwx 4096 May 31 2013 02:49:46 +00:00  CONFD_LOG_DIR
flash: 2056916992 bytes total (2052784128 bytes free)
```

```
DellEMC#
```

**Example (NFS Mount)**

```
DellEMC# dir nfsmount:
Directory of nfsmount:

1 drwx 512 Jun 15 2015 02:47:57 +00:00 .
2 drwx 512 Jun 15 2015 02:47:57 +00:00 ..

nfsmount: 1463410688 bytes total (585719808 bytes free)
```

**Related Commands**

- `cd` — changes the working directory.

**format**

Erase all existing files and reformat the file system. After the file system is formatted, files cannot be restored.

**Syntax**

```
format {flash: | usbflash:}
```

**Defaults**

None

**Command Modes**

EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>7.8.1.0</td>
<td>Introduced on the S-Series</td>
</tr>
</tbody>
</table>

**Usage Information**

You must include the colon (:) when entering this command.

After reformatting is complete, three empty directories are automatically created on flash: CRASH_LOG_DIR, TRACE_LOG_DIR and NVTRACE_LOG_DIR.

⚠ **CAUTION:** This command deletes all files, including the startup configuration file. So, after executing this command, consider saving the running config as the startup config (use the write memory command or copy running-config startup-config command).

**Related Commands**

- `copy` — copy the current configuration to either the startup-configuration file or the terminal.
- `show file-systems` — display information about the file systems on the system.

## fsck flash

Checks the flash file system for errors.

**Syntax**

```
fsck {flash: | usbflash:}
```

**Parameters**

- `flash:` For a directory on the internal Flash, enter `flash://` directory name.
- `usbflash:` For a directory on the external USB flash, enter `usbflash://` directory name.

**Defaults**

None

**Command Modes**

EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on S4820T.</td>
</tr>
</tbody>
</table>

### Usage Information

Include the colon (:) when entering this command. This command checks the specified flash memory for errors. If errors are found, the command recommends that you format the flash.

⚠️ **CAUTION:** If you elect to format the flash, all files — including the startup configuration file — are lost. If you do decide to format the specified flash, consider saving the running configuration as the startup configuration after formatting the flash (use the `write memory` command or `copy running-config startup-config` command).

### Related Commands
- `copy` — copy one file to another location.
- `show file-systems` — display information about the file systems on the system.

#### mkdir

Creates a directory on the NFS mounted file system.

**Syntax**

```
mkdir nfsmount://mount-point/username
```

**Command Modes**

### mount nfs

Mounts an NFS file system to a device.

#### Syntax

```
mount nfs rhost:path mount-point [username password]
```

#### Parameters

- `rhost:path`: Enter the remote host's path directory.
- `mount-point`: Enter the folder name in the local file system.
- `username`: (OPTIONAL) Enter the user name to access the device.
- `password`: (OPTIONAL) Enter the password.

**Example**

```
DellEMC# rmdir nfsmount://nfs-mountpoint/guest
Proceed to remove the directory [confirm yes/no]: yes
```

**Related Commands**

- `mkdir` — create a directory.

---

**HTTP Copy via CLI**

Copy one file to another location. Dell Networking OS supports IPv4 and IPv6 addressing for FTP, TFTP, and SCP (in the `hostip` field).

**Syntax**

```plaintext
```

You can copy from the server to the switch and vice-versa.

**Parameters**

- `copy http:`
  - Address or name of remote host [ ]: 10.16.206.77
  - Port number of the server [80]:
  - Source file name [ ]: sample_file
  - User name to login remote host: x
  - Password to login remote host:
  - Destination file name [sample_file]:

---

**File Management**

74
rename

Rename a file in the local file system.

Syntax

rename url url

Parameters

- url
  - Enter the following keywords and a filename:
    - For a file on the internal Flash, enter flash:// followed by the filename.
    - For a file on an NFS mounted file system, enter nfsmount:// followed by the mount point and file path.
    - For a file on an external USB drive, enter usbflash:// followed by the filename.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON. Added support for NFS mount.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on S-Series
**restore factory-defaults**

Restore factory defaults.

**Syntax**

```
restore factory-defaults stack-unit {stack-unit-number | all} {clear-all | bootvar | nvram}
```

**Parameters**

- **factory-defaults**
  - Return the system to its factory default mode.

- **stack-unit-number**
  - Enter the stack member unit identifier to restore only the mentioned stack-unit. The range is from 1 to 6.

- **all**
  - Enter the keyword all to restore all units in the stack.

- **bootvar**
  - Enter the keyword bootvar to reset boot line.

- **clear-all**
  - Enter the keywords clear-all to reset the NvRAM, boot environment variables, and the system startup configuration.

- **nvram**
  - Enter the keyword nvram to reset the NvRAM only.

**Command Modes**

- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.8(2.0)
  - Introduced on the S3100 series.

- 9.8(0.0P5)
  - Introduced on the S4048-ON.

- 9.8(0.0P2)
  - Introduced on the S3048-ON.

- 9.5(0.1)
  - Added bootvar as a new parameter.

- 9.2(1.0)
  - Introduced on the Z9500.

- 9.0.2.0
  - Introduced on the S6000.

- 9.0.0.0
  - Introduced on the Z9000.

- 8.3.19.0
  - Introduced on the S4820T.

- 8.3.12.0
  - Introduced on the S4810.

- 8.3.16.0
  - Introduced on the MXL 10/40GbE Switch IO Module.

**Usage Information**

Restoring factory defaults deletes the existing startup configuration and all persistent settings (stacking, fan-out, and so forth).

When restoring all units in a stack, all the units in the stack are placed into stand-alone mode.
When restoring a single unit in a stack, that unit placed in stand-alone mode. No other units in the stack are affected.

When restoring units in stand-alone mode, the units remain in stand-alone mode after the restoration. After the restore is complete, the units power cycle immediately.

⚠️ **CAUTION:** There is no undo for this command.

Following are the factory-default environment variables:

- baudrate
- primary_boot
- secondary_boot
- default_boot
- ipaddr
- gatewayip
- netmask
- macaddr
- mgmtautoneg
- mgmtspeed100
- mgmtfullduplex

Each boot path variable (primary_boot, secondary_boot, and default_boot) is further split into the following three independent variables:

- primary_server, primary_file, and primary_type
- secondary_server, secondary_file, and secondary_type
- default_server, default_file, and default_type

💡 **NOTE:** For information on the default values that these variables take, refer to the Restoring Factory Default Environment Variables section in the Dell EMC Networking OS Configuration guide.

---

**Example (all stack units)**

```
DellEMC# restore factory-defaults stack-unit all clear-all
**************************************************************
* Warning - Restoring factory defaults will delete the existing *
* startup-config and all persistent settings (stacking, fanout, etc.)*
* All the units in the stack will be split into standalone units. *
* After restoration the unit(s) will be powercycled immediately. *
* Proceed with caution ! *
**************************************************************
Proceed with factory settings? Confirm [yes/no]:yes
-- Restore status --
Unit Nvram Config
------------------------
1 Success Success
2 Success Success
3 Success Success
4 Not present
5 Not present
Power-cycling the unit(s).
DellEMC#
```
show boot system

Displays information about boot images currently configured on the system.

**Syntax**

```
show boot system stack-unit {stack-unit-id | all}
```

**Parameters**

- `all` Enter the keyword `all` to display the boot image information for all stack units.
- `stack-unit-id` Enter the `stack-unit-id` to display boot image information for a stack-unit.

**Defaults**

`none`

**Command Modes**

- EXEC
- EXEC Privilege
show bootvar

Display the variable settings for the boot parameters.

Syntax

```
show bootvar
```

Command Modes

EXEC Privilege

Related Commands

- `format flash` — erases all the existing files and reformats the file system in the internal flash memory.

**show os-version**

Display the release and software image version information of the image file specified.

**Syntax**

```
show os-version [file-url]
```
### Parameters

**file-url**

(Optional) Enter the following location keywords and information:

- For a file on the internal flash, enter `flash://` followed by the filename.
- For a file on an FTP server, enter `ftp://user:password@hostip/filepath`.
- For a file on a TFTP server, enter `tftp://hostip/filepath`.
- For a file on the USB port, enter `usbflash://filepath`.

### E-Series

Original command.

### Example

```plaintext
Usage Information

NOTE: A filepath that contains a dot ( . ) is not supported.
```

### show running-config

Display the current configuration and display changes from the default values.

**Syntax**

```plaintext
show running-config [entity] [configured] [status] [compressed]
```
Parameters

(OPTIONAL) To display that entity’s current (non-default) configuration, enter one of the following keywords:

1. **NOTE:** If you did not configure anything that entity, nothing displays and the prompt returns.

- **aaa** for the current AAA configuration
- **acl** for the current ACL configuration
- **arp** for the current static ARP configuration
- **as-path** for the current AS-path configuration
- **bfd** for the current BFD configuration
- **bgp** for the current BGP configuration
- **boot** for the current boot configuration
- **cam-profile** for the current CAM profile in the configuration
- **class-map** for the current class-map configuration
- **community-list** for the current community-list configuration
- **ecmp-group** for the current ECMP group configuration
- **eis** for the current EIS configuration
- **ethernet** for the current Ethernet CFM configuration
- **fefd** for the current FEFD configuration
- **ftp** for the current FTP configuration
- **frrp** for the current FRRP configuration
- **fvrp** for the current FVRP configuration
- **gvrp** for the current GVRP configuration
- **host** for the current host configuration
- **hardware-monitor** for hardware-monitor action-on-error settings
- **hypervisor** for the current hypervisor configuration
- **igmp** for the current IGMP configuration
- **interface** for the current interface configuration
- **interface port-channel** for the current port-channel interface configuration
- **interface tunnel** for all configured tunnels. For a specific tunnel, enter the tunnel ID. The range is from 1 to 16383.
- **ip** for the current IP configuration
- **isis** for the current ISIS configuration
- **line** for the current line configuration
- **lldp** for the current LLDP configuration
- **load-balance** for the current port-channel load-balance configuration

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
9.2.(0.0) Added support for the tunnel and EIS interface types.
9.0.0.0 Added support for the VLT option.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.

Upgrade the bootflash image or system image of the management unit.

**Syntax**

```plaintext
upgrade boot {all | bootflash-image | bootselector-image} stack-unit {stack-unit-number | all} {booted | flash: | ftp: | nfsmount | scp: | tftp: | usbflash:} file-url
```

**Parameters**

- **boot**: Enter the keyword `boot` to change the boot image.
- **system**: Enter the keyword `system` to change the system image.
- **ftp**: After entering the keyword `ftp:`, you can either follow it with the location of the source file in this form: `//userid:password@hostip/filepath` or press Enter to launch a prompt sequence.
- **scp**: After entering the keyword `scp:`, you can either follow it with the location of the source file in this form: `//userid:password@hostip/filepath` or press Enter to launch a prompt sequence.
- **slot0**: After entering the keyword `slot0:`, you can either follow it with the location of the source file in this form: `//hostlocation/filepath` or press Enter to launch a prompt sequence.
- **tftp**: After entering the keyword `tftp:`, you can either follow it with the location of the source file in this form: `//hostlocation/filepath` or press Enter to launch a prompt sequence.
- **flash**: After entering the keyword `flash:`, you can either follow it with the location of the source file in this form: `flash://filepath` or press Enter to launch a prompt sequence.
- **A: | B:** Enter the partition to upgrade from the flash.
- **stack-unit**: Enter the keywords `stack-unit:` to synch the image to the stack-unit.
- **file-url**: Enter the following location keywords and information to upgrade using an Dell EMC Networking OS image other than the one currently running:
  - To specify an Dell EMC Networking OS image on the internal flash, enter `flash://file-path/filename`.
  - To specify an Dell EMC Networking OS image on an FTP server, enter `ftp://user:password@hostip/filepath`.
  - To specify an Dell EMC Networking OS image on the external flash, enter `slot0://file-path/filename`.
  - To copy a file on a TFTP server, enter `tftp://hostip/filepath/filename`.

where `hostip` is either an IPv4 dotted decimal address or an IPv6 URI `[x:x:x:x]` format address.

**Defaults**

- none

**Command Modes**

- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### Version Description

- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.0(0.0)** Added support for IPv6 for the `file-url` parameter.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000. Added support for the SSD on the Z9000 only.
- **8.3.7.0** Introduced on the S4810.
- **7.7.1.0** Added support for TFTP and SCP.
- **7.6.1.0** Introduced on the S-Series.

### Usage Information

RFC 3986 specifies that IPv6 host addresses in a uniform resource identifier (URI) must be enclosed in square brackets, `[X::XX::X]`. For maximum flexibility this command accepts IPv6 host addresses with or without the square brackets.

Reload Dell EMC Networking OS after executing this command. To copy Dell EMC Networking OS from the management unit to one or more stack members, use the `upgrade system stack-unit (S-Series stack member)` command.

### Example

```
DellEMC# upgrade system ftp://username:password@10.11.1.1/FTOS-SB-7.7.1.0.bin
Erasing Sseries Image Upgrade Table of Contents, please wait.
112946259 bytes successfully copied
DellEMC# reload
DellEMC#
```

### upgrade system

Upgrade the Dell EMC Networking OS image. To upgrade the boot flash or boot selector image, use the `upgrade boot` command.

#### Syntax

```
upgrade system {flash: | ftp: | nfsmount: | scp: | stack-unit {stack-unit-id | all} | tftp: | usbflash:} file-url {A: | B:}
```

#### Parameters

- **system** Enter the keyword `system` to upgrade the operating system (OS) image.
- **flash:** `file-url` Enter the keyword `flash:` and specify the location of the image file in the format `//directory-path` or press Enter to launch a prompt sequence.
ftp: file-url

Enter the keyword ftp: and specify the location of the image file in the format //userid:password@host-ip/filepath or press Enter to launch a prompt sequence.

nfsmount://<mount-point>/filepath

Enter the keyword nfsmount: and specify the location of the image file in the format //<mount-point>/filepath.

scp: file-url

Enter the keyword scp: and specify the location of the image file in the format userid:password@host-ip/filepath or press Enter to launch a prompt sequence.

stack-unit stack-unit-id

Enter the keyword stack-unit and specify the stack-unit ID to sync the image to that stack-unit.

stack-unit all

Enter the keyword stack-unit followed by the keyword all to sync the image on all stack-units.

tftp: file-url

Enter the keyword tftp: and specify the location of the image file in the format //host-ip/filepath or press Enter to launch a prompt sequence.

usbflash: file-path

Enter the keyword usbflash: and specify the location of the source file in the format //directory-path to upgrade form an external flash device or press Enter to launch a prompt sequence.

A: | B:

Specify the flash partition of the operating-system image to be upgraded.

Defaults

none

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.13(0.0) Enhanced to specify the MD5, SHA1, or SHA256 hash of the OS image that the system uses to validate the image during reboot.
9.12(1.0) Introduced on the S5048F-ON.
9.10(0.0) Introduced on the S6100-ON.
9.8(1.0) Introduced on the Z9100-ON.
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Added support for NFS mount.
9.2(1.0) Introduced on the Z9500.
9.0(0.0) Added support for IPv6 for the file-url parameter.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000. Added support for the SSD on the Z9000 only.
8.3.7.0 Introduced on the S4810.
### Usage Information

RFC 3986 specifies that IPv6 host addresses in a uniform resource identifier (URI) must be enclosed in square brackets, [X::X::X]. For maximum flexibility this command accepts IPv6 host addresses with or without the square brackets.

After you upgrade the system image, using the `upgrade system` command, specify the default boot location using the `boot system` command. Save the configuration to the startup configuration file using the `write memory` command and reload the system using the `reload` command to use the new Dell EMC Networking OS software.

If you enable the verified boot feature using the `verified boot` command, the `upgrade system` command prompts you to enter the hash value of the Dell EMC Networking OS image. This is applicable only for the local partitions such as A: or B:. You can get the hash from the iSupport page.

**NOTE:** You can apply a set of configurations, available only in the new version to which you want to upgrade the system to, without having to re-boot the system twice. In order to accomplish this seamless upgrade, perform the following tasks:

1. Upgrade the system image to the new image and configure the primary partition to boot from the new image using the `boot system` command.
2. Update the startup configuration file with the new set of configurations and then reload the device using the `reload` command.

The new set of configurations are parsed from the startup configuration file and applied to the NVRAM. During the system boot up, the new set of configurations are applied to the system from the updated NVRAM configurations.

The following commands require NVRAM write to take effect in a single reload:

- **Forwarding CLIs:**
  - `hardware forwarding-table mode {scaled-l2-switch | scaled-13-routes | scaled-13-hosts}`
  - `cam-ipv6 extended-prefix {1024 | 2048 | 3072}`
  - `ip ecmp-group maximum-paths 2-64`
- **ACL CAM carving related CLIs:**
  - `cam-acl cli`
  - `cam-acl-vlan cli`
  - `cam-acl-egress cli`
  - `cam-sharing`
- **Feature keyword CLIs:**
  - `feature udf-acl`
  - `feature aclrange`
  - `feature ipv6acloptimized`
  - `feature acloptimized`

### Example

```
DellEMC# upgrade system tftp://10.11.8.12/dv-rainier-13 a:
Received block num: 50
```
Received block num: 64 
.......................................................... 
93924044 bytes successfully copied 
System image upgrade completed successfully. 
.........................................................
Image upgraded to all
DellEMC#

The following example shows that the system prompts for the hash value of the OS image with the OS image verification feature enabled:

Dell# upgrade system tftp://10.16.127.35/FTOS-SE-9.11.0.1 A:
Hash Value: e42e2548783c2d5db239ea2fa9de4232 
........................................
This section contains command information to configure and monitor the system, including Telnet, file transfer protocol (FTP), and trivial file transfer protocol (TFTP).

**asf-mode**

Enable alternate store and forward (ASF) mode and forward packets as soon as a threshold is reached.

**Syntax**

```markdown
asf-mode stack-unit {unit-id | all} queue size
```

To return to standard Store and Forward mode, use the no asf-mode command.

**Parameters**

- **unit-id**
  - Enter the stack member unit identifier of the stack member to reset.
- **queue size**
  - Enter the queue size of the stack member. The range is from 0 to 15.

**Defaults**

Not configured

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

8.3(11.0) | Introduced on the Z9000.
8.3(7.0) | Introduced on the S4810.

**Usage Information**

You must save the configuration and reload the system to implement ASF. When you enter the command, the system sends a message stating that the new mode is enabled when the system reloads.

**banner exec**

Configure a message that is displayed when your enter EXEC mode.

**Syntax**

```
banner exec c line c
```

To delete a banner, use the `no banner exec` command.

**Parameters**

- `c`
  - Enter the keywords `banner exec`, then enter a character delineator, represented here by the letter `c`. Press ENTER.
- `line`
  - Enter a text string for your banner message ending the message with your delineator. In the following example, the delineator is a percent character (`%`); the banner message is “testing, testing”.

**Defaults**

No banner is displayed.

</tbody>
</table>
### Usage Information
After entering the `banner login` command, type one or more spaces and a delineator character. Enter the banner text then the second delineator character. When the user is connected to the router, if a message of the day banner is configured, it displays first. If no message of the day banner is configured, the login banner and prompt appear. After the user has logged in, the banner EXEC (if configured) displays.

### Example
```
DellEMC(conf)# banner exec ?
LINE c banner-text c, where 'c' is a delimiting character
DellEMC(conf)# banner exec %
Enter TEXT message. End with the character '%'.
This is the banner%
DellEMC(conf)# end
DellEMC# exit
```

### Related Commands
- `line` — enables and configures the console and virtual terminal lines to the system.

### banner login

Set a message of the day banner to appear after logging on to the system.

#### Syntax
```
banner login {acknowledgement | keyboard-interactive | c line c}
```

Enter `no banner login` to delete the banner text. Enter `no banner login keyboard-interactive` to automatically go to the banner message prompt (does not require a carriage return).

#### Parameters
- `keyboard-interactive` Enter the `keyboard-interactive` keyword and then press Enter (carriage return) to retrieve the message banner prompt.
- `acknowledgement` Enter the `acknowledgement` keyword to require a positive acknowledgement from the user while logging in to the system.
- `c` Enter a delineator character to specify the start and end of the text banner. You cannot use the delineator character in the banner message.
line

Enter text string for your text banner message, with a maximum of 50 lines and up to 255 characters per line.

Defaults

No banner is configured and a carriage return (CR) is required when creating a banner.

<tr>
<td>7.6.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

Usage Information

Enter the banner login command, type one or more spaces and a delineator character, type the banner text, and then type the second delineator character. The message of the day banner displays first when you are connected to the router; otherwise the login banner and prompt appear. After you have logged in, the banner EXEC (if configured) displays.

Example

```
DellEMC(conf)#banner login ?
acknowledgement Require positive acknowledgment after login prompt
keyboard-interactive Press enter key to get prompt
LINE c banner-text (max length 255) c, where 'c' is a delimiting character
DellEMC(conf)#no banner login ?
acknowledgement Disable positive acknowledgment required after login prompt
keyboard-interactive Prompt will be displayed by default
```

If you configure the acknowledgement keyword, the system requires a positive acknowledgement from the user while logging in to the system.

```bash
$ telnet 10.11.178.16
Trying 10.11.178.16...
Connected to 10.11.178.16.
```
Escape character is '^]'.
THIS IS A LOGIN BANNER. PRESS ‘Y’ TO ACKNOWLEDGE. ACKNOWLEDGE?

Related Commands
- banner motd — sets a Message of the Day banner.
- banner exec — enables the display of a text string when you enter EXEC mode.

**banner motd**

Set a message of the day (MOTD) banner.

**Syntax**

```
banner motd c line c
```

To delete a Message of the Day banner, enter `no banner motd`.

**Parameters**

- `c`  
  Enter a delineator character to specify the limits of the text banner. The delineator is a percent character (%).

- `line`  
  Enter a text string for your MOTD banner the message with your delineator. The delineator is a percent character (%).

**Defaults**

No banner is configured.

</tbody>
</table>
**cam-acl**

Allocate content addressable memory (CAM) for IPv4 and IPv6 ACLs.

**Syntax**

cam-acl {default | l2acl number ipv4acl number ipv6acl number ipv4qos number l2qos number l2pt number ipmacacl number [vman-qos | vman-dual-qos] number ecfmacl number {fcoeacl number} {iscsioptacl {0|2}} {openflow {4|8}}

**Parameters**

- **default**
  Use the default CAM profile settings and set the CAM as follows:
  - L2Acl : 6
  - IPv4Acl : 4
  - IPv6Acl : 0
  - IPv4Qos : 2
  - L2Qos : 1
  - L2PT : 0
  - IpMacAcl : 0
  - VmanQos : 0
  - VmanDualQos : 0
  - EcfmAcl : 0
  - nlbclusteracl: 0
  - FcoeAcl : 0
  - iscsiOptAcl : 0
  - ipv4pbr : 0
  - ipv4udfmirracl: 0
  - vrfv4Acl :0
  - Openflow : 0
  - fedgovacl : 0

Allocate space to each CAM region.

Enter the CAM profile name then the amount of CAM space to be allotted. The total space allocated must equal to 13. The ipv6acl range must be a factor of 2.
Enter 4 or 8 for the number of OpenFlow FP blocks.

- **4**: Creates 242 entries for use by the OpenFlow controller (256 total entries minus the 14 entries reserved for internal functionality)
- **8**: Creates 498 entries for use by the OpenFlow controller (512 total entries minus the 14 entries reserved for internal functionality)

<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

For the new settings to take effect, save the new CAM settings to the startup-config (write-mem or copy run start) then reload the system.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks and these blocks cannot be reallocated. The ipv4acl profile range is from 1 to 8.

When configuring space for IPv6 ACLs, the total number of Blocks must equal 13.

Ranges for the CAM profiles are from 1 to 10, except for the ipv6acl profile which is from 0 to 10. The ipv6acl allocation must be a factor.

If you enabled BMP, to perform a reload on the chassis to upgrade any configuration changes that have changed the NVRAM content, use the reload conditional nvram-cfg-change command.
cam-acl-vlan

Specify the number of VFP blocks allocated to OpenFlow.

Syntax

```
cam-acl-vlan {default | vlanopenflow {0|1}}
```

Defaults

Disabled.

Parameters

- **default**: Reset VLAN CAM ACL entries to default settings
- **vlanopenflow**: Enter the number 1 to allocate VFP blocks and enable OpenFlow. (Default) Enter the number 0 to disable OpenFlow.

Command Modes

Usage Information

Reboot the switch after changing the parameter values for changes to take effect.

For platform-specific instructions about using this command, see the SDN section of the Dell EMC Networking OS Configuration Guide.

clear average-power

Reset the average power and average power start time.

Syntax

```
clear average-power stack-unit {stack-unit-number}
```

Parameters

- **stack-unit-number**: Enter the stack unit number.

Defaults

None

Command Modes

- **EXEC Privilege**

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>

<td>Introduced on all Dell EMC Networking OS platforms</td>
</tr>
</tbody>
</table>
Usage Information

This command resets the average power and average power start time to the current time. Average power and average power start time will be calculated from the reset time (ie current time).

Example

```
DellEMC#clear average-power stack-unit 1
Proceed to clear Average power ? Confirm [yes/no]:yes
DellEMC#
```

clear line

Reset a terminal line.

Syntax

```
clear line {line-number | console 0 | vty number}
```

Parameters

- **line-number**: Enter a number for one of the 12 terminal lines on the system. The range is from 0 to 11.
- **aux 0**: Enter the keywords `aux 0` to reset the auxiliary port.
- **console 0**: Enter the keywords `console 0` to reset the console port.
- **vty number**: Enter the keyword `vty` then a number to clear a terminal line. The range is from 0 to 9.

Usage Information

Users entering EXEC Privilege mode or any other configured privilege level can access configuration commands. To protect against unauthorized access, use the `enable password` command to configure a password for the `enable` command at a specific privilege level. If no privilege level is specified, the default is privilege level 15. If you are authorized for the EXEC Privilege mode by your role, you do not need to enter an `enable password`.

Related Commands

- `enable password` — configures a password for the `enable` command and to access a privilege level.

enable optic-info-update interval

Enable polling intervals of optical information updates for simple network management protocol (SNMP).

Syntax

```
enable optic-info-update [interval seconds]
```

To disable optical power information updates, use the `no enable optic-info-update interval` command.

Parameters

- `interval seconds` Enter the keyword `interval` then the polling interval in seconds. The range is from 120 to 6000 seconds. The default is 300 seconds (5 minutes).

Defaults

Disabled

</tr>
<tr>
<td>9.0.2.0</td>
<td>Introduced on the S6000.</td>
</tr>
<tr>
<td>8.3.19.0</td>
<td>Replacement command for the S4820T. Replaces the <code>enable xfp-power-updates</code> command.</td>
</tr>
<tr>
<td>8.3.11.4</td>
<td>Replacement command for the Z9000. Replaces the <code>enable xfp-power-updates</code> command</td>
</tr>
<tr>
<td>8.3.10.0</td>
<td>Replacement command for the S4810 only. Replaces the <code>enable xfp-power-updates</code> command.</td>
</tr>
</tbody>
</table>

Usage Information

To enable polling and to configure the polling frequency, use this command.
enable xfp-power-updates

Enable 10–gigabit small form-factor pluggable (XFP) power updates for SNMP.

Syntax

```
enable xfp-power-updates interval seconds
```

Parameters

- **interval seconds**
  - Enter the keyword `interval` then the polling interval in seconds. The range is from 120 to 6000 seconds. Default: **300 seconds** (5 minutes).

Defaults

Disabled

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3.19.0</td>
<td>Deprecated command for S4820T. Replaced by the <code>enable optic-info-update interval</code> command to update information on temperature and power monitoring in the SNMP MIB.</td>
</tr>
<tr>
<td>8.3.11.4</td>
<td>Deprecated command for Z9000. Replaced by the <code>enable optic-info-update interval</code> command to update information on temperature and power monitoring in the SNMP MIB.</td>
</tr>
<tr>
<td>8.3.10.0</td>
<td>Deprecated command for the S4810 only. Replaced by the <code>enable optic-info-update interval</code> command to update information on temperature and power monitoring in the SNMP MIB.</td>
</tr>
<tr>
<td>8.1.1.0</td>
<td>Introduced on the E-Series.</td>

<tr>
<td>7.6.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series and E-Series.</td>
</tr>
</tbody>
</table>

Usage Information

The chassis MIB contains the entry `chSysXfpRecvPower` in the `chSysPortTable` table. Periodically, IFA polls the XFP power for each of the ports and sends the values to IFM where it is cached. To enable polling and to configure the polling frequency, use this command.

end

Return to EXEC Privilege mode from other command modes (for example, CONFIGURATION or ROUTER OSPF modes).

Syntax

```
end
```

**Related Commands**
- **exit** — returns to the lower command mode.

**exec-timeout**

Set a time interval that the system waits for input on a line before disconnecting the session.

**Syntax**

```
exec-timeout minutes [seconds]
```

To return to default settings, use the **no exec-timeout** command.
**Parameters**

- **minutes**: Enter the number of minutes of inactivity on the system before disconnecting the current session. The range is from 0 to 35791. The default is **10 minutes** for the console line and **30 minutes** for the VTY line.
- **seconds**: (OPTIONAL) Enter the number of seconds. The range is from 0 to 2147483. The default is **0 seconds**.

**Defaults**

- **10 minutes** for console line; **30 minutes** for VTY lines; **0 seconds**

**Command Modes**

- LINE

**E-Series**
Original command.

**Related Commands**
- `end` — returns to EXEC Privilege mode.
**ftp-server enable**

Enable FTP server functions on the system.

**Syntax**

`ftp-server [vrf vrf-name] enable`

**Parameters**

- `vrf vrf-name`
  Enter the keyword `vrf` and then the name of the VRF to enable the FTP server to listen to that VRF instance.

**NOTE:** Use this attribute to specify the VRF that is used by the FTP server to accept client connections. If no VRF is specified, then the default VRF is used.

**Defaults**

Disabled.

</tbody>
</table>
Version Description
7.5.1.0 Introduced on the C-Series.
E-Series Original command.

Usage Information After you enable FTP server functions with the `ftp-server enable` command, Dell EMC Networking recommends specifying a top-level directory path. Without a top-level directory path specified, the Dell EMC Networking OS directs users to the flash directory when logging in to the FTP server.

Related Commands
- `ftp-server username` — sets a username and password for incoming FTP connections to the E-Series.

**ftp-server username**

Create a user name and associated password for incoming FTP server sessions.

**Syntax**
```
ftp-server username username password [encryption-type] password
```
To delete a user name and its password, use the `no ftp-server username username` command.

**Parameters**
- `username` Enter a text string up to 40 characters long as the user name.
- `password` Enter the keyword `password` then a string up to 40 characters long as the password.
  - Without specifying an encryption type, the password is unencrypted.
- `encryption-type` (OPTIONAL) After the keyword `password`, enter one of the following numbers:
  - 0 (zero) for an unencrypted (clear text) password
  - 7 (seven) for a hidden text password

**Defaults** Not enabled.

**Command Modes** CONFIGURATION

The hostname is used in the prompt.

**ip http source-interface**

Specify an interface as the source interface for HTTP connections.

**Syntax**

```
ip http source-interface interface
```

To delete an interface, use the `no ip http source-interface interface` command.

**Parameters**

- `interface`
  - Enter the following keywords and the interface information:
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
    - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

**Command Modes**

`CONFIGURATION`

**Command History**

This command was introduced in the Dell EMC Networking OS.

</table>
ip http vrf

Configure an HTTP client with a VRF used to connect to the HTTP server.

Syntax
ip http vrf {management | vrf-name}

To undo the HTTP client configuration, use the ip http vrf command.

Parameters
management Enter the keyword management for configuring the management VRF that uses an HTTP client.

vrf-name Enter a VRF name that the HTTP client uses. If you do not specify a VRF name, the HTTP client uses the default VRF.

Defaults Disabled

Command Modes CONFIGURATION

Command History This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.8(0.0) Introduced on the S4810, S4820T, S5000, S6000, S6000–ON, and Z9500.

Usage Information To make the HTTP clients VRF-aware, use the ip http vrf command. The HTTP client uses the VRF name that you specify to reach the HTTP server. If you do not specify a VRF name, the HTTP client uses the default VRF.
ip ftp password

Specify a password for outgoing FTP connections.

Syntax

```
ip ftp password [encryption-type] password
```

To remove a password and return to the default setting, use the no ip ftp password [password]
command.

Parameters

- **encryption-type** (OPTIONAL) Enter one of the following numbers:
  - 0 (zero) for an unencrypted (clear text) password
  - 7 (seven) for a hidden text password

- **password** Enter a string up to 40 characters as the password.

Defaults

Not configured.

Usage Information

The password is listed in the configuration file; you can view the password by entering the show running-config ftp command.
Use the `ip ftp password` command when you use the `ftp:` parameter in the `copy` command.

Related Commands

**ip ftp source-interface**

Specify an interface's IP address as the source IP address for FTP connections.

**Syntax**

```
ip ftp source-interface interface
```

To delete an interface, use the `no ip ftp source-interface interface` command.

**Parameters**

- **interface**
  
  Enter the following keywords and the interface information:
  
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
  - For a tunnel interface, enter the keyword `tunnel`.

**Defaults**

The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

**Command Modes**

- `CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

### Version Description

- **8.5.1.0**: Added support for 4-port 40G line cards on ExaScale.
- **8.2.1.0**: Increased number of VLANs on ExaScale to 4094 (was 2094).
- **8.1.1.0**: Introduced on the E-Series ExaScale.
- **7.6.1.0**: Introduced on the S-Series.
- **7.5.1.0**: Introduced on the C-Series.
- **E-Series**: Original command.

### ip ftp username

Assign a user name for outgoing FTP connection requests.

**Syntax**

```
ip ftp username username
```

To return to anonymous FTP connections, use the `no ip ftp username [username]` command.

**Parameters**

- **username**: Enter a text string as the user name up to 40 characters long.

**Defaults**

No user name is configured.

ip ftp vrf

Configures an FTP client with a VRF that is used to connect to the FTP server.

Syntax

ip ftp [vrf {vrf-name | management}]

To undo the FTP client configuration, use the ip ftp [vrf vrf-name] command.

Parameters

- **vrf-name**: Enter the vrf-name to specify the VRF that is used by the FTP client.
- **management**: Enter the keyword management to specify that the VRF used by the FTP client is a management VRF.

Defaults

Disabled

Related Commands

- ip ssh server — enables the secure shell (SSH) server on the system.

ip telnet server vrf

Configures the TELNET server on either a specific VRF or a management VRF.

Syntax  
ip telnet server vrf {vrf-name | any | management}
To undo the TELNET server configuration, use the `no ip telnet server [vrf vrf-name]` command.

**Parameters**

- `vrf-name` Enter the `vrf-name` to specify the VRF that is used by the TELNET server.
- `any` Enter the keyword `any` to enable server from any VRF.
- `management` Enter the keyword `management` to specify a management VRF that is used by the TELNET server.

**Defaults**

Disabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.5(0.0) | Introduced on the Z9500.
9.4.(0.0) | Introduced on the S-Series and Z9000.

**Usage Information**

You can enable the TELNET server on either a management VRF or a user-defined VRF but not both. If you do not specify a VRF name, then the TELNET server is enabled on the default VRF.

**Example**

```
DellEMC(conf)# ip telnet server vrf vrf1
DellEMC(conf)# no ip telnet server vrf
DellEMC(conf)# ip telnet server vrf management
DellEMC(conf)# no ip telnet server vrf
DellEMC(conf)#
```

---

**ip telnet source-interface**

Set an interface's IP address as the source address in outgoing packets for Telnet sessions.

**Syntax**

```
ip telnet source-interface interface
```

To return to the default setting, use the `no ip telnet source-interface [interface]` command.

**Parameters**

- `interface` Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

- For Loopback interfaces, enter the keyword `loopback` then a number from zero (0) to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel`.

**Defaults**
The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

**Related Commands**
- `telnet` — telnet to another device.
**ip telnet vrf**

Configures a TELNET client to use a specific VRF.

**Syntax**

```
ip telnet [vrf vrf-name]
```

To undo the TELNET client configuration, use the `ip telnet [vrf vrf-name]` command.

**Parameters**

- `vrf vrf-name`
  
  Enter the keyword `vrf` and then the name of the VRF to specify the VRF that is used by the TELNET client.

**Defaults**

Disabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant FTOS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>

**Usage Information**

If you configure a TELNET client to use a specific VRF, then you need not explicitly specify the same VRF during the TELNET client sessions corresponding to that VRF.

**Example**

```
Dell(conf)# ip telnet vrf vrf1
Dell(conf)# do telnet 10.10.10.2
Dell(conf)# no ip telnet vrf vrf1
Dell(conf)#
```

---

**ip tftp source-interface**

Assign an interface's IP address in outgoing packets for TFTP traffic.

**Syntax**

```
ip tftp source-interface interface
```

To return to the default setting, use the `no ip tftp source-interface interface` command.

**Parameters**

- `interface`
  
  Enter the following keywords and slot/port[/subport] or number information:
  
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.

For a port channel interface, enter the keywords `port-channel` then a number.

For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**
The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

Usage Information  Use this command to make the TFTP clients VRF aware. The VRF name that you specify is used by the TFTP client to reach the TFTP server. If no VRF is specified, then the default VRF is used.

Related Commands  
- `ftp-server topdir` — sets the directory to be used for incoming FTP connections.
- `ftp-server username` — sets a username and password for incoming FTP connections.

### line

Enable and configure console and virtual terminal lines to the system. This command accesses LINE mode, where you can set the access conditions for the designated line.

**Syntax**  
```
line {aux 0 | console 0 | vty number [end-number]}
```

**Parameters**
- **aux 0**  
Enter the keyword aux 0 to configure the auxiliary terminal connection.
- **console 0**  
Enter the keyword console 0 to configure the console port. The console option is <0-0>.
- **vty number**  
Enter the keyword vty then a number from 0 to 9 to configure a virtual terminal line for remote sessions. The system supports 10 remote sessions.
- **end-number**  
(OPTIONAL) Enter a number from 1 to 9 as the last virtual terminal line to configure. You can configure multiple lines at one time.

**Defaults**  
Not configured

**Command Modes**  
CONFIGURATION

**Command History**  
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### Configuration Information

**Version**
- **9.10(0.1)**: Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)**: Introduced on the S3148.
- **9.10(0.0)**: Introduced on the S6100-ON.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100–ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Introduced on the S6000-ON.
- **9.2(1.0)**: Introduced on the Z9500.
- **9.0.2.0**: Introduced on the S6000.
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.12.0**: Introduced on the S4810.
- **8.3.11.1**: Introduced on the Z9000.
- **8.1.1.0**: Introduced on the E-Series.
- **7.6.1.0**: Introduced on the S-Series.
- **7.5.1.0**: Introduced on the C-Series.
- **E-Series**: Original command

**Usage Information**

You cannot delete a terminal connection.

**Related Commands**

- `access-class` — restricts the incoming connections to a particular IP address in an IP access control list (ACL).
- `password` — specifies a password for users on terminal lines.

### login concurrent-session

This command is used to configure the limit of concurrent sessions for all users on console and virtual terminal lines.

**Syntax**

```plaintext
login concurrent-session {limit number-of-sessions | clear-line enable}
no login concurrent-session {limit number-of-sessions | clear-line enable}
```

**Parameters**

- `limit number-of-sessions`:
  - Sets the number of concurrent sessions that any user can have on console and virtual terminal lines. The range is from 1 to 12 (10 VTY lines, one console, and one AUX line).

- `clear-line enable`:
  - Enables you to clear your existing sessions.

**Defaults**

Not configured. You can use all the available sessions.

**Command Modes**

`CONFIGURATION`

</tr>
</tbody>
</table>

Usage Information

You must have either the System Administrator or Security Administrator privileges to configure login concurrent-session limit or to enable clear-line.

To limit the number of concurrent sessions that any user can have on console, auxiliary, and virtual terminal lines, use the `login concurrent-session limit number-of-sessions` command.

If the `login concurrent-session clear-line enable` command is configured, you are provided with an option to clear any of your existing sessions after a successful login authentication. When you reach the maximum concurrent session limit, you can still log in by clearing any of your existing sessions.

Example

The following example shows how to limit the number of concurrent sessions that any user can have to four:

```
DellEMC(conf)# login concurrent-session limit 4
DellEMC(conf)#
```

The following example shows how to use the `login concurrent-session clear-line enable` command.

```
DellEMC(conf)# login concurrent-session clear-line enable
DellEMC(conf)#
```

When you try to log in, the following message appears with all your existing concurrent sessions, providing an option to close any one of the existing sessions:

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Current sessions for user admin:

  2  vty 0  10.14.1.97
  3  vty 1  10.14.1.97
Clear existing session? [line number/Enter to cancel]:
```

When you try to create more than the permitted number of sessions, the following message appears, prompting you to close one of your existing sessions:

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
```
Escape character is '^]'.
Login: admin
Password:
Maximum concurrent sessions for the user reached.
Current sessions for user admin:

Related Commands
- login statistics — enable and configure user login statistics on console and virtual terminal lines.
- show login statistics — displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

login statistics

Enable and configure user login statistics on console and virtual terminal lines.

Syntax

login statistics {enable | time-period days}
no login statistics {enable | time-period days}

Parameters

- **enable**
  Enables login statistics for the last 30 days by default.

- **time-period days**
  Sets the number of days the system stores user login statistics; range is from 1 to 30.

Defaults

Not configured

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the S4810, S4820, S5000, S6000, S6000-ON, and Z9500.</td>
</tr>
</tbody>
</table>

Usage Information

Only the system and security administrators can configure login activity tracking and view the login activity details of other users.
If you enable user login statistics, the system displays the last successful login details of the current user, the details of any failed login attempts by others, and if the current user’s permissions have changed since the last login.

If you use the `login statistics time-period days` command to set a custom time period, the system only reports the login statistics during that interval.

**NOTE**: Login statistics are not applicable for login sessions that do not use authentication on user names. For example, the system does not report login activity for a telnet session that prompts only a password field.

**Example**

When you log into the system, it displays a message similar to the following:

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Last successful login: 12:52:01 UTC Tue Mar 22 2016 Line vty0 (10.11.178.14).
There were 1 unsuccessful login attempt(s) since the last successful login.
There were 1 unsuccessful login attempt(s) for user admin in the last 30 day(s).
There were 1 successful login attempt(s) for user admin in the last 30 day(s).
```

The preceding message shows that the user had previously logged in to the system using the VTY line from 10.11.178.14. It also displays the number of unsuccessful login attempts since the last login and the number of unsuccessful login attempts in the last 30 days.

```
$ telnet 10.11.178.14
Trying 10.11.178.14...
Connected to 10.11.178.14.
Escape character is '^]'.
Login: admin
Password:
Last successful login: 12:52:01 UTC Tue Mar 22 2016 on console
There were 2 unsuccessful login attempt(s) since the last successful login.
There were 3 unsuccessful login attempt(s) for user admin in last 12 day(s).
There were 1 successful login attempt(s) for user admin in the last 30 day(s).
```

The preceding message shows that the user had previously logged in to the system using the console line. It also displays the number of unsuccessful login attempts since the last login and the number of unsuccessful login attempts during a custom time period.

**Related Commands**

- `login concurrent-session` — configures the limit of concurrent sessions for all users on console and virtual terminal lines.
- `show login statistics` — displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

### motd-banner

Enable a message of the day (MOTD) banner to appear when you log in to the system.

**Syntax**

```
motd-banner
```

To disable the MOTD banner, use the `no motd-banner` command.

**Defaults**

Enabled on all lines.
ping

Test connectivity between the system and another device by sending echo requests and waiting for replies.

Syntax

```
ping [host | ip-address | ipv6-address] [count {number | continuous}] [datagram-size] [timeout] [source (ip src-ipv4-address) | interface] [tos] [df-bit (y | n)] [validate-reply(y | n)] [outgoing-interface] [pattern pattern] [sweep-min-size] [sweep-max-size] [sweep-interval] [ointerface (ip src-ipv4-address) | interface] [ethernet | vrf vrf-name]
```

Parameters

- **host** (OPTIONAL) Enter the host name of the devices to which you are testing connectivity.
- **ip-address** (OPTIONAL) Enter the IPv4 address of the device to which you are testing connectivity. The address must be in the dotted decimal format.
- **ipv6-address** (OPTIONAL) Enter the IPv6 address, in the x:x:x:x format, to which you are testing connectivity.
  
  **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.
- **count** Enter the number of echo packets to be sent. The default is 5.
datagram size
Enter the ICMP datagram size. The range is from 36 to 15360 bytes. The default is 100.

timeout
Enter the interval to wait for an echo reply before timing out. The range is from 0 to 3600 seconds. The default is 2 seconds.

source
Enter the IPv4 or IPv6 source ip address or the source interface. For IPv6 addresses, you may enter global addresses only. Enter the IP address in A.B.C.D format.

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.
- For a Tunnel interface, enter the keyword tunnel then a number from 1 to 16383.

tos
(IPv4 only) Enter the type of service required. The range is from 0 to 255. The default is 0.

df-bit
(IPv4 only) Enter Y or N for the “don’t fragment” bit in IPv4 header.

- N: Do not set the “don’t fragment” bit.
- Y: Do set “don’t fragment” bit

Default is No.

validate-reply
(IPv4 only) Enter Y or N for reply validation.

- N: Do not validate reply data.
- Y: Do validate reply data.

Default is No.

outgoing-interface
(IPv6 link-local address) Enter the outgoing interface for ping packets to a destination link-local address.

pattern pattern
(IPv4 only) Enter the IPv4 data pattern. Range: 0-FFFF. Default: 0xABCD.

sweep-min-size
Enter the minimum size of datagram in sweep range. The range is from 52 to 15359 bytes.

sweep-max-size
Enter the maximum size of datagram in sweep range. The range is from 53 to 15359 bytes.

sweep-interval
Enter the incremental value for sweep size. The range is from 1 to 15308 seconds.

interface
(IPv4 only) Enter the outgoing interface for multicast packets. Enter the IP address in A.B.C.D format.

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

ethernet
Enter the keyword ethernet to test layer2 connectivity.
vrf vrf-name

Enter the keyword vrf followed by the name of the VRF to test connectivity to the VRF.

Defaults

None.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>

Usage Information

When you enter the ping command without specifying an IP/IPv6 address (Extended Ping), you are prompted for a target IP/IPv6 address, a repeat count, a datagram size (up to 1500 bytes), a timeout (in seconds), and for Extended Commands.
The following table provides descriptions for the ping command status response symbols displayed in the output.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>
<td>Each exclamation point indicates receipt of a reply.</td>
</tr>
<tr>
<td>.</td>
<td>Each period indicates the network server timed out while waiting for a reply.</td>
</tr>
<tr>
<td>U</td>
<td>A destination unreachable error PDU was received.</td>
</tr>
<tr>
<td>Q</td>
<td>Source quench (destination too busy).</td>
</tr>
<tr>
<td>M</td>
<td>Could not fragment.</td>
</tr>
<tr>
<td>?</td>
<td>Unknown packet type.</td>
</tr>
<tr>
<td>&amp;</td>
<td>Packet lifetime exceeded.</td>
</tr>
</tbody>
</table>

**Example (IPv4)**

DellEMC# ping 172.31.1.255
Type Ctrl-C to abort.
Sending 5, 100-byte ICMP Echos to 172.31.1.255, timeout is 2 seconds:
Reply to request 1 from 172.31.1.208 0 ms
Reply to request 1 from 172.31.1.216 0 ms
Reply to request 1 from 172.31.1.205 16 ms
: :
Reply to request 5 from 172.31.1.209 0 ms
Reply to request 5 from 172.31.1.66 0 ms
Reply to request 5 from 172.31.1.87 0 ms
DellEMC#

**Example (IPv6)**

DellEMC# ping 100::1
Type Ctrl-C to abort.
Sending 5, 100-byte ICMP Echos to 100::1, timeout is 2 seconds:
!!!!!
Success rate is 100.0 percent (5/5), round-trip min/avg/max = 0/0/0 (ms)
DellEMC#

**reload**

Reboot the system.

**Syntax**

```
reload [conditional nvram-cfg-change | no-confirm [discard-running] | dell-diag | onie [install | uninstall | rescue]]
```

**Parameters**

- **conditional nvram-cfg-change** *(OPTIONAL)* Reload into the Dell EMC Networking Operating System (OS) if the condition is true. A configuration change to the NVRAM requires a switch reload. To reload the switch, select `nvram-cfg-change`.
- **no-confirm** *(discard-running)* Reload the chassis without prompting for further confirmation.
- **dell-diag** *(OPTIONAL)* Reload the system into the Dell diagnostics mode.
- **onie** *(install | uninstall | rescue)* *(OPTIONAL)* Reload the system into the ONIE mode. You can also use one of the following options to reload the system and enter the respective modes directly:
  - `install` — enter the Install mode and install the networking OS
• uninstall — enter the Uninstall mode and uninstall the networking OS
• rescue — enter the Rescue mode and access the file system

Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>E-Series</td>
<td>Original command.</td>
</tr>
</tbody>
</table>

Usage Information
If you use only the reload command, the system boots into the Dell EMC Networking OS.

If there is a change in the running configuration, the system prompts you to save the new configuration when you reload the system using the reload command. You can also save your running configuration manually using the copy running-config command.

You can use the conditional parameter if any configuration changes made to the NVRAM, such as, stack-group and fanout configurations, must be saved.

When you use the reload command after making configuration changes, the system prompts you to update the hash for the startup configuration using the verified boot hash command.

Example

```
DellEMC# reload
```

```
Verified startup-configuration is enabled, Hash for startup-configuration is
```
invalid.
Please update Hash for the startup-configuration before reload.

Example

The following example shows how to reload the system:

```
DellEMC# reload
Proceed with reload [confirm yes/no]: yes
```

The following example shows how to reload the system into Dell diagnostics mode:

```
DellEMC# reload dell-diag
Proceed with reload [confirm yes/no]: yes
```

The following example shows how to reload the system into ONIE mode:

```
DellEMC# reload onie
Proceed with reload [confirm yes/no]: yes
```

The following example shows how to reload the system into ONIE prompt and enter the install mode directly:

```
DellEMC# reload onie install
Proceed with reload [confirm yes/no]: yes
```

**send**

Send messages to one or all terminal line users.

**Syntax**

```
send [*] | [line ] | [console] | [vty]
```

**Parameters**

- ***:** Enter the asterisk character * to send a message to all tty lines.
- **line:** Send a message to a specific line. The range is from 0 to 11.
- **console:** Enter the keyword console to send a message to the primary terminal line.
- **vty:** Enter the keyword vty to send a message to the virtual terminal.

**Defaults**

none

**Command Modes**

EXEC

**Command History**

</table>
Messages can contain an unlimited number of lines; however, each line is limited to 255 characters. To move to the next line, use <CR>. To send the message use CTR-Z; to abort a message, use CTR-C.

### service timestamps

To debug and log messages, add time stamps. This command adds either the uptime or the current time and date.

**Syntax**

```
service timestamps {debug | log} [datetime [localtime] [msec] [show-timezone] | uptime]
```

To disable timestamping, use the `no service timestamps [debug | log]` command.

**Parameters**

- `debug` (OPTIONAL) Enter the keyword debug to add timestamps to debug messages.
- `log` (OPTIONAL) Enter the keyword log to add timestamps to log messages with severity from 0 to 6.
- `datetime` (OPTIONAL) Enter the keyword datetime to have the current time and date added to the message.
- `localtime` (OPTIONAL) Enter the keyword localtime to include the localtime in the timestamp.
- `msec` (OPTIONAL) Enter the keyword msec to include milliseconds in the timestamp.
- `show-timezone` (OPTIONAL) Enter the keyword show-timezone to include the time zone information in the timestamp.
- `uptime` (OPTIONAL) Enter the keyword uptime to have the timestamp based on time elapsed since system reboot.

**Defaults**

```
datetime
```

**Command Modes**

**Usage Information**

If you do not specify parameters and enter service timestamps, it appears as service timestamps debug datetime in the running-configuration.

To view the current options set for the service timestamps command, use the show running-config command.

### show alarms

View alarms currently active in the system.

**Syntax**

```
show alarms [threshold]
```

**Parameters**

- `threshold` (OPTIONAL) Enter the keyword threshold to display the temperature thresholds in Celsius for each level.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
8.1.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the S-Series.
show cpu-traffic-stats

View the CPU traffic statistics.

Syntax

show cpu-traffic-stats [port number | all | cp ]

Parameters

port number (OPTIONAL) Enter the port number to display traffic statistics on that port only. The range is from 1 to 1568.
all  (OPTIONAL) Enter the keyword all to display traffic statistics on all the interfaces receiving traffic, sorted based on the traffic.

cp  (OPTIONAL) Enter the keyword cp to display traffic statistics on the specified CPU.

Defaults

Command Modes

EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version  Description
9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the S6100-ON.
9.8(2.0)   Introduced on the S3100 series.
9.8(1.0)   Introduced on the Z9100–ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0)   Introduced on the S6000-ON.
9.2(1.0)   Introduced on the Z9500.
9.2.0.0     Introduced on the S6000.
9.0.0.0     Introduced on the Z9000.
8.3.19.0    Introduced on the S4820T.
8.3.12.0    Introduced on the S4810.
8.3.11.1    Introduced on the Z9000.
7.6.1.0     Introduced on the S-Series.
7.5.1.0     Introduced on the C-Series
6.2.1.1     Introduced on the E-Series.

Usage Information

Traffic statistics are sorted on a per-interface basis; the interface receiving the most traffic is displayed first. All CPU and port information is displayed unless a specific port or CPU is specified. Traffic information is displayed for router ports only; not for management interfaces. The traffic statistics are collected only after the debug cpu-traffic-stats command is executed; not from the system bootup.

NOTE: After debugging is complete, use the no debug cpu-traffic-stats command to shut off traffic statistics collection.

Example

DellEMC# show cpu-traffic-stats
Processor : CP
-----------
Received 100% traffic on TenGigabitEthernet 8/2 Total packets:100
LLC:0, SNAP:0, IP:100, ARP:0, other:0
Unicast:100, Multicast:0, Broadcast:0
Processor : RP1
-----------
Received 62% traffic on TenGigabitEthernet 8/2 Total packets:500
LLC:0, SNAP:0, IP:500, ARP:0, other:0
show debugging

View a list of all enabled debugging processes.

Syntax

    show debugging

Example

DellEMC# show debug
generic ip:
    IP packet debugging is on for
    ManagementEthernet 1/1
    Port-channel 1-2
    Port-channel 5
tenGigabitEthernet 4/1-4/3,4/5-4/6,4/10-4/11,20
tenGigabitEthernet 5/1-5/3,5/5-5/6,5/10-5/11,15,17,19,21
show environment

View system component status (for example, temperature or voltage).

Syntax

```
show environment [all | fan | pem | stack-unit unit-id | thermal-sensor ]
```

Parameters

- `all` Enter the keyword all to view all components.
- `fan` Enter the keyword fan to view information on the fans. The output of this command is chassis-dependent.
- `pem` Enter the keyword pem to view only information on power entry modules.
- `stack-unit unit-id` Enter the keywords stack-unit then the unit-id to display information on a specific stack member.
- `thermal-sensor` Enter the keywords thermal-sensor to view information on thermal sensors.

Command Modes

- EXEC
- EXEC Privilege

Version | Description
--- | ---
7.8.1.0 | The output of the `show environment fan` command for the S Series is changed to display fan speeds instead of showing the fan status as up or down.

Usage Information

The following example shows the output of the `show environment` command.

```plaintext
DellEMC# show environment

-- Fan Status --
Unit Bay TrayStatus Fan0 Speed Fan1 Speed
-------------------------------
0  0  up  up  6971  up  7072
0  1  up  up  6971  up  7021
0  2  up  up  7021  up  7021

Speed in RPM

-- Power Supplies --
Unit Bay Status Type FanStatus FanSpeed(rpm) Power AvgPower AvgPowerStartTime
-----------------------------------------------
1  1  up  AC  up  6960  48  31  14/4/2017 17:24
1  2  up  AC  up  6656  40  26  14/4/2017 17:24

-- Unit Environment Status --
Unit Status Temp Voltage TempStatus
-------------------------------
* 0 online 36C ok 1

* Management Unit

-- Thermal Sensor Readings (deg C) --
Unit Sensor0 Sensor1 Sensor2 Sensor3 Sensor4 Sensor5 Sensor6
-----------------------------
0  40  36  37  37  31  31  46

DellEMC# show environment fan

-- Fan Status --

-----------------------------------------------
1  1  up  AC  up  6960  48  31  14/4/2017 17:24
1  2  up  AC  up  6656  40  26  14/4/2017 17:24

DellEMC# show environment thermal-sensor

-- Thermal Sensor Readings (deg C) --
Unit Sensor0 Sensor1 Sensor2 Sensor3 Sensor4 Sensor5 Sensor6
-----------------------------
0  39  36  37  37  31  31  46
```
show inventory

Display the switch type, components (including media), and Dell EMC Networking Operating System (OS), including hardware identification numbers and configured protocols.

Syntax

    show inventory [media slot]

Parameters

  media slot  (OPTIONAL) Enter the keyword media then the stack ID of the stack member for which you want to display pluggable media inventory.

  NOTE: This parameter is available but not supported in Dell EMC Networking Operating System version 8.3.11.4. Because stacking is not supported, if you use this parameter, the output displays “Media not present or accessible” (refer to the Usage Information section).

Defaults

  none

* - Management Unit

Related Commands
  • show interfaces — displays the interface configuration.

148  Control and Monitoring
show login statistics

Displays login statistics of users who have used the console or virtual terminal lines to log in to the system.

Syntax

```
show login statistics [all | [successful-attempts | unsuccessful-attempts] [user login-id] [time-period days]] | user login-id
```

Parameters

- `all` (Optional) Displays the login statistics of all users in the last 30 days or the custom defined time period.
- `time-period days` (Optional) Displays the number of failed login attempts by the current user in the specified period.
- `successful-attempts` (Optional) Displays the number of successful login attempts by the current user in the last 30 days or the custom defined time period.
- `unsuccessful-attempts` (Optional) Displays the number of failed login attempts by the current user in the last 30 days or the custom defined time period.
- `user login-id` (Optional) Displays the login statistics of a specific user in the last 30 days or the custom defined time period. When you use it with the `unsuccessful-attempts` keyword, the system displays the number of failed login attempts by a specific user in the last 30 days or the custom defined time period.

Defaults

None

</tr>
</tbody>
</table>

Usage Information

To view the successful and failed login details of the current user in the last 30 days or the custom defined period, use the `show login statistics` command.
To view the successful and failed login details of all users in the last 30 days or the custom defined period, use the `show login statistics all` command. You can use this command only if you have system or security administrator rights.

To view the successful and failed login details of a specific user in the last 30 days or the custom defined time period, use the `show login statistics user user-id` command. If you have system or security administrator rights, you can view the login statistics of other users. If you do not have system or security administrator rights, you can view your login statistics but not the login statistics of others.

**NOTE:** By default, these commands display the details for the last 30 days. If you set a custom-defined time period for login statistics using the `login statistics time-period days` command, these commands display details only for that period.

### Example

The following is sample output of the `show login statistics` command.

```
DellEMC#show login statistics
------------------------------------------------------------------
User: admin
Last login time: 12:52:01 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.143 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 0
Successful login attempt(s) in last 30 day(s): 1
------------------------------------------------------------------
```

The following is sample output of the `show login statistics all` command.

```
DellEMC#show login statistics all
------------------------------------------------------------------
User: admin
Last login time: 08:54:28 UTC Wed Mar 23 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 4
------------------------------------------------------------------
User: admin1
Last login time: 12:49:19 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 2
------------------------------------------------------------------
User: admin2
Last login time: 12:49:27 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 2
------------------------------------------------------------------
User: admin3
Last login time: 13:18:42 UTC Tue Mar 22 2016
Last login location: Line vty0 ( 10.16.127.145 )
Unsuccessful login attempt(s) since the last successful login: 0
Unsuccessful login attempt(s) in last 30 day(s): 3
Successful login attempt(s) in last 30 day(s): 2
```

150  Control and Monitoring
The following is sample output of the `show login statistics user user-id` command.

DellEMC# show login statistics user admin

------------------------------------------------------------------
User: admin
Last login time: 12:52:01 UTC Tue Mar 22 2016
Last login location: Line vty0 (10.16.127.143)
Unsuccessful login attempt(s) since the last successful login: 0
Successful login attempt(s) in last 30 day(s): 1
------------------------------------------------------------------

The following is sample output of the `show login statistics unsuccessful-attempts` command.

DellEMC# show login statistics unsuccessful-attempts
There were 3 unsuccessful login attempt(s) for user admin in last 30 day(s).

The following is sample output of the `show login statistics unsuccessful-attempts time-period days` command.

DellEMC# show login statistics unsuccessful-attempts time-period 15
There were 0 unsuccessful login attempt(s) for user admin in last 15 day(s).

The following is sample output of the `show login statistics unsuccessful-attempts user login-id` command.

DellEMC# show login statistics unsuccessful-attempts user admin
There were 3 unsuccessful login attempt(s) for user admin in last 12 day(s).

The following is sample output of the `show login statistics successful-attempts` command.

DellEMC# show login statistics successful-attempts
There were 4 successful login attempt(s) for user admin in last 30 day(s).

Related Commands
- login statistics — enable and configure user login statistics on console and virtual terminal lines.
- login concurrent-session — configures the limit of concurrent sessions for all users on console and virtual terminal lines.

**show memory**

View current memory usage on the switch.

**Syntax**

```
show memory [stack-unit id]
```

**Parameters**

- `stack-unit id` (OPTIONAL) Enter the keyword `stack-unit` then the stack unit ID to display memory information on the designated stack member.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
show processes cpu

Display CPU usage information based on processes running.

Syntax

Parameters

management-unit  (OPTIONAL) Display processes running in the control processor. The 1-99 variable sets the number of tasks to display in order of the highest CPU usage in the past five (5) seconds. Add the keyword details to display all running processes (except sysdlp). Refer to Example (management-unit).

stack-unit id  (OPTIONAL) Enter the keyword stack-unit then the stack member ID.

As an option of the show processes cpu command, this option displays CPU usage for the designated stack member. Or, as an option of the command, this option limits the output of memory statistics to the designated stack member.

Refer to Example (stack-unit).

summary  (OPTIONAL) Enter the keyword summary to view CPU utilization of processes related to stack-unit processing.
Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Related Commands
- show hardware layer2 acl — displays Layer 2 ACL data for the selected stack member and stack member port-pipe.
- show hardware layer3 — displays Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.
- show hardware stack-unit — displays the data plane or management plane input and output statistics of the designated component of the designated stack member.
- show hardware system-flow — displays Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.
- show interfaces stack-unit — displays information on all interfaces on a specific S-Series stack member.
- show processes memory (S-Series) — displays CPU usage information based on processes running in an S-Series.

154 Control and Monitoring
**show processes ipc flow-control**

Display the single window protocol queue (SWPQ) statistics.

**Syntax**

```plaintext
show processes ipc flow-control [cp]
```

**Parameters**

- `cp` (OPTIONAL) Enter the keyword `cp` to view the control processor’s SWPQ statistics.

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>Retr /Available Retra</td>
<td>Number of retries left</td>
</tr>
<tr>
<td>Total/ Max Retra</td>
<td>Number of retries allowed</td>
</tr>
</tbody>
</table>

### Important Points:

- The SWP provides flow control-based reliable communication between the sending and receiving software tasks.
- A sending task enqueues messages into the SWP queue for a receiving task and waits for an acknowledgement.
- If no response is received within a defined period of time, the SWP timeout mechanism resubmits the message at the head of the FIFO queue.
- After retrying a defined number of times, the SWP-2-NOMORETIMEOUT timeout message is generated.
- In the S-Series example, a retry (Retries) value of zero indicates that the SWP mechanism reached the maximum number of retransmissions without an acknowledgement.

### Example

DellEMC# show processes ipc flow-control cp

DellEMC#
show processes memory

Display memory usage information based on processes running in the S-Series or Z-Series system.

Syntax

show processes memory {management-unit | stack unit {unit-id | all | summary}}

Parameters

management-unit Enter the keyword management-unit for CPU memory usage of the stack management unit.

stack unit unit id Enter the keyword stack unit then a stack unit ID of the member unit for which to display memory usage on the forwarding processor.

all Enter the keyword all for detailed memory usage on all stack members.

summary Enter the keyword summary for a brief summary of memory availability and usage on all stack members.

Command Modes

• EXEC
• EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0) Introduced on the S3048-ON and S4048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.0.2.0 Introduced on the S6000.
9.0.0.0 Introduced on the Z9000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.11.1 Introduced on the Z9000.
7.7.1.0 Added the management-unit option.
7.6.1.0 Introduced on the S-Series.

Usage Information

show processes memory output

Field Description

Total: Total system memory available
MaxUsed: Total maximum memory used ever (history indicated with time stamp)
CurrentUsed: Total memory currently in use
show processes memory output

<table>

</tbody>
</table>

The output for the `show process memory` command displays the memory usage statistics running on CP part (sysd) of the system. The sysd is an aggregate task that handles all the tasks running on S-Series' CP.

For the S-Series, the output of the `show memory` command and this command differ based on which Dell OS processes are counted.

- In the `show memory` output, the memory size is equal to the size of the application processes.
- In the output of this command, the memory size is equal to the size of the application processes plus the size of the system processes.

**Example**

```
DellEMC# show processes memory stack-unit 1
Total: 268435456, MaxUsed: 2420244, CurrentUsed: 2420244, CurrentFree: 266015212

DellEMC#
```
show reset-reason

Display the reason for the last system reboot.

Syntax

```
show reset-reason [stack-unit {stack-unit-number | all}]
```

Parameters

- `stack-unit unit-number`  
  (OPTIONAL) Enter the keyword `stack-unit` and the stack unit number to view the reason for the last system reboot for that stack unit.
- `all`  
  (OPTIONAL) Enter the keyword `stack-unit` and the keyword `all` to view the reason for the last system reboot of all stack units in the stack.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version | Description
---|---
9.14(0.0) | Introduced on the S5048F-ON.
9.13(0.0) | Introduced on the S3048–ON, S3100 series, S4048–ON, S4048T–ON, S5000, S6000, S6000–ON, S6010–ON, S6100–ON, Z9100–ON, C9010, MXL, M-IOA, and FN-IOM.

Usage Information

You can use the `show reset-reason` without the `stack-unit` option to view the reason for the last system reboot of the local system.

Example — User-initiated reboot with the reload command

```bash
DellEMC#show reset-reason
Cause : Reset by User through CLI command
Reset Time: 11/05/2017-08:36
```

Example — System reboot due to the upgrade command

```bash
DellEMC# show reset-reason
Cause: Reboot by Software upgrade Module.
Reset Time: 8/9/2017 1:39 PM.
```
Example — System reboot for unknown reasons
DellEMC# show reset-reason
Cause: N/A
Reload Time: N/A

Example — System reboot due to power loss or pressing the power button off and on.
DellEMC# show reset-reason
Cause: N/A
Reset Time: N/A

Example — System reboot due to watchdog timeout
DellEMC# show reset-reason
Cause: N/A
Reset Time: N/A

Example — System reboot due to thermal shutdown
The example shows the reason for the last reboot as N/A for thermal shutdown.
DellEMC# show reset-reason
Cause: N/A
Reload Time: N/A

Example — System reboot due to BIOS boot fail
DellEMC# show reset-reason
Cause: N/A
Reset Time: N/A

Example — Unknown reason
If the reason for the last system reboot is not available, the system displays the reason as N/A.
DellEMC# show reload-reason
Cause: N/A
Time: N/A

Example — Reset reason of a single stack unit
DellEMC# show reset-reason stack-unit 1
Cause: Reset by User through CLI command
Reset Time: 11/05/2017-08:36

Example — Reset reason of all stack units
DellEMC# show reset-reason stack-unit all
Last Reset Reason:

show software ifm

Display interface management (IFM) data.

Syntax
show software ifm {clients [summary] | ifagt number | ifcb interface | stack-unit unit-ID | trace-flags}

Parameters
clients
Enter the keyword clients to display IFM client information.

summary
(Optional) Enter the keyword summary to display brief information about IFM clients.
**ifagt number**
Enter the keyword `ifagt` then the number of an interface agent to display software pipe and IPC statistics.

**ifcb interface**
Enter the keyword `ifcb` then one of the following interface IDs then the interface information to display interface control block information for that interface:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**stack-unit unit-ID**
Enter the keyword `stack-unit` then the stack member number to display IFM information for that unit.

**trace-flags**
Enter the keyword `trace-flags` to display IFM information for internal trace flags.

**Defaults**
None.

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0) | Introduced on the S3048-ON and S4048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
9.0.0.0 | Introduced on the Z9000.
8.3.19.0 | Introduced on the S4820T.
8.3.12.0 | Introduced on the S4810.
8.3.11.1 | Introduced on the Z9000.
8.5.1.0 | Added support for 4-port 40G line cards on the E-Series.
7.6.1.0 | Introduced for the C-Series and S-Series.

**Example**

```
DellEMC# show software ifm clients summary
ClntType | Inst svcMask subSvcMask tlvSvcMask tlvSubSvc swp
IPM      | 0 0x00000000 0x00000000 0x00000000 0x00000000 31

OSPF     | 0 0x00000000 0x00000000 0x00000000 0x00000000 0
PIM      | 0 0x00000000 0x00000000 0x00000000 0x00000000 0
```
show system

Display the status of all stack members or a specific member.

Syntax

```none
show system [brief | stack-unit unit-id]
```

Parameters

- `brief` (OPTIONAL) Enter the keyword `brief` to view an abbreviated list of system information.
- `stack-unit unit-id` (OPTIONAL) Enter the keywords `stack-unit` then the stack member ID for information on that stack member.

Command Modes

- EXEC
- EXEC Privilege

Command History

Speed in RPM
show tech-support

Display a collection of data from other show commands, necessary for Dell EMC Networking technical support to perform troubleshooting.

Syntax

```
show tech-support [stack-unit unit-id | page]
```

Parameters

- **stack-unit** (OPTIONAL) Enter the keywords stack-unit to view CPU memory usage for the stack member designated by unit-id.
- **page** (OPTIONAL) Enter the keyword page to view 24 lines of text at a time. Press the SPACE BAR to view the next 24 lines. Press the ENTER key to view the next line of text. When using the pipe command ( | ), enter one of these keywords to filter command output. For details about filtering commands, refer to CLI Basics.
- **save** Enter the keyword save to save the command output.
  - flash: Save to local flash drive (flash://filename. A maximum of 20 characters.

</tr>
</tbody>
</table>

Usage Information

Without the page or stack-unit option, the command output is continuous. To interrupt the command output, use Ctrl-z.
The `save` option works with other filtering commands. This allows you to save specific information of a `show` command. The `save` entry must always be the last option. For example: `DellEMC# show tech-support | grep regular-expression | except regular-expression | find regular-expression | save flash://result`

This display output is an accumulation of the same information that is displayed when you execute one of the following `show` commands:

- `show version`
- `show os-version`
- `show revision`
- `show clock`
- `show running-config`
- `show system stack-ports`
- `show interfaces`
- `show process memory`
- `show process cpu`
- `show file system`
- `show system`
- `show environment`
- `show ip traffic`
- `show ip management route`
- `show ip route summary`
- `show Inventory`
- `show log summary`
- `show command-history (last 20 commands)`
- `show log`

Example (options under `show tech-support`)

```
DellEMC# show tech-support ?
page       Page through output
stack-unit Unit Number
            Pipe through a command
<cr>
DellEMC# show tech-support stack-unit 1 ?
            Pipe through a command
<cr>
DellEMC# show tech-support stack-unit 1 | ?
except    Show only text that does not match a pattern
find      Search for the first occurrence of a pattern
grep      Show only text that matches a pattern
no-more   Don't paginate output
save      Save output to a file

DellEMC# show tech-support stack-unit 1 | save ?
flash:     Save to local file system (flash: //filename (max 20 chars))

DellEMC# show tech-support stack-unit 1 | save flash://LauraSave
Start saving show command report .......
DellEMC#

DellEMC# dir
Directory of flash:

Build Time: Thu Jun 28 10:15:47 2018
Build Path: /build/build02/SW/SRC
Dell EMC Networking OS uptime is 1 minute(s)

System image file is "system://A"

System Type: S4048-ON
Control Processor: Intel Rangeley with 2 Gbytes (2127560704 bytes) of memory, core(s) 2.

8G bytes of boot flash memory.

1 54-port TE/FG (SK-ON)
48 Ten GigabitEthernet/IEEE 802.3 interface(s)
6 Forty GigabitEthernet/IEEE 802.3 interface(s)

Example(show tech-support stack-unit)

DellEMC#show tech-support

ssh-peer-stack-unit

Open an SSH connection to the peer stack-unit.

Syntax

ssh-peer-stack-unit [-l username]

Parameters

-username (OPTIONAL) Enter the keyword -l then your user name. The default is the user name associated with the terminal.

Defaults

Not configured.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.7(0.0) Introduced on the S6000-ON.
9.0.0.0 Introduced on the Z9000.
### telnet

Connect through Telnet to a server. The Telnet client and server in Dell EMC Networking support IPv4 and IPv6 connections. You can establish a Telnet session directly to the router or a connection can be initiated from the router.

**NOTE:** The Telnet server and client are VRF-aware. Using the vrf parameter in this command, you can make a Telnet server or client to listen to a specific VRF. This capability enables a Telent server or client to look up the correct routing table and establish a connection.

**Syntax**

telnet {host | ip-address | ipv6-address prefix-length | vrf vrf instance name} [/source-interface]

**Parameters**

- **host**
  - Enter the name of a server.

- **ip-address**
  - Enter the IPv4 address in dotted decimal format of the server.

- **ipv6-address prefix-length**
  - Enter the IPv6 address in the x:x:x:x format then the prefix length in the /x format. The range is from /0 to /128.

  **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

- **vrf instance**
  - (Optional) Enter the keyword vrf then the VRF instance name.

- **source-interface**
  - (OPTIONAL) Enter the keywords /source-interface then the interface information to include the source interface. Enter the following keywords and the interface information:

    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
    - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
    - For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
    - For a Null interface, enter the keyword null then the Null interface number.
    - For a port channel interface, enter the keywords port-channel then a number.
    - For Tunnel interface types, enter the keyword tunnel then the slot/port information. The range is from 1 to 16383.
    - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

- EXEC
- EXEC Privilege
**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

The VRF configured using this command has a higher precedence than a VRF configured using the `ip telnet vrf vrf-name` command. If you do not use the VRF attribute in this command, then TELNET client uses the VRF configured using the `ip telnet vrf vrf-name` command.

The source interface configured using this command has a higher precedence than the source interface configured using the `ip telnet source-interface` command. If you do not configure a source interface using this command, then the TELNET client uses the source interface configured using the `ip telnet source-interface` command.

In case there is a mismatch between the VRF telnet source interface and the telnet VRF, then an error is reported.

**Example**

```sh
DellEMC# telnet vrf vrf1 10.10.10.2
```
**telnet-peer-stack-unit**

Open a Telnet connection to the peer stack unit.

**Syntax**

```
telnet-peer-stack-unit
```

**Defaults**

Not configured.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

**terminal length**

Configure the number of lines displayed on the terminal screen.

**Syntax**

```
terminal length screen-length
```

**Parameters**

- `screen-length`  
  Enter a number of lines. Entering zero causes the terminal to display without pausing. The range is from 0 to 512.

**Defaults**

24 lines

**Command Modes**

traceroute

View a packet’s path to a specific device.

Syntax
t traceroute { host | vrf instance | ip-address | ipv6-address }

Parameters
- **host** Enter the name of device.
- **vrf instance** (Optional) E-Series Only: Enter the keyword vrf then the VRF Instance name.
- **ip-address** Enter the IP address of the device in dotted decimal format.
- **ipv6-address** Enter the IPv6 address, in the x:x:x::x format, to which you are testing connectivity.

NOTE: The :: notation specifies successive hexadecimal fields of zeros.

Defaults
- Timeout = 5 seconds
- Probe count = 3
• 30 hops max
• 40 byte packet size
• UDP port = 33434

Command Modes
• EXEC
• EXEC Privilege

Command History

</tr>
</tbody>
</table>

E-Series
Original command.

Usage Information
When you enter the traceroute command without specifying an IP address (Extended Traceroute), you are prompted for a target and source IP address, timeout (in seconds) (default is 5), a probe count (default is 3), minimum TTL (default is 1), maximum TTL (default is 30), and port number (default is 33434). To keep the default setting for those parameters, press the ENTER key.

For IPv6, you are prompted for a minimum hop count (default is 1) and a maximum hop count (default is 64).

Example (IPv4)

DellEMC# traceroute www.Dell EMC Networking.com
Translating "www.Dell EMC Networking.com"...domain server (10.11.0.1) [OK]
Tracing the route to www.Dell EMC Networking.com (10.11.84.18),
30 hops max, 40 byte packets

TTL Hostname      Probe1     Probe2     Probe3
1   10.11.199.190 001.000 ms 001.000 ms 002.000 ms
2   gwegress-sjc-02.Dell EMC Networking.com (10.11.30.126) 005.000 ms 001.000 ms
3   fw-sjc-01.Dell EMC Networking.com (10.11.127.254) 000.000 ms 000.000 ms 000.000 ms
4   www.Dell EMC Networking.com (10.11.84.18) 000.000 ms 000.000 ms 000.000 ms

Example (IPv6)

DellEMC# traceroute 100::1

Type Ctrl-C to abort.

Tracing the route to 100::1, 64 hops max, 60 byte packets

Hops Hostname Probe1    Probe2    Probe3
1    100::1 000.000 ms 000.000 ms 000.000 ms

DellEMC# traceroute 3ffe:501:ffff:100:201:e8ff:fe00:4c8b

Type Ctrl-C to abort.

Tracing the route to 3ffe:501:ffff:100:201:e8ff:fe00:4c8b,
64 hops max, 60 byte packets

Hops Hostname Probe1    Probe2    Probe3
1  3ffe:501:ffff:100:201:e8ff:fe00:4c8b 000.000 ms 000.000 ms 000.000 ms

Related Commands

- ping — tests the connectivity to a device.

undebug all

Disable all debug operations on the system.

Syntax
undebug all

Defaults
none

Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version    Description
9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the S6100-ON.
virtual-ip

Configure a virtual IP address for the active management interface. You can configure virtual addresses both for IPv4 and IPv6 independently.

**Syntax**
```
virtual-ip {ipv4-address | ipv6-address}
```
To return to the default, use the `no virtual-ip {ipv4-address | ipv6-address}` command.

**Parameters**

- `ipv4-address` Enter the IP address of the active management interface in a dotted decimal format (A.B.C.D).
- `ipv6-address` Enter an IPv6 address of the active management interface, in the x:x:x:x::x format.

**NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**Defaults**

none

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.1)
  - Introduced on the S6010-ON and S4048T-ON.
- 9.10(0.0)
  - Introduced on the S3148.
- 9.10(0.0)
  - Introduced on the S6100-ON.
- 9.8(2.0)
  - Introduced on the S3100 series.

**Version**

- 9.8(2.0)
  - Introduced on the S3100 series.
- 9.8(1.0)
  - Introduced on the Z9100-ON.
- 9.8(0.0P5)
  - Introduced on the S4048-ON.
- 9.8(0.0P2)
  - Introduced on the S3048-ON.
- 9.7(0.0)
  - Introduced on the S6000-ON.
- 9.2(1.0)
  - Introduced on the Z9500.
- 9.0.2.0
  - Introduced on the S6000.
- 8.3.19.0
  - Introduced on the S4820T.
- 8.3.12.0
  - Introduced on the S4810.
- 8.3.11.1
  - Introduced on the Z9000.
- 8.1.1.0
  - Introduced on the E-Series.
- 7.6.1.0
  - Introduced on the S-Series.
- 7.5.1.0
  - Introduced on the C-Series.
- E-Series
  - Original command.
### Version Description
- **9.10(0.1)** Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)** Introduced on the S6000-ON.
- **9.0.2.0** Introduced on the S6000.
- **9.0.0.0** Introduced on the Z9000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.12.0** Introduced on the S4810.
- **8.1.1.0** Introduced on the E-Series.
- **7.5.1.0** Introduced on the C-Series.

**E-Series** Original command.

### Usage Information
You can configure both IPv4 and IPv6 virtual addresses simultaneously, but only one of each. Each time this command is issued, it replaces the previously configured address of the same family, IPv4 or IPv6. The `no virtual-ip` command takes an address/prefix-length argument, so that the desired address only is removed. If you enter the `no virtual-ip` command without any specified address, then both IPv4 and IPv6 virtual addresses are removed.

### Related Commands
- `ip address` — assigns a primary and secondary IP address to the interface.

---

### write

Copy the current configuration to either the startup-configuration file or the terminal.

**Syntax**
```
write [memory [compressed] | terminal]
```

**Parameters**
- `memory`
Enter the keyword `memory` to copy the current running configuration to the startup configuration file. This command is similar to the `copy running-config startup-config` command.
- `compressed`
Enter the keyword `compressed` to write the operating configuration to the startup-config file in the compressed mode.
- `terminal`
Enter the keyword `terminal` to copy the current running configuration to the terminal. This command is similar to the `show running-config` command.

**Command Modes**
EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**E-Series**

Original command.

**Usage Information**

The `write memory` command saves the running-configuration to the file labeled startup-configuration. When using a LOCAL CONFIG FILE other than the startup-config not named “startup-configuration” (for example, you used a specific file during the `boot config` command), the running-config is not saved to that file; use the `copy` command to save any running-configuration changes to that local file.

When you use the `write memory` command to copy the running configuration to the startup configuration file with the startup configuration verification feature enabled, the system prompts you to update the hash for the startup configuration using the `verified boot hash` command.
802.1X is a port-based Network Access Control (PNAC) that provides an authentication mechanism to devices wishing to attach to a LAN or WLAN. Until the authentication, only extensible authentication protocol over LAN (EAPOL) traffic is allowed through the port to which a client is connected. After authentication is successful, normal traffic passes through the port.

The Dell EMC Networking OS supports remote authentication dial-in service (RADIUS) and active directory environments using 802.1X Port Authentication.

**Important Points to Remember**

Dell EMC Networking OS limits network access for certain users by using virtual local area network (VLAN) assignments. 802.1X with VLAN assignment has these characteristics when configured on the switch and the RADIUS server.

- If the primary RADIUS server becomes unresponsive, the authenticator begins using a secondary RADIUS server, if configured.
- If no VLAN is supplied by the RADIUS server or if you disable 802.1X authorization, the port configures in its access VLAN after successful authentication.
- If you enable 802.1X authorization but the VLAN information from the RADIUS server is not valid, the port returns to the Unauthorized state and remains in the configured access VLAN. This safeguard prevents ports from appearing unexpectedly in an inappropriate VLAN due to a configuration error. Configuration errors create an entry in Syslog.
- If you enable 802.1X authorization and all information from the RADIUS server is valid, the port is placed in the specified VLAN after authentication.
- If you enable port security on an 802.1X port with VLAN assignment, the port is placed in the RADIUS server assigned VLAN.
- If you disable 802.1X on the port, it returns to the configured access VLAN.
- When the port is in the Force Authorized, Force Unauthorized, or Shutdown state, it is placed in the configured access VLAN.
- If an 802.1X port is authenticated and put in the RADIUS server assigned VLAN, any change to the port access VLAN configuration does not take effect.
- The 802.1X with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN membership.

debug dot1x

Display 802.1X debugging information.

Syntax: `debug dot1x [all | auth-pae-fsm | backend-fsm | eapol-pdu] [interface interface]`

Parameters:
- `all`: Enable all debugs in dot1x.
- `auth-pae-fsm`: Enable Authentication PAE FSM debugs in dot1x.
- `backend-fsm`: Enable Backend Auth FSM debugs in dot1x.
- `eapol-pdu`: Enable EAPOL frame trace in dot1x.
- `interface interface`: Restricts the debugging information to an interface. The interface option is available only when the interface is either operationally up or dot1x related interface configuration exists before enabling debugging for that interface.

Defaults: Disabled

Command Modes: EXEC Privilege

9.10(0.1)      Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)      Introduced on the S3148.
9.10(0.0)      Introduced on the S6100-ON.
9.8(2.0)       Introduced on the S3100 series.
9.8(1.0)       Introduced on the Z9100-ON.
9.8(0.0P5)     Introduced on the S4048-ON.
9.8(0.0P2)     Introduced on the S3048-ON.
9.7(0.0)       Introduced on the S6000-ON.
9.2(1.0)       Introduced on the Z9500.
dot1x auth-fail-vlan

Configure an authentication failure VLAN for users and devices that fail 802.1X authentication.

Syntax

dot1x auth-fail-vlan vlan-id [max-attempts number]

To delete the authentication failure VLAN, use the no dot1x auth-fail-vlan vlan-id [max-attempts number] command.

Parameters

- vlan-id: Enter the VLAN Identifier. The range is from 1 to 4094.
- max-attempts: (OPTIONAL) Enter the keywords max-attempts followed number of attempts desired before authentication fails. The range is from 1 to 5. The default is 3.

Defaults

- 3 attempts

8.3.11.1 | Introduced on the Z9000.
8.4.1.0 | Introduced on the C-Series and S-Series.
8.4.1.0 | Introduced on the C-Series and S-Series.
8.4.1.0 | Introduced on the C-Series and S-Series.
Version | Description
---|---
8.3.11.1 | Introduced on the Z9000.
8.4.1.0 | Introduced on the C-Series and S-Series.

**Usage Information**

If the host responds to 802.1X with an incorrect login/password, the login fails. The switch attempts to authenticate again until the maximum attempts configured is reached. If the authentication fails after all allowed attempts, the interface moves to the authentication failed VLAN.

After the authentication VLAN is assigned, the port-state must be toggled to restart authentication. Authentication occurs at the next reauthentication interval (`dot1x reauthentication`).

**Related Commands**

- `dot1x port-control` — enable port control on an interface
- `dot1x guest-vlan` — configure a guest VLAN for limited access users or for devices that are not 802.1X capable.
- `show dot1x interface` — display the 802.1X configuration of an interface.

**dot1x auth-server**

Configure the authentication server to RADIUS.

**Syntax**

`dot1x auth-server radius`

**Defaults**

None

</tbody>
</table>

**Usage Information**
The prerequisites for enabling MAB-only authentication on a port are:

- Enable 802.1X authentication globally on the switch and on the port (the `dot1x authentication` command).
- Enable MAC authentication bypass on the port (the `dot1x mac-auth-bypass` command).

In MAB-only authentication mode, a port authenticates using the host MAC address even though 802.1X authentication is enabled. If the MAB-only authentication fails, the host is placed in the guest VLAN (if configured).

To disable MAB-only authentication on a port, enter the `no dot1x auth-type mab-only` command.
Related Commands

- dot1x mac-auth-bypass — enable MAC authentication bypass.

dot1x authentication (Configuration)

Enable dot1x globally. Enable dot1x both globally and at the interface level.

Syntax

```
dot1x authentication
```

To disable dot1x on a globally, use the no dot1x authentication command.

Defaults

Disabled

</tr>
<tr>
<td>9.9(0.0)</td>
<td>Introduced on the C9000 Series.</td>
</tr>
</tbody>
</table>

## Usage Information

The `dot1x critical-vlan` command configures critical VLAN for the interface. If the authentication server is not reachable or not responding, the authenticator places the port or the supplicant in critical VLAN within the first attempt.

Use this command in Interface Batch mode to configure critical VLAN for users in a dual-homing setup.

## Example

```
DellEMC(conf)#show dot1x interface twentyFiveGigE 1/41

802.1x information on Tf 1/41:
-----------------------------
Dot1x Status:              Enable
Port Control:              AUTO
Port Auth Status:          AUTHORIZED (CRITICAL-VLAN)
Re-Authentication:         Enable
Untagged VLAN id:          400
Guest VLAN:                Enable

Auth-Fail VLAN:            Enable
Auth-Fail VLAN id:         400
Auth-Fail Max-Attempts:    3
Critical VLAN:             Enable
Critical VLAN id:          400
Mac-Auth-Bypass:           Disable
Mac-Auth-Bypass Only:      Disable
Tx Period:                 30 seconds
Quiet Period:              60 seconds
ReAuth Max:                2
Supplicant Timeout:        30 seconds
Server Timeout:            30 seconds
Re-Auth Interval:          60 seconds
Max-EAP-Req:               2
Host Mode:                 SINGLE_HOST
Auth PAE State:            Authenticated
Backend State:             Idle
```

dot1x guest-vlan

Configure a guest VLAN for limited access users or for devices that are not 802.1X capable.

### Syntax

```
dot1x guest-vlan vlan-id
```

To disable the guest VLAN, use the `no dot1x guest-vlan vlan-id` command.

### Parameters

- `vlan-id` Enter the VLAN Identifier. The range is from 1 to 4094.
Defaults
Not configured.

<td>Introduced on the Z9000.</td>
</tr>
<tr>
<td>7.6.1.0</td>
<td>Introduced on the C-Series, E-Series, and S-Series.</td>
</tr>
</tbody>
</table>

Usage Information
1X authentication is enabled when an interface is connected to the switch. If the host fails to respond within a designated amount of time, the authenticator places the port in the guest VLAN.

If a device does not respond within 30 seconds, it is assumed that the device is not 802.1X capable. Therefore, a guest VLAN is allocated to the interface and authentication, for the device, occurs at the next reauthentication interval (dot1x reauthentication).

If the host fails authentication for the designated number of times, the authenticator places the port in authentication failed VLAN (dot1x auth-fail-vlan).

**NOTE:** You can create the Layer 3 portion of a guest VLAN and authentication fail VLANs regardless if the VLAN is assigned to an interface or not. After an interface is assigned a guest VLAN (which has an IP address), routing through the guest VLAN is the same as any other traffic. However, the interface may join/leave a VLAN dynamically.

Related Commands
- `dot1x auth-fail-vlan` — Configure an authentication failure VLAN.
- `dot1x reauthentication` — Enable periodic re-authentication of the client.
- `dot1x reauth-max` — Configure the maximum number of times to re-authenticate a port before it becomes unauthorized.
dot1x host-mode

Enable single-host or multi-host authentication.

Syntax

    dot1x host-mode {single-host | multi-host | multi-auth}

Parameters

- **single-host**: Enable single-host authentication.
- **multi-host**: Enable multi-host authentication.
- **multi-auth**: Enable multi-suppliant authentication.

Defaults

- **single-host**

Command Modes

INTERFACEx

Command History

</tr>
<tr>
<td>8.3.2.0</td>
<td>Added the single-host and multi-host options on the C-Series, E-Series, and S-Series.</td>
</tr>
</tbody>
</table>

Usage Information

- Single-host mode authenticates only one host per authenticator port and drops all other traffic on the port.
- Multi-host mode authenticates the first host to respond to an Identity Request and then permits all other traffic on the port.
- Multi-suppliant mode authenticates every device attempting to connect to the network on the authenticator port.
Related Commands

- `show dot1x interface` — display the 802.1X configuration of an interface.

**dot1x mac-auth-bypass**

Enable MAC authentication bypass. If 802.1X times out because the host did not respond to the Identity Request frame, Dell EMC Networking OS attempts to authenticate the host based on its MAC address.

### Syntax

```
dot1x mac-auth-bypass
```

To disable MAC authentication bypass on a port, use the `no dot1x mac-auth-bypass` command.

### Defaults

Disabled

</tbody>
</table>

### Usage Information

To disable MAC authentication bypass on a port, enter the `no dot1x mac-auth-bypass` command.

**dot1x max-eap-req**

Configure the maximum number of times an extensive authentication protocol (EAP) request is transmitted before the session times out.

### Syntax

```
dot1x max-eap-req number
```

To return to the default, use the `no dot1x max-eap-req` command.
Parameters

number

Enter the number of times an EAP request is transmitted before a session time-out. The range is from 1 to 10. The default is 2.

Defaults

2

dot1x max-suppllicants

Restrict the number of supplicants that can be authenticated and permitted to access the network through the port. This configuration is only takes effect in Multi-auth mode.

Syntax
dot1x max-suppllicants number

Parameters

number

Enter the number of supplicants that can be authenticated on a single port in Multi-auth mode. The range is from 1 to 128. The default is 128.

Defaults

128 hosts can be authenticated on a single authenticator port.

**Related Commands**

- `dot1x host-mode` — enable single-host or multi-host authentication.

---

**dot1x port-control**

Enable port control on an interface.

**Syntax**

```
dot1x port-control {force-authorized | auto | force-unauthorized}
```

**Parameters**

- `force-authorized` Enter the keywords `force-authorized` to forcibly authorize a port.
- `auto` Enter the keyword `auto` to authorize a port based on the 802.1X operation result.
- `force-unauthorized` Enter the keywords `force-unauthorized` to forcibly de-authorize a port.

**Defaults**

None

**Command Modes**

Auto

### dot1x profile

Configure a dot1x profile to define a list of trusted supplicant MAC addresses.

**Syntax**

```
[no] dot1x profile profile-name
```

**Parameters**

- `profile-name` Enter a dot1x profile-name. The profile name length is limited to 32 characters.

**Defaults**

None

**Command Modes**

- CONFIGURATION
- CONFIGURATION TERMINAL BATCH

**Error Strings**

NONE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.0) Introduced on the S3100 series, S4048-ON, S4810T, S5000, S6000, S6000-ON, S6100-ON, the Configuration Terminal Batch mode on C9010, Z9100-ON, and Z9500.
- 9.10(0.0) Introduced on the S3148.
- 9.9(0.0) Introduced on the C9010.
- 9.0.2.0 Introduced on the S4810.
- 8.3.11.1 Introduced on the Z9000.
- 7.6.1.0 Introduced on the C-Series and S-Series.
- 7.4.1.0 Introduced on the E-Series.

**Usage Information**

The dot1x profile command configures a dot1x profile to define a list of trusted supplicant MAC addresses. Maximum number of dot1x profiles is limited to 10. This command launches dot1x profile mode for entering profile...
related commands such as the mac command. The dot1x static-mab command assigns the dot1x profile to an interface.

Use this command in Configuration Terminal Batch mode to configure the dot1x profile in a dual-homing setup.

Related Commands
  • dot1x static-mab
  • mac

dot1x quiet-period

Set the number of seconds that the authenticator remains quiet after a failed authentication with a client.

Syntax
  dot1x quiet-period seconds

To disable quiet time, use the no dot1x quiet-time command.

Parameters
  seconds
    Enter the number of seconds. The range is from 1 to 65535. The default is 60.

Defaults
  60 seconds

**dot1x reauth-max**

Configure the maximum number of times a port can re-authenticate before the port becomes unauthorized.

**Syntax**

```
dot1x reauth-max number
```

---

192 802.1X
To return to the default, use the `no dot1x reauth-max` command.

**Parameters**

`number` Enter the permitted number of re-authentications. The range is from 1 to 10. The default is 2.

**Defaults**

2

</tr>
</tbody>
</table>

Usage Information

When you configure the dot1x server-timeout value, take into account the communication medium used to communicate with an authentication server and the number of RADIUS servers configured. Ideally, the dot1x server-timeout value (in seconds) is based on the configured RADIUS-server timeout and retransmit values and calculated according to the following formula:

\[
\text{dot1x server-timeout seconds} > (\text{radius-server retransmit seconds} + 1) \times \text{radius-server timeout seconds}.
\]

Where the default values are as follows: dot1x server-timeout (30 seconds), radius-server retransmit (3 seconds), and radius-server timeout (5 seconds).

Example

```
DellEMC(conf)# radius-server host 10.11.197.105 timeout 6
DellEMC(conf)# radius-server host 10.11.197.105 retransmit 4
DellEMC(conf)# interface tengigabitethernet 2/23
DellEMC(conf-if-te-2/23)# dot1x server-timeout 40
DellEMC(conf-if-te-2/23)#
```

dot1x static-mab

Enable static MAC authorization bypass (MAB) and configure static MAB profile to an interface.

Syntax

```
[no] dot1x static-mab profile profile-name
```
Parameters

**profile profile-name** Enter the keyword `profile` and the `profile-name` to configure the static MAB profile name. The profile name length is limited to 32 characters.

**Defaults**

Disabled.

**Command Modes**

INTERFACE

INTERFACE (BATCH MODE)

**Command History**

</tr>
<tr>
<td>9.9(0.0)</td>
<td>Introduced on the C9010.</td>
</tr>
</tbody>
</table>

**Usage Information**

The `dot1x static-mab` command enables static MAB (mac auth bypass) and configures the associated profile on a dot1x interface. Static MAB bypasses the authentication server for the supplicant MAC addresses configured in the associated profile.

Before you enable static MAB, you must do the following:

- Enable MAC authentication bypass on the port by configuring the `dot1x mac-auth-bypass` command.
- Ensure that no configured profile exists at the time of configuring the `static-mab` command.
- Use this command in Interface Batch Mode to enable static MAB in a dual-homing setup.

**Example**

```
DellEMC(conf)#do show dot1x interface twentyFiveGigE 1/41

Usage Information

The `mac` command configures a list of supplicant MAC addresses for a `dot1x` profile represented with a profile-name. You can configure up to 6 MAC addresses in a single `mac` command. The maximum number of MAC addresses that you can configure in a single profile is limited to 100.

Use this command in Configuration Terminal Batch mode to configure a list of supplicant MAC addresses for `dot1x` profile in a dual-homing setup.

Example

```bash
DellEMC(conf)#dot1x profile mySupplicants
DellEMC(conf-dot1x-profile)#mac 00:50:56:AA:01:10 00:50:56:AA:01:11
DellEMC(conf-dot1x-profile)#show config
dot1x profile mySupplicants
  mac 00:50:56:aa:01:10
  mac 00:50:56:aa:01:11
DellEMC(conf-dot1x-profile)#
DellEMC(conf-dot1x-profile)#exit
```

show dot1x cos-mapping interface

Display the CoS priority-mapping table the RADIUS server provides and applies to authenticated supplicants on an 802.1X-enabled system.

**Syntax**

```
show dot1x cos-mapping interface interface [mac-address mac-address]
```

**Parameters**

- `interface` Enter one of the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

- `mac-address` (Optional) MAC address of an 802.1X-authenticated supplicant.

**Defaults**

None

**Command Modes**

- EXEC
- EXEC privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### Version Description

- **9.10(0.1)** Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)** Introduced on the S3148.
- **9.10(0.0)** Introduced on the S6100-ON.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100–ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000–ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **9.0.0.0** Introduced on the Z9000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.12.0** Introduced on the S4810.
- **8.3.11.1** Introduced on the Z9000.
- **8.4.2.1** Introduced on the C-Series and S-Series.

### Usage Information

Enter a supplicant’s MAC address using the `mac-address` option to display CoS mapping information only for the specified supplicant.

You can display the CoS mapping information applied to traffic from authenticated supplicants on 802.1X-enabled ports that are in Single-Hot, Multi-Host, and Multi-Supplicant authentication modes.

### Example

```plaintext
DellEMC# show dot1x cos-mapping interface tengigabitethernet 1/32
802.1p CoS re-map table on Te 1/32:
----------------------------------
Dot1p        Remapped Dot1p
0            7
1            6
2            5
3            4
4            3
5            2
6            1
7            0
DellEMC#

DellEMC# show dot1x cos-mapping interface tengigabitethernet 1/32 mac-address 00:00:00:00:00:10
Supplicant Mac: 0 0 0 0 0 10 Lookup for Mac:

802.1p CoS re-map table for Supplicant: 00:00:00:00:00:10
----------------------------------
Dot1p        Remapped Dot1p
0            7
1            6
2            5
3            4
```

---

802.1X 199
show dot1x interface

Display the 802.1X configuration of an interface.

Syntax

show dot1x interface interface [mac-address mac-address]

Parameters

- **interface**: Enter one of the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

- **mac-address** (Optional) MAC address of a supplicant.

Defaults

None

Command Modes

- EXEC
- EXEC privilege

Command History

If you enable 802.1X multi-supplicant authentication on a port, additional 802.1X configuration details (Port Authentication status, Untagged VLAN ID, Authentication PAE state, and Backend state) display for each supplicant, as shown in the following example.

**Example**

DellEMC# show dot1x interface tengigabitethernet 1/32

802.1X information on Te 1/32:
----------------------------------
Dot1x Status: Enable
Port Control: AUTO
Port Auth Status: AUTHORIZED (MAC-AUTH-BYPASS)
Re-Authentication: Disable
Untagged VLAN id: 400
Guest VLAN: Enable
Guest VLAN id: 100
Auth-Fail VLAN: Disable
Auth-Fail VLAN id: NONE
Auth-Fail Max-Attempts: NONE
Mac-Auth-Bypass: Enable
Mac-Auth-Bypass Only: Enable
Tx Period: 3 seconds
Quiet Period: 60 seconds
ReAuth Max: 2
Supplicant Timeout: 30 seconds
Server Timeout: 30 seconds
Re-Auth Interval: 3600 seconds
Max-EAP-Req: 2
Host Mode: SINGLE_HOST
Auth PAE State: Authenticated
Backend State: Idle
DellEMC#

**Example (mac-address)**

DellEMC# show dot1x interface tengigabitethernet 1/32 mac-address 00:00:00:00:00:10
Supplicant Mac: 0 0 0 0 0 10 Lookup for Mac:

802.1X information on Te 1/32:
----------------------------------
Dot1x Status: Enable

DellEMC#

show dot1x profile

Display all the dot1x profiles or the details of a specific profile configured in the system.

Syntax

```
show dot1x profile profile-name
```

Parameters

- `profile-name`: Specify a static dot1x profile-name. The maximum character limit for a profile name is 32 characters.

Defaults

None

Command Modes

EXEC

Command History

Access Control Lists (ACL)

Access control lists (ACLs) are supported by the Dell EMC Networking OS. Dell EMC Networking OS supports the following types of ACL, IP prefix list, and route maps:

- Commands Common to all ACL Types
- Common IP ACL Commands
- Standard IP ACL Commands
- Extended IP ACL Commands
- Common MAC Access List Commands
- Standard MAC ACL Commands
- Extended MAC ACL Commands
- IP Prefix List Commands
- Route Map Commands
- AS-Path Commands
- IP Community List Commands

**NOTE:** For ACL commands that use the Trace function, see Trace List Commands section in Security.

**NOTE:** For IPv6 ACL commands, see IPv6 Access Control Lists (IPv6 ACLs).

Topics:

- Commands Common to all ACL Types
- Common IP ACL Commands
- Standard IP ACL Commands
- Extended IP ACL Commands
- Common MAC Access List Commands
- Standard MAC ACL Commands
- Extended MAC ACL Commands
- IP Prefix List Commands
- Route Map Commands
- AS-Path Commands
- IP Community List Commands
- UDF ACL Commands
- deny (for Standard IP ACLs)
- deny (for Extended IP ACLs)
- seq (for Standard IPv4 ACLs)
- deny tcp (for Extended IP ACLs)
- deny udp (for Extended IP ACLs)
- deny arp (for Extended MAC ACLs)
- deny icmp (for Extended IP ACLs)
- deny ether-type (for Extended MAC ACLs)
• deny (for Standard MAC ACLs)
• deny (for Extended MAC ACLs)
• permit (for Standard IP ACLs)
• permit arp (for Extended MAC ACLs)
• permit ether-type (for Extended MAC ACLs)
• permit icmp (for Extended IP ACLs)
• permit udp (for Extended IP ACLs)
• permit (for Extended IP ACLs)
• permit (for Standard MAC ACLs)
• seq (for Standard MAC ACLs)
• permit tcp (for Extended IP ACLs)
• seq arp (for Extended MAC ACLs)
• seq ether-type (for Extended MAC ACLs)
• seq (for IP ACLs)
• seq (for IPv6 ACLs)
• permit udp (for IPv6 ACLs)
• permit tcp (for IPv6 ACLs)
• permit icmp (for IPv6 ACLs)
• permit (for IPv6 ACLs)
• deny udp (for IPv6 ACLs)
• deny tcp (for IPv6 ACLs)
• deny icmp (for Extended IPv6 ACLs)
• deny (for IPv6 ACLs)

Commands Common to all ACL Types

The following commands are available within each ACL mode and do not have mode-specific options. Some commands in this chapter may use similar names, but require different options to support the different ACL types (for example, the deny and permit commands).

remark

Enter a description for an ACL entry.

Syntax
remark remark-number description

To remove a remark, use the no remark command.

Parameters

remark-number (Optional) Enter the remark number. The range is from 0 to 65535 for MAC ACL and 0 to 4294967290 for IP ACL.

NOTE: You can use the same sequence number for the remark and an ACL rule.

description Enter a description of up to 80 characters.

Defaults
Not configured.

Command Modes
• CONFIGURATION-STANDARD-ACCESS-LIST
• CONFIGURATION-EXTENDED-ACCESS-LIST
• CONFIGURATION-MAC ACCESS LIST-STANDARD
• CONFIGURATION-MAC ACCESS LIST-EXTENDED

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.14.0.0 Made the remark number as an optional value.
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.1.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
6.4.1.0 Introduced on the E-Series.

Usage Information
The remark command is available in each ACL mode. You can configure up to 4294967291 remarks for a given IP ACL and 65536 remarks for a given MAC ACL.

You can include a remark with or without a remark number. If you do not enter a remark number, the remark inherits the sequence number of the last ACL rule. If there is no ACL rule when you enter a remark, the remark takes sequence number 5. If you configure two remarks with the same sequence number and different strings, the second one replaces the first string. You cannot configure two or more remarks with the same string and different sequence numbers.

To remove a remark, use the no remark command with or without the sequence number. If there is a matching string, the system deletes the remark.

Example
The following example shows the use of the remark command twice within CONFIGURATION-STANDARD-ACCESS-LIST mode. The remark precedes the rule in the running configuration because it is assumed that the remark is for the rule with the same sequence number, or the group of rules that follow the remark.

DellEMC(config-std-nacl)# remark 10 Deny rest of the traffic
DellEMC(config-std-nacl)# remark 5 Permit traffic from XYZ Inc.
DellEMC(config-std-nacl)# show config
!
ip access-list standard test
remark 5 Permit traffic from XYZ Inc.
seq 5 permit 1.1.1.0/24
remark 10 Deny rest of the traffic
seq 10 deny any
DellEMC(config-std-nacl)#

The following example shows adding a remark without a sequence number:

DellEMC(config-ext-nacl)#permit ip any any
DellEMC(config-ext-nacl)#remark permit any ip
DellEMC(config-ext-nacl)#show c

! 
ip access-list extended testac
  seq 5 permit ip any any
  remark 5 permit any ip

The following example shows that the system displays an error message when the same remark string is used with different remark numbers.

DellEMC(config-ext-nacl)#seq 100 permit ip any any
DellEMC(config-ext-nacl)#remark 10 permit any ip
DellEMC(config-ext-nacl)#remark permit any ip
DellEMC(config-ext-nacl)#remark permit any ip
DellEMC(config-ext-nacl)#% Error : Remark string already exists

Related Commands
- show config — display the current ACL configuration.

show config

Display the current ACL configuration.

Syntax
show config

Command Modes
- CONFIGURATION-STANDARD-ACCESS-LIST
- CONFIGURATION-EXTENDED-ACCESS-LIST
- CONFIGURATION-MAC ACCESS LIST-STANDARD
- CONFIGURATION-MAC ACCESS LIST-EXTENDED

Command History

Common IP ACL Commands

The following commands are available within both Ingress and Egress IP ACL modes (Standard and Extended) and do not have mode-specific options. When an ACL is created without a rule and then is applied to an interface, ACL behavior reflects an implicit permit. The platform supports both Ingress and Egress IP ACLs.

1) **NOTE:** Also refer to the Commands Common to all ACL Types section.

### access-class

Apply a standard ACL to a terminal line.

**Syntax**

```
access-class access-list-name [ipv4 | ipv6]
```

To remove an ACL, use the no access-class command.

**Parameters**

- **access-list-name**
  Enter the name of a configured Standard ACL, up to 140 characters.
- **ipv4**
  Enter the keyword ipv4 to configure an IPv4 access class.
- **ipv6**
  Enter the keyword ipv6 to configure an IPv6 access class.

**Defaults**

Not configured.

**Command Modes**

- LINE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

When you use the `access-class access-list-name` command without specifying the `ipv4` or `ipv6` attribute, both IPv4 as well as IPv6 rules that are defined in that ACL are applied to the terminal. This method is a generic way of configuring access restrictions.

To be able to filter access exclusively using either IPv4 or IPv6 rules, use either the `ipv4` or `ipv6` attribute along with the `access-class access-list-name` command. Depending on the attribute that you specify (`ipv4` or `ipv6`), the ACL processes either IPv4 or IPv6 rules, but not both. Using this configuration, you can set up two different types of access classes with each class processing either IPv4 or IPv6 rules separately.

However, if you already have configured generic IP ACL on a terminal line, then you cannot further apply IPv4 or IPv6 specific filtering on top of this configuration. Because, both IPv4 and IPv6 access classes are already configured on this terminal line. Before applying either IPv4 or IPv6 filtering, first undo the generic configuration using the `no access-class access-list-name` command.

Similarly, if you have configured either IPv4 or IPv6 specific filtering on a terminal line, you cannot apply generic IP ACLs on top of this configuration. Before applying the generic ACL configuration, first undo the existing configuration using the `no access-class access-list-name [ipv4 | ipv6]` command.
clear counters ip access-group

Erase all counters maintained for access lists.

**Syntax**

```
clear counters ip access-group [access-list-name]
```

**Parameters**

- `access-list-name` (OPTIONAL) Enter the name of a configured access-list, up to 140 characters.

**Command Modes**

- EXEC Privilege

**Command History**

</table>

**ip access-group**

Assign an IP access list (IP ACL) to an interface.

**Syntax**

```
ip access-group access-list-name {in | out} [implicit-permit] [vlan vlan-id] [vrf vrf-name]
```
To delete an IP access-group configuration, use the `no ip access-group access-list-name {in | out} [implicit-permit] [vlan vlan-id] [layer3] [vrf vrf-name]` command.

**Parameters**

- **access-list-name**: Enter the name of a configured access list, up to 140 characters.
- **in**: Enter the keyword `in` to apply the ACL to incoming traffic.
- **out**: Enter the keyword `out` to apply the ACL to outgoing traffic.
- **implicit-permit**: (OPTIONAL) Enter the keyword `implicit-permit` to change the default action of the ACL from implicit-deny to implicit-permit (that is, if the traffic does not match the filters in the ACL, the traffic is permitted instead of dropped).
- **vlan vlan-id**: (OPTIONAL) Enter the keyword `vlan` then the ID numbers of the VLANs. The range is from 1 to 4094 (you can use IDs from 1 to 4094).
- **vrf vrf-name**: (OPTIONAL) Enter the keyword `vrf` then the ID numbers of the VRFs. The range is from 1 to 63 (you can use IDs from 1 to 63).

**NOTE**: When you specify a single VRF, use the name of the VRF instead of the VRF ID number. Use the VRF ID numbers only when you specify a range of VRFs.

- **layer3**: (OPTIONAL) Enter the keyword `layer3` to enable layer 3 mode. It ensures that all the ACL rules in the access-group are applied only for L3 router packets.

**Defaults**

Not enabled.

**Command Modes**

INTERFACE/VRF MODE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>
Version   Description
7.8.1.0    Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names were up to 16 characters long.
7.6.1.0    Introduced on the S-Series.
7.5.1.0    Introduced on the C-Series.
6.2.1.1    Introduced on the E-Series.

Usage Information
You can assign one ingress ACL and one egress ACL to an interface.

**NOTE:** This command supports Loopback interfaces EE3 and EF series route processor modules (RPMs). This command does not support Loopback interfaces ED series RPMs and S-Series Loopback interfaces.

**NOTE:** If you apply outbound(egress) IP acl on a switch port, the filter applies only for routed traffic egressing out of that port.

To associate an access-list to a non-default VRF, use the vrf attribute of this command. You can use this command at the interface context (physical/LAG) to apply the access-list to a range of VRFs.

The VRF MODE is not available for the default and management VRFs.

In the Dell EMC Networking OS versions prior to 9.13(0.0), the system does not install any of your ACL rules if the available CAM space is lesser than what is required for your set of ACL rules. Effective with the Dell EMC Networking OS version 9.13(0.0), the system installs your ACL rules until all the allocated CAM memory is used. If there is no implicit permit in your rule, the Dell EMC Networking OS ensures that an implicit deny is installed at the end of your rule. This behavior is applicable for IPv4 and IPv6 ingress and egress ACLs.

One of the usage scenarios for using the layer3 keyword at the VLAN level, is to avoid ACL being applied on the L2 traffic which comes in via ICL.

**NOTE:** The usage scenario listed above is one of many other usage scenarios.

Related Commands
* ip access-list standard — configure a standard ACL.
* ip access-list extended — configure an extended ACL.

### ip mirror-access-group

Assign an IP mirror access control to an interface.

**Syntax**
```
ip mirror-access-group access-list-name {in} [implicit-permit] [vlan vlan-id] [optimized]
```

To remove an IP mirror-access-group configuration, use the `no ip mirror-access-group access-list-name {in | out} [implicit-permit] [vlan vlan-id] [optimized]` command.

**Parameters**

- **access-list-name**
  - Enter the name of a configured access list, up to 140 characters.

- **in**
  - Enter the keyword `in` to apply the ACL to incoming traffic.
**implicit-permit**

(OPTIONAL) Enter the keyword `implicit-permit` to change the default action of the ACL from implicit-deny to implicit-permit (that is, if the traffic does not match the filters in the ACL, the traffic is permitted instead of dropped).

**vlan vlan-id**

(OPTIONAL) Enter the keyword `vlan` then the ID numbers of the VLANs. The range is from 1 to 4094 (you can use IDs from 1 to 4094).

**optimized**

(OPTIONAL) Enter the keyword `optimized` to enable ACL optimization.

**Defaults**

Not enabled.

**Command Modes**

INTERFACE

**Command History**

## show ip accounting access-list

Display the IP access-lists created on the switch and the sequence of filters.

**Syntax**

```
show ip accounting {access-list access-list-name | cam_count} interface [vrf vrf-name]
```

**Parameters**

- **access-list-name**
  - Enter the name of the ACL to be displayed.
- **cam_count**
  - List the count of the CAM rules for this ACL.
- **interface interface**
  - Enter the keyword `interface` then the one of the following keywords and the interface information:
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- **in | out**
  - Identify whether ACL is applied on the ingress or egress side.
- **vrf vrf-name**
  - (Optional) Enter the keyword `vrf` and then the name of the VRF to view the IP accounting information on either a default or a non-default VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.11(0.0) | Updated the show command output to include monitor option.
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100--ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000--ON.
### Version Description

- **9.4.(0.0)**  
  Added support for VRF.
- **9.2(1.0)**  
  Introduced on the Z9500.
- **9.0.2.0**  
  Introduced on the S6000.
- **8.3.19.0**  
  Introduced on the S4820T.
- **8.3.11.1**  
  Introduced on the Z9000.
- **8.5.1.0**  
  Added support for the 4-port 40G line cards.
- **8.3.7.0**  
  Introduced on the S4810.
- **7.6.1.0**  
  Introduced on the S-Series.
- **7.5.1.0**  
  Introduced on the C-Series.
- **6.2.1.1**  
  Introduced.

### Usage Information

**NOTE:** The vrf option is available only when VRF feature is enabled.

**show ip accounting access-lists**

**Field**  
- **“Extended IP...”**  
  Displays the name of the IP ACL.
- **“seq 5...”**  
  Displays the filter. If the keywords count or byte were configured in the filter, the number of packets or bytes the filter processes is displayed at the end of the line.
- **“order 4”**  
  Displays the QoS order of priority for the ACL entry.

**Example**

```plaintext
DellEMC# show ip accounting access-list L3-ACL vrf vrf3
!
Standard Ingress IP access list L3-ACL on vrf3
Total cam count 3
  seq 5 permit 10.1.2.0/24 any negotiate 150 monitor 300 count (0 packets)
  seq 10 permit 20.1.2.0/24
  seq 15 permit 30.1.2.0/24
DellEMC#
```

### show ip access-lists

Display all of the IP ACLs configured in the system, whether or not they are applied to an interface, and the count of matches/mismatches against each ACL entry displayed.

**Syntax**

```
show ip access-lists [access-list-name] [interface interface] [in | out] [vrf vrf-name]
```

**Parameters**

- **access-list-name**  
  Enter the name of a configured MAC ACL, up to 140 characters.
- **interface interface**  
  Enter the keyword interface followed by the one of the following keywords and slot/port or number information:
  - For a VLAN interface, enter the keyword vlan followed by the slot/port number.
For a Port Channel interface, enter the keyword `port-channel` followed by a number.

For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` followed by the slot/port/subport information.

For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

- **in | out** Identify whether ACL is applied on the ingress or egress side.
- **vrf vrf-name** Enter the keyword `vrf` and then the name of the VRF to display the access-lists that are configured on either the default or non-default VRFs.

**Command Modes**

- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Standard IP ACL Commands**

When you create an ACL without any rule and then apply it to an interface, the ACL behavior reflects an implicit permit.

The platform supports both Ingress and Egress IP ACLs.

| NOTE | Also refer to the Commands Common to all ACL Types and Common IP ACL Commands sections. |

**deny**

To drop packets with a certain IP address, configure a filter.

**Syntax**

```
deny {source | any | host {ip-address}} [count [bytes] | log] [dscp value] [ecn value] [fragments] [monitor] [no-drop] [order]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {source [mask] | any | host ip-address}` command.

**Parameters**

- **source** Enter the IP address in dotted decimal format of the network from which the packet was sent.
any

Enter the keyword any to specify that all routes are subject to the filter.

host ip-address

Enter the keyword host and then enter the IP address to specify a host IP address only.

count

(OPTIONAL) Enter the keyword count to count the packets.

bytes

(OPTIONAL) Enter the keyword bytes to count the bytes.

log

(OPTIONAL) Enter the keyword log to enter ACL matches in the log.

dscp

(OPTIONAL) Enter the keyword dscp to match the IP DSCP values. The range is from 0 to 63.

ecn

(OPTIONAL) Enter the keyword ecn to match the ECN bits. The range is from 0 to 3.

order

(OPTIONAL) Enter the keyword order to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have higher priority). If you do not use the keyword order, the ACLs have the lowest order by default (255).

monitor

(OPTIONAL) Enter the keyword monitor to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

NOTE: For more information, see “Flow-based Monitoring” in the Port Monitoring section of the Dell EMC Networking OS Configuration Guide.

fragments

Enter the keyword fragments to use ACLs to control packet fragments.

no-drop

Enter the keywords no-drop to match only the forwarded packets.

Defaults

Not configured.

Command Modes

CONFIGURATION-STANDARD-ACCESS-LIST

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.12(0.0) Removed the session-ID option from the monitor parameter.

9.11(0.0) Added support for session-ID to the monitor parameter.

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the S6100-ON.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100-ON.

9.8(0.0P6) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.8(0.0) Added the no-drop parameter.

9.7(0.0) Introduced on the S6000-ON.

9.2(1.0) Introduced on the Z9500.

9.0.2.0 Introduced on the S6000.

<td>Added support for the non-contiguous mask and added the monitor option.</td>
</tr>
<tr>
<td>6.5.1.0</td>
<td>Expanded to include the optional QoS order priority for the ACL entry.</td>
</tr>
</tbody>
</table>

**Usage Information**

The `order` option is relevant in the context of the Policy GoS feature only. For more information, see the Quality of Service section in the Dell EMC Networking OS Configuration Guide.

The software cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment.

**Related Commands**

- `ip access-list standard` — configure a standard ACL.
- `permit` — configure a permit filter.

**ip access-list standard**

Create a standard IP access list (IP ACL) to filter based on IP address.

**Syntax**

```
ip access-list standard access-list-name
```

To delete an access list, use the `no ip access-list standard access-list-name` command.

**Parameters**

- `access-list-name` Enter a string up to 140 characters long as the ACL name.

**Defaults**

All IP access lists contain an implicit “deny any,” that is, if no match occurs, the packet is dropped.

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

### Usage Information

Dell EMC Networking OS supports one ingress and one egress IP ACL per interface. 
Prior to Dell EMC Networking OS version 7.8.1.0, names are up to 16 characters long. 
The number of entries allowed per ACL is hardware-dependent. For detailed specifications on entries allowed per ACL, refer to your line card documentation.

### Example

```
DellEMC(conf)# ip access-list standard TestList
DellEMC(config-std-nacl)#
```

### Related Commands

- `ip access-list extended` — create an extended access list.
- `show config` — display the current configuration.

### permit

To permit packets from a specific source IP address to leave the switch, configure a filter.

```
permit {source [mask] | any | host ip-address} [count [bytes] | log] [dscp value] [ecn value] [fragments] [monitor] [no-drop] [order]
```

To remove this filter, you have two choices:
- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit {source [mask] | any | host ip-address}` command.

**Parameters**

- `source` Enter the IP address in dotted decimal format of the network from which the packet was sent.
**mask** *(OPTIONAL)* Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

**any** Enter the keyword any to specify that all routes are subject to the filter.

**host ip-address** Enter the keyword host then the IP address to specify a host IP address or hostname.

**count** *(OPTIONAL)* Enter the keyword count to count the packets.

**bytes** *(OPTIONAL)* Enter the keyword bytes to count the bytes.

**log** *(OPTIONAL)* Enter the keyword log to enter ACL matches in the log.

**dscp** *(OPTIONAL)* Enter the keyword dscp to match the IP DSCP values. The range is from 0 to 63.

**ecn** *(OPTIONAL)* Enter the keyword ecn to match the ECN bits. The range is from 0 to 3.

**order** *(OPTIONAL)* Enter the keyword order to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword order, the ACLs have the lowest order by default (255).

**monitor** *(OPTIONAL)* Enter the keyword monitor to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**fragments** Enter the keyword fragments to use ACLs to control packet fragments.

**no-drop** Enter the keywords no-drop to match only the forwarded packets.

**Defaults** Not configured.

**Command Modes** CONFIGURATION-STANDARD-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>

**Usage Information**

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the “Quality of Service” section of the *Dell EMC Networking OS Configuration Guide*.

**Related Commands**

- `deny` — assign a IP ACL filter to deny IP packets.
- `ip access-list standard` — create a standard ACL.

### resequence access-list

Re-assign sequence numbers to entries of an existing access-list.

**Syntax**

resequence access-list \{ipv4 | ipv6 | mac\} \{access-list-name StartingSeqNum Step-to-Increment\}

**Parameters**

- `ipv4 | ipv6 | mac` Enter the keyword `ipv4` or `ipv6` or `mac` to identify the access list type to resequence.
- `access-list-name` Enter the name of a configured IP access list.
- `StartingSeqNum` Enter the starting sequence number to resequence. The range is from 0 to 4294967290.
- `Step-to-Increment` Enter the step to increment the sequence number. The range is from 1 to 4294967290.

**Defaults**

None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<td>Introduced on the S3148.</td>
</tr>
</tbody>
</table>
seq

Assign a sequence number to a deny or permit filter in an IP access list while creating the filter.

Syntax

```
seq sequence-number {deny | permit} {source [mask] | any | host ip-address} 
[count [byte] | log] [dscp value] [ecn value] [fragments] [monitor] [no-drop] [order]
```

To delete a filter, use the `no seq sequence-number` command.

Parameters

- `sequence-number`: Enter a number from 0 to 4294967290.
- `deny`: Enter the keyword `deny` to configure a filter to drop packets meeting this condition.
- `permit`: Enter the keyword `permit` to configure a filter to forward packets meeting this criteria.
- `source`: Enter an IP address in dotted decimal format of the network from which the packet was received.
- `mask`: (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
- `any`: Enter the keyword `any` to specify that all routes are subject to the filter.
**Command: host**

- **ip-address**: Enter the keyword `host` then the IP address to specify a host IP address or hostname.

**Command: count**

- **(OPTIONAL)** Enter the keyword `count` to count packets the filter processes.

**Command: bytes**

- **(OPTIONAL)** Enter the keyword `bytes` to count bytes the filter processes.

**Command: log**

- **(OPTIONAL)** Enter the keyword `log` to enter ACL matches in the log.

**Command: dscp**

- **(OPTIONAL)** Enter the keyword `dscp` to match to the IP DCSCP values. The range is from 0 to 63.

**Command: ecn**

- **(OPTIONAL)** Enter the keyword `ecn` to match to the ECN values. The range is from 0 to 3.

**Command: order**

- **(OPTIONAL)** Enter the keyword `order` to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword `order`, the ACLs have the lowest order by default (255).

**Command: monitor**

- **(OPTIONAL)** Enter the keyword `monitor` to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**NOTE**: For more information, see “Flow-based Monitoring” in the Port Monitoring section of the Dell EMC Networking OS Configuration Guide.

**Command: fragments**

- Enter the keyword `fragments` to use ACLs to control packet fragments.

**Command: no-drop**

- Enter the keywords `no-drop` to match only the forwarded packets.

**Defaults**

- Not configured

**Command Modes**

- CONFIGURATION-STANDARD-ACCESS-LIST

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
---|---
9.12(0.0) | Removed the session-ID option from the `monitor` parameter.
9.11(0.0) | Added support for `session-ID` to the `monitor` parameter.
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.8(0.0) | Added the no-drop parameter.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
Version | Description
--- | ---
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.3.1.0 | Add the DSCP value for ACL matching.
8.2.1.0 | Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
8.1.1.0 | Introduced on the E-Series.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
7.4.1.0 | Added support for the non-contiguous mask and added the monitor option.
6.5.10 | Expanded to include the optional QoS order priority for the ACL entry.

Usage Information

The order option is relevant in the context of the Policy GoS feature only. The following applies:

- The seq sequence-number command is applicable only in an ACL group.
- The order option works across ACL groups that are applied on an interface via the GoS policy framework.
- The order option takes precedence over seq sequence-number.
- If you do not configure sequence-number, the rules with the same order value are ordered according to their configuration order.
- If you configure sequence-number, the sequence-number is used as a tie breaker for rules with the same order.

Related Commands

- deny — configure a filter to drop packets.
- permit — configure a filter to forward packets.

Extended IP ACL Commands

When an ACL is created without any rule and then applied to an interface, ACL behavior reflects an implicit permit.

The following commands configure extended IP ACLs, which in addition to the IP address, also examine the packet’s protocol type.

The platform supports both Ingress and Egress IP ACLs.

**NOTE:** Also refer to the Commands Common to all ACL Types and Common IP ACL Commands sections.

deny

Configure a filter that drops IP packets meeting the filter criteria.

**Syntax**

deny {ip | ip-protocol-number} {source mask | any | host ip-address} {destination mask | any | host ip-address} [ttl operator] [count [byte] | log] [dscp value] [order] [monitor] [fragments] [no-drop]

To remove this filter, you have two choices:

- Use the no seq sequence-number command if you know the filter’s sequence number.
Use the `no deny {ip | ip-protocol-number} {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**

- **ip**
  - Enter the keyword `ip` to configure a generic IP access list. The keyword `ip` specifies that the access list denies all IP protocols.

- **ip-protocol-number**
  - Enter a number from 0 to 255 to deny based on the protocol identified in the IP protocol header.

- **source**
  - Enter the IP address of the network or host from which the packets were sent.

- **mask**
  - Enter a network mask in `/prefix` format (`/x`) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or noncontiguous.

- **any**
  - Enter the keyword `any` to specify that all routes are subject to the filter.

- **host ip-address**
  - Enter the keyword `host` then the IP address to specify a host IP address.

- **destination**
  - Enter the IP address of the network or host to which the packets are sent.

- **ttl**
  - Enter the keyword `ttl` to deny a packet based on the time to live value. The range is from 1 to 255.

- **operator**
  - Enter one of the following logical operand:
    - `eq` (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
    - `neq` (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
    - `gt` (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
    - `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
    - `range` (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

- **count**
  - (OPTIONAL) Enter the keyword `count` to count packets that the filter processes.

- **byte**
  - (OPTIONAL) Enter the keyword `byte` to count bytes that the filter processes.

- **log**
  - (OPTIONAL, E-Series only) Enter the keyword `log` to enter ACL matches in the log.

- **dscp**
  - (OPTIONAL) Enter the keyword `dscp` to match to the IP DCSCP values.

- **order**
  - (OPTIONAL) Enter the keyword `order` to specify the GoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword `order`, the ACLs have the lowest order by default (255).

- **monitor**
  - (OPTIONAL) Enter the keyword `monitor` to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see Flow-based Monitoring in the Port Monitoring section in the Dell EMC Networking OS Configuration Guide.

- **fragments**
  - Enter the keyword `fragments` to use ACLs to control packet fragments.

- **no-drop**
  - Enter the keywords `no-drop` to match only the forwarded packets.

**Defaults**

- Not configured.

**Command Modes**

- `CONFIGURATION-EXTENDED-ACCESS-LIST`
**Command History**

</tr>
</tbody>
</table>

**Usage Information**

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the Quality of Service section in the *Dell EMC Networking OS Configuration Guide*.

When you use the `log` option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets’ details.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see Port Monitoring.

The C-Series and S-Series cannot count both packets and bytes, when you enter the count byte options, only bytes are incremented.
NOTE: When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Related Commands

- deny tcp — assign a filter to deny TCP packets.
- deny udp — assign a filter to deny UDP packets.
- ip access-list extended — create an extended ACL.

**deny icmp**

To drop all or specific internet control message protocol (ICMP) messages, configure a filter.

**Syntax**

deny icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} [ttl operator] [dscp] [count [byte] [order] [fragments] [monitor] [no-drop]

To remove this filter, you have two choices:

- Use the no seq sequence-number command if you know the filter’s sequence number.
- Use the no deny icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} command.

**Parameters**

- **source** Enter the IP address of the network or host from which the packets were sent.
- **mask** Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
- **any** Enter the keyword any to specify that all routes are subject to the filter.
- **host ip-address** Enter the keyword host then the IP address to specify a host IP address.
- **destination** Enter the IP address of the network or host to which the packets are sent.
- **ttl** Enter the keyword ttl to deny a packet based on the time to live value. The range is from 1 to 255.
- **operator** Enter one of the following logical operand:
  - eq(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
  - neq(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
  - gt(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
  - lt (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
  - range(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
- **dscp** Enter this keyword dscp to deny a packet based on the DSCP value. The range is from 0 to 63.
- **count** (OPTIONAL) Enter the keyword count to count packets processed by the filter.
- **byte** (OPTIONAL) Enter the keyword byte to count bytes processed by the filter.
(OPTIONAL) Enter the keyword order to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower order numbers have a higher priority) If you did not use the keyword order, the ACLs have the lowest order by default (255).

fragments

Enter the keyword fragments to use ACLs to control packet fragments.

monitor

(Optional) Enter the keyword monitor to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see Flow-based Monitoring in the Port Monitoring section in the Dell EMC Networking OS Configuration Guide.

no-drop

Enter the keywords no-drop to match only the forwarded packets.

Defaults

Not configured.

CONFIGURATION-EXTENDED-ACCESS-LIST

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.12(0.0) Introduced the ttl parameter. Removed the session-ID option from the monitor parameter.

9.11(2.0P0) Added the type parameter to filter the ICMP packets based on the type and code on the S6000, S6000-ON, S6100-ON, Z9100-ON.

9.11(0.0) Added support for session-ID to the monitor parameter.

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the S6100-ON.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100-ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.8(0.0) Added the no-drop parameter.

9.7(0.0) Introduced on the S6000-ON.

9.2(1.0) Introduced on the Z9500.

9.0.2.0 Introduced on the S6000.

8.3.19.0 Introduced on the S4820T.

8.3.11.1 Introduced on the Z9000.

8.3.7.0 Introduced on the S4810.

8.3.1.0 Added the keyword dscp.

8.2.1.0 Allows ACL control of fragmented packets for IP (Layer 3) ACLs.

8.1.1.0 Introduced on the E-Series.

7.4.1.0 Added support for non-contiguous mask and added the monitor option.
deny tcp

Configure a filter that drops transmission control protocol (TCP) packets meeting the filter criteria.

Syntax

```
deny tcp {source mask | any | host ip-address} [bit] [operator port [port]] 
{destination mask | any | host ip-address} [ttl operator] [dscp] [bit] 
[operator port [port]] [count [bytes] [order] [fragments] [monitor] [no-drop]
```

Parameters

- **source**: Enter the IP address of the network or host from which the packets are sent.
- **mask**: Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
- **any**: Enter the keyword any to specify that all routes are subject to the filter.
- **host ip-address**: Enter the keyword host then the IP address to specify a host IP address.
- **ttl**: Enter the keyword ttl to deny a packet based on the time to live value. The range is from 1 to 255.
- **operator**: Enter one of the following logical operand:
  - `eq` (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
  - `neq` (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
  - `gt` (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
  - `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
  - `range` (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
- **dscp**: Enter this keyword dscp to deny a packet based on the DSCP value. The range is from 0 to 63.
- **bit**: Enter a flag or combination of bits:
  - `ack`: acknowledgement field
• fin: finish (no more data from the user)
• psh: push function
• rst: reset the connection
• syn: synchronize sequence numbers
• urg: urgent field

**Operator**

(OPTIONAL) Enter one of the following logical operator:
- **eq** = equal to
- **neq** = not equal to
- **gt** = greater than
- **lt** = less than
- **range** = inclusive range of ports (you must specify two ports for the **port** command)

**Port port**

Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is from 0 to 65535.

The following list includes some common TCP port numbers:
- 23 = Telnet
- 20 and 21 = FTP
- 25 = SMTP
- 169 = SNMP

**Destination**

Enter the IP address of the network or host to which the packets are sent.

**Mask**

Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

**Count**

(OPTIONAL) Enter the keyword **count** to count packets the filter processes.

**Byte**

(OPTIONAL) Enter the keyword **byte** to count bytes the filter processes.

**Order**

(OPTIONAL) Enter the keyword **order** to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority) If you did not use the keyword **order**, the ACLs have the lowest order by default (255).

**Fragments**

Enter the keyword **fragments** to use ACLs to control packet fragments.

**Monitor**

(OPTIONAL) Enter the keyword **monitor** to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see Flow-based Monitoring in the Port Monitoring section in the Dell EMC Networking OS Configuration Guide.

**No-drop**

Enter the keywords **no-drop** to match only the forwarded packets.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION-EXTENDED-ACCESS-LIST

</tr>
<tr>
<td>6.5.1.0</td>
<td>Expanded to include the optional QoS <code>order</code> priority for the ACL entry.</td>
</tr>
</tbody>
</table>

**Usage Information**

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the Quality of Service section of the *Dell EMC Networking OS Configuration Guide*.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see the Port Monitoring section.

The C-Series and S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.
Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, \texttt{gt}, \texttt{lt}, or range) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

**Example**

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

**Related Commands**

- \texttt{deny} — assign a filter to deny IP traffic.
- \texttt{deny udp} — assign a filter to deny UDP traffic.

---

**deny udp**

To drop user datagram protocol (UDP) packets meeting the filter criteria, configure a filter.

**Syntax**

deny udp \{source mask | any | host ip-address\} \{destination mask | any | host ip-address\} \{operator port [port]\} \{destination mask | any | host ip-address\} \{operator port [port]\} \{count [byte] [order] [fragments] [monitor] [no-drop]\}

To remove this filter, you have two choices:

- Use the \texttt{no seq} sequence-number command if you know the filter’s sequence number.
- Use the \texttt{no deny udp \{source mask | any | host ip-address\} \{destination mask | any | host ip-address\}} command.

**Parameters**

- \texttt{source} Enter the IP address of the network or host from which the packets were sent.
- \texttt{mask} Enter a network mask in \texttt{/prefix} format (\texttt{/x}) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
- \texttt{any} Enter the keyword \texttt{any} to specify that all routes are subject to the filter.
- \texttt{host ip-address} Enter the keyword \texttt{host} then the IP address to specify a host IP address.
- \texttt{ttl} Enter the keyword \texttt{ttl} to deny a packet based on the time to live value. The range is from 1 to 255.
- \texttt{operator} Enter one of the following logical operand:
- **eq** (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
- **neq** (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
- **gt** (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
- **lt** (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
- **range** (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

**dscp**

Enter this keyword `dscp` to deny a packet based on the DSCP value. The range is from 0 to 63.

**operator**

(Optional) Enter one of the following logical operand:

- **eq** = equal to
- **neq** = not equal to
- **gt** = greater than
- **lt** = less than
- **range** = inclusive range of ports (you must specify two ports for the `port` command)

**port**

Enter the application layer port number. Enter two port numbers if using the range logical operand. The range is from 0 to 65535.

**destination**

Enter the IP address of the network or host to which the packets are sent.

**mask**

Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

**count**

(Optional) Enter the keyword `count` to count packets processed by the filter.

**byte**

(Optional) Enter the keyword `byte` to count bytes processed by the filter.

**order**

(Optional) Enter the keyword `order` to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you did not use the keyword `order`, the ACLs have the lowest order by default (255).

**fragments**

Enter the keyword `fragments` to use ACLs to control packet fragments.

**monitor**

(Optional) Enter the keyword `monitor` to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see Flow-based Monitoring in the Port Monitoring section in the Dell EMC Networking OS Configuration Guide.

**no-drop**

Enter the keywords `no-drop` to match only the forwarded packets.

**Defaults**

Not configured.

**Command Modes**

`CONFIGURATION-EXTENDED-ACCESS-LIST`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

The `order` option is relevant in the context of the Policy GoS feature only. For more information, see the Quality of Service section of the *Dell EMC Networking OS Configuration Guide*.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, see the Port Monitoring section.

The C-Series and S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt` or `range`) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.
An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

Related Commands
- `deny` — assign a filter to deny IP traffic.
- `deny tcp` — assign a filter to deny TCP traffic.

**ip access-list extended**

Name (or select) an extended IP access list (IP ACL) based on IP addresses or protocols.

**Syntax**

```
ip access-list extended access-list-name
```

To delete an access list, use the `no ip access-list extended access-list-name` command.

**Parameters**

- `access-list-name` Enter a string up to 140 characters long as the access list name.

**Defaults**

All access lists contain an implicit "deny any"; that is, if no match occurs, the packet is dropped.

### ip access-list extended

To pass IP packets meeting the filter criteria, configure a filter.

**Syntax**

`permit {source mask | any | host ip-address} {destination mask | any | host ip-address} [ttl operator] [count [bytes]] [dscp value] [order] [fragments] [monitor] [no-drop]`

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**

- **source**
  
  Enter the IP address in dotted decimal format of the network from which the packet was sent.

- **mask**
  
  (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

- **any**
  
  Enter the keyword any to specify that all routes are subject to the filter.

- **host ip-address**
  
  Enter the keyword host then the IP address to specify a host IP address or hostname.
destination
Enter the IP address of the network or host to which the packets are sent.

ttl
Enter the keyword ttl to permit a packet based on the time to live value. The range is from 1 to 255.

operator
Enter one of the following logical operand:

• eq(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
• neq(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
• gt(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
• lt(less than) — matches packets that contain a ttl value that is less than the specified ttl value.
• range(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

count
(OPTIONAL) Enter the keyword count to count packets processed by the filter.

bytes
(OPTIONAL) Enter the keyword bytes to count bytes processed by the filter.

dscp
(OPTIONAL) Enter the keyword dscp to match to the IP DCSCP values.

order
(OPTIONAL) Enter the keyword order to specify the QoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword order, the ACLs have the lowest order by default (255).

fragments
Enter the keyword fragments to use ACLs to control packet fragments.

monitor
(OPTIONAL) Enter the keyword monitor to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the Dell EMC Networking OS Configuration Guide.

no-drop
Enter the keywords no-drop to match only the forwarded packets.

Defaults
Not configured.

<td>Added support for the non-contiguous mask and added the monitor option.</td>
</tr>
<tr>
<td>6.5.10</td>
<td>Expanded to include the optional GoS order priority for the ACL entry.</td>
</tr>
</tbody>
</table>

**Usage Information**

The `order` option is relevant in the context of the Policy GoS feature only. For more information, see the “Quality of Service” section of the Dell EMC Networking OS Configuration Guide.

The software cannot count both packets and bytes; when you enter the count byte options, only bytes are incremented.

**Related Commands**

- `ip access-list extended` — create an extended ACL.
- `permit tcp` — assign a permit filter for TCP packets.
- `permit udp` — assign a permit filter for UDP packets.

### permit tcp

To pass TCP packets meeting the filter criteria, configure a filter.

**Syntax**

```
permit tcp {source mask | any | host ip-address} {bit} [operator port [port]]
(destination mask | any | host ip-address) [bit] [ttl operator] [dscp]
[operator port [port]] [count [byte] [order] [fragments] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit tcp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.
Parameters

source
Enter the IP address of the network or host from which the packets were sent.

mask
Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

any
Enter the keyword any to specify that all routes are subject to the filter.

host ip-address
Enter the keyword host then the IP address to specify a host IP address.

bit
Enter a flag or combination of bits:

- ack: acknowledgement field
- fin: finish (no more data from the user)
- psh: push function
- rst: reset the connection
- syn: synchronize sequence numbers
- urg: urgent field

ttl
Enter the keyword ttl to permit a packet based on the time to live value. The range is from 1 to 255.

operator
Enter one of the following logical operand:

- eq(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
- neq(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
- gt(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
- lt(less than) — matches packets that contain a ttl value that is less than the specified ttl value.
- range(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

dscp
Enter the keyword dscp to permit a packet based on the DSCP value. The range is from 0 to 63.

operator
(Optional) Enter one of the following logical operand:

- eq = equal to
- neq = not equal to
- gt = greater than
- lt = less than
- range = inclusive range of ports (you must specify two ports for the port parameter)

port port
Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.

The following list includes some common TCP port numbers:

- 23 = Telnet
- 20 and 21 = FTP
- 25 = SMTP
- 169 = SNMP
destination
Enter the IP address of the network or host to which the packets are sent.

mask
Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in
A.B.C.D format, may be either contiguous or non-contiguous.

count
(OPTIONAL) Enter the keyword count to count packets the filter processes.

byte
(OPTIONAL) Enter the keyword byte to count bytes the filter processes.

order
(OPTIONAL) Enter the keyword order to specify the QoS priority for the ACL entry.
The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-
order numbers have a higher priority). If you do not use the keyword order, the ACLs
have the lowest order by default (255).

fragments
Enter the keyword fragments to use ACLs to control packet fragments.

monitor
(OPTIONAL) Enter the keyword monitor to describe the traffic that you want to
monitor and the ACL in which you are creating the rule is applied to the monitored
interface. For more information, see “Flow-based Monitoring” in the Port Monitoring
section of the Dell EMC Networking OS Configuration Guide.

no-drop
Enter the keywords no-drop to match only the forwarded packets.

Defaults
Not configured.

Command Modes
CONFIGURATION-EXTENDED-ACCESS-LIST

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC

Version Description
9.12(0.0) Introduced the ttl parameter. Removed the session-ID option from the monitor
parameter.

9.11(2.0P0) Added the established parameter on the S6000, S6000-ON, S6100-ON, Z9100–
ON.

9.11(0.0) Added support for session-ID to the monitor parameter.

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the S6100-ON.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100–ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.8(0.0) Added the no-drop parameter.

9.7(0.0) Introduced on the S6000–ON.

9.2(1.0) Introduced on the Z9500.

9.0.2.0 Introduced on the S6000.

8.3.19.0 Introduced on the S4820T.

8.3.11.1 Introduced on the Z9000.
### Version Description
- 8.3.7.0 Introduced on the S4810.
- 8.3.1.0 Added the keyword dscp.
- 8.2.1.0 Allows ACL control of fragmented packets for IP (Layer 3) ACLs.
- 8.1.1.0 Introduced on the E-Series.
- 7.6.1.0 Introduced on the S-Series.
- 7.5.1.0 Introduced on the C-Series.
- 7.4.1.0 Added support for non-contiguous mask and added the monitor option. Deprecated the keyword established.
- 6.5.10 Expanded to include the optional QoS order priority for the ACL entry.

#### Usage Information
The order option is relevant in the context of the Policy GoS feature only. For more information, see the “Quality of Service” section of the Dell EMC Networking OS Configuration Guide.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

The S-Series cannot count both packets and bytes; when you enter the count byte options, only bytes increment.

The monitor option is relevant in the context of flow-based monitoring only. For more information, see the Port Monitoring section.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, gt, lt, or range) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

#### Example
An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

```markdown
DellEMC# Data            Mask         From To   #Covered
1 0000111110100000 1111111111000000 4000 4031 32
2 0000111111100000 1111111111000000 4032 4095 64
3 0001000000000000 1111111111000000 4096 6143 2048
4 0001100000000000 1111111111000000 6144 7167 1024
5 0001110000000000 1111111111000000 7168 7679 512
6 0001111000000000 1111111111000000 7680 7935 256
7 0001111100000000 1111111111000000 7936 7999 64
8 0001111101000000 1111111111111111 8000 8000 1
Total Ports: 4001
```

An ACL rule with a TCP port lt 1023 uses only one entry in the CAM.

```markdown
DellEMC# Data            Mask         From To   #Covered
1 0000000000000000 1111111111000000 0 1023 1024
Total Ports: 1024
```

#### Related Commands
- `ip access-list extended` — create an extended ACL.
- `permit` — assign a permit filter for IP packets.
- `permit udp` — assign a permit filter for UDP packets.
permit udp

To pass UDP packets meeting the filter criteria, configure a filter.

**Syntax**

```
permit udp {source mask | any | host ip-address} [operator port [port]]
{destination mask | any | host ip-address} [ttl operator] [dscp] [operator port [port]] [count [byte] [order] [fragments] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**

- **source**
  - Enter the IP address of the network or host from which the packets were sent.

- **mask**
  - Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.

- **any**
  - Enter the keyword any to specify that all routes are subject to the filter.

- **host ip-address**
  - Enter the keyword host and then enter the IP address to specify a host IP address.

- **ttl**
  - Enter the keyword ttl to permit a packet based on the time to live value. The range is from 1 to 255.

- **operator**
  - Enter one of the following logical operand:
    - `eq` (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
    - `neq` (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
    - `gt` (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
    - `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
    - `range` (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

- **dscp**
  - Enter the keyword dscp to deny a packet based on the DSCP value. The range is from 0 to 63.

- **operator**
  - (OPTIONAL) Enter one of the following logical operand:
    - `eq` = equal to
    - `neq` = not equal to
    - `gt` = greater than
    - `lt` = less than
    - `range` = inclusive range of ports (you must specify two ports for the port parameter)

- **port port**
  - Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is 0 to 65535.

- **destination**
  - Enter the IP address of the network or host to which the packets are sent.
count (OPTIONAL) Enter the keyword count to count packets processed by the filter.

byte (OPTIONAL) Enter the keyword byte to count bytes processed by the filter.

order (OPTIONAL) Enter the keyword order to specify the GoS priority for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword order, the ACLs have the lowest order by default (255).

fragments Enter the keyword fragments to use ACLs to control packet fragments.

monitor (OPTIONAL) Enter the keyword monitor to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the Dell EMC Networking OS Configuration Guide.

no-drop Enter the keywords no-drop to match only the forwarded packets.

Defaults Not configured.

Command Modes CONFIGURATION-EXTENDED-ACCESS-LIST

</table>
Version | Description
--- | ---
7.4.1.0 | Added support for non-contiguous mask and added the `monitor` option.
6.5.10 | Expanded to include the optional QoS `order` priority for the ACL entry.

**Usage Information**

The `order` option is relevant in the context of the Policy QoS feature only. For more information, see the “Quality of Service” section of the *Dell EMC Networking OS Configuration Guide*.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

The S-Series cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment.

The `monitor` option is relevant in the context of flow-based monitoring only. For more information, refer to Port Monitoring.

Most ACL rules require one entry in the CAM. However, rules with TCP and UDP port operators (for example, `gt`, `lt`, or range) may require more than one entry. The range of ports is configured in the CAM based on bit mask boundaries; the space required depends on exactly what ports are included in the range.

**Example**

An ACL rule with a TCP port range of 4000–8000 uses eight entries in the CAM.

</tbody>
</table>

Total Ports: 1024

**Related Commands**

- `ip access-list extended` — create an extended ACL.
- `permit` — assign a permit filter for IP packets.
- `permit tcp` — assign a permit filter for TCP packets.

**resequence access-list**

Re-assign sequence numbers to entries of an existing access-list.

**Syntax**

```
resequence access-list {ipv4 | mac} {access-list-name StartingSeqNum Step-to-Increment}
```
seq

Assign a sequence number to a deny or permit filter in an extended IP access list while creating the filter.

**Syntax**

```
seq sequence-number {deny | permit} {ip-protocol-number | icmp | ip | tcp | udp} {source mask | any | host ip-address} {destination mask | any | host ip-address}
```

### Parameters

- **ipv4 | mac**: Enter the keyword *ipv4* or *mac* to identify the access list type to resequence.
- **access-list-name**: Enter the name of a configured IP access list, up to 140 characters.
- **StartingSeqNum**: Enter the starting sequence number to resequence. The range is from 0 to 4294967290.
- **Step-to-Increment**: Enter the step to increment the sequence number. The range is from 1 to 4294967290.

### Defaults

None

### Command Modes

### Usage Information

When all sequence numbers are exhausted, this feature permits re-assigning a new sequence number to entries of an existing access-list.
address) [operator [portnumber ]] [ttl operator] [count [byte] | log] [dscp value] [ecn value] [fragments] [monitor [session-ID]] [no-drop] [order]

Parameters

sequence-number Enter a number from 0 to 4294967290.
deny Enter the keyword deny to configure a filter to drop packets meeting this condition.
permit Enter the keyword permit to configure a filter to forward packets meeting this criteria.
ip-protocol-number Enter a number from 0 to 255 to filter based on the protocol identified in the IP protocol header.
icmp Enter the keyword icmp to configure an ICMP access list filter.
ip Enter the keyword ip to configure a generic IP access list. The keyword ip specifies that the access list permits all IP protocols.
tcp Enter the keyword tcp to configure a TCP access list filter.
udp Enter the keyword udp to configure a UDP access list filter.
source Enter an IP address in dotted decimal format of the network from which the packet was received.
mask (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
any Enter the keyword any to specify that all routes are subject to the filter.
host ip-address Enter the keyword host and then enter the IP address to specify a host IP address or hostname.
operator (OPTIONAL) Enter one of the following logical operands:
  • eq = equal to
  • neq = not equal to
  • gt = greater than
  • lt = less than
  • range = inclusive range of ports (you must specify two ports for the port parameter.)
portnumber (OPTIONAL) Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.
The following list includes some common TCP port numbers:
  • 23 = Telnet
  • 20 and 21 = FTP-DATA and FTP
  • 25 = SMTP
  • 169 = SNMP
destination Enter the IP address of the network or host to which the packets are sent.
ttl Enter the keyword ttl to permit or deny a packet based on the time to live value. The range is from 1 to 255.
operator Enter one of the following logical operand:
  • eq(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
- **neq**(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
- **gt**(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
- **lt**(less than) — matches packets that contain a ttl value that is less than the specified ttl value.
- **range**(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

**count** (OPTIONAL) Enter the keyword count to count the packets.

**bytes** (OPTIONAL) Enter the keyword bytes to count the bytes.

**log** (OPTIONAL) Enter the keyword log to enter ACL matches in the log.

**dscp** (OPTIONAL) Enter the keyword dscp to match to the IP DSCP values. The range is from 0 to 63.

**ecn** (OPTIONAL) Enter the keyword ecn to match to the ECN values. The range is from 0 to 3.

**order** (OPTIONAL) Enter the keyword order to specify the QoS order for the ACL entry. The range is from 0 to 254 (where 0 is the highest priority and 254 is the lowest; lower-order numbers have a higher priority). If you do not use the keyword order, the ACLs have the lowest order by default (255).

**monitor** (OPTIONAL) Enter the keyword monitor then the session-ID to describe the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. The session-ID range is from 0 to 65535.

**NOTE:** For more information, see “Flow-based Monitoring” in the Port Monitoring section of the Dell EMC Networking OS Configuration Guide.

**fragments** Enter the keyword fragments to use ACLs to control packet fragments.

**no-drop** Enter the keywords no-drop to match only the forwarded packets.

**Defaults** Not configured

**Command Modes** CONFIGURATION-EXTENDED-ACCESS-LIST

**Command History** This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>6.5.10</td>
<td>Expanded to include the optional QoS order priority for the ACL entry.</td>
</tr>
</tbody>
</table>

Usage Information

The monitor option is relevant in the context of flow-based monitoring only. For more information, refer to Port Monitoring.

The order option is relevant in the context of the Policy QoS feature only. The following applies:

- The seq sequence-number command is applicable only in an ACL group.
- The order option works across ACL groups that are applied on an interface via the QoS policy framework.
- The order option takes precedence over seq sequence-number.
- If you do not configure sequence-number, the rules with the same order value are ordered according to their configuration order.
- If you configure sequence-number, the sequence-number is used as a tie breaker for rules with the same order.

When you use the log option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets’ details.

If you configure the sequence-number, the sequence-number is used as a tie breaker for rules with the same order.

**NOTE:** When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Related Commands

- **deny** — configure a filter to drop packets.
- **permit** — configure a filter to forward packets.
Common MAC Access List Commands

The following commands are available within both MAC ACL modes (Standard and Extended) and do not have mode-specific options. These commands allow you to clear, display, and assign MAC ACL configurations.

The platform supports both Ingress and Egress MAC ACLs.

The MAC ACL can be applied on Physical, Port-channel and VLAN interfaces. As per the specified rules in the ACL, the traffic on the interface/ VLAN members or Port-channel members will be permitted or denied.

**clear counters mac access-group**

Clear counters for all or a specific MAC ACL.

**Syntax**

```
clear counters mac access-group [mac-list-name]
```

**Parameters**

- `mac-list-name` (OPTIONAL) Enter the name of a configured MAC access list.

**Command Modes**

- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

mac access-group

Apply a MAC ACL to traffic entering or exiting an interface. You can apply a MAC ACL on a physical, port-channel, or VLAN interface.

Syntax

```
mac access-group access-list-name {in [vlan vlan-range] | out}
```

To delete a MAC access-group, use the `no mac access-group mac-list-name` command.

Parameters

- **access-list-name**: Enter the name of a configured MAC access list, up to 140 characters.
  
  **NOTE:** This option is available only with the keyword `in` option.

- **vlan vlan-range**: (OPTIONAL) Enter the keyword `vlan` and then enter a range of VLANs. The range is from 1 to 4094 (you can use IDs 1 to 4094).
  
  **NOTE:** This option is available only with the keyword `in` option.

- **optimized**: Enter the keyword `optimized` to enable ACL optimization.

- **in**: Enter the keyword `in` to configure the ACL to filter incoming traffic.

- **out**: Enter the keyword `out` to configure the ACL to filter outgoing traffic.

**NOTE:**

1. If the MAC ACL is applied on VLAN, none of the VLAN members should have an access list applied for that VLAN.

2. If the MAC ACL is applied on a Physical or Port Channel interface, the VLAN in which this port is associated should not have an access list applied.

3. If the MAC ACL is applied on a VLAN, then that VLAN should not belong to VLAN ACL group.

4. If the MAC ACL is applied on a VLAN ACL group, then none of the VLANs in that group should have an access list applied on it.

Defaults

```
none
```

Command Modes

```
INTERFACE
```

### Version Description

- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **8.1.1.0** Introduced on the E-Series.
- **7.8.1.0** Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **6.1.1.0** Introduced on the E-Series.

### Usage Information

You can assign one ingress ACL and one egress ACL (standard or extended) to an interface.

### Related Commands

- `mac access-list standard` — configure a standard MAC ACL.
- `mac access-list extended` — configure an extended MAC ACL.

### show mac access-lists

Display all of the Layer 2 ACLs configured in the system, whether or not they are applied to an interface, and the count of matches/mismatches against each ACL entry displayed.

#### Syntax

```plaintext
show mac access-lists [access-list-name] [interface interface] [in | out]
```

#### Parameters

- **access-list-name** Enter the name of a configured MAC ACL, up to 140 characters.
- **interface interface** Enter the keyword `interface` then the one of the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
  - For a port-channel interface, enter the keywords `port-channel` then the port-channel ID.
- **in | out** Identify whether ACL is applied on ingress or egress side.

#### Command Modes

- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**show mac accounting access-list**

Display MAC access list configurations and counters (if configured).

**Syntax**

```plaintext
show mac accounting access-list access-list-name interface interface in | out
```

**Parameters**

- **access-list-name**  
Enter the name of a configured MAC ACL, up to 140 characters.
- **interface interface**  
Enter the keyword `interface` then the one of the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- **in | out**  
Identify whether ACL is applied on ingress or egress side.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

</tr>
<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series</td>
</tr>
<tr>
<td>6.1.1.0</td>
<td>Introduced on the E-Series</td>
</tr>
</tbody>
</table>

**Usage Information**

The ACL hit counters increment the counters for each matching rule, not just the first matching rule.

**Example**

```bash
DellEMC# show mac accounting access-list TestMac interface tengigabitethernet 1/8 in
Ingress Standard mac access-list TestMac on TenGigabitEthernet 1/89
Total cam count 2
  seq 5 permit aa:aa:aa:00:00 00:00:00:ff:ff count (0 packets)
  seq 10 deny any count (20072594 packets)
DellEMC#
```

**Standard MAC ACL Commands**

When you create an access control list without any rule and then apply it to an interface, the ACL behavior reflects implicit permit. These commands configure standard MAC ACLs and support both Ingress and Egress MAC ACLs.

**NOTE:** For more information, also refer to the [Commands Common to all ACL Types](#) and [Common MAC Access List Commands](#) sections.

---

**Access Control Lists (ACL)** 253
deny

To drop packets with a the MAC address specified, configure a filter.

Syntax

    deny {any | mac-source-address [mac-source-address-mask]} [count [byte]] [log] [monitor]

To remove this filter, you have two choices:

- Use the no seq sequence-number command if you know the filter’s sequence number.
- Use the no deny {any | mac-source-address mac-source-address-mask} command.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>any</td>
<td>Enter the keyword any to specify that all routes are subject to the filter.</td>
</tr>
<tr>
<td>mac-source-address-mask</td>
<td>(OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of 00:00:00:00:00:00 is applied (in other words, the filter allows only MAC addresses that match).</td>
</tr>
<tr>
<td>count</td>
<td>(OPTIONAL) Enter the keyword count to count packets processed by the filter.</td>
</tr>
<tr>
<td>byte</td>
<td>(OPTIONAL) Enter the keyword byte to count bytes processed by the filter.</td>
</tr>
<tr>
<td>log</td>
<td>(OPTIONAL, E-Series only) Enter the keyword log to log the packets.</td>
</tr>
<tr>
<td>monitor</td>
<td>(OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see the “Flow-based Monitoring” in the Port Monitoring section in the Dell EMC Networking OS Configuration Guide.</td>
</tr>

</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
</tbody>
</table>
Version Description
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.1.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
7.4.1.0 Added the monitor option.

Usage Information
When you use the log option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets’ details.

NOTE: When you configure ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Related Commands
- **permit** — configures a MAC address filter to pass packets.
- **seq** — configures a MAC address filter with a specified sequence number.

### mac access-list standard

To configure a standard MAC ACL, name a new or existing MAC access control list (MAC ACL) and enter MAC ACCESS LIST mode. Also refer to the Commands Common to all ACL Types section and the Common MAC Access List Commands section.

**Syntax**

```
mac access-list standard mac-list-name
```

To delete a MAC access list, use the `no mac access-list standard mac-list-name` command.

**Parameters**

- **mac-list-name**
  
  Enter a text string as the name of the standard MAC access list (140 character maximum).

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** **Description**
9.10(0.1)Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)Introduced on the S3148.
9.10(0.0)Introduced on the S6100-ON.
9.8(2.0)Introduced on the S3100 series.
9.8(0.0P5)Introduced on the S4048-ON.
9.8(0.0P2)Introduced on the S3048-ON.
9.7(0.0)Introduced on the S6000–ON.
9.2(1.0)Introduced on the Z9500.
**Version** | **Description**
---|---
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.1.1.0 | Introduced on the E-Series.
7.8.1.0 | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
6.1.1.0 | Introduced on the E-Series.

**Usage Information**
Dell EMC Networking OS supports one ingress and one egress MAC ACL per interface.

The number of entries allowed per ACL is hardware-dependent. For detailed specifications about entries allowed per ACL, see your line card documentation.

**NOTE:** Ingress ACLs are supported on C-Series and S-Series platforms only.

**Example**
```bash
DellEMC(conf)# mac-access-list access-list standard TestMAC
DellEMC(config-std-macl)# permit 00:00:00:00:00:00 00:00:00:00:ff:ff count
DellEMC(config-std-macl)# deny any count
DellEMC(config-std-macl)#
```

**permit**
To forward packets from a specific source MAC address, configure a filter.

**Syntax**
```
permit {any | mac-source-address [mac-source-address-mask]} [count [byte]] | [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To remove this filter, you have two choices:
- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit {any | mac-source-address mac-source-address-mask}` command.

**Parameters**
- **any**
  - Enter the keyword `any` to forward all packets received with a MAC address.
- **mac-source-address**
- **mac-source-address-mask**
  - (OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of `00:00:00:00:00:00` is applied (in other words, the filter allows only MAC addresses that match).
- **count**
  - (OPTIONAL) Enter the keyword `count` to count packets processed by the filter.
- **byte**
  - (OPTIONAL) Enter the keyword `byte` to count bytes processed by the filter.
- **log**
  - (OPTIONAL) Enter the keyword `log` to include ACL messages in the log.
threshold-in msgs count
(OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.

interval minutes
(OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.

monitor
(OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section of the Dell EMC Networking OS Configuration Guide.

Defaults
Not configured.

9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.1.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
6.1.1.0 Introduced on the E-Series.

Usage Information
When you use the log option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets’ details.

NOTE: When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

Related Commands
• deny — configure a MAC ACL filter to drop packets.
To a deny or filter in a MAC access list while creating the filter, assign a sequence number.

Syntax

```
seq sequence-number deny {any | mac-source-address [mac-source-address-mask]} [count [byte]] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {any | mac-source-address mac-source-address-mask}` command.

Parameters

- **any**: Enter the keyword `any` to specify that all routes are subject to the filter.
- **mac-source-address**: Enter a MAC address in nn:nn:nn:nn:nn:nn format.
- **mac-source-address-mask**: (OPTIONAL) Specify which bits in the MAC address must match. If no mask is specified, a mask of 00:00:00:00:00:00 is applied (in other words, the filter allows only MAC addresses that match).
- **count**: (OPTIONAL) Enter the keyword `count` to count packets processed by the filter.
- **byte**: (OPTIONAL) Enter the keyword `byte` to count bytes processed by the filter.
- **log**: (OPTIONAL) Enter the keyword `log` to include ACL messages in the log.
- **threshold-in-msgs count**: (OPTIONAL) Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.
- **interval minutes**: (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.
- **monitor**: (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface. For more information, see “Flow-based Monitoring” in the Port Monitoring section in the Dell EMC Networking OS Configuration Guide.

**Usage Information**

When you use the `log` option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets’ details.

**NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

**Related Commands**

- `deny` — configure a filter to drop packets.
- `permit` — configure a filter to forward packets.

---

### Extended MAC ACL Commands

When an access-list is created without any rule and then applied to an interface, ACL behavior reflects implicit permit. The following commands configure Extended MAC ACLs.

The platform supports both Ingress and Egress MAC ACLs.

**NOTE:** For more information, also refer to the [Commands Common to all ACL Types](#) and [Common MAC Access List Commands](#) sections.

#### deny

To drop packets that match the filter criteria, configure a filter.

**Syntax**

```
deny {any | host mac-address | mac-source-address mac-source-address-mask} {any |
host mac-address | mac-destination-address mac-destination-address-mask}
[ethertype-operator] [count [byte]] [log [interval minutes] [threshold-in msgs
[count]] [monitor]
```
To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {any | host mac-address | mac-source-address mac-source-address-mask} {any | host mac-address | mac-destination-address mac-destination-address-mask}` command.

**Parameters**

<table>
<thead>
<tr>

</tbody>
</table>

**Usage Information**

When you use the log option, the CP processor logs detail the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets’ details.

**NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

**Related Commands**

- **permit** — configure a MAC address filter to pass packets.
- **seq** — configure a MAC address filter with a specified sequence number.

---

**mac access-list extended**

Name a new or existing extended MAC access control list (extended MAC ACL).

**Syntax**

```
mac access-list extended access-list-name [cpu-qos]
```

To delete a MAC access list, use the `no mac access-list extended access-list-name` command.
Parameters

- **access-list-name** Enter a text string as the MAC access list name, up to 140 characters.
- **cpu-qos** Enter the keywords `cpu-qos` to assign this ACL to control plane traffic only (CoPP).

Defaults

None

</tbody>
</table>

Usage Information

The number of entries allowed per ACL is hardware-dependent. For detailed specifications about entries allowed per ACL, refer to your line card documentation.

Prior to 7.8.1.0, names are up to 16 characters long.

Example

```bash
DellEMC(conf)# mac-access-list access-list extended TestMATExt
DellEMC(config-ext-macl)# remark 5 IPv4
DellEMC(config-ext-macl)# seq 10 permit any any ev2 eq 800 count bytes
DellEMC(config-ext-macl)# remark 15 ARP
DellEMC(config-ext-macl)# seq 20 permit any any ev2 eq 806 count bytes
DellEMC(config-ext-macl)# remark 25 IPv6
DellEMC(config-ext-macl)# seq 30 permit any any ev2 eq 86dd count bytes
DellEMC(config-ext-macl)# seq 40 permit any any count bytes
DellEMC(config-ext-macl)# exit
DellEMC(conf)# do show mac accounting access-list snickers interface tengig
```
Extended mac access-list snickers on TenGigabitEthernet 1/17
seq 10 permit any any ev2 eq 800 count bytes (559851886 packets 191402152148 bytes)
seq 20 permit any any ev2 eq 806 count bytes (74481486 packets 5031686754 bytes)
seq 30 permit any any ev2 eq 86dd count bytes (7751519 packets 797843521 bytes)

Related Commands
- `mac access-list standard` — configure a standard MAC access list.
- `show mac accounting access-list` — display MAC access list configurations and counters (if configured).

**permit**

To pass packets matching the criteria specified, configure a filter.

**Syntax**

```
permit {any | host mac-address | mac-source-address mac-source-address-mask}
{any | host mac-address | mac-destination-address mac-destination-address-mask}
[ethertype operator] [count [byte]] | [log] [monitor]
```

To remove this filter, you have two choices:
- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit {any | host mac-address | mac-source-address mac-source-address-mask}
{any | host mac-address | mac-destination-address mac-destination-address-mask}` command.

**Parameters**

- **any**
  - Enter the keyword `any` to forward all packets.

- **host**
  - Enter the keyword `host` then a MAC address to forward packets with that host address.

- **mac-source-address**

- **mac-source-address-mask**
  - (OPTIONAL) Specify which bits in the MAC address must match.

  The MAC ACL supports an inverse mask; therefore, a mask of ff:ff:ff:ff:ff:ff allows entries that do not match and a mask of 00:00:00:00:00:00 only allows entries that match exactly.

- **mac-destination-address**
  - Enter the destination MAC address and mask in nn:nn:nn:nn:nn:nn format.

- **mac-destination-address-mask**
  - Specify which bits in the MAC address must be matched.

  The MAC ACL supports an inverse mask; therefore, a mask of ff:ff:ff:ff:ff:ff allows entries that do not match and a mask of 00:00:00:00:00:00 only allows entries that match exactly.

- **ethertype operator**
  - (OPTIONAL) To filter based on protocol type, enter one of the following Ethertypes:
    - `ev2` - is the Ethernet II frame format
    - `llc` - is the IEEE 802.3 frame format
    - `snap` - is the IEEE 802.3 SNAP frame format

- **count**
  - (OPTIONAL) Enter the keyword `count` to count packets the filter processes.
byte (OPTIONAL) Enter the keyword byte to count bytes the filter processes.
log (OPTIONAL, E-Series only) Enter the keyword log to log the packets.
monitor (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**NOTE:** For more information, see Flow-based Monitoring in the "Port Monitoring" section of the Dell EMC Networking OS Configuration Guide.

**Defaults**
Not configured.

**Command Modes**
CONFIGURATION-MAC ACCESS LIST-EXTENDED

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**
When you use the log option, the CP processor logs details about the packets that match. Depending on how many packets match the log entry and at what rate, the CP may become busy as it has to log these packets’ details.

**NOTE:** When you configure the ACL logging and byte counters simultaneously, byte counters may display an incorrect value. Configure packet counters with logging instead.

**Related Commands**
- deny — configure a MAC ACL filter to drop packets.
• seq — configure a MAC ACL filter with a specified sequence number.

**IP Prefix List Commands**

When you create an access-list without any rule and then apply it to an interface, the ACL behavior reflects implicit permit. To configure or enable IP prefix lists, use these commands.

**clear ip prefix-list**

Reset the number of times traffic meets the conditions ("hit" counters) of the configured prefix lists.

**Syntax**

`clear ip prefix-list [prefix-name]`

**Parameters**

prefix-name  
(Optional) Enter the name of the configured prefix list to clear only counters for that prefix list, up to 140 characters long.

**Defaults**

Clears "hit" counters for all prefix lists unless a prefix list is specified.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**deny**

To drop packets meeting the criteria specified, configure a filter.

**Syntax**

```plaintext
deny ip-prefix [ge min-prefix-length] [le max-prefix-length]
```

To delete a drop filter, use the `no deny ip-prefix` command.

**Parameters**

- **ip-prefix**: Specify an IP prefix in the network/length format. For example, 35.0.0.0/8 means match the first 8 bits of address 35.0.0.0.
- **ge min-prefix-length**: (OPTIONAL) Enter the keyword `ge` and then enter the minimum prefix length, which is a number from zero (0) to 32.
- **le max-prefix-length**: (OPTIONAL) Enter the keyword `le` and then enter the maximum prefix length, which is a number from zero (0) to 32.

**Defaults**

Not configured.

**Command Modes**

PREFIX-LIST

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### ip prefix-list

Enter the PREFIX-LIST mode and configure a prefix list.

**Syntax**

```
ip prefix-list prefix-name
```

To delete a prefix list, use the `no ip prefix-list prefix-name` command.

**Parameters**

- **prefix-name**
  
  Enter a string up to 16 characters long as the name of the prefix list, up to 140 characters long.

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

</tr>
</tbody>
</table>

**Usage Information**

Sequence numbers for this filter are automatically assigned starting at sequence number 5.

If you do not use the `ge` or `le` options, only packets with an exact match to the prefix are filtered.
### seq

To a deny or permit filter in a prefix list while configuring the filter, assign a sequence number.

**Syntax**

```plaintext
seq sequence-number {deny | permit} {any} | [ip-prefix /nn {ge min-prefix-length} {le max-prefix-length}] | [bitmask number]
```

To delete a specific filter, use the `no seq sequence-number {deny | permit} {any} | [ip-prefix {ge min-prefix-length} {le max-prefix-length}] | [bitmask number]`.

**Parameters**

- `sequence-number` Enter a number. The range is from 1 to 4294967294.
- `deny` Enter the keyword `deny` to configure a filter to drop packets meeting this condition.
- `permit` Enter the keyword `permit` to configure a filter to forward packets meeting this condition.
- `any` (OPTIONAL) Enter the keyword `any` to match any packets.
- `ip-prefix /nn` (OPTIONAL) Specify an IP prefix in the network/length format. For example, 35.0.0.0/8 means match the first 8 bits of address 35.0.0.0.
- `ge min-prefix-length` (OPTIONAL) Enter the keyword `ge` and then enter the minimum prefix length, which is a number from zero (0) to 32.
- `le max-prefix-length` (OPTIONAL) Enter the keyword `le` and then enter the maximum prefix length, which is a number from zero (0) to 32.
- `bitmask number` Enter the keyword `bitmask` then enter a bit mask number in dotted decimal format.

**Defaults**

Not configured.

**Command Modes**

PREFIX-LIST

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Example**

```
DellEMC# show ip prefix-list detail
Ip Prefix-list with the last deletion/insertion: PL_OSPF_to_RIP
ip prefix-list PL_OSPF_to_RIP:
count: 3, range entries: 1, sequences: 5 - 25
  seq 5 permit 1.1.1.0/24 (hit count: 0)
  seq 10 deny 2.1.0.0/16 ge 23 (hit count: 0)
  seq 25 permit 192.0.0.0 bitmask 192.0.0.0 (hit count: 800)
DellEMC#
```
Version | Description
------- | -------
8.3.7.0 | Introduced on the S4810.
8.1.1.0 | Introduced on the E-Series.
7.8.1.0 | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
6.1.1.0 | Introduced on the E-Series.

Example

```
DellEMC# show ip prefix-list summary
Ip Prefix-list with the last deletion/insertion: PL_OSPF_to_RIP
ip prefix-list PL_OSPF_to_RIP:
count: 3, range entries: 1, sequences: 5 - 25
DellEMC#
```

**Route Map Commands**

When you create an access-list without any rule and then applied to an interface, the ACL behavior reflects implicit permit. To configure route maps and their redistribution criteria, use the following commands.

**continue**

To a route-map entry with a higher sequence number, configure a route-map.

**Syntax**

```
continue [sequence-number]
```

**Parameters**

- `sequence-number` (OPTIONAL) Enter the route map sequence number. The range is from 1 to 65535.

**Defaults**

Not configured.

**Command Modes**

ROUTE-MAP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
------- | -------
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
### Version

- **8.1.1.0**: Introduced on the E-Series.
- **7.6.1.0**: Introduced on the S-Series.
- **7.5.1.0**: Introduced on the C-Series.
- **7.4.1.0**:Introduced on the E-Series.

### Usage Information

The `continue` feature allows movement from one route-map entry to a specific route-map entry (the sequence number). If you do not specify the sequence number, the `continue` feature simply moves to the next sequence number (also known as an implied continue). If a match clause exists, the `continue` feature executes only after a successful match occurs. If there are no successful matches, the `continue` feature is ignored.

#### Match clause with Continue clause

The `continue` feature can exist without a match clause. A continue clause without a match clause executes and jumps to the specified route-map entry.

With a match clause and a continue clause, the match clause executes first and the continue clause next in a specified route map entry. The `continue` clause launches only after a successful match. The behavior is:

- A successful match with a continue clause, the route map executes the set clauses and then goes to the specified route map entry upon execution of the `continue` clause.
- If the next route map entry contains a continue clause, the route map executes the `continue` clause if a successful match occurs.
- If the next route map entry does not contain a continue clause, the route map evaluates normally. If a match does not occur, the route map does not continue and falls through to the next sequence number, if one exists.

#### Set Clause with Continue Clause

If the route-map entry contains sets with the `continue` clause, set actions are performed first then the `continue` clause jumps to the specified route map entry.

- If a set action occurs in the first route map entry and then the same set action occurs with a different value in a subsequent route map entry, the last set of actions overrides the previous set of actions with the same `set` command.
- If `set community` additive and `set as-path` prepend are configure, the communities and AS numbers are prepended.

### Related Commands

- `set community` — specify a COMMUNITY attribute.
- `set as-path` — configure a filter to modify the AS path.

### description

Add a description to this route map.

**Syntax**

```
description {description}
```

To remove the description, use the `no description {description}` command.

**Parameters**

- `description` Enter a description to identify the route map (80 characters maximum).

**Defaults**

None

- route-map — enable a route map.

---

**match as-path**

To match routes that have a certain AS number in their BGP path, configure a filter.

**Syntax**

```
match as-path as-path-name
```

To delete a match AS path filter, use the no match as-path as-path-name command.

**Parameters**

- `as-path-name`: Enter the name of an established AS-PATH ACL, up to 140 characters.

**Defaults**

Not configured.

**Command Modes**

Match community

To match routes that have a certain COMMUNITY attribute in their BGP path, configure a filter.

Syntax

```
match community community-list-name [exact]
```

To delete a community match filter, use the `no match community` command.

Parameters

- `community-list-name` Enter the name of a configured community list.
- `exact` (OPTIONAL) Enter the keywords `exact` to process only those routes with this community list name.

Defaults
Not configured.

Command Modes

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
### match interface

To match routes whose next hop is on the interface specified, configure a filter.

**Syntax**

```
match interface interface
```

To remove a match, use the **no match interface interface** command.

**Parameters**

- **interface**
  
  Enter the following keywords and the interface information:
  
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

- ROUTE-MAP

**Command History**

match ip route-source

To match based on the routes advertised by routes specified in IP access lists or IP prefix lists, configure a filter.

Syntax

```
match ip route-source {prefix-list prefix-list-name}
```

To delete a match, use the `no match ip route-source {prefix-list prefix-list-name}` command.
Parameters

prefix-list prefix-list-name

Enter the keywords prefix-list and then enter the name of configured prefix list, up to 140 characters.

Defaults
Not configured.

match metric

To match on a specified value, configure a filter.

Syntax

```
match metric metric-value
```

To delete a value, use the `no match metric [metric-value]` command.

Parameters

- `metric-value` Enter a value to match. The range is from zero (0) to 4294967295.

Defaults

Not configured.

**match origin**

To match routes based on the value found in the BGP path ORIGIN attribute, configure a filter.

**Syntax**

```
match origin {egp | igp | incomplete}
```

To disable matching filter, use the `no match origin {igp | egp | incomplete}` command.

**Parameters**

- **egp**
  - Enter the keyword `egp` to match routes originating outside the AS.

- **igp**
  - Enter the keyword `igp` to match routes originating within the same AS.

- **incomplete**
  - Enter the keyword `incomplete` to match routes with incomplete routing information.

</table>
To delete a match, use the `no match route-type {local | internal | external [type-1 | type-2] | level-1 | level-2}` command.

**Parameters**

- `external [type-1 | type-2]`
  - Enter the keyword `external` then either `type-1` or `type-2` to match only on OSPF Type 1 routes or OSPF Type 2 routes.

- `internal`
  - Enter the keyword `internal` to match only on routes generated within OSPF areas.

- `level-1`
  - Enter the keyword `level-1` to match IS-IS Level 1 routes.

- `level-2`
  - Enter the keyword `level-2` to match IS-IS Level 2 routes.

- `local`
  - Enter the keyword `local` to match only on routes generated within the switch.

**Defaults**

Not configured.

7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
pre-6.1.1.0 | Introduced on the E-Series.

**Related Commands**

- `match interface` — redistribute routes that match the next-hop interface.
- `match ip address` — redistribute routes that match an IP address.
- `match ip next-hop` — redistribute routes that match the next-hop IP address.
- `match ip route-source` — redistribute routes that match routes advertised by other routers.
- `match metric` — redistribute routes that match a specific metric.
match tag

To redistribute only routes that match a specified tag value, configure a filter.

Syntax

```
match tag tag-value
```

To remove a match, use the `no match tag` command.

Parameters

- **tag-value**: Enter a value as the tag on which to match. The range is from zero (0) to 4294967295.

Defaults

Not configured.

- `match metric` — redistribute routes that match a specific metric.
match route-type — redistribute routes that match a route type.

**route-map**

Enable a route map statement and configure its action and sequence number. This command also places you in ROUTE-MAP mode.

**Syntax**

```
route-map map-name [permit | deny] [sequence-number]
```

To delete a route map, use the `no route-map map-name [permit | deny] [sequence-number]` command.

**Parameters**

- `map-name` Enter a text string of up to 140 characters to name the route map for easy identification.
- `permit` (OPTIONAL) Enter the keyword `permit` to set the route map default as permit. If you do not specify a keyword, the default is `permit`.
- `deny` (OPTIONAL) Enter the keyword `deny` to set the route map default as deny.
- `sequence-number` (OPTIONAL) Enter a number to identify the route map for editing and sequencing with other route maps. You are prompted for a sequence number if there are multiple instances of the route map. The range is from 1 to 65535.

**Defaults**

- Not configured.
- If you do not define a keyword (permit or deny) for the route map, the `permit` action is the default.

set as-path

To modify the AS path for border gateway protocol (BGP) routes, configure a filter.

Syntax

```
set as-path prepend as-number [... as-number]
```

To remove an AS-Path setting, use the `no set as-path {prepend as-number | tag}` command.

Parameters

- `prepend as-number` Enter the keyword prepend and then enter up to eight AS numbers to be inserted into the BGP path information. The range is from 1 to 65535.

Defaults

Not configured.

### Usage Information

You can prepend up to eight AS numbers to a BGP route.

This command influences best path selection in BGP by inserting a tag or AS number into the AS_PATH attribute.

### Related Commands

- `match as-path` — redistribute routes that match an AS-PATH attribute.

---

### set automatic-tag

To automatically compute the tag value of the route, configure a filter.

**Syntax**

```
set automatic-tag
```

To return to the default, enter `no set automatic-tag`.

**Defaults**

Not configured.

**Command Modes**

Access Control Lists (ACL)  287
**set comm-list delete**

To remove the specified community list from the BGP route’s COMMUNITY attribute, configure a filter.

**Syntax**

```
set comm-list community-list-name delete
```

To insert the community list into the COMMUNITY attribute, use the `no set comm-list community-list-name delete` command.

**Parameters**

- `community-list-name` Enter the name of an established Community list, up to 140 characters.

**Defaults**

Not configured.

<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

The community list used in the `set comm-list delete` command must be configured so that each filter contains only one community. For example, the filter deny 100:12 is acceptable, but the filter deny 120:13 140:33 results in an error.

If the `set comm-list delete` command and the `set community` command are configured in the same route map sequence, the deletion command (`set comm-list delete`) is processed before the insertion command (`set community`).

**Related Commands**

- `match community` — redistribute routes that match the COMMUNITY attribute.
- `set community` — specify a COMMUNITY attribute.

## set community

Allows you to assign a BGP COMMUNITY attribute.

**Syntax**

```
set community {community-number | local-as | no-advertise | no-export | none} [additive]
```

To delete a BGP COMMUNITY attribute assignment, use the `no set community {community-number | local-as | no-advertise | no-export | none}` command.

**Parameters**

- `community-number` Enter the community number in AA:NN format where AA is the AS number (2 bytes) and NN is a value specific to that autonomous system.

- `local-AS` Enter the keywords `local-AS` to drop all routes with the COMMUNITY attribute of NO_EXPORT_SUBCONFED.

  All routes with the NO_EXPORT_SUBCONFED (0xFFFFFF03) community attribute must not be advertised to external BGP peers.

- `no-advertise` Enter the keywords `no-advertise` to drop all routes containing the well-known community attribute of NO_ADVERTISE.

  All routes with the NO_ADVERTISE (0xFFFFFF02) community attribute must not be advertised to other BGP peers.

- `no-export` Enter the keywords `no-export` to drop all routes containing the well-known community attribute of NO_EXPORT.
All routes with the NO_EXPORT (0xFFFFFF01) community attribute must not be advertised outside a BGP confederation boundary.

**none**

Enter the keyword `none` to remove the community attribute from routes meeting the route map criteria.

**additive**

(Optional) Enter the keyword `additive` to add the communities to already existing communities.

**Defaults**

Not configured.

**Command Modes**

- `show ip bgp community` — display BGP community groups.

---

**set level**

To specify the IS-IS level or OSPF area to which matched routes are redistributed, configure a filter.

**Syntax**

```
set level {backbone | level-1 | level-1-2 | level-2 | stub-area}
```
To remove a set level condition, use the `no set level {backbone | level-1 | level-1-2 | level-2 | stub-area}` command.

<table>

- `set metric-type` — specify the metric type assigned to redistributed routes.
- `set tag` — specify the tag assigned to redistributed routes.
set local-preference

To set the BGP LOCAL_PREF attribute for routers within the local autonomous system, configure a filter.

Syntax

```
set local-preference value
```

To delete a BGP LOCAL_PREF attribute, use the `no set local-preference` command.

Parameters

- **value**: Enter a number as the LOCAL_PREF attribute value. The range is from 0 to 4294967295.

Defaults

Not configured.

Usage Information

The `set local-preference` command changes the LOCAL_PREF attribute for routes meeting the route map criteria. To change the LOCAL_PREF for all routes, use the `bgp default local-preference` command.

Related Commands

- `bgp default local-preference` — change the default LOCAL_PREF attribute for all routes.
To assign a new metric to redistributed routes, configure a filter.

**Syntax**

```
set metric [+ | -] metric-value
```

To delete a setting, enter `no set metric`.

**Parameters**

- `+`  
  (OPTIONAL) Enter `+` to add a metric-value to the redistributed routes.
- `-`  
  (OPTIONAL) Enter `-` to subtract a metric-value from the redistributed routes.
- `metric-value`  
  Enter a number as the new metric value. The range is from zero (0) to 4294967295.

9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3(19.0) | Introduced on the S4820T.
8.3(11.1) | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.1.1.0 | Introduced on the E-Series.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
pre-6.1.1.0 | Introduced on the E-Series.

**Related Commands**

- `set automatic-tag` — compute the tag value of the route.
- `set level` — specify the OSPF area for route redistribution.
- `set metric-type` — specify the route type assigned to redistributed routes.
• *set tag* — specify the tag assigned to redistributed routes.

## set metric-type

To assign a new route type for routes redistributed to OSPF, configure a filter.

**Syntax**

```
set metric-type {internal | external | type-1 | type-2}
```

To delete a setting, use the `no set metric-type` command.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>internal</td>
<td>Enter the keyword <code>internal</code> to assign the Interior Gateway Protocol metric of the next hop as the route’s BGP MULTI_EXIT_DES (MED) value.</td>
</tr>
<tr>
<td>external</td>
<td>Enter the keyword <code>external</code> to assign the IS-IS external metric.</td>
</tr>
<tr>
<td>type-1</td>
<td>Enter the keyword <code>type-1</code> to assign the OSPF Type 1 metric.</td>
</tr>
<tr>
<td>type-2</td>
<td>Enter the keyword <code>type-2</code> to assign the OSPF Type 2 metric.</td>
</tr>
</tbody>
</table>

**Defaults**

Not configured.

Related Commands

- `set automatic-tag` — compute the tag value of the route.
- `set level` — specify the OSPF area for route redistribution.
- `set metric` — specify the metric value assigned to redistributed routes.
- `set tag` — specify the tag assigned to redistributed routes.

**set next-hop**

To specify an IP address as the next hop, configure a filter.

**Syntax**

```
set next-hop ip-address
```

To delete the setting, use the `no set next-hop ip-address` command.

**Parameters**

- `ip-address` Specify an IP address in dotted decimal format.

**Defaults**

Not configured.

</table>
Usage Information

If you configure the `set next-hop` command, its configuration takes precedence over the `neighbor next-hop-self` command in the ROUTER BGP mode.

If you configure the `set next-hop` command with the interface’s IP address (either Loopback or physical), the software declares the route unreachable.

Related Commands

- `match ip next-hop` — redistribute routes that match the next-hop IP address.

**set origin**

To manipulate the BGP ORIGIN attribute, configure a filter.

**Syntax**

```plaintext
set origin {igp | egp | incomplete}
```

To delete an ORIGIN attribute setting, use the `no set origin` command.

**Parameters**

- `egp` Enter the keyword `egp` to set routes originating from outside the local AS.
- `igp` Enter the keyword `igp` to set routes originating within the same AS.
- `incomplete` Enter the keyword `incomplete` to set routes with incomplete routing information.

**Defaults**

Not configured.

**Command Modes**

ROUTE-MAP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**set tag**

To specify a tag for redistributed routes, configure a filter.

**Syntax**
```
set tag tag-value
```

To delete a setting, use the `no set tag` command.

**Parameters**
- `tag-value` Enter a number as the tag. The range is from zero (0) to 4294967295.

**Defaults**
Not configured.

**Related Commands**
- `set automatic-tag` — compute the tag value of the route.
- `set level` — specify the OSPF area for route redistribution.
set metric — specify the metric value assigned to redistributed routes.
set metric-type — specify the route type assigned to redistributed routes.

**set weight**

To add a non-RFC compliant attribute to the BGP route to assist with route selection, configure a filter.

**Syntax**

```
set weight weight
```

To delete a weight specification, use the no set weight weight command.

**Parameters**

- **weight**

  Enter a number as the weight used by the route meeting the route map specification. The range is from 0 to 65535. The default is router-originated = 32768 and all other routes = 0.

  When there are multiple routes to the same destination, the routes with a higher weight are preferred.

**Defaults**

router-originated = 32768; all other routes = 0

### Example

```
DellEMC(conf-nprefixl)# show config
!
ip prefix-list PL_OSPF_to_RIP
  seq 5 permit 1.1.1.0/24
  seq 10 deny 2.1.0.0/16 ge 23
  seq 25 permit 192.0.0.0 bitmask 192.0.0.0
DellEMC(conf-nprefixl)#
```
show route-map

Display the current route map configurations.

Syntax

    show route-map [map-name]

Parameters

    map-name  (OPTIONAL) Enter the name of a configured route map, up to 140 characters.

Command Modes

    - EXEC
    - EXEC Privilege

Command History

Example

```
DellEMC# show route-map
route-map firpo, permit, sequence 10
  Match clauses:
  Set clauses:
    tag 34
DellEMC#
```
**AS-Path Commands**

The following commands configure AS-Path ACLs.

### ip as-path access-list

Enter AS-PATH ACL mode and configure an access control list based on the BGP AS_PATH attribute.

**Syntax**

```
ip as-path access-list as-path-name
```

**Parameters**

- `as-path-name` Enter the access-list name, up to 140 characters.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.2(1.0) | Introduced on the Z9500.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.1.1.0 | Introduced on the E-Series.
7.8.1.0 | Increased the name string to accept up to 140 characters. Prior to 7.8.1.0, names are up to 16 characters long.
pre-Version 6.1.1.0 | Introduced on the E-Series.

**Usage Information**

To apply the AS-PATH ACL to BGP routes, use the `match as-path` or `neighbor filter-list` commands.

**Example**

```
DellEMC(conf)# ip as-path access-list TestPath
DellEMC(config-as-path)#
```

**Related Commands**

- `match as-path` — match on routes contain a specific AS-PATH.
**show ip as-path-access-lists**

Display the all AS-PATH access lists configured on the E-Series.

**Syntax**

```
show ip as-path-access-lists
```

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

ip as-path access-list acc
   permit 750
   deny 10
DellEMC#
```

**IP Community List Commands**

IP community list commands are supported on the Dell EMC Networking OS.

**ip community-list**

Enter COMMUNITY-LIST mode and create an IP community-list for BGP.

**Syntax**

```
ip community-list comm-list-name
```

To delete a community-list, use the no ip community-list comm-list-name command.

**Parameters**

- **comm-list-name** Enter a text string as the name of the community-list, up to 140 characters.

**Command Modes**

- CONFIGURATION
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

UDF ACL Commands

The following commands are available within each UDF ACL mode.

**deny ip**

Disassociate the UDF in IP access-list.

**Syntax**

```
deny ip {source mask | any | host ip-address} {destination mask | any | host ip-address} udf-pkt-format name udf-qualifier-value name
```

To remove this filter, use the `no seq sequence-number` command.

**Parameters**

- **source**
  - Enter the IP address of the network or host from which the packets were sent.
- **mask**
  - Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or noncontiguous.
- **any**
  - Enter the keyword `any` to specify that all routes are subject to the filter.
- **host ip-address**
  - Enter the keyword `host` then the IP address to specify a host IP address.
- **destination**
  - Enter the IP address of the network or host to which the packets are sent.
- **udf-pkt-format name**
  - Enter the keywords `udf-pkt-format` then the UDF ACL profile name.
- **udf-qualifier-value name**
  - Enter the keywords `udf-qualifier-value` then the UDF qualifier value profile name.

**Command Modes**

- CONFIGURATION-STANDARD-ACCESS-LIST mode
- CONFIGURATION-EXTENDED-ACCESS-LIST mode

**Example**

```
Dell(config-ext-nacl)#deny ip any any udf-pkt-format ipinip udf-qualifier-value ipnip_val1
```

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command.

**Example**

```
304 Access Control Lists (ACL)
```
**feature udf-acl**

Enable udf-acl feature on a switch.

**Syntax**

```
feature udf-acl
```

To disable the udf-acl feature, use the `no feature udf-acl` command.

**Defaults**

Disabled

**Command Modes**

CONFIGURATION

**Example**

```
Dell(conf)#feature udf-acl
```

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command.

**Version**  
9.8(0.0)  
Introduced on the S6000, Z9500, and S4048-ON.

---

**key**

Configure UDF data context for parsing the different header location offset and required bytes.

**Syntax**

```
key description udf-id id packetbase PacketBase offset bytes length bytes
```

To return to the default settings, use the `no key description udf-id id packetbase PacketBase offset bytes length bytes` command.

**Parameters**

- **description**
  
  Enter the key name for reference, up to 64 characters.

- **udf-id id**
  
  Enter the keywords `udf-id` then the ID used in the actual UDF ACL group. The range is from 1 to 12.

- **packetbase PacketBase**
  
  Enter the keyword `packetbase` then the option to refer to start of packet offset. The options are:
  - `innerL3Header` — Offset is at inner L3 header.
  - `innerL4Header` — Offset is at inner L4 header.
  - `outerL3Header` — Offset is at outer L3 header.
  - `outerL4Header` — Offset is at outer L4 header.
offset bytes

Enter the keyword offset then the offset value. The range is from 0 to 126, in multiples of 2.

length bytes

Enter the keyword length then the length value. The range is from 2 to 24, in multiples of 2 bytes.

Defaults

None

Command Modes

CONFIGURATION-UDF TCAM

Example

Dell(conf-udf-tcam)#key innerL3header udf-id 6 packetbase innerL3Header offset 0 length 2

Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell Networking OS Command Line Reference Guide.

The following is a list of the Dell Networking OS version history for this command.

Version Description

9.8(0.0) Introduced on the S6000, Z9500, and S4048-ON.

Related Commands

udf-tcam — creates a context for UDF TCAM.

show config — displays the current UDF TCAM profile configuration.

match

Configure the packet type to match for which the UDF offset bytes have to be parsed.

Syntax

match l2ethertype ipv4 ipprotocol value vlantag tagStatus

To return to the default settings, use the no match l2ethertype ipv4 ipprotocol value vlantag tagStatus command.

Parameters

l2ethertype

Enter the keyword l2ethertype to match the L2 Ethertype.

ipv4

Enter the keyword ipv4 to match the IPv4 packet.

ipprotocol value

Enter the keyword ipprotocol then the option to match the IPv4 protocol. The options are:

- IP protocol number. The range is from 0 to 255.
- icmp — Internet control message protocol.
- tcp — Transmission control protocol.
- udp — User datagram protocol.

vlantag tagStatus

Enter the keyword vlantag then the option to match the VLAN packet. The options are:

- any — Any VLAN packet.
- double-tagged — Double tagged VLAN packet.
- single-tagged — Single tagged VLAN packet.
- untagged — Untagged VLAN packet.

Defaults
None

Command Modes
CONFIGURATION-UDF TCAM

Example
Dell(conf-udf-tcam)#match l2ethertype ipv4 ipprotocol 4 vlantag any

Related Commands
udf-tcam — creates a context for UDF TCAM.
show config — displays the current UDF TCAM profile configuration.

permit ip

Associate the UDF in IP access-list.

Syntax
permit ip {source mask | any | host ip-address} {destination mask | any | host ip-address} udf-pkt-format name udf-qualifier-value name

To remove this filter, use the no seq sequence-number command.

Parameters
- source
  - Enter the IP address of the network or host from which the packets were sent.
- mask
  - Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or noncontiguous.
- any
  - Enter the keyword any to specify that all routes are subject to the filter.
- host ip-address
  - Enter the keyword host then the IP address to specify a host IP address.
- destination
  - Enter the IP address of the network or host to which the packets are sent.
- udf-pkt-format name
  - Enter the keywords udf-pkt-format then the UDF ACL profile name.
- udf-qualifier-value name
  - Enter the keywords udf-qualifier-value then the UDF qualifier value profile name.

Command Modes
CONFIGURATION-STANDARD-ACCESS-LIST mode

Command Modes
CONFIGURATION-EXTENDED-ACCESS-LIST mode

Example
Dell(config-ext-nacl)#permit ip any any udf-pkt-format ipinip udf-qualifier-value ipnip_val1

udf-tcam ipnip seq 1
key innerL3header udf-id 6 packetbase innerL3Header offset 0 length 2
match 12ethertype ipv4 ipprotocol 4 vlantag any
!
udf-qualifier-value ipnip_val1
Dell(conf-udf-tcam)#
```

udf-id

Assign value for each configured UDF ID in the given UDF TCAM profile.

Syntax

```
udf-id id value mask
```

To return to the default settings, use the no udf-id 1-12 value mask command.

Parameters

- **id**
  - Enter the UDF ID range. The range is from 1 to 12.
- **value**
  - Enter the value for the UDF in Hex, up to 24 bytes.
- **mask**
  - Enter the mask for the UDF in Hex, up to 24 bytes.

Defaults

None
Command Modes

CONFIGURATION-UDF-Qualifier-Value Profile

Example

Dell(conf-udf-tcam-qual-val)# udf-id 1 aa ff

**udf-tcam**

Create a context for UDF TCAM.

**Syntax**

```
udf-tcam name seq number
```

To return to the default settings, use the `no udf-tcam name seq number` command.

**Parameters**

- `name`: Enter the UDF ACL profile name, up to 64 characters.
- `number`: Enter the keyword `seq` then the sequence number of the Udf-Tcam table. The range is from 1 to 512.

**Defaults**

None

**Command Modes**

**deny (for Standard IP ACLs)**

To drop packets with a certain IP address, configure a filter.

**Syntax**

```
deny {source | any | host {ip-address}}[count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {source [mask] | any | host ip-address} command.

**Parameters**

- `log` (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.
- `threshold-in msgs count` (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated, with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.
- `interval minutes` (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
monitor  (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults  
By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Command Modes  
CONFIGURATION-STANDARD-ACCESS-LIST

Command History

<tr>
<td>9.4(0.0)</td>
<td>Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.</td>
</tr>
</tbody>
</table>

Usage Information  
When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

Related Commands  
-  ip access-list standard — configure a standard ACL.
-  permit — configure a permit filter.
deny (for Extended IP ACLs)

Configure a filter that drops IP packets meeting the filter criteria.

Syntax

```plaintext
deny {ip | ip-protocol-number} {source mask | any | host ip-address} 
{destination mask | any | host ip-address} [ttl operator] [count [byte]] [dscp value] [order] [monitor] [fragments] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To remove this filter, you have two choices:

- Use the no seq sequence-number command if you know the filter’s sequence number.
- Use the no deny {ip | ip-protocol-number} {source mask | any | host ip-address} 
  {destination mask | any | host ip-address} command.

Parameters

- **ttl**
  - Enter the keyword `ttl` to deny a packet based on the time to live value. The range is from 1 to 255.

- **operator**
  - Enter one of the following logical operand:
    - `eq` (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
    - `neq` (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
    - `gt` (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
    - `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
    - `range` (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

- **log**
  - (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.

- **threshold-in-msgs count**
  - (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.

- **interval minutes**
  - (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.

- **monitor**
  - (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

- By default, 10 ACL logs are generated if you do not specify the threshold explicitly.
- The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

### Related Commands

- `deny tcp` — assign a filter to deny TCP packets.
- `deny udp` — assign a filter to deny UDP packets.
- `ip access-list extended` — create an extended ACL.
seq (for Standard IPv4 ACLs)

Assign a sequence number to a deny or permit filter in an IP access list while creating the filter.

Syntax

```
seq sequence-number {deny | permit} {source [mask] | any | host ip-address}
[count [bytes]] [dscp value] [order] [fragments] [log [interval minutes]
[threshold-in-msgs [count]] [monitor]
```

To delete a filter, use the no seq sequence-number command.

Parameters

- **log** (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- **threshold-in msgs count** (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- **interval minutes** (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- **monitor** (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists.

This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**
- deny — configure a filter to drop packets.
- permit — configure a filter to forward packets.

**deny tcp (for Extended IP ACLs)**

Configure a filter that drops transmission control protocol (TCP) packets meeting the filter criteria.

**Syntax**

```plaintext
deny tcp {source mask | any | host ip-address} [bit] [operator port [port]]
    {destination mask | any | host ip-address} [ttl operator] [dscp] [bit]
    [operator port [port]] [count [byte]] [order] [fragments] [log [interval
    minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:
- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny tcp {source mask | any | host ip-address} {destination mask
    | any | host ip-address}` command.

**Parameters**

- **ttl**
  - Enter the keyword `ttl` to deny a packet based on the time to live value. The range is from 1 to 255.

- **operator**
  - Enter one of the following logical operand:
    - `eq(equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.`
    - `neq(not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.`
    - `gt(greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.`
    - `lt (less than) — matches packets that contain a ttl value that is less than the specified ttl value.`
    - `range(inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.`
log (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.

threshold-in msgs count (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the seq, permit, or deny commands. The threshold range is from 1 to 100.

interval minutes (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

monitor (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults
By default, 10 ACL logs are generated if you do not specify the threshold explicitly.
The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Version Description
9.12(0.0) Introduced the ttl parameter.
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.4(0.0) Added the support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0) Added the support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information
When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.
You can activate flow-based monitoring for a monitoring session by entering the flow-based `enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

```
Related Commands
  • deny — assign a filter to deny IP traffic.
  • deny udp — assign a filter to deny UDP traffic.
```

deny udp (for Extended IP ACLs)

To drop user datagram protocol (UDP) packets meeting the filter criteria, configure a filter.

```
Syntax
  deny udp {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator port [port]] [ttl operator] [dscp] [operator port [port]] [count [byte]] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]]]

To remove this filter, you have two choices:
  • Use the no seq sequence-number command if you know the filter's sequence number.
  • Use the no deny udp {source mask | any | host ip-address} {destination mask | any | host ip-address} command.
```

```
Parameters
  ttl
    Enter the keyword `ttl` to deny a packet based on the time to live value. The range is from 1 to 255.

  operator
    Enter one of the following logical operand:
    • `eq` (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
    • `neq` (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
    • `gt` (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
    • `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
    • `range` (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

  log
    (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.

  threshold-in msgs count
    (OPTIONAL) Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. with the `seq`, `permit` or `deny` commands. The threshold range is from 1 to 100.

  interval minutes
    (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
```
By default, 10 ACL logs are generated if you do not specify the threshold explicitly. The default frequency at which ACL logs are generated is five minutes.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

Related Commands

- `deny` — assign a filter to deny IP traffic.
- `deny tcp` — assign a filter to deny TCP traffic.

deny arp (for Extended MAC ACLs)

Configure an egress filter that drops ARP packets on egress ACL supported line cards. (For more information, refer to your line card documentation).

**Syntax**

deny arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]] [monitor]

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number} command.

**Parameters**

- `log` (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.
- `threshold-in-msgs` (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.

318  Access Control Lists (ACL)
**interval minutes**  
(Optional) Enter the keyword *interval* followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.

**monitor**  
(Optional) Enter the keyword *monitor* when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**  
By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Usage Information**  
When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).
deny icmp (for Extended IP ACLs)

To drop all or specific internet control message protocol (ICMP) messages, configure a filter.

NOTE: Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

Syntax

```
deny icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} [ttl operator] [dscp] [message-type] [count [byte]] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny icmp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

Parameters

- `ttl` Enter the keyword `ttl` to deny a packet based on the time to live value. The range is from 1 to 255.

- `operator` Enter one of the following logical operand:
  - `eq` (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
  - `neq` (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
  - `gt` (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
  - `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
  - `range` (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

- `log` (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.

- `threshold-in msgs count` (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.

- `interval minutes` (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.

- `monitor` (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Command Modes

- CONFIGURATION-EXTENDED-ACCESS-LIST
deny ether-type (for Extended MAC ACLs)

Configure an egress filter that drops specified types of Ethernet packets on egress ACL supported line cards. (For more information, refer to your line card documentation).

Syntax

```
deny ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any}` command.

Parameters

- `log` (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.
- `threshold-in-msgs count` (OPTIONAL) Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation
of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.

**interval minutes** (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.

**monitor** (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).
deny (for Standard MAC ACLs)

To drop packets with a the MAC address specified, configure a filter.

Syntax

```
deny {any | mac-source-address [mac-source-address-mask]} [count [byte]] [log [interval minutes] [threshold-in-msgs [count]]][monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {any | mac-source-address mac-source-address-mask}` command.

Parameters

- **log** (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- **threshold-in msgs count** (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated, with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- **interval minutes** (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The threshold range is from 1 to 10 minutes.
- **monitor** (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly. The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

9.4(0.0) |Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

Related Commands

- deny — assign a IP ACL filter to deny IP packets.
- ip access-list standard — create a standard ACL.

permit arp (for Extended MAC ACLs)

Configure a filter that forwards ARP packets meeting this criteria. This command is supported only on 12-port GE line cards with SFP optics; refer to your line card documentation for specifications.

Syntax

```
permit arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number} [count [byte]] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To remove this filter, you have two choices:

- Use the no seq sequence-number command if you know the filter’s sequence number.
- Use the {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number} command.

Parameters

- **log** (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- **threshold-in-msgs count** (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- **interval minutes** (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
monitor (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Command Modes

CONFIGURATION-EXTENDED-ACCESS-LIST

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000-ON.

9.4(0.0) Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.

9.3(0.0) Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

permit ether-type (for Extended MAC ACLs)

Configure a filter that allows traffic with specified types of Ethernet packets. This command is supported only on 12-port GE line cards with SFP optics. For specifications, refer to your line card documentation.

Syntax

```
permit ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```
To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any}` command.

**Parameters**

- `log` (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.
- `threshold-in-msgs` (OPTIONAL) Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. The threshold range is from 1 to 100.
- `interval minutes` (OPTIONAL) Enter the `interval` keyword followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- `monitor` (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.4(0.0) | Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0) | Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both
the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**permit icmp (for Extended IP ACLs)**

Configure a filter to allow all or specific ICMP messages.

**Syntax**

```
permit icmp {source mask | any | host ip-address} {destination mask | any | host ip-address} [ttl operator] [dscp] [count [byte]] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]]] [monitor]```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit icmp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

**Parameters**

- **ttl**
  - Enter the keyword `ttl` to permit a packet based on the time to live value. The range is from 1 to 255.

- **operator**
  - Enter one of the following logical operand:
    - `eq` (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
    - `neq` (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
    - `gt` (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
    - `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
    - `range` (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

- **log**
  - (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.

- **threshold-in msgs count**
  - (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.

- **interval minutes**
  - (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

- **monitor**
  - (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.
The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Usage Information**
When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**permit udp (for Extended IP ACLs)**

To pass UDP packets meeting the filter criteria, configure a filter.

**Syntax**

```
permit udp {source mask | any | host ip-address} [operator port [port]]
{destination mask | any | host ip-address} [ttl operator] [dscp] [operator port]
```

**Example**

```
CONFIGURATION mode
permit udp any any source 192.0.2.0 0.0.0.255
```

**Description**

Configure a filter to allow packets with a specified source or destination UDP port.

**Related Commands**

- deny udp — assign a filter to deny UDP packets.
- seq udp — assign a filter with specific sequence number.
To remove this filter, you have two choices:

- Use the `no seq` sequence-number command if you know the filter’s sequence number.
- Use the `no permit udp {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.

### Parameters

- **ttl**: Enter the keyword `ttl` to permit a packet based on the time to live value. The range is from 1 to 255.
- **operator**: Enter one of the following logical operand:
  - `eq` (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
  - `neq` (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
  - `gt` (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
  - `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
  - `range` (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
- **log** *(OPTIONAL)*: Enter the keyword `log` to enable the triggering of ACL log messages.
- **threshold-in-msgs** *(OPTIONAL)*: Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.
- **interval minutes** *(OPTIONAL)*: Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- **monitor** *(OPTIONAL)*: Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

### Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

- `ip access-list extended` — create an extended ACL.
- `permit` — assign a permit filter for IP packets.
- `permit tcp` — assign a permit filter for TCP packets.

### permit (for Extended IP ACLs)

To pass IP packets meeting the filter criteria, configure a filter.

**Syntax**

```
permit {source mask | any | host ip-address} {destination mask | any | host ip-address} [count [bytes]] [ttl operator] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no deny {source mask | any | host ip-address} {destination mask | any | host ip-address}` command.
Parameters

**ttl**

Enter the keyword `ttl` to permit a packet based on the time to live value. The range is from 1 to 255.

**operator**

Enter one of the following logical operand:

- `eq` (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
- `neq` (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.

Related Commands

- `ip access-list extended` — create an extended ACL.
- `permit tcp` — assign a permit filter for TCP packets.
- `permit udp` — assign a permit filter for UDP packets.

permit (for Standard MAC ACLs)

To forward packets from a specific source MAC address, configure a filter.

Syntax

```
permit {any | mac-source-address [mac-source-address-mask]} [count [byte]] | [log [interval minutes] [threshold-in-msgs [count]]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
- Use the `no permit {any | mac-source-address mac-source-address-mask}` command.

Parameters

- `log` (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.
- `threshold-in msgs` (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.

<td>9.3(0.0)</td>
<td>Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.</td>
</tr>
</tbody>
</table>
Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

Related Commands

- deny — configure a filter to drop packets.
- permit — configure a filter to forward packets.

permit tcp (for Extended IP ACLs)

To pass TCP packets meeting the filter criteria, configure a filter.

Syntax

```
permit tcp {source mask | any | host ip-address} [bit] [operator port [port]]
(destination mask | any | host ip-address) [bit] [ttl operator] [dscp]
[operator port [port]] [count [byte]] [order] [fragments] [log [interval
minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the no seq sequence-number command if you know the filter’s sequence number.
- Use the no permit tcp {source mask | any | host ip-address} {destination mask | any | host ip-address} command.

Parameters

ttl

Enter the keyword ttl to permit a packet based on the time to live value. The range is from 1 to 255.

operator

Enter one of the following logical operand:

- eq (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
- neq (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
- gt (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
- lt (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
- range (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
log

(Optional) Enter the keyword log to enable the triggering of ACL log messages.

threshold-in msgs count

(Optional) Enter the threshold-in-msgs keyword followed by a value to indicate
the maximum number of ACL logs that can be generated, exceeding which the generation
of ACL logs is terminated with the seq, permit, or deny commands. The threshold
range is from 1 to 100.

interval minutes

(Optional) Enter the keyword interval followed by the time period in minutes at
which ACL logs must be generated. The interval range is from 1 to 10 minutes.

monitor

(Optional) Enter the keyword monitor when the rule is describing the traffic that you
want to monitor and the ACL in which you are creating the rule is applied to the
monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which
ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet
count for that new interval commences from zero. If ACL logging was stopped previously because the configured
threshold is exceeded, it is re-enabled for this new interval.

If ACL logging was stopped because the configured threshold is exceeded, it is re-enabled after the logging interval
period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You
can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs
that are associated with egress interfaces.
You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**
- `ip access-list extended` — create an extended ACL.
- `permit` — assign a permit filter for IP packets.
- `permit udp` — assign a permit filter for UDP packets.

## seq arp (for Extended MAC ACLs)

Configure an egress filter with a sequence number that filters ARP packets meeting this criteria. This command is supported only on 12-port GE line cards with SFP optics. For specifications, refer to your line card documentation.

**NOTE:** Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

**Syntax**
```
seq sequence-number {deny | permit} arp {destination-mac-address mac-address-mask | any} vlan vlan-id {ip-address | any | opcode code-number} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```
To remove this filter, use the no seq sequence-number command.

**Parameters**
- `log` (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- `threshold-in-msgs count` (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated, with the seq, permit, or deny commands. You can enter a threshold in the range of 1-100.
- `interval minutes` (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.
- `monitor` (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**
By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**seq ether-type (for Extended MAC ACLs)**

Configure an egress filter with a specific sequence number that filters traffic with specified types of Ethernet packets. This command is supported only on 12-port GE line cards with SFP optics. For specifications, refer to your line card documentation.

**NOTE:** Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer the topic of this command discussed earlier in this guide.

**Syntax**

```plaintext
seq sequence-number {deny | permit} ether-type protocol-type-number {destination-mac-address mac-address-mask | any} vlan vlan-id {source-mac-address mac-address-mask | any} [count [byte]] [order] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

**Parameters**

- `log` (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- `threshold-in-msgs` (OPTIONAL) Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. With the `seq`, `permit`, or `deny` commands. You can enter a threshold in the range of 1-100.
### interval minutes

(OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.

### monitor

(OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

#### Defaults

This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).
seq (for IP ACLs)

Assign a sequence number to a deny or permit filter in an extended IP access list while creating the filter.

Syntax

```
seq sequence-number {deny | permit} {ip-protocol-number | icmp | ip | tcp | udp} {source mask | any | host ip-address} {destination mask | any | host ip-address} [operator port [port]] [ttl operator] [count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

Parameters

- **ttl**
  
Enter the keyword `ttl` to permit or deny a packet based on the time to live value. The range is from 1 to 255.

- **operator**
  
Enter one of the following logical operand:
  
  - `eq` (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
  - `neq` (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
  - `gt` (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
  - `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
  - `range` (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

- **log**
  
  (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.

- **threshold-in-msgs**
  
  (OPTIONAL) Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.

- **interval minutes**
  
  (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

- **monitor**
  
  (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

- By default, 10 ACL logs are generated if you do not specify the threshold explicitly.
- The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

- **deny** — configure a filter to drop packets.
- **permit** — configure a filter to forward packets.

**seq (for IPv6 ACLs)**

Assign a sequence number to a deny or permit the filter in an IPv6 access list while creating the filter.

**Syntax**

```
seq sequence-number {deny | permit} {ipv6-protocol-number | icmp | ip | tcp | udp} {source address mask | any | host ipv6-address} (destination address | any | host ipv6-address) [operator port [portnumber]] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To delete a filter, use the no seq sequence-number command.

**Parameters**

- **sequence-number** Enter a number from 0 to 4294967290.
deny Enter the keyword deny to configure a filter to drop packets meeting this condition.

permit Enter the keyword permit to configure a filter to forward packets meeting this criteria.

ipv6-protocol-number Enter a number to filter based on the protocol identified in the IPv6 protocol header.

icmp Enter the keyword icmp to configure an ICMP access list filter.

ip Enter the keyword ip to configure a generic IP access list. The keyword ip specifies that the access list permits all IP protocols.

tcp Enter the keyword tcp to configure a TCP access list filter.

udp Enter the keyword udp to configure a UDP access list filter.

source Enter an IP address in dotted decimal format of the network from which the packet was received.

mask (OPTIONAL) Enter a network mask in /prefix format (/x) .

any Enter the keyword any to specify that all routes are subject to the filter.

host ipv6-address Enter the keyword host and then enter the IPv6 address to specify a host IP address or hostname.

operator (OPTIONAL) Enter one of the following logical operands:

  • eq = equal to
  • neq = not equal to
  • gt = greater than
  • lt = less than
  • range = inclusive range of ports (you must specify two ports for the port parameter.)

portnumber (OPTIONAL) Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.

The following list includes some common TCP port numbers:

  • 23 = Telnet
  • 20 and 21 = FTP-DATA and FTP
  • 25 = SMTP
  • 169 = SNMP

destination Enter the IP address of the network or host to which the packets are sent.

count (OPTIONAL) Enter the keyword count to count the packets.

bytes (OPTIONAL) Enter the keyword bytes to count the bytes.

log (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.

threshold-in msgs count (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminate with the seq, permit, or deny commands. The threshold range is from 1 to 100.

interval minutes (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
(OPTIONAL) Enter the keyword **monitor** when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

**Usage Information**

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists.

This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**Related Commands**

- `permit` — configure a filter to forward packets.
permit udp (for IPv6 ACLs)

Configure a filter to pass UDP packets meeting the filter criteria.

**Syntax**

```
permit udp {source address mask | any | host ipv6-address} [operator port [port]] {destination address | any | host ipv6-address} [operator port [port]]
[ttl operator] [count [byte]] [log [interval minutes] [threshold-in-msgs count]] [monitor]
```

To remove this filter, you have two choices:

- Use the no seq sequence-number command if you know the filter’s sequence number.
- Use the no permit udp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} command.

**Parameters**

- **ttl**
  Enter the keyword `ttl` to permit a packet based on the time to live value. The range is from 1 to 255.

- **operator**
  Enter one of the following logical operand:
  
  - `eq` (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
  - `neq` (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
  - `gt` (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
  - `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
  - `range` (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

- **log**
  (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.

- **threshold-in-msgs count**
  (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the `seq`, `permit`, or `deny` commands. The threshold range is from 1 to 100.

- **interval minutes**
  (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

- **monitor**
  (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

- By default, 10 ACL logs are generated if you do not specify the threshold explicitly.
- The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

### Version Description
- **9.12(0.0)** Introduced the `ttl` parameter.
- **9.10(0.1)** Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)** Introduced on the S3148.
- **9.10(0.0)** Introduced on the S6100.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100–ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000–ON.
- **9.5(0.1)** Introduced on the Z9500.
- **9.4(0.0)** Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
- **9.3.0.0** Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

### Usage Information
When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

### permit tcp (for IPv6 ACLs)
Configure a filter to pass TCP packets that match the filter criteria.

**Syntax**

```plaintext
permit tcp {source address mask | any | host ipv6-address} [operator port [port]] {destination address | any | host ipv6-address} [bit] [operator port [port]] [ttl operator] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command if you know the filter’s sequence number.
Use the `no permit tcp (source address mask | any | host ipv6-address) (destination address | any | host ipv6-address)` command.

**Parameters**

- **source address mask**
  - Enter a network mask in /prefix format (/x).

- **host ipv6-address**
  - Enter the keyword `host` then the IP address to specify a host IP address.

- **destination address**
  - Enter the IPv6 address of the network or host to which the packets are sent.

- **bit**
  - Enter a flag or combination of bits:
    - `ack`: acknowledgement field
    - `fin`: finish (no more data from the user)
    - `psh`: push function
    - `rst`: reset the connection
    - `syn`: synchronize sequence numbers
    - `urg`: urgent field

- **operator**
  - (OPTIONAL) Enter one of the following logical operand:
    - `eq`: equal to
    - `neq`: not equal to
    - `gt`: greater than
    - `lt`: less than
    - `range`: inclusive range of ports (you must specify two ports for the port parameter)

- **port port**
  - Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.
  - The following list includes some common TCP port numbers:
    - `23`: Telnet
    - `20` and `21`: FTP
    - `25`: SMTP
    - `169`: SNMP

- **ttl**
  - Enter the keyword `ttl` to permit a packet based on the time to live value. The range is from 1 to 255.

- **operator**
  - Enter one of the following logical operand:
    - `eq` (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
    - `neq` (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
    - `gt` (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
    - `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
    - `range` (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
count (OPTIONAL) Enter the keyword count to count packets the filter processes.

byte (OPTIONAL) Enter the keyword byte to count bytes the filter processes.

log (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.

threshold-in msgs count (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated, with the seq, permit, or deny commands. The threshold range is from 1 to 100.

interval minutes (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

monitor (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults
By default, 10 ACL logs are generated if you do not specify the threshold explicitly.
The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

Command Modes ACCESS-LIST

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.12(0.0) Introduced the ttl parameter.
9.11(2.0P0) Added the established parameter on the S6000, S6000-ON, S6100-ON, Z9100-ON.
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.5(0.1) Introduced on the Z9500.
9.4(0.0) Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0) Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information
When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.
If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

Related Commands
- `permit` — assign a permit filter for IP packets.

**permit icmp (for IPv6 ACLs)**

To allow all or specific internet control message protocol (ICMP) messages, configure a filter.

**Syntax**
```
permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} {message-type} [ttl operator] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:
- Use the `no seq sequence-number` command if you know the filter's sequence number.
- Use the `no permit icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command.

**Parameters**
- **source address**
  - Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
- **mask**
  - Enter the keyword `mask` to specify a host IP address.
- **any**
  - Enter the keyword `any` to specify that all routes are subject to the filter.
- **host ipv6-address**
  - Enter the keyword `host` then the IPv6 address to specify a host IP address.
- **destination address**
  - Enter the IP address of the network or host to which the packets are sent.
- **ttl**
  - Enter the keyword `ttl` to permit a packet based on the time to live value. The range is from 1 to 255.
- **operator**
  - Enter one of the following logical operand:
    - `eq(equal to)` — matches packets that contain a ttl value that is equal to the specified ttl value.
    - `neq(not equal to)` — matches packets that contain a ttl value that is not equal to the specified ttl value.
    - `gt(greater than)` — matches packets that contain a ttl value that is greater than the specified ttl value.
    - `lt (less than)` — matches packets that contain a ttl value that is less than the specified ttl value.
    - `range(inclusive range of values)` — matches packets that contain a ttl value that falls between the specified range of ttl values.
count (OPTIONAL) Enter the keyword count to count packets processed by the filter.

byte (OPTIONAL) Enter the keyword byte to count bytes processed by the filter.

log (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.

threshold-in msgs count (OPTIONAL) Enter the `threshold-in-msgs count` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.

interval minutes (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

monitor (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

 Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

Version Description
9.12(0.0) Introduced the `ttl` parameter.
9.11(2.0P1) Added the `type` parameter to filter the ICMP packets based on the type and code on the S6000, S6000–ON, S6100–ON, Z9100–ON.
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000–ON.
9.5(0.1) Introduced on the Z9500.
9.4(0.0) Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.
9.3(0.0) Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.
If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the `flow-based enable` command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**permit (for IPv6 ACLs)**

To configure a filter that matches the filter criteria, select an IPv6 protocol number, ICMP, IPv6, TCP, or UDP.

```
Syntax
    permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp} [count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]]] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter’s sequence number
- Use the `no permit {ipv6-protocol-number | icmp | ipv6 | tcp | udp}` command

**Parameters**

- `log` (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- `threshold-in-msgs count` (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- `interval minutes` (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.
- `monitor` (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.
- `no-drop` Enter the keywords no-drop to match only the forwarded packets.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

### deny udp (for IPv6 ACLs)

Configure a filter to drop user datagram protocol (UDP) packets meeting the filter criteria.

**Syntax**

`deny udp {source address mask | any | host ipv6-address} [operator port [port]] {destination address | any | host ipv6-address} [operator port [port]] [ttl operator] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]`

To remove this filter, you have two choices:

- Use the no seq sequence-number command syntax if you know the filter’s sequence number
Use the `no deny udp (source address mask | any | host ipv6-address) (destination address | any | host ipv6-address)` command

**Parameters**

- `ttl` Enter the keyword `ttl` to deny a packet based on the time to live value. The range is from 1 to 255.

- `operator` Enter one of the following logical operand:
  - `eq` (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
  - `neq` (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
  - `gt` (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
  - `lt` (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
  - `range` (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

- `log` (OPTIONAL) Enter the keyword `log` to enable the triggering of ACL log messages.

- `threshold-in msgs count` (OPTIONAL) Enter the `threshold-in-msgs` keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. The threshold range is from 1 to 100.

- `interval minutes` (OPTIONAL) Enter the keyword `interval` followed by the time period in minutes at which ACL logs are generated. The threshold range is from 1 to 10 minutes.

- `monitor` (OPTIONAL) Enter the keyword `monitor` when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

### Version Description

- **9.8(0.0P2)**
  Introduced on the S3048-ON.

- **9.7(0.0)**
  Introduced on the S6000-ON.

- **9.5(0.1)**
  Introduced on the Z9500.

- **9.4(0.0)**
  Added support for flow-based monitoring on the S4810, S4820T, S6000, Z9000, and MXL 10/40GbE Switch IO Module platforms.

- **9.3(0.0)**
  Added support for logging of ACLs on the S4810, S4820T, Z9000, and MXL 10/40GbE Switch IO Module platforms.

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs.

You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

### deny tcp (for IPv6 ACLs)

Configure a filter that drops TCP packets that match the filter criteria.

**Syntax**

```
deny tcp {source address mask | any | host ipv6-address} [operator port [port]]
(destination address | any | host ipv6-address) [bit] [operator port [port]]
[ttl operator] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter's sequence number.
- Use the `no deny tcp {source address mask | any | host ipv6-address}
(destination address | any | host ipv6-address)` command.

**Parameters**

- `source address` Enter a network mask in /prefix format (/x).
- `mask` Enter the keyword `any` to specify that all routes are subject to the filter.
- `host ipv6-address` Enter the keyword `host` then the IP address to specify a host IP address.
**destination address** Enter the IPv6 address of the network or host to which the packets are sent.

**bit** Enter a flag or combination of bits:

- **ack**: acknowledgement field
- **fin**: finish (no more data from the user)
- **psh**: push function
- **rst**: reset the connection
- **syn**: synchronize sequence numbers
- **urg**: urgent field

**operator** (OPTIONAL) Enter one of the following logical operand:

- **eq** = equal to
- **neq** = not equal to
- **gt** = greater than
- **lt** = less than
- **range** = inclusive range of ports (you must specify two ports for the port parameter)

**port port** Enter the application layer port number. Enter two port numbers if you are using the range logical operand. The range is from 0 to 65535.

The following list includes some common TCP port numbers:

- 23 = Telnet
- 20 and 21 = FTP
- 25 = SMTP
- 169 = SNMP

**ttl** Enter the keyword **ttl** to permit a packet based on the time to live value. The range is from 1 to 255.

**operator** Enter one of the following logical operand:

- **eq** (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
- **neq** (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
- **gt** (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
- **lt** (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
- **range** (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.

**count** (OPTIONAL) Enter the keyword **count** to count packets the filter processes.

**byt** (OPTIONAL) Enter the keyword **byte** to count bytes the filter processes.

**log** (OPTIONAL) Enter the keyword **log** to enable the triggering of ACL log messages.

**threshold-in msgs** (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated, with the **seq**, **permit**, or **deny** commands. The threshold range is from 1 to 100.
interval minutes  (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The interval range is from 1 to 10 minutes.

monitor  (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults
By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and
egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

deny icmp (for Extended IPv6 ACLs)

Configure a filter to drop all or specific ICMP messages.

NOTE: Only the options that have been newly introduced in Release 9.3(0.0) and Release 9.4(0.0) are described here. For a complete description on all of the keywords and variables that are available with this command, refer to the topic of this command discussed earlier in this guide.

Syntax

```plaintext
deny icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address} [message-type] [ttl operator] [count [byte]] [log [interval minutes] [threshold-in-msgs [count]] [monitor]
```

To remove this filter, you have two choices:

- Use the `no seq sequence-number` command syntax if you know the filter’s sequence number
- Use the `no deny icmp {source address mask | any | host ipv6-address} {destination address | any | host ipv6-address}` command

Parameters

- **source address**
  - Enter a network mask in /prefix format (/x) or A.B.C.D. The mask, when specified in A.B.C.D format, may be either contiguous or non-contiguous.
- **mask**
  - Enter the keyword *any* to specify that all routes are subject to the filter.
- **host ipv6-address**
  - Enter the keyword *host* then the IPv6 address to specify a host IP address.
- **destination**
  - Enter the IP address of the network or host to which the packets are sent.
- **ttl**
  - Enter the keyword *ttl* to deny a packet based on the time to live value. The range is from 1 to 255.
- **operator**
  - Enter one of the following logical operand:
    - *eq* (equal to) — matches packets that contain a ttl value that is equal to the specified ttl value.
    - *neq* (not equal to) — matches packets that contain a ttl value that is not equal to the specified ttl value.
    - *gt* (greater than) — matches packets that contain a ttl value that is greater than the specified ttl value.
    - *lt* (less than) — matches packets that contain a ttl value that is less than the specified ttl value.
    - *range* (inclusive range of values) — matches packets that contain a ttl value that falls between the specified range of ttl values.
- **log**
  - (OPTIONAL) Enter the keyword *log* to enable the triggering of ACL log messages.
- **threshold-inmsgs**
  - (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated. With the seq, permit, or deny commands. You can enter a threshold in the range of 1-100.
(OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. You can enter an interval in the range of 1-10 minutes.

(OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.

Defaults

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is 5 minutes. By default, flow-based monitoring is not enabled.

</tr>
<tr>
<td>9.3.0.0</td>
<td>Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.</td>
</tr>
</tbody>
</table>

Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and
egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).

**deny (for IPv6 ACLs)**

Configure a filter that drops IPv6 packets that match the filter criteria.

**Syntax**

```
deny {ipv6-protocol-number | icmp | ipv6 | tcp | udp} [count [byte]] [dscp value] [order] [fragments] [log [interval minutes] [threshold-in-msgs [count]] [monitor] [no-drop]
```

To remove this filter, you have two choices:

- Use the no seq sequence-number command syntax if you know the filter’s sequence number
- Use the no deny {ipv6-protocol-number | icmp | ipv6 | tcp | udp} command

**Parameters**

- log
  - (OPTIONAL) Enter the keyword log to enable the triggering of ACL log messages.
- threshold-in msgs count
  - (OPTIONAL) Enter the threshold-in-msgs keyword followed by a value to indicate the maximum number of ACL logs that can be generated, exceeding which the generation of ACL logs is terminated, with the seq, permit, or deny commands. The threshold range is from 1 to 100.
- interval minutes
  - (OPTIONAL) Enter the keyword interval followed by the time period in minutes at which ACL logs must be generated. The time interval range is from 1 to 10 minutes.
- monitor
  - (OPTIONAL) Enter the keyword monitor when the rule is describing the traffic that you want to monitor and the ACL in which you are creating the rule is applied to the monitored interface.
- no-drop
  - Enter the keywords no-drop to match only the forwarded packets.

**Defaults**

By default, 10 ACL logs are generated if you do not specify the threshold explicitly.

The default frequency at which ACL logs are generated is five minutes. By default, flow-based monitoring is not enabled.

9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
### Version Description

**9.8(0.0P5)**  
Introduced on the S4048-ON.

**9.8(0.0P2)**  
Introduced on the S3048-ON.

**9.8(0.0)**  
Added the no-drop parameter.

**9.7(0.0)**  
Introduced on the S6000-ON.

**9.5(0.1)**  
Introduced on the Z9500.

**9.4(0.0)**  
Added support for flow-based monitoring on the S4810, S4820T, S6000, and Z9000 platforms.

**9.3(0.0)**  
Added support for logging of ACLs on the S4810, S4820T, and Z9000 platforms.

### Usage Information

When the configured maximum threshold is exceeded, generation of logs is stopped. When the interval at which ACL logs are configured to be recorded expires, the subsequent, fresh interval timer is started and the packet count for that new interval commences from zero. If ACL logging was stopped previously because the configured threshold is exceeded, it is re-enabled for this new interval.

If ACL logging is stopped because the configured threshold is exceeded, it is re-enabled after the logging interval period elapses. ACL logging is supported for standard and extended IPv4 ACLs, IPv6 ACLs, and MAC ACLs. You can configure ACL logging only on ACLs that are applied to ingress interfaces; you cannot enable logging for ACLs that are associated with egress interfaces.

You can activate flow-based monitoring for a monitoring session by entering the flow-based enable command in the Monitor Session mode. When you enable this capability, traffic with particular flows that are traversing through the ingress and egress interfaces are examined and, appropriate ACLs can be applied in both the ingress and egress direction. Flow-based monitoring conserves bandwidth by monitoring only specified traffic instead all traffic on the interface. This feature is particularly useful when looking for malicious traffic. It is available for Layer 2 and Layer 3 ingress and egress traffic. You may specify traffic using standard or extended access-lists. This mechanism copies all incoming or outgoing packets on one port and forwards (mirrors) them to another port. The source port is the monitored port (MD) and the destination port is the monitoring port (MG).
Access Control List (ACL) VLAN Groups and Content Addressable Memory (CAM)

This section describes the access control list (ACL) virtual local area network (VLAN) group, and content addressable memory (CAM) enhancements.

member vlan

Add VLAN members to an ACL VLAN group.

Syntax

```
member vlan {VLAN-range}
```

Parameters

```
VLAN-range
```

Enter the member VLANs using comma-separated VLAN IDs, a range of VLAN IDs, a single VLAN ID, or a combination. For example:

- Comma-separated: 3, 4, 6
- Range: 5-10
- Combination: 3, 4, 5-10, 8

Default

None

Command Modes

CONFIGURATION (conf-acl-vl-grp)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>

</tr>
<tr>
<td>9.3.(0.0)</td>
<td>Introduced on the S4810, S4820T, and Z9000 platforms.</td>
</tr>
</tbody>
</table>

Usage Information

At a maximum, there can be only 32 VLAN members in all ACL VLAN groups. A VLAN can belong to only one group at any given time.

You can create an ACL VLAN group and attach the ACL with the VLAN members. The optimization is applicable only when you create an ACL VLAN group. If you apply an ACL separately on the VLAN interface, each ACL has a mapping with the VLAN and increased CAM space utilization occurs.

Attaching an ACL individually to VLAN interfaces is similar to the behavior of ACL-VLAN mapping storage in CAM prior to the implementation of the ACL VLAN group functionality.
ip access-group

Apply an egress IP ACL to the ACL VLAN group.

Syntax
ip access-group {group name} out implicit-permit

Parameters

- **group-name**: Enter the name of the ACL VLAN group where you want the egress IP ACLs applied, up to 140 characters.
- **out**: Enter the keyword out to apply the ACL to outgoing traffic.
- **implicit-permit**: Enter the keyword implicit-permit to change the default action of the ACL from implicit-deny to implicit-permit (that is, if the traffic does not match the filters in the ACL, the traffic is permitted instead of dropped).

Default
None

Command Modes
CONFIGURATION (conf-acl-vl-grp)

</tr>
<tr>
<td>9.3.(0.0)</td>
<td>Introduced on the S4810, S4820T, and Z9000 platforms.</td>
</tr>
</tbody>
</table>

Usage Information
You can apply only an egress IP ACL on an ACL VLAN group.

show acl-vlan-group

Display all the ACL VLAN groups or display a specific ACL VLAN group, identified by name.

Syntax
show acl-vlan-group {group-name | detail}

Parameters

- **group-name**: (Optional) Display only the ACL VLAN group that is specified, up to 140 characters.
- **detail**: Display information in a line-by-line format to display the names in their entirety.

Without the detail option, the output displays in a table style and information may be truncated.

Default
No default behavior or values

</tr>
<tr>
<td>9.3.(0.0)</td>
<td>Introduced on the S4810, S4820T, Z9000 and MXL platforms</td>
</tr>
</tbody>
</table>

Usage Information

When an ACL-VLAN-Group name or the Access List Group Name contains more than 30 characters, the name is truncated in the `show acl-vlan-group` command output.

Examples

The following sample illustrates the output of the `show acl-vlan-group` command.

```
NOTE: Some group names and some access list names are truncated.

DellEMC# show running-config acl-vlan-group

acl-vlan-group Test
  member vlan 1-100
  ip access-group test in

DellEMC# show acl-vlan-group

<table>
<thead>
<tr>
<th>Group Name</th>
<th>Egress IP Acl</th>
<th>Ingress IP Acl</th>
<th>Ingress V6 Acl</th>
<th>Vlan Members</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test</td>
<td>-</td>
<td>test</td>
<td>-</td>
<td>1-100</td>
</tr>
</tbody>
</table>
```

The following sample output is displayed when using the `show acl-vlan-group group-name` option.

```
NOTE: The access list name is truncated.

DellEMC# show acl-vlan-group TestGroupSeventeenTwenty

<table>
<thead>
<tr>
<th>Group Name</th>
<th>Egress IP Acl</th>
<th>Ingress IP Acl</th>
<th>Ingress IPV6 Acl</th>

</tr>
<tr>
<td>Vlan Members</td>
<td>Test</td>
<td>-</td>
<td>test</td>
</tr>
<tr>
<td>-</td>
<td></td>
<td></td>
<td>1-100</td>
</tr>
</tbody>
</table>
```

The following sample output shows the line-by-line style display when using the `show acl-vlan-group detail` option.

```
NOTE: No group or access list names are truncated

DellEMC# show acl-vlan-group detail

<p>| Group Name : |
| Test         |</p>
<table>
<thead>
<tr>
<th>Egress IP Acl:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ingress IP Acl:</td>
</tr>
<tr>
<td>test</td>
</tr>
<tr>
<td>Ingress IPV6 Acl:</td>
</tr>
<tr>
<td>-</td>
</tr>
<tr>
<td>Vlan Members :</td>
</tr>
<tr>
<td>1-100</td>
</tr>
</tbody>
</table>
```

```
show cam-acl-vlan

Display the number of flow processor (FP) blocks that is allocated for the different VLAN services.

Syntax

```
show cam-acl-vlan
```
cam-acl-vlan

Allocate the number of flow processor (FP) blocks or entries for VLAN services and processes.

**Syntax**

```
cam-acl-vlan { default | vlanopenflow <0-2> | vlaniscsi <0-2> | vlanaclopt <0-2>
```

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**  

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Usage Information**

After CAM configuration for ACL VLAN groups is performed, you must reboot the system to enable the settings to be stored in nonvolatile storage. During the initialization of CAM, the chassis manager reads the NVRAM and allocates the dynamic VCAP regions.

The following table describes the output fields of this show command:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chassis Vlan Cam ACL</td>
<td>Details about the CAM blocks allocated for ACLs for various VLAN operations at a system-wide, global level.</td>
</tr>
<tr>
<td>Stack Unit &lt;number&gt;</td>
<td>Details about the CAM blocks allocated for ACLs for various VLAN operations for a particular stack unit.</td>
</tr>
<tr>
<td>Current Settings(in block sizes)</td>
<td>Information about the number of FP blocks that are currently in use or allocated.</td>
</tr>
<tr>
<td>VlanOpenFlow</td>
<td>Number of FP blocks for VLAN open flow operations.</td>
</tr>
<tr>
<td>VlanIscsi</td>
<td>Number of FP blocks for VLAN internet small computer system interface (iSCSI) counters.</td>
</tr>
<tr>
<td>VlanHp</td>
<td>Number of FP blocks for VLAN high performance processes.</td>
</tr>
<tr>
<td>VlanFcoe</td>
<td>Number of FP blocks for VLAN Fiber Channel over Ethernet (FCoE) operations.</td>
</tr>
<tr>
<td>VlanAclOpt</td>
<td>Number of FP blocks for ACL VLAN optimization feature.</td>
</tr>
</tbody>
</table>

**Example**

```
DellEMC# show cam-acl-vlan
-- Chassis Vlan Cam ACL --
 Current Settings(in block sizes)
VlanOpenFlow :         0
VlanIscsi    :         0
VlanAclOpt   :         2
VlanHp       :         1
VlanFcoe     :         1
DellEMC#
```
Parameters

- **default**: Reset the number of FP blocks to default. By default, 0 groups are allocated for the ACL in VCAP. ACL VLAN groups or CAM optimization is not enabled by default, and you need to allocate the slices for CAM optimization.

- **vlanopenflow <0-2>**: Allocate the number of FP blocks for VLAN open flow operations.

- **vlaniscsi <0-2>**: Allocate the number of FP blocks for VLAN iSCSI counters.

- **vlanaclopt <0-2>**: Allocate the number of FP blocks for the ACL VLAN optimization feature.

**Default**

If you use the default keyword with the cam-acl-vlan command, the FP blocks allocated for VLAN processes are restored to their default values. No FP blocks or dynamic VLAN Content Aware Processor (VCAP) groups are allocated for VLAN operations by default.

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.5(0.1) | Introduced on the Z9500.
9.3(0.0) | Introduced on the S4810 and Z9000 platforms.

**Usage Information**

The VLAN ContentAware Processor (VCAP) application is a pre-ingress CAP that modifies the VLAN settings before packets are forwarded. To support the ACL CAM optimization functionality, the CAM carving feature is enhanced. A total of four VACP groups are present, of which two are for fixed groups and the other two are for dynamic groups. Out of the total of two dynamic groups, you can allocate zero, one, or two flow processor (FP) blocks to iSCSI Counters, OpenFlow and ACL Optimization. You can configure only two of these features at a point in time.

### show cam-usage

View the amount of CAM space available, used, and remaining in each partition (including IPv4 Flow and Layer 2 ACL sub-partitions).

**Syntax**

```
show cam-usage [acl | router | switch]
```

**Parameters**

- **acl**: (OPTIONAL) Enter the keyword acl to display Layer 2 and Layer 3 ACL CAM usage.

- **router**: (OPTIONAL) Enter the keyword router to display Layer 3 CAM usage.

- **switch**: (OPTIONAL) Enter the keyword switch to display Layer 2 CAM usage.

**Command Modes**

- EXEC

- EXEC Privilege
Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version  Description
9.8(0.0P5)  Introduced on the S4048-ON.

### show running config acl-vlan-group

Display the running configuration of all or a given ACL VLAN group.

**Syntax**

```plaintext
show running config acl-vlan-group group name
```
### Parameters

**group-name**
Display only the ACL VLAN group that is specified. The maximum group name is 140 characters.

**Default**
None

**Command Modes**
EXEC
EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.3.(0.0)</td>
<td>Introduced on the S4810, S4820T, Z9000 and MXL platforms</td>
</tr>
</tbody>
</table>

**Examples**
The following sample output shows the line-by-line style display when using the `show running-config acl-vlan-group` option. Note that no group or access list names are truncated.

```
Dell #show running-config acl-vlan-group

 acl-vlan-group Test
    member vlan 1-100
    ip access-group test in

DellEMC#show running-config acl-vlan-group Test

 acl-vlan-group Test
    member vlan 1-100
    ip access-group test in

DellEMC#
```

### acl-vlan-group

Create an ACL VLAN group.

**Syntax**

```
apcl-vlan-group {group name}
```

To remove an ACL VLAN group, use the `no acl-vlan-group {group name}` command.

**Parameters**

**group-name**
Specify the name of the ACL VLAN group. The name can contain a maximum 140 characters.

**Default**
No default behavior or values

**Command Modes**
CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Usage Information

You can have up to eight different ACL VLAN groups at any given time. When you configure an ACL VLAN group, you enter the ACL VLAN Group Configuration mode.

To avoid the problem of excessive consumption of CAM area, you can configure ACL VLAN groups that combines all the VLANs that are applied with the same ACL in a single group. A unique identifier for each of ACL attached to the VLAN is used as a handle or locator in the CAM area instead of the VLAN id. This method of processing significantly reduces the number of entries in the CAM area and saves memory space in CAM.

You can create an ACL VLAN group and attach the ACL with the VLAN members. Optimization is applicable only when you create an ACL VLAN group. If you apply an ACL separately on the VLAN interface, each ACL maps with the VLAN and increased CAM space utilization occurs.

Attaching an ACL individually to VLAN interfaces is similar to the behavior of ACL-VLAN mapping storage in CAM prior to the implementation of the ACL VLAN group functionality.

show acl-vlan-group detail

Display all the ACL VLAN Groups or display a specific ACL VLAN Group by name. To display the names in their entirety, the output displays in a line-by-line format.

Syntax

```
show acl-vlan-group detail
```

Parameters

detail

Display information in a line-by-line format to display the names in their entirety.

Without the detail option, the output is displayed in a table style and information may be truncated.

Default

No default behavior or values

Command Modes

EXEC

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.3.(0.0)</td>
<td>Introduced on the S4810, S4820T and Z9000 platforms</td>
</tr>
</tbody>
</table>

Usage Information

The output for this command displays in a line-by-line format. This allows the ACL-VLAN-Group names (or the Access List Group Names) to display in their entirety.
The following sample output shows the line-by-line style display when using the `show acl-vlan-group detail` option. Note that no group or access list names are truncated.

```
DellEMC# show acl-vlan-group detail
Group Name :
  Test
Egress IP Acl :
  -
Ingress IP Acl :
  test
Ingress IPV6 Acl :
  -
Vlan Members :
  1-100
DellEMC#
```

description (ACL VLAN Group)

Add a description to the ACL VLAN group.

Syntax

```
description description
```

Parameters

```
description  Enter a description to identify the ACL VLAN group (80 characters maximum).
```

Default

No default behavior or values

Command Modes

CONFIGURATION (conf-acl-vl-grp)

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

```
Version   Description
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.3.(0.0)   Introduced on the S4810, S4820T, and Z9000 platforms
```

Usage Information

Enter a description for each ACL VLAN group that you create for effective and streamlined administrative and logging purposes.
Bidirectional Forwarding Detection (BFD)

Bidirectional forwarding detection (BFD) is a detection protocol that provides fast forwarding path failure detection. The Dell EMC Networking OS implementation is based on the standards specified in the IETF Draft draft-ietf-bfd-base-03, and supports BFD on all Layer 3 physical interfaces including VLAN interfaces and port-channels.

Topics:
- bfd all-neighbors
- bfd enable (Configuration)
- bfd enable (Interface)
- bfd interval
- bfd protocol-liveness
- ip route bfd
- ip ospf bfd all-neighbors
- ipv6 ospf bfd all-neighbors
- ipv6 route bfd
- isis bfd all-neighbors
- neighbor bfd disable
- show bfd neighbors
- vrrp bfd neighbor

**bfd all-neighbors**

Enable BFD sessions with all neighbors discovered by Layer 3 protocols virtual router redundancy protocol (VRRP), intermediate system to intermediate system (IS-IS), open shortest path first (OSPF), OSPFv3, or border gateway protocol (BGP) on router interfaces, and (optionally) reconfigure the default timer values.

**Syntax**

```
bfd all-neighbors [interval interval min_rx min_rx multiplier value role {active | passive}]
```

**Parameters**

- **interval milliseconds**
  - (OPTIONAL) Enter the keyword interval to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200. Dell EMC recommends using more than 100 milliseconds.

- **min_rx milliseconds**
  - Enter the keyword min_rx to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 1000. The default is 200. Dell EMC recommends using more than 100 milliseconds.

- **multiplier value**
  - Enter the keyword multiplier to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3.

- **role [active | passive]**
  - Enter the role that the local system assumes:
    - **Active** — The active system initiates the BFD session. Both systems can be active for the same session.
**Passive** — The passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is **active**.

</tr>
</tbody>
</table>
### Usage Information

All neighbors inherit the timer values configured with the `bfd neighbor` command except in the following cases:

- Timer values configured with the `isis bfd all-neighbors` or `ip ospf bfd all-neighbors` commands in INTERFACE mode override timer values configured with the `bfd neighbor` command. Likewise, using the `no bfd neighbor` command does not disable BFD on an interface if you explicitly enable BFD using the `isis bfd all-neighbors` command.
- Neighbors that have been explicitly enabled or disabled for a BFD session with the `bfd neighbor` or `neighbor bfd disable` commands in ROUTER BGP mode do not inherit the global BFD enable/disable value configured with the `bfd neighbor` command or configured for the peer group to which a neighbor belongs. The neighbors inherit only the global timer values (configured with the `bfd neighbor` command).

You can only enable BFD for VRRP in INTERFACE command mode (`vrrp bfd all-neighbors`).

You can enable BFD on both default and nondefault VRFs for OSPF and BGP protocols for both IPv4 and IPv6 neighbors.

**NOTE:** The `bfd all-neighbors` command is applicable for both IPv4 and IPv6 BGP sessions.

### bfd enable (Configuration)

Enable BFD on all interfaces.

**Syntax**

```plaintext
bfd enable
```

Disable BFD using the `no bfd enable` command.

**Defaults**

BFD is disabled by default.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### bfd interval

Specify non-default BFD session parameters beginning with the transmission interval.

**Syntax**

```
bfd interval interval min_rx min_rx multiplier value role {active | passive}
```

**Parameters**

- `interval milliseconds`: Enter the keywords `interval` to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200. Dell EMC recommends using more than 100 milliseconds.
**min_rx milliseconds**  
Enter the keywords `min_rx` to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 1000. The default is `200`. Dell EMC recommends using more than 100 milliseconds.

**multiplier value**  
Enter the keywords `multiplier` to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is `3`.

**role [active | passive]**  
Enter the role that the local system assumes:

- **Active** — The active system initiates the BFD session. Both systems can be active for the same session.
- **Passive** — The passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is **Active**.

---

**Defaults**  
Refer to **Parameters**.

Usage Information

Protocol Liveness is a feature that notifies the BFD Manager when a client protocol (for example, OSPF and ISIS) is disabled. When a client is disabled, all BFD sessions for that protocol are torn down. Neighbors on the remote system receive an Admin Down control packet and are placed in the Down state. Peer routers might take corrective action by choosing alternative paths for the routes that originally pointed to this router.

**ip route bfd**

Enable BFD for all neighbors configured through static routes.

**Syntax**

```
ip route bfd [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active | passive}]
```

To disable BFD for all neighbors configured through static routes, use the `no ip route bfd [vrf vrf-name] [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active | passive}]` command.

**Parameters**

- **prefix-list prefix-list-name** (Optional) Enter the keyword `prefix-list` followed by the name of the prefix list to enable or disable BFD on specific neighbors.
- **interval milliseconds** (OPTIONAL) Enter the keywords `interval` to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200.
- **min_rx milliseconds** Enter the keywords `min_rx` to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is 200.
- **multiplier value** Enter the keywords `multiplier` to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3.
- **role [active | passive]** Enter the role that the local system assumes:
  - Active — active system initiates the BFD session. Both systems can be active for the same session.
• Passive — passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is Active.

Defaults

See Parameters.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.13(0.0) Introduced the vrf keyword on S3100 series, S3048–ON, S4048–ON, S4048T-ON, S5000, S6000, S6000–ON, S6010–ON, S6100–ON, C9010, Z9500, and Z9100–ON.
9.12(1.0) Introduced on the S5048F–ON.
9.11(2.5) Introduced the vrf keyword on the Z9100–ON.
9.11(0.0) Introduced the prefix-list keyword.
9.10(1.0) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000–ON.
9.3(0.0) Introduced on S6000.
9.2(1.0) Introduced on the Z9500.
9.2(0.0) Introduced on Z9000, S4810, and S4820T.
8.2.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the C-Series.
7.4.1.0 Introduced on the E-Series.

ip ospf bfd all-neighbors

Establish BFD sessions with all OSPF neighbors on a single interface or use non-default BFD session parameters.

Syntax

ip ospf bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]

To disable all BFD sessions on an OSPF interface implicitly, use the no ip ospf bfd all-neighbors disable command in interface mode.

Parameters

disable (OPTIONAL) Enter the keyword disable to disable BFD on this interface.
interval milliseconds  (OPTIONAL) Enter the keyword interval to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200.

min_rx milliseconds  Enter the keywords min_rx to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is 200.

multiplier value  Enter the keyword multiplier to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3.

role [active | passive]  Enter the role that the local system assumes:

  • Active — active system initiates the BFD session. Both systems can be active for the same session.
  • Passive — passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is Active.

Defaults  See Parameters.

Command Modes  INTERFACE

Command History  This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.2)  Introduced support for enabling BFD on non-default VRFs for OSPFv2.
9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)  Introduced on the S3148.
9.8(2.0)  Introduced on the S3100 series.
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.2.0.0  Introduced on the Z9000, S4820T, and S4810.

Usage Information  This command provides the flexibility to fine-tune the timer values based on individual interface needs when you configure ip ospf bfd in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the bfd all-neighbors command. Using the no form of this command does not disable BFD if you configure BFD in CONFIGURATION mode.

To disable BFD on a specific interface while you configure BFD in CONFIGURATION mode, use the keyword disable.

ipv6 ospf bfd all-neighbors

Establish BFD sessions with all OSPFv3 neighbors on a single interface or use non-default BFD session parameters.

Syntax  ipv6 ospf bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]
To disable all BFD sessions on an OSPFv3 interface implicitly, use the `no ipv6 ospf bfd all-neighbors disable` command in interface mode.

**Parameters**

- **disable** (OPTIONAL) Enter the keyword disable to disable BFD on this interface.
- **interval milliseconds** (OPTIONAL) Enter the keyword interval to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is 200.
- **min_rx milliseconds** Enter the keywords min_rx to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is 200.
- **multiplier value** Enter the keyword multiplier to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is 3.
- **role [active | passive]** Enter the role that the local system assumes:
  - **Active** — active system initiates the BFD session. Both systems can be active for the same session.
  - **Passive** — passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is **Active**.

**Defaults**

See Parameters.

**Usage Information**

This command provides the flexibility to fine-tune the timer values based on individual interface needs when you configure ipv6 ospf BFD in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the `bfd all-neighbors` command. Using the `no` form of this command does not disable BFD if you configure BFD in CONFIGURATION mode.

To disable BFD on a specific interface while you configure BFD in CONFIGURATION mode, use the keyword disable.
ipv6 route bfd

Enable BFD for all IPv6 neighbors configured through static routes.

Syntax

```
ipv6 route bfd [vrf vrf-name] [prefix-list prefix-list-name] [interval interval min_rx min_rx min_rx multiplier value role {active | passive}]
```

To disable BFD for all IPv6 neighbors configured through static routes, use the `no ipv6 route bfd [vrf vrf-name] [prefix-list prefix-list-name] [interval interval min_rx min_rx multiplier value role {active | passive}]` command.

Parameters

- **vrf vrf-name**: (Optional) Enter the keyword `vrf` and then the name of the VRF to enable or disable BFD on the next-hop IPv6 neighbor corresponding to that VRF.
- **prefix-list prefix-list-name**: (Optional) Enter the keyword `prefix-list` followed by the name of the prefix list to enable or disable BFD on specific IPv6 neighbors.
- **interval milliseconds**: (OPTIONAL) Enter the keywords `interval` to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is `200`.
- **min_rx milliseconds**: Enter the keywords `min_rx` to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 1000. The default is `200`.
- **multiplier value**: Enter the keywords `multiplier` to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is `3`.
- **role [active | passive]**: Enter the role that the local system assumes:
  - **Active** — active system initiates the BFD session. Both systems can be active for the same session.
  - **Passive** — passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is **Active**.

Defaults

See Parameters.

Command Modes

**CONFIGURATION**

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.13(0.0) 
Introduced on the S3100 series, S3048–ON, S4048–ON, S4048T-ON, S5000, S6000, S6000–ON, S6100–ON, C9010, and the Z9500.

9.12(1.0) 
Introduced on the S5048F–ON.

9.11(2.5) 
Introduced the `ipv6 route bfd` command on the Z9100–ON.

Example

```
DellEMC(conf)#ipv6 route bfd
DellEMC(conf)#ipv6 route bfd vrf vrf1 prefix-list p6_le
```
**isis bfd all-neighbors**

Enable BFD on all IS-IS neighbors discovered on an interface.

**Syntax**

```
isis bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]]
```

To remove all BFD sessions with IS-IS neighbors discovered on this interface, use the `no isis bfd all-neighbors [disable | [interval interval min_rx min_rx multiplier value role {active | passive}]])` command.

**Parameters**

- **disable** *(OPTIONAL)* Enter the keyword `disable` to disable BFD on this interface.
- **interval milliseconds** *(OPTIONAL)* Enter the keywords `interval` to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is `200`.
- **min_rx milliseconds** Enter the keywords `min_rx` to specify the minimum rate at which the local system would like to receive control packets from the remote system. The range is from 50 to 1000. The default is `200`.
- **multiplier value** Enter the keywords `multiplier` to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is `3`.
- **role {active | passive}** Enter the role that the local system assumes:
  - **Active** — active system initiates the BFD session. Both systems can be active for the same session.
  - **Passive** — passive system does not initiate a session. It only responds to a request for session initialization from the active system.

The default is `Active`.

**Defaults**

See Parameters.

### Usage Information

This command provides the flexibility to fine-tune the timer values based on individual interface needs when ISIS BFD is configured in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the `bfd all-neighbors` command. Using the `no` form of this command does not disable BFD if BFD is configured in CONFIGURATION mode.

To disable BFD on a specific interface while BFD is configured in CONFIGURATION mode, use the keyword `disable`.

### neighbor bfd disable

Explicitly disable a BFD session with a BGP neighbor or a BGP peer group.

**Syntax**

```
neighbor {ip-address | ipv6-address | peer-group-name} bfd disable
```

**Parameters**

- `ip-address`: Enter the IP address of the BGP neighbor that you want to explicitly disable for BFD sessions in dotted decimal format (A.B.C.D).
- `peer-group-name`: Enter the name of the peer group that you want to explicitly disable for BFD sessions.

**Defaults**

None

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

## show bfd neighbors

Display BFD neighbor information on all interfaces or a specified interface.

**Syntax**

```
show bfd [vrf vrf name] neighbors [interface] [detail]
```

**Parameters**

- **vrf vrf name**  
  (Optional) Enter the keyword `vrf` and then the name of the VRF to display the BFD sessions with all neighbors within the VRF.

- **interface**  
  (OPTIONAL) Enter one of the following keywords and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- **detail**  
  (OPTIONAL) Enter the keyword `detail` to view detailed information about BFD neighbors.

**Defaults**

None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Related Commands**

- `show bfd neighbors` — display the BFD neighbor information on all interfaces or a specified interface.
Border Gateway Protocol

BGP is an external gateway protocol that transmits interdomain routing information within and between autonomous systems (AS). BGP version 4 (BGPv4) supports classless inter-domain routing (CIDR) and the aggregation of routes and AS paths. Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically sent messages to update those routing tables.

NOTE: For more information about configuring the border gateway protocol (BGP), see the BGP section in the Dell EMC Networking OS Configuration Guide.

Topics:
- BGP IPv4 Commands
- MBGP Commands
- BGP Extended Communities (RFC 4360)
- IPv6 BGP Commands
- IPv6 MBGP Commands

BGP IPv4 Commands

Border Gateway Protocol (BGP) is an external gateway protocol that transmits interdomain routing information within and between Autonomous Systems (AS). BGP supports classless interdomain routing (CIDR) and the aggregation of routes and AS paths. Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically send messages to update those routing tables.

NOTE: Dell EMC Networking OS supports 2-byte (16-bit) and 4-byte (32-bit) format for autonomous system numbers (ASNs), where the 2-byte format is 1 to 65535 and the 4-byte format is 1 to 4294967295.

NOTE: Dell EMC Networking OS supports dotted format as well as the traditional plain format for AS numbers. The dot format is displayed when using the `show ip bgp` commands. To determine the comparable dot format for an ASN from a traditional format, use ASN/65536. ASN%65536. For more information about using the 2– or 4-byte format, refer to the Dell EMC Networking OS Configuration Guide.

address-family

Enable the IPv4 multicast or the IPv6 address family.

Syntax

```
address-family {ipv4 multicast | ipv6 unicast} [vrf vrf-name]
```

Parameters

- `ipv4 multicast`
Enter the keyword ipv4 followed by the keyword multicast to enable BGPv4 multicast mode.

- `vrf vrf-name`
Enter the keyword vrf and then the name of the VRF to enable VRF mode.

NOTE: It is not possible to enable VRF mode for IPv6 unicast without configuring the corresponding IPv4 unicast mode for the same VRF. While deletion, whenever the IPv4 VRF mode is deleted for the VRF, Dell EMC Networking OS automatically deletes the IPv6 VRF configurations as well.
ipv6 unicast

Enter the keyword ipv6 followed by the keyword unicast to enable BGPv6 mode.

Defaults
Not configured.
Command Modes
ROUTER BGP
Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

aggregate-address

To minimize the number of entries in the routing table, summarize a range of prefixes.

Syntax
aggregate-address ip-address mask [advertise-map map-name] [as-set] [attribute-map map-name] [summary-only] [suppress-map map-name]

Parameters
- **ip-address mask**
  Enter the IP address and mask of the route to be the aggregate address. Enter the IP address in dotted decimal format (A.B.C.D) and mask in /prefix format (/x).
- **advertise-map map-name**
  (OPTIONAL) Enter the keywords advertise-map then the name of a configured route map to set filters for advertising an aggregate route.
- **as-set**
  (OPTIONAL) Enter the keyword as-set to generate path attribute information and include it in the aggregate.

AS_SET includes AS_PATH and community information from the routes included in the aggregated route.
attribute-map map-name

(OPTIONAL) Enter the keywords attribute-map then the name of a configured route map to modify attributes of the aggregate, excluding AS_PATH and NEXT_HOP attributes.

summary-only

(OPTIONAL) Enter the keyword summary-only to advertise only the aggregate address. Specific routes are not advertised.

suppress-map map-name

(OPTIONAL) Enter the keywords suppress-map then the name of a configured route map to identify which more-specific routes in the aggregate are suppressed.

Defaults
Not configured.

Command Modes
• ROUTER BGP ADDRESS FAMILY
• ROUTER BGP ADDRESS FAMILY IPv6

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
7.7.1.0 Introduced on the C-Series.

Usage Information
At least one of the routes included in the aggregate address must be in the BGP routing table for the configured aggregate to become active.

If routes within the aggregate are constantly changing, do not add the as-set parameter to the aggregate as the aggregate flaps to keep track of the changes in the AS_PATH.

In route maps used in the suppress-map parameter, routes meeting the deny clause are not suppress; in other words, they are allowed. The opposite is also true: routes meeting the permit clause are suppressed.

If the route is injected via the network command, that route still appears in the routing table if the summary-only parameter is configured in the aggregate-address command.

The summary-only parameter suppresses all advertisements. If you want to suppress advertisements to only specific neighbors, use the neighbor distribute-list command.
In the `show ip bgp` command, aggregates contain an ‘a’ in the first column and routes suppressed by the aggregate contain an ‘s’ in the first column.

When an aggregate address is denied using a peer's outbound route-map, individual routes suppressed by the aggregate address are advertised to that peer.

The attribute-map corresponding to an aggregate address is applied during the outbound update creation time; the value set in that attribute-map will not be shown in the output of the `show ip bgp aggregate route` command.

**bgp add-path**

Allow the advertisement of multiple paths for the same address prefix without the new paths replacing any previous ones.

**Syntax**

```
bgp add-path [send | receive | both | enable] path-count
```

**Parameters**

- `send` Enter the keyword `send` to indicate that the system sends multiple paths to peers.
- `receive` Enter the keyword `receive` to indicate that the system accepts multiple paths from peers.
- `both` Enter the keyword `both` to indicate that the system sends and accepts multiple paths from peers.
- `enable` Enter the keyword `enable` to enable add-path support support for the node.
- `path-count` Enter the number paths supported. The range is from 2 to 64.

**Defaults**

Disabled

**Command Modes**

- ROUTER BGP
- ROUTER BGP-address-family

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>
**Version**

- **8.3.8.0**
  Introduced on the S4810.

**Usage Information**

Using this command recycles all current sessions.

**Related Commands**

- `neighbor add-path` — specify that this neighbor/peer group can send/receive multiple path advertisements.

---

**bgp always-compare-med**

Allows you to enable comparison of the MULTI_EXIT_DISC (MED) attributes in the paths from different external ASs.

**Syntax**

```
bgp always-compare-med
```

To disable comparison of MED, enter `no bgp always-compare-med`.

**Defaults**

Disabled (that is, the software only compares MEDs from neighbors within the same AS).

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tr>
<td>8.2.1.0</td>
<td>Introduced command.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Any update without a MED attribute is the least preferred route.

If you enable this command, use the `clear ip bgp *` command to recompute the best path.
**bgp asnotation**

Allows you to implement a method for AS number representation in the command line interface (CLI).

**Syntax**

```
bgp asnotation [asplain | asdot+ | asdot]
```

To disable a dot or dot+ representation and return to ASPLAIN, enter the `no bgp asnotation` command.

**Defaults**

asplain

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S6010-ON and S4048T-ON.</td>
</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.7(0.0)</td>
<td>Introduced on the S6000-ON.</td>
</tr>
<tr>

</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
<tr>
<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.1.0</td>
<td>Introduced the dynamic application of AS notation changes.</td>
</tr>
<tr>
<td>8.2.1.0</td>
<td>Introduced.</td>
</tr>
</tbody>
</table>

**Usage Information**

Before enabling this feature, enable the `enable bgp four-octet-as-support` command. If you disable the `four-octect-support` command after using dot or dot+ format, the AS numbers revert to asplain text.

When you apply an asnotation, it is reflected in the running-configuration. If you change the notation type, the running-config updates dynamically and the new notation shows.

**Example**

```
DellEMC(conf)# router bgp 1
DellEMC(conf-router_bgp)# bgp asnotation asdot
DellEMC(conf-router_bgp)# ex
DellEMC(conf)#do show run | grep bgp

router bgp 1
  bgp four-octet-as-support
  bgp asnotation asdot

DellEMC(conf)#router bgp 1
DellEMC(conf-router_bgp)# bgp asnotation asdot+
DellEMC(conf-router_bgp)# ex
```
DellEMC(conf)#do show run | grep bgp
router bgp 1
  bgp four-octet-as-support
  bgp asnotation asdot+

DellEMC(conf)#router bgp 1
DellEMC(conf-router_bgp)# bgp asnotation asplain
DellEMC(conf-router_bgp)# ex

DellEMC(conf)#do show run | grep bgp
router bgp 1
  bgp four-octet-as-support

DellEMC(conf)#

Related Commands
  • bgp four-octet-as-support — enable 4-byte support for the BGP process.

bgp bestpath as-path ignore

Ignore the AS PATH in BGP best path calculations.

Syntax
bgp bestpath as-path ignore
To return to the default, enter the no bgp bestpath as-path ignore command.

Defaults
Disabled (that is, the software considers the AS_PATH when choosing a route as best).

Command Modes
ROUTER BGP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>
If you enable this command, use the `clear ip bgp *` command to recompute the best path.

**bgp bestpath as-path multipath-relax**

Include prefixes received from different AS paths during multipath calculation.

**Syntax**

```
bgp bestpath as-path multipath-relax
```

To return to the default BGP routing process, use the `no bgp bestpath as-path multipath-relax` command.

**Defaults**

Disabled

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

<td>Introduced on the Z9000.</td>
</tr>
<tr>
<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

**Usage Information**

The `bestpath router bgp configuration mode` command changes the default bestpath selection algorithm. The `multipath-relax` option allows load-sharing across providers with different (but equal-length) autonomous system paths. Without this option, ECMP expects the AS paths to be identical for load-sharing.

**bgp bestpath med confed**

Enable MULTI_EXIT_DISC (MED) attribute comparison on paths learned from BGP confederations.

**Syntax**

```
bgp bestpath med confed
```

To disable MED comparison on BGP confederation paths, enter the `no bgp bestpath med confed` command.

**Defaults**

Disabled

**Command Modes**

ROUTER BGP
Command History

<tr>
<td>7.8.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

Usage Information

The software compares the MEDs only if the path contains no external autonomous system numbers. If you enable this command, use the clear ip bgp * command to recompute the best path.

bgp bestpath med missing-as-best

During path selection, indicate preference to paths with missing MED (MULTI_EXIT_DISC) over paths with an advertised MED attribute.

Syntax

bgp bestpath med missing-as-best

To return to the default selection, use the no bgp bestpath med missing-as-best command.

Defaults

Disabled

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S6010-ON and S4048T-ON.</td>

<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
</tbody>
</table>
Usage Information

The MED is a 4-byte unsigned integer value and the default behavior is to assume a missing MED as 4294967295. This command causes a missing MED to be treated as 0. During path selection, paths with a lower MED are preferred over paths with a higher MED.

```
bgp bestpath router-id ignore
```

Do not compare router-id information for external paths during best path selection.

**Syntax**

```
bgp bestpath router-id ignore
```

To return to the default selection, use the `no bgp bestpath router-id ignore` command.

**Defaults**

Disabled

**Command Modes**

ROUTER BGP

**Command History**

</tr>
</tbody>
</table>

**Usage Information**

Route reflection to clients is not necessary if all client routers are fully meshed.

**Related Commands**

- `bgp cluster-id` — assign an ID to a BGP cluster with two or more route reflectors.
- `neighbor route-reflector-client` — configure a route reflector and clients.
**bgp cluster-id**

Assign a cluster ID to a BGP cluster with more than one route reflector.

**Syntax**

```
bgp cluster-id {ip-address | number}
```

To delete a cluster ID, use the `no bgp cluster-id {ip-address | number}` command.

**Parameters**

- `ip-address` Enter an IP address as the route reflector cluster ID.
- `number` Enter a route reflector cluster ID as a number from 1 to 4294967295.

**Defaults**

Not configured.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
- 9.10(0.0) Introduced on the S3148.
- 9.8(2.0) Introduced on the S3100 series.
- 9.8(0.0P5) Introduced on the S4048-ON.
- 9.8(0.0P2) Introduced on the S3048-ON.
- 9.7(0.0) Introduced on the S6000–ON.
- 9.2(1.0) Introduced on the Z9500.
- 9.0.2.0 Introduced on the S6000.
- 8.3.19.0 Introduced on the S4820T.
- 8.3.11.1 Introduced on the Z9000.
- 8.3.7.0 Introduced on the S4810.
- 7.8.1.0 Introduced on the S-Series.
- 7.7.1.0 Introduced on the C-Series.

**Usage Information**

When a BGP cluster contains only one route reflector, the cluster ID is the route reflector’s router ID. For redundancy, a BGP cluster may contain two or more route reflectors. Assign a cluster ID with the `bgp cluster-id` command. Without a cluster ID, the route reflector cannot recognize route updates from the other route reflectors within the cluster.

The default format for displaying the cluster-id is dotted decimal, but if you enter the cluster-id as an integer, it is displayed as an integer.

This command automatically restarts the BGP instance for the configuration to take effect.

**Related Commands**

- `bgp client-to-client reflection` — enable route reflection between the route reflector and clients.
bgp confederation identifier

Configure an identifier for a BGP confederation.

Syntax

bgp confederation identifier as-number

Parameters

- **as-number**: Enter the AS number. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

Defaults

Not configured.

Command Modes

- ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
7.7.1.0 Introduced on the C-Series. Added support for the 4-byte format.

Usage Information

To accept 4-byte formats before entering a 4-byte AS number, configure your system. All the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

The autonomous systems configured in this command are visible to the EBGP neighbors. Each autonomous system is fully meshed and contains a few connections to other autonomous systems. The next hop, MED, and local preference information is preserved throughout the confederation.

Dell EMC Networking OS accepts confederation EBGP peers without a LOCAL_PREF attribute. The software sends AS_CONFED_SET and accepts AS_CONFED_SET and AS_CONF_SEQ.
If a local-as is configured, BGP does not allow for the configuration of BGP confederation. Similarly, if BGP confederation is configured, then BGP does not allow the configuration of local-as.

If the neighbor is an eBGP neighbor, then BGP performs a check on the first AS number. In this scenario, it is mandatory that the first sequence in the AS path is of type AS_SEQUENCE or AS_CONFED_SEQUENCE (in the case of confederations). If the first entry appears as an AS_CONFED_SET and the neighbor is not in the local AS, then this is strictly a problem with the neighbor node.

This command automatically restarts the BGP instance for the configuration to take effect.

Related Commands

- `bgp four-octet-as-support` — enable 4-byte support for the BGP process.

**bgp confederation peers**

Specify the autonomous systems (ASs) that belong to the BGP confederation.

**Syntax**

```
bgp confederation peers as-number [...as-number]
```

To return to the default, use the `no bgp confederation peers` command.

**Parameters**

- `as-number` Enter the AS number. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).
- `...as-number` (OPTIONAL) Enter up to 16 confederation numbers. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

**Defaults**

Not configured.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.8(2.0) | Introduced on the S3100 series.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000–ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
Version Description
7.7.1.0 Introduced on the C-Series. Added support for the 4-byte format.

Usage Information
All the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

The autonomous systems configured in this command are visible to the EBGP neighbors. Each autonomous system is fully meshed and contains a few connections to other autonomous systems.

After specifying autonomous systems numbers for the BGP confederation, recycle the peers to update their configuration.

Related Commands
- bgp confederation identifier — configure a confederation ID.
- bgp four-octet-as-support — enable 4-byte support for the BGP process.

bgp connection-retry-timer

Configures the BGP connection retry timer.

Syntax
bgp connection-retry-timer retry-timer-value

To return to the default configuration, enter the no connection-retry-timer retry-timer-value command.

Parameters
retry-timer-value Enter a value that denotes the time interval after which the session retries the connection. The valid range is from 10 to 65535.

Defaults
60 seconds.

Command Modes
ROUTER BGP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.4.(0.0) Introduced on the S4810.

bgp dampening

Enable BGP route dampening and configure the dampening parameters.

Syntax
bgp dampening [half-life reuse suppress max-suppress-time] [route-map map-name]

To disable route dampening, use the no bgp dampening [half-life reuse suppress max-suppress-time] [route-map map-name] command.
Parameters

**half-life** (OPTIONAL) Enter the number of minutes after which the Penalty is decreased. After the router assigns a Penalty of 1024 to a route, the Penalty is decreased by half after the half-life period expires. The range is from 1 to 45. The default is **15 minutes**.

**reuse** (OPTIONAL) Enter a number as the reuse value, which is compared to the flapping route’s Penalty value. If the Penalty value is less than the reuse value, the flapping route is once again advertised (or no longer suppressed). The range is from 1 to 20000. The default is **750**.

**suppress** (OPTIONAL) Enter a number as the suppress value, which is compared to the flapping route’s Penalty value. If the Penalty value is greater than the suppress value, the flapping route is no longer advertised (that is, it is suppressed). The range is from 1 to 20000. The default is **2000**.

**max-suppress-time** (OPTIONAL) Enter the maximum number of minutes a route can be suppressed. The default is four times the half-life value. The range is from 1 to 255. The default is **60 minutes**.

**route-map map-name** (OPTIONAL) Enter the keyword route-map then the name of a configured route map. Only match commands in the configured route map are supported.

Defaults

Disabled.

Command Modes

- ROUTER BGP
- ROUTER BGP-address-family

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Usage Information

If you enter the bgp dampening command, the default values for half-life, reuse, suppress, and max-suppress-time are applied. The parameters are position-dependent; therefore, if you configure one parameter, configure the parameters in the order they appear in the CLI.

Route refresh is sent when you enable BGP dampening.

Related Commands

- `show ip bgp dampened-paths` — view the BGP paths.

**bgp default local-preference**

Change the default local preference value for routes exchanged between internal BGP peers.

**Syntax**

```
bgp default local-preference value
```

To return to the default value, use the `no bgp default local-preference` command.

**Parameters**

- `value`
  
Enter a number to assign to routes as the degree of preference for those routes. When routes are compared, the higher the degree of preference or local preference value, the more the route is preferred. The range is from 0 to 4294967295. The default is 100.

**Defaults**

100

**Command Modes**

ROUTER BGP

**Command History**

</tbody>
</table>
All routers apply the bgp default local-preference command setting within the AS. To set the local preference for a specific route, use the set local-preference command in ROUTE-MAP mode.

**Related Commands**

- **set local-preference** — assign a local preference value for a specific route.

---

### bgp dmzlink-bw

Enables BGP Link Bandwidth.

**Syntax**

```
bgp dmzlink-bw
```

To disable BGP Link Bandwidth, enter the `no bgp dmzlink-bw` command.

**Parameters**

- **dmzlink-bw**

  Enter the keyword `dmzlink-bw` to enable BGP Link Bandwidth in BGP multipath.

**Defaults**

N/A

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(0.0P5)</td>

<tr>
<td>9.7(0.0)</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>9.2(1.0)</td>
<td>Introduced on the Z9500.</td>
</tr>
</tbody>
</table>

**Usage Information**

Configuring or un-configuring the command brings down and brings up the BGP Route Manager, this results in tear down and re-establishment of all active sessions.

Link Bandwidth has to be configured on the router to tell it to associate Link Bandwidth with prefixes (paths) and/or to use Link Bandwidth in BGP Multipath route selection.

This is done under BGP configuration and is supported per address family – for IPv4 and IPv6 address families.

The configuration for a particular address family applies across all VRFs configured.

This command must be performed on the router which is attaching link bandwidth to prefixes (typically a border router) as well as the router which is expected to load share traffic proportional to the bandwidth of the external links.
bgp enforce-first-as

Disable (or enable) enforce-first-as check for updates received from EBGP peers.

**Syntax**

```
bgp enforce-first-as
```

To turn off the default, use the `no bgp enforce-first-as` command.

**Defaults**

Enabled

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>7.4.1.0</td>
<td>Introduced.</td>
</tr>
</tbody>
</table>

**Usage Information**

This command is enabled by default, that is for all updates received from EBGP peers, BGP ensures that the first AS of the first AS segment is always the AS of the peer. If not, the update is dropped and a counter is increments. Use the `show ip bgp neighbors` command to view the “failed enforce-first-as check” counter.

If you disable the `enforce-first-as` command, it can be viewed using the `show ip protocols` command.

In the event of an enforce-first-as check failure, the existing BGP session is flapped.

**Related Commands**

- `show ip bgp neighbors` — view the information the BGP neighbors exchange.
- `show ip protocols` — view information on routing protocols.
bfgp fast-external-fallover

Enable the fast external fallover feature, which immediately resets the BGP session if a link to a directly connected external peer fails.

Syntax

bgp fast-external-fallover

To disable fast external fallover, use the no bgp fast-external-fallover command.

Defaults

Enabled

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

Usage Information

The bgp fast-external-fallover command appears in the show config command output.

The fast external fallover configuration is applied only after you manually reset all the existing BGP sessions. As a result, after you execute this command, you must also manually execute the clear ip bgp command in order for the configuration to take effect.
bpg four-octet-as-support

Enable 4-byte support for the BGP process.

Syntax

bpg four-octet-as-support

To disable fast external failover, use the no bpg four-octet-as-support command.

Defaults

Disabled (supports 2-byte format)

Command Modes

ROUTER BGP

Command History

</tbody>
</table>

Usage Information

Routers supporting 4-byte ASNs advertise that function in the OPEN message. The behavior of a 4-byte router is slightly different depending on whether it is speaking to a 2-byte router or a 4-byte router.

When creating Confederations, all the routers in the Confederation must be 4 byte or 2 byte identified routers. You cannot mix them.

Where the 2-byte format is from 1 to 65535, the 4-byte format is from 1 to 4294967295. Both formats are accepted and the advertisements reflect the entered format.

For more information about using the 2 byte or 4-byte format, refer to the Dell EMC Networking OS Configuration Guide.

This command automatically restarts the BGP instance for the configuration to take effect.
**bgp graceful-restart**

To support graceful restart as a receiver only, enable graceful restart on a BGP neighbor, a BGP node, or designate a local router.

**Syntax**

```plaintext
gbg graceful-restart [restart-time seconds] [stale-path-time seconds] [role receiver-only]
```

To return to the default, use the `no bgp graceful-restart` command.

**Parameters**

- **restart-time seconds**
  - Enter the keyword `restart-time` then the maximum number of seconds to restart and bring-up all the peers. The range is from 1 to 3600 seconds. The default is **120 seconds**.

- **stale-path-time seconds**
  - Enter the keyword `stale-path-time` then the maximum number of seconds to wait before restarting a peer’s stale paths. The default is **360 seconds**.

- **role receiver-only**
  - Enter the keyword `role receiver-only` to designate the local router to support graceful restart as a receiver only.

**Defaults**

as above

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.1)
  - Introduced on the S6010-ON and S4048T-ON.

- 9.10(0.0)
  - Introduced on the S3148.

- 9.10(0.0)
  - Introduced on the S6100-ON.

- 9.8(2.0)
  - Introduced on the S3100 series.

- 9.8(1.0)
  - Introduced on the Z9100-ON.

- 9.8(0.0P5)
  - Introduced on the S4048-ON.

- 9.8(0.0P2)
  - Introduced on the S3048-ON.

- 9.7(0.0)
  - Introduced on the S6000--ON.

- 9.2(1.0)
  - Introduced on the Z9500.

- 9.0.2.0
  - Introduced on the S6000.

- 8.3.19.0
  - Introduced on the S4820T.

- 8.3.11.1
  - Introduced on the Z9000.

- 8.3.7.0
  - Introduced on the S4810.

- 7.8.1.0
  - Introduced on the S-Series.

- 7.7.1.0
  - Introduced on the C-Series.

**Usage Information**

This feature is advertised to BGP neighbors through a capability advertisement. In Receiver Only mode, BGP saves the advertised routes of peers that support this capability when they restart.
BGP graceful restart is active only when the neighbor becomes established. Otherwise it is disabled. Graceful-restart applies to all neighbors with established adjacency.

This command automatically restarts the BGP instance for the configuration to take effect.

**bgp non-deterministic-med**

Compare MEDs of paths from different autonomous systems.

**Syntax**

`bgp non-deterministic-med`

To return to the default, use the `no bgp non-deterministic-med` command.

**Defaults**

Disabled (that is, paths/routes for the same destination but from different ASs do not have their MEDs compared).

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

In Non-Deterministic mode, paths are compared in the order in which they arrive. This method can lead to Dell EMC Networking OS choosing different best paths from a set of paths, depending on the order in which they are received from the neighbors because MED may or may not get compared between adjacent paths. In Deterministic mode (no bgp non-deterministic-med), Dell EMC Networking OS compares MED between adjacent paths within an AS group because all paths in the AS group are from the same AS.

When you change the path selection from Deterministic to Non-Deterministic, the path selection for the existing paths remains Deterministic until you enter the `clear ip bgp` command to clear existing paths.
**bgp outbound-optimization**

Enables outbound optimization for IBGP peer-group members.

**Syntax**

```
bgp outbound-optimization
```

To disable outbound optimization, enter the `no bgp outbound-optimization` command.

**Defaults**

Enabled.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.4.(0.0)</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>9.2(1.0)</td>
<td>Introduced on the Z9500.</td>
</tr>
</tbody>
</table>

**Usage Information**

The updates are sent to all the neighbors in the peer-group and all the neighbors have the same attributes including next-hop.

Enabling or disabling outbound optimization dynamically resets all neighbor sessions.

When you enable outbound optimization, all peers receive the same update packets. Also, the next-hop address, which is chosen as one of the addresses of the neighbor's reachable interface, is the same for all peers.

---

**bgp recursive-bgp-next-hop**

Enable next-hop resolution through other routes learned by BGP.

**Syntax**

```
bgp recursive-bgp-next-hop
```

To disable next-hop resolution, use the `no bgp recursive-bgp-next-hop` command.

**Defaults**

Enabled

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>

<td>Introduced on the S6100-ON.</td>
</tr>
<tr>
<td>9.8(2.0)</td>
<td>Introduced on the S3100 series.</td>
</tr>
</tbody>
</table>
Usage Information

This command is a knob to disable BGP next-hop resolution using BGP learned routes. During the next-hop resolution, only the first route that the next-hop resolves through is verified for the route's protocol source and is checked if the route is learned from BGP or not.

The `clear ip bgp` command is required for this command to take effect and to keep the BGP database consistent. Execute the `clear ip bgp` command right after executing this command.

Related Commands

- `clear ip bgp` — clear the ip bgp.

`bgp regex-eval-optz-disable`

Disables the Regex Performance engine that optimizes complex regular expression with BGP.

**Syntax**

```plaintext
bgp regex-eval-optz-disable
```

To re-enable optimization engine, use the `no bgp regex-eval-optz-disable` command.

**Defaults**

Enabled

**Command Modes**

ROUTER BGP (conf-router_bgp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

BGP uses regular expressions (regex) to filter route information. In particular, the use of regular expressions to filter routes based on AS-PATHs and communities is common. In a large-scale configuration, filtering millions of routes based on regular expressions can be quite CPU intensive, as a regular expression evaluation involves generation and evaluation of complex finite state machines.

BGP policies, containing regular expressions to match as-path and communities, tend to use much CPU processing time, which in turn affects the BGP routing convergence. Additionally, the `show bgp` commands, which are filtered through regular expressions, use up CPU cycles particularly with large databases. The Regex Engine Performance Enhancement feature optimizes the CPU usage by caching and reusing regular expression evaluation results. This caching and reuse may be at the expense of RP1 processor memory.

**Examples**

DellEMC(conf-router_bgp)# no bgp regex-eval-optz-disable
DellEMC(conf-router_bgp)# do show ip protocols
Routing Protocol is "ospf 22222"
  Router ID is 2.2.2.2
  Area     Routing for Networks
          51     10.10.10.0/00
Routing Protocol is "bgp 1"
  Cluster Id is set to 10.10.10.0
  Router Id is set to 10.10.10.0
  Fast-external-fallover enabled
  Regular expression evaluation optimization enabled
  Capable of ROUTE_REFRESH
  For Address Family IPv4 Unicast
    BGP table version is 0, main routing table version 0
    Distance: external 20 internal 200 local 200

DellEMC(conf-router_bgp)#

**Related Commands**

- `show ip protocols` — view information on all routing protocols enabled and active on the E-Series.
bgp router-id

Assign a user-given ID to a BGP router.

Syntax

```
bgp router-id ip-address
```

To delete a user-assigned IP address, use the no bgp router-id command.

Parameters

- **ip-address**: Enter an IP address in dotted decimal format to reset only that BGP neighbor.

Defaults

The router ID is the highest IP address of the Loopback interface or, if no Loopback interfaces are configured, the highest IP address of a physical interface on the router.

Command Modes

- **ROUTER BGP**

Command History

Usage Information

Peering sessions are reset when you change the router ID of a BGP router.

This command automatically restarts the BGP instance for the configuration to take effect.
clear ip bgp

Reset BGP sessions. The soft parameter (BGP Soft Reconfiguration) clears the policies without resetting the TCP connection.

```
Syntax
    clear ip bgp [vrf vrf-name] [* | <1-4294967295> | <0.1-65535.65535> | A.B.C.D | X:X:X::X {soft {in | out}} | dampening | flap-statistics | ipv4 | ipv6 | peer-group]

Parameters
    vrf vrf-name
        Enter the keyword vrf and then the name of the VRF to clear all BGP sessions corresponding to that VRF.

        NOTE: Use this attribute to clear a BGP instance corresponding to either a specific address family in a default VRF or an IPv4 address family in a non-default VRF.

    *  
        Enter an asterisk (*) to reset all BGP sessions.

    <1-4294967295>  
        Enter <1-4294967295> to clear peers with the AS number.

    <0.1-65535.65535>  
        Enter <0.1-65535.65535> to clear peers with the AS number in dot format.

    A.B.C.D  
        Enter the BGP neighbor address in the A.B.C.D format to clear.

    X:X:X::X  
        Enter the BGP neighbor address in the X:X:X::X format to clear.

    soft  
        (OPTIONAL) Enter the keyword soft to configure and activate policies without resetting the BGP TCP session, that is, BGP Soft Reconfiguration.

        NOTE: If you enter the clear ip bgp ip-address soft command, both inbound and outbound policies are reset.

    in  
        (OPTIONAL) Enter the keyword in to activate only inbound policies.

    out  
        (OPTIONAL) Enter the keyword out to activate only outbound policies.

        NOTE: You must execute the clear ip bgp soft out command when ever there is a change in the local policy. If you do not run this command after a local policy change, then these policy changes are not reflected in the responses to the peer’s route refresh messages.

    dampening  
        Enter the keyword dampening to clear the flap dampening information.

    flap-statistics  
        Enter the keywords flap-statistics to clear the flap statistics information.

    ipv4  
        Enter the ipv4 address family to clear.

    ipv6  
        Enter the ipv6 address family to clear.

    peer-group  
        Enter the peer-group to clear all members of the peer-group.

Command Modes
    EXEC Privilege

Command History

**Related Commands**

- `bgp recursive-bgp-next-hop` — disable next-hop resolution through other routes learned by the BGP.

**clear ip bgp dampening**

Clear information on route dampening and return the suppressed route to the Active state.

**Syntax**

```
clear ip bgp [vrf vrf-name] [ipv4 [multicast | unicast] | ipv6 unicast] [dampening [ipv4-address mask | ipv6-address mask]]
```

**Parameters**

- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf and then the name of the VRF to clear information on route dampening corresponding to that VRF.

  **NOTE:** You can use this attribute on a specific VRF to remove history routes corresponding to that VRF. You can also use this attribute to return the suppressed routes corresponding to a specific VRF to an active state.

- **ipv4 multicast** (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to clear the ipv4 multicast routes.

- **ipv4 unicast** (OPTIONAL) Enter the keyword ipv4 followed by the keyword unicast to clear the ipv4 unicast routes.
ipv6 unicast  (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to clear the ipv6 unicast routes.

ipv4-address mask  (OPTIONAL) Enter an IPv4 address in dotted decimal format and the prefix mask in slash format (/x) to clear dampening information only that BGP neighbor.

ipv6-address mask  (OPTIONAL) Enter the IPv6 address and the network mask to clear information on IPv6 route dampening.

Command Modes  
EXEC Privilege

Command History  
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version  Description
9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the S6100-ON.
9.8(2.0)  Introduced on the S3100 series.
9.8(1.0)  Introduced on the Z9100–ON.
9.8(0.0P6)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)  Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)  Added support for VRF.
9.2(1.0)  Introduced on the Z9500.
9.0.2.0  Introduced on the S6000.
8.3.19.0  Introduced on the S4820T.
8.3.11.1  Introduced on the Z9000.
8.3.7.0  Introduced on the S4810.
7.8.1.0  Introduced on the S-Series.
7.7.1.0  Introduced on the C-Series.

Usage Information  
After you enter this command, the software deletes the history routes and returns the suppressed routes to the Active state.

The clear ip bgp dampening command does not clear the history paths.
clear ip bgp flap-statistics

Clear BGP flap statistics, which includes number of flaps and the time of the last flap.

Syntax

```
clear ip bgp [vrf vrf-name] [ipv4 [multicast | unicast] | ipv6 unicast] [flap-statistics [ipv4-address mask | ipv6-address mask] | filter-list as-path-name | regexp regular-expression]
```

Parameters

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to clear BGP flap statistics corresponding to that VRF.
  
  **NOTE:** You can use this attribute on a specific VRF to remove history routes corresponding to that VRF. You can also use this attribute to return the suppressed routes corresponding to a specific VRF to an active state.

- `ipv4 multicast` (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to clear information related only to ipv4 multicast routes.

- `ipv4 unicast` (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to clear information related only to ipv4 unicast routes.

- `ipv6 unicast` (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to clear information related only to ipv6 unicast routes.

- `ipv4-address mask` (OPTIONAL) Enter an IPv4 address in dotted decimal format and the prefix mask in slash format (/x) to reset only that prefix.

- `ipv6-address mask` (OPTIONAL) Enter the IPv6 address followed by the network mask to reset only that prefix.

- `filter-list as-path-name` (OPTIONAL) Enter the keywords `filter-list` then the name of a configured AS-PATH list.

- `regexp regular-expression` (OPTIONAL) Enter the keyword `regexp` then regular expressions. Use one or a combination of the following:
  
  - . = (period) any single character (including a white space).
  - * = (asterisk) the sequences in a pattern (0 or more sequences).
  - + = (plus) the sequences in a pattern (1 or more sequences).
  - ? = (question mark) sequences in a pattern (either 0 or 1 sequences).

  **NOTE:** Enter an escape sequence (CTRL+v) prior to entering the `?` regular expression.

  - [ ] = (brackets) a range of single-character patterns.
  - ( ) = (parenthesis) groups a series of pattern elements to a single element.
  - { } = (braces) minimum and the maximum match count.
  - ^ = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
  - $ = (dollar sign) the end of the output string.
clear ip bgp peer-group

Reset a peer-group’s BGP sessions.

Syntax

clear ip bgp [vrf vrf-name] peer-group peer-group-name [ipv4 [multicast | unicast] | ipv6 unicast] [soft {in | out}]

Parameters

vrf vrf-name Enter the keyword vrf and then the name of the VRF to reset the peer group corresponding to that VRF.
NOTE: You can use this attribute on a specific VRF to remove history routes corresponding to that VRF. You can also use this attribute to return the suppressed routes corresponding to a specific VRF to an active state.

`peer-group-name` Enter the peer group name to reset the BGP sessions within that peer group.

`ipv4 multicast` (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to reset `ipv4` multicast routes.

`ipv4 unicast` (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to reset `ipv4` unicast routes.

`ipv6 unicast` (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to reset `ipv6` unicast routes.

`soft` (OPTIONAL) Enter the keyword `soft` to reset soft configuration.

`in` Enter the keyword `in` to re-configure soft inbound updates.

`out` Enter the keyword `out` to re-configure soft outbound updates.

**Command Modes**

EXEC Privilege

deny bandwidth

Enables you to specify link band width extended-community attribute as the matching criteria to deny incoming or outgoing traffic.

Syntax

```
deny bandwidth
```
To disable this setting, enter the `no deny bandwidth` command.

**Parameters**

- **bandwidth**
  Enter the keyword `bandwidth` to specify extended-community attribute as the matching criteria for denying traffic. The range is from 0 to 102400.

**Defaults**

N/A

**Command Modes**

EXTENDED COMMUNITY LIST

**Command History**

**Related Commands**

- `permit bandwidth` — specify link bandwidth extended-community attribute as the matching criteria to permitting incoming or outgoing traffic.

---

**debug ip bgp**

Display all information on BGP, including BGP events, keepalives, notifications, and updates.

**Syntax**

```
debug ip bgp [vrf vrf-name | A.B.C.D | X:X:X::X | peer-group peer-group-name] [in | out]
```

To disable all BGP debugging, use the `no debug ip bgp` command.

**Parameters**

- **vrf vrf-name**
  Enter the keyword `vrf` and then the name of the VRF to debug BGP information corresponding to that VRF.

  **NOTE:** Use this attribute to debug BGP protocol operations corresponding to either a default or non-default VRF.

- **A.B.C.D**
  Enter the IPv4 address of the neighbor in dotted decimal format.

- **X:X:X::X**
  (OPTIONAL) Enter an IPv6 address.
Enter the keywords `peer-group` then the name of the peer group to debug.

**Command Modes**

- EXEC Privilege

**Command History**

</tr>
</tbody>
</table>
Usage Information

To view information on both incoming and outgoing routes, do not include the in and out parameters in the debugging command. The in and out parameters cancel each other; for example, if you enter the `debug ip bgp in` command and then enter the `debug ip bgp out` command, you do not see information on the incoming routes.

Entering a `no debug ip bgp` command removes all configured debug commands for BGP.

Related Commands

- `debug ip bgp events` — view information about BGP events.
- `debug ip bgp keepalives` — view information about BGP keepalives.
- `debug ip bgp notifications` — view information about BGP notifications.
- `debug ip bgp updates` — view information about BGP updates.
- `show debugging` — view enabled debugging operations.

**debug ip bgp dampening**

View information on routes being dampened.

**Syntax**

```
debug ip bgp [vrf vrf-name] [ipv4 {unicast | multicast} | ipv6 unicast] dampening
```

To disable debugging, use the `no debug ip bgp dampening` command.

**Parameters**

- `vrf vrf-name` Enter the keyword vrf followed by the name of the VRF to view information on dampened routes corresponding to that VRF.
- `ipv4 multicast` (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view dampened-route information related only to ipv4 multicast routes.
- `ipv4 unicast` (OPTIONAL) Enter the keyword ipv4 followed by the keyword unicast to view dampened-route information related only to ipv4 unicast routes.
- `ipv6 unicast` (OPTIONAL) Enter the keyword ipv4 followed by the keyword unicast to view dampened-route information related only to ipv6 unicast routes.

debug ip bgp events

Display information on local BGP state changes and other BGP events.

Syntax

debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X::X | peer-group peer-group-name] events [in | out]

To disable debugging, use the no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X::X | peer-group peer-group-name] events [in | out] command.

Parameters

- vrf vrf-name (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display BGP state changes corresponding to that VRF.
- A.B.C.D (OPTIONAL) Enter the IPv4 address of the neighbor.
- X:X:X::X (OPTIONAL) Enter an IPv6 address.
- peer-group peer-group-name (OPTIONAL) Enter the keyword peer-group then the name of the peer group.
- in (OPTIONAL) Enter the keyword in to view only events on inbound BGP messages.
- out (OPTIONAL) Enter the keyword out to view only events on outbound BGP messages.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
Version | Description
----- | -------------------------
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.

**Usage Information**
To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

**debug ip bgp keepalives**
Display information about BGP keepalive messages.

**Syntax**
```
debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X::X | peer-group peer-group-name] keepalives [in | out]
```
To disable debugging, use the `no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X::X | peer-group peer-group-name] keepalives [in | out]` command.

**Parameters**
- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display BGP keepalive information corresponding to that VRF.
- **A.B.C.D** (OPTIONAL) Enter the IPv4 address of the neighbor.
- **X:X:X::X** (OPTIONAL) Enter an IPv6 address.
- **peer-group peer-group-name** (OPTIONAL) Enter the keyword peer-group then the name of the peer group.
- **in** (OPTIONAL) Enter the keyword in to view only inbound keepalive messages.
- **out** (OPTIONAL) Enter the keyword out to view only outbound keepalive messages.

**Command Modes**
EXEC Privilege

### Usage Information

To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

---

**debug ip bgp notifications**

Allows you to view information about BGP notifications received from neighbors.

**Syntax**

```plaintext
download ip bgp [vrf vrf-name] [A.B.C.D | X:X:X::X | peer-group peer-group-name] notifications [in | out]
```

To disable debugging, use the `no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X::X | peer-group peer-group-name] notifications [in | out]` command.

### Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view neighbor BGP notification information corresponding to that VRF.
- **A.B.C.D** (OPTIONAL) Enter the IPv4 address of the neighbor.
- **X:X:X::X** (OPTIONAL) Enter an IPv6 address.
- **peer-group peer-group-name** (OPTIONAL) Enter the keyword `peer-group` then the name of the peer group.
- **in** (OPTIONAL) Enter the keyword `in` to view BGP notifications received from neighbors.
- **out** (OPTIONAL) Enter the keyword `out` to view BGP notifications sent to neighbors.

**Usage Information**
To remove all configured debug commands for BGP, enter the `no debug ip bgp` command.

**debug ip bgp soft-reconfiguration**

Enable soft-reconfiguration debug.

**Syntax**

```
debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X | peer-group-name] soft-reconfiguration
```

To disable, use the `debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X | peer-group-name] soft-reconfiguration` command.

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable soft-reconfiguration debugging on that VRF.
- `A.B.C.D` (OPTIONAL) Enter the IPv4 address of the neighbor in dotted decimal format.
- `X:X:X:X` (OPTIONAL) Enter an IPv6 address.
- `peer-group-name` (OPTIONAL) Enter the name of the peer group to disable or enable all routers within the peer group.
Defaults
Disabled

Usage Information
This command turns on BGP soft-reconfiguration inbound debugging. If no neighbor is specified, debug turns on for all neighbors.

dbg ip bgp updates

Allows you to view information about BGP updates.

Syntax

dbg ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] updates [in | out | prefix-list prefix-list-name]

to disable debugging, use the no debug ip bgp [vrf vrf-name] [A.B.C.D | X:X:X:X::X | peer-group peer-group-name] updates [in | out | prefix-list prefix-list-name] command.

Parameters

vrf vrf-name  (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to view BGP updates information corresponding to that VRF.
A.B.C.D  (OPTIONAL) Enter an IPv4 address of the neighbor.
X:XXX::X  (OPTIONAL) Enter an IPv6 address.
peer-group peer-group-name  (OPTIONAL) Enter the keyword peer-group followed by the name of the peer group.
in  (OPTIONAL) Enter the keyword in to view only BGP updates received from neighbors.
out  (OPTIONAL) Enter the keyword out to view only BGP updates sent to neighbors.
prefix-list prefix-list-name  (OPTIONAL) Enter the keyword prefix-list then the name of an established prefix list. If the prefix list is not configured, the default is permit (to allow all routes).
ip-address  (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
peer-group-name  (OPTIONAL) Enter the name of the peer group to disable or enable all routers within the peer group.

</tbody>
</table>

Usage Information
To remove all configured debug commands for BGP, enter the no debug ip bgp command.
**default-metric**

Allows you to change the metric of redistributed routes to locally originated routes. Use this command with the `redistribute` command.

**Syntax**

```
default-metric number
```

To return to the default setting, use the `no default-metric` command.

**Parameters**

- `number` Enter a number as the metric to be assigned to routes from other protocols. The range is from 1 to 4294967295.

**Defaults**

0

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

</table>

**Usage Information**

The `default-metric` command in BGP sets the value of the BGP MULTI_EXIT_DISC (MED) attribute for redistributed routes only.

**Related Commands**

- `bgp always-compare-med` — enable comparison of all BGP MED attributes.
description

Enter a description of the BGP routing protocol.

Syntax
description \{description\}

To remove the description, use the no description \{description\} command.

Parameters

\textbf{description} \hspace{1cm} Enter a description to identify the BGP protocol (80 characters maximum).

Defaults
none

Command Modes
ROUTER BGP

Related Commands

- \textbf{router bgp} — enter ROUTER mode on the switch.
**maximum-paths**

Configure the maximum number of parallel routes (multipath support) BGP supports.

**Syntax**

```plaintext
maximum-paths {ebgp | ibgp} number
```

To return to the default values, enter the `no maximum-paths` command.

**Parameters**

- **ebgp**
  - Enter the keyword `ebgp` to enable multipath support for External BGP routes.
- **ibgp**
  - Enter the keyword `ibgp` to enable multipath support for Internal BGP routes.
- **number**
  - Enter a number as the maximum number of parallel paths. The range is from 2 to 64.

**Defaults**

`none`

**Command Modes**

`ROUTER BGP`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.1)
  - Introduced on the S6010-ON and S4048T-ON.
- 9.10(0.0)
  - Introduced on the S3148.
- 9.10(0.0)
  - Introduced on the S6100-ON.
- 9.8(2.0)
  - Introduced on the S3100 series.
- 9.8(1.0)
  - Introduced on the Z9100-ON.
- 9.8(0.0P5)
  - Introduced on the S4048-ON.
- 9.8(0.0P2)
  - Introduced on the S3048-ON.
- 9.7(0.0)
  - Introduced on the S6000-ON.
- 9.2(1.0)
  - Introduced on the Z9500.
- 9.0.2.0
  - Introduced on the S6000.
- 8.3.19.0
  - Introduced on the S4820T.
- 8.3.11.1
  - Introduced on the Z9000.
- 8.3.8.0
  - Support from 2 to 64 paths on the S4810. Command syntax changed to `max-path` (was `maximum-paths`).
- 8.3.7.0
  - Introduced on the S4810.
- 7.8.1.0
  - Introduced on the S-Series.
- 7.7.1.0
  - Introduced on the C-Series.

**Usage Information**

If you enable this command, use the `clear ip bgp *` command to recompute the best path.
**neighbor activate**

This command allows the specified neighbor/peer group to be enabled for the current AFI/SAFI (Address Family Identifier/Subsequent Address Family Identifier).

Syntax

```
neighbor [ip-address | peer-group-name] activate
```

To disable, use the `no neighbor [ip-address | peer-group-name] activate` command.

Parameters

- **ip-address**  
  (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name**  
  (OPTIONAL) Enter the name of the peer group.
- **activate**  
  Enter the keyword `activate` to enable the neighbor/peer group in the new AFI/SAFI.

Defaults

IPv4 Unicast – Enabled.
IPv6 Unicast – Disabled.

Command Modes

- **CONFIGURATION-ROUTER-BGP-ADDRESS FAMILY**

</table>

Usage Information

By default, when you create a neighbor/peer group configuration in the Router BGP context, this enables IPv4/Unicast AFI/SAFI. When you use `activate` in the new context, the neighbor/peer group enables for AFI/SAFI. It is possible to activate or de-activate a peer from the IPv4/IPv6 unicast address family.
The no neighbor peer ip-address activate command takes precedence over the no neighbor peer-group-name activate command.

The following table lists the neighbor activation and its expected results:

<table>
<thead>
<tr>
<th>S.No</th>
<th>Peer IP-Address</th>
<th>Peer-Group-Name</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Activate</td>
<td>Activate</td>
<td>Send Updates</td>
</tr>
<tr>
<td>2</td>
<td>Activate</td>
<td>No-Activate</td>
<td>Send Updates</td>
</tr>
<tr>
<td>3</td>
<td>No-Activate</td>
<td>Activate</td>
<td>Stop Updates</td>
</tr>
<tr>
<td>4</td>
<td>No-Activate</td>
<td>No-Activate</td>
<td>Stop Updates</td>
</tr>
</tbody>
</table>

**neighbor add-path**

This command allows the specified neighbor/peer group to send/receive multiple path advertisements.

**Syntax**

```
neighbor [ip-address | peer-group-name] add-path [send | receive | both] path-count
```

**Parameters**

- **ip-address**
  - (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name**
  - (OPTIONAL) Enter the name of the peer group.
- **send**
  - Enter the keyword send to indicate that the system sends multiple paths to peers.
- **receive**
  - Enter the keyword receive to indicate that the system accepts multiple paths from peers.
- **both**
  - Enter the keyword both to indicate that the system sends and accepts multiple paths from peers.
- **path-count**
  - Enter the number paths supported. The range is from 2 to 64.

**Defaults**

none

**Command Modes**

CONFIGURATION-ROUTER-BGP-ADDRESS FAMILY

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

## Related Commands

- `bgp add-path` — allow the advertisement of multiple paths for the same address prefix without the new paths implicitly replacing any previous ones.

## neighbor advertisement-interval

Set the advertisement interval between BGP neighbors or within a BGP peer group.

### Syntax

```
neighbor {ip-address | peer-group-name} advertisement-interval seconds
```

To return to the default value, use the `no neighbor {ip-address | peer-group-name} advertisement-interval` command.

### Parameters

- `ip-address` (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- `peer-group-name` Enter the name of the peer group to set the advertisement interval for all routers in the peer group.
- `seconds` Enter a number as the time interval, in seconds, between BGP advertisements. The range is from 0 to 600 seconds. The default is 5 seconds for internal BGP peers and 30 seconds for external BGP peers.

### Defaults

- `seconds = 5 seconds` (internal peers)
- `seconds = 30 seconds` (external peers)

### Command Modes

- `ROUTER BGP`

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**neighbor advertisement-start**

To send BGP routing updates, set the minimum interval before starting.

**Syntax**
```
neighbor {ip-address} advertisement-start seconds
```
To return to the default value, use the `no neighbor {ip-address} advertisement-start` command.

**Parameters**
- `ip-address` (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- `seconds` Enter a number as the time interval, in seconds, before BGP route updates are sent. The range is from 0 to 3600 seconds.

**neighbor allowas-in**

Set the number of times an AS number can occur in the AS path.

**Syntax**
```
neighbor {ip-address | peer-group-name} allowas-in number
```

To return to the default value, use the `no neighbor {ip-address | peer-group-name} allowas-in` command.

**Parameters**

- **ip-address** (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name** Enter the name of the peer group to set the advertisement interval for all routers in the peer group.
- **number** Enter a number of times to allow this neighbor ID to use the AS path. The range is from 1 to 10.

**Defaults**
Not configured.

**Command Modes**
ROUTER BGP

**Command History**

</table>
Usage Information

You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

Related Commands

- `bgp four-octet-as-support` — enable 4-byte support for the BGP process.

**neighbor default-originate**

Inject the default route to a BGP peer or neighbor.

**Syntax**

```
neighbor {ip-address | peer-group-name} default-originate [route-map map-name]
```

To remove a default route, use the `no neighbor {ip-address | peer-group-name} default-originate` command.

**Parameters**

- `ip-address` (OPTIONAL) Enter the IP address of the neighbor in dotted decimal format.
- `peer-group-name` Enter the name of the peer group to set the default route of all routers in that peer group.
- `route-map map-name` (OPTIONAL) Enter the keyword `route-map` then the name of a configured route map.

**Defaults**

Not configured.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
Usage Information

If you apply a route map to a BGP peer or neighbor with the neighbor default-originate command configured, the software does not apply the set filters in the route map to that BGP peer or neighbor.

When you configure a route-map for a BGP peer or peer group with the neighbor default-originate command, the command checks for the existence of the route in BGP RIB.

Route-map configuration on a BGP peer or peer group works only when the LOC-RIB contains at least one route.

When you apply a default route to a BGP peer or peer group using the neighbor default-originate command, changes to the configured default route-map are applied to the BGP peer or peer group only after a delay of 15 seconds. As a result, you must wait for a period of 15 seconds before manually resetting BGP using the clear ip bgp command.

In case of eBGP, the neighbor default-originate command does not support extended-community as a non-transitive route-map attribute.

You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.

In order that settings corresponding to the neighbor default-originate command take effect, you must execute the clear ip bgp command immediately after you execute the neighbor default-originate command.

neighbor description

Assign a character string describing the neighbor or group of neighbors (peer group).

Syntax

neighbor {ip-address | peer-group-name} description text

To delete a description, use the no neighbor {ip-address | peer-group-name} description command.

Parameters

- **ip-address**: Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name**: Enter the name of the peer group.
- **text**: Enter a continuous text string up to 80 characters.

Defaults

Not configured.

Command Modes

ROUTER BGP

Command History

neighbor distribute-list

Distribute BGP information via an established prefix list.

Syntax

neighbor {ip-address | peer-group-name} distribute-list prefix-list-name {in | out}

To delete a neighbor distribution list, use the no neighbor {ip-address | peer-group-name} distribute-list prefix-list-name {in | out} command.

Parameters

ip-address

Enter the IP address of the neighbor in dotted decimal format.

peer-group-name

Enter the name of the peer group to apply the distribute list filter to all routers in the peer group.

prefix-list-name

Enter the name of an established prefix list.

If the prefix list is not configured, the default is permit (to allow all routes).

in

Enter the keyword in to distribute only inbound traffic.

out

Enter the keyword out to distribute only outbound traffic.

Defaults

Not configured.

Command Modes

ROUTER BGP

Command History

**Usage Information**

Other BGP filtering commands include: neighbor filter-list, ip as-path access-list, and neighbor route-map.

**Related Commands**

- `neighbor route-map` — assign a route map to a neighbor or peer group.

---

**neighbor ebgp-multihop**

Attempt and accept BGP connections to external peers on networks that are not directly connected.

**Syntax**

```
neighbor {ip-address | peer-group-name} ebgp-multihop [ttl]
```

To disallow and disconnect connections, use the `no neighbor {ip-address | peer-group-name} ebgp-multihop` command.

**Parameters**

- **ip-address**
  - Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name**
  - Enter the name of the peer group.
- **ttl**
  - (OPTIONAL) Enter the number of hops as the Time to Live (ttl) value. The range is from 1 to 255. The default is **255**.

**Defaults**

Disabled.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>
Version | Description
--------|-----------------|
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.

Usage Information
To prevent loops, the neighbor ebgp-multihop command does not install the default routes of the multihop peer. Networks not directly connected are not considered valid for best-path selection.

neighbor fall-over

Enable or disable fast fall-over for BGP neighbors.

Syntax
neighbor {ipv4-address | peer-group-name} fall-over
To disable, use the no neighbor {ipv4-address | peer-group-name} fall-over command.

Parameters
- **ipv4-address**: Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name**: Enter the name of the peer group.

Defaults
Disabled.

Command Modes
ROUTER BGP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version | Description
--------|-----------------|
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(1.0) | Introduced on the Z9100--ON.
9.8(0.0) | Introduced on the S3048--ON and S4048--ON.
9.7(0.0) | Introduced on the S6000--ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
Version Description
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.
7.7.1.0 Introduced on the C-Series.
7.4.1.0 Introduced

Usage Information
When you enable failover, BGP keeps track of IP or IPv6 ability to reach the peer remote address and the peer local address. Whenever either address becomes unreachable (for example, no active route exists in the routing table for the peer IP or IPv6 destination/local address), BGP brings down the session with the peer.

Related Commands
- show ip bgp neighbors — display information on the BGP neighbors.

neighbor local-as

To accept external routes from neighbors with a local AS number in the AS number path, configure Internal BGP (IBGP) routers.

Syntax
neighbor {ip-address | peer-group-name} local-as as-number [no-prepend]

To return to the default value, use the no neighbor {ip-address | peer-group-name} local-as command.

Parameters
- ip-address: Enter the IP address of the neighbor in dotted decimal format.
- peer-group-name: Enter the name of the peer group to set the advertisement interval for all routers in the peer group.
- as-number: Enter the AS number to reset all neighbors belonging to that AS. The range is from 0 to 65535 (2 byte), from 1 to 4294967295 (4 byte) or from 0.1 to 65535.65535 (dotted format).
- no prepend: Specifies that local AS values do not prepend to announcements from the neighbor.

Defaults
Not configured.

Command Modes
ROUTER BGP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
Version | Description
---|---
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.

Usage Information
If a local-as is configured, BGP does not allow for the configuration of BGP confederation. Similarly, if BGP confederation is configured, then BGP does not allow the configuration of local-as.

This command automatically restarts the neighbor session for the configuration to take effect.

Related Commands
- `bgp four-octet-as-support` — enable 4-byte support for the BGP process.

**neighbor maximum-prefix**

Control the number of network prefixes received.

**Syntax**
```
neighbor {ip-address | peer-group-name} maximum-prefix maximum [threshold] [warning-only]
```

To return to the default values, use the `no neighbor {ip-address | peer-group-name} maximum-prefix maximum` command.

**Parameters**
- **ip-address**
  - Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name**
  - Enter the name of the peer group.
- **maximum**
  - Enter a number as the maximum number of prefixes allowed for this BGP router. The range is from 1 to 4294967295.
- **threshold**
  - (OPTIONAL) Enter a number to be used as a percentage of the maximum value. When the number of prefixes reaches this percentage of the maximum value, the E-Series software sends a message. The range is from 1 to 100 percent. The default is 75.
- **warning-only**
  - (OPTIONAL) Enter the keyword `warning-only` to set the router to send a log message when the maximum value is reached. If this parameter is not set, the router stops peering when the maximum number of prefixes is reached.

**Defaults**
- `threshold = 75`

**NOTE:** When you set this option, the router accepts BGP prefixes only until the maximum configured value. After the maximum number is reached, the router drops any additional prefixes that it receives.
Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

Usage Information

If you configure the neighbor maximum-prefix command and the neighbor receives more prefixes than the neighbor maximum-prefix command configuration allows, the neighbor goes down and the show ip bgp summary command displays (prfxd) in the State/PfxRcd column for that neighbor. The neighbor remains down until you enter the clear ip bgp command for the neighbor or the peer group to which the neighbor belongs or you enter the neighbor shutdown and neighbor no shutdown commands.

Related Commands

- `show ip bgp summary` — display the current BGP configuration.

neighbor next-hop-self

Allows you to configure the router as the next hop for a BGP neighbor.

**Syntax**

```
neighbor {ip-address | peer-group-name} next-hop-self [all]
```

To return to the default setting, use the `no neighbor {ip-address | peer-group-name} next-hop-self [all]` command.

**Parameters**

- `ip-address` Enter the IP address of the neighbor in dotted decimal format.
- `peer-group-name` Enter the name of the peer group.
- `all` Specifies that the route reflector is the next hop for both iBGP and eBGP-learned routes.
Defaults
Disabled.

Command Modes
ROUTER BGP

Command History

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.0)</td>
<td>Introduced the all keyword on the S4810, S4820, S4048-ON, S3048-ON, S3100 series, S6010-ON, S4040T-ON, S5000, S6000, S6000-ON, S6100-ON, Z9100-ON, and Z9500.</td>
</tr>
<tr>
<td>9.2(1.0)</td>
<td>Introduced on the Z9500.</td>
</tr>
<tr>
<td>9.0.2.0</td>
<td>Introduced on the S6000.</td>
</tr>
<tr>
<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>7.8.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

Usage Information
If you configure the set next-hop command in ROUTE-MAP mode, the configuration takes precedence over the neighbor next-hop-self command.

If you do not use the all keyword, the next hop of only eBGP-learned routes is updated by the route reflector. If you use the all keyword, the next hop of both eBGP- and iBGP-learned routes are updated by the route reflector.

neighbor password

Enable message digest 5 (MD5) authentication on the TCP connection between two neighbors.

Syntax
neighbor {ip-address | peer-group-name} password [encryption-type] password
To delete a password, use the no neighbor {ip-address | peer-group-name} password command.

Parameters
- **ip-address**: Enter the IP address of the router to be included in the peer group.
- **peer-group-name**: Enter the name of a configured peer group.
- **encryption-type**: (OPTIONAL) Enter 7 as the encryption type for the password entered. 7 means that the password is encrypted and hidden.
- **password**: Enter a text string up to 80 characters long. The first character of the password must be a letter.

You cannot use spaces in the password.

Defaults
Not configured.

Command Modes
ROUTER BGP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S6010-ON and S4048T-ON.</td>
</tr>
</tbody>
</table>
Usage Information

This command automatically restarts the neighbor session for the configuration to take effect.

Configure the same password on both BGP peers or a connection does not occur. When you configure MD5 authentication between two BGP peers, each segment of the TCP connection between them is verified and the MD5 digest is checked on every segment sent on the TCP connection.

Configuring a password for a neighbor causes an existing session to be torn down and a new one established.

If you specify a BGP peer group by using the peer-group-name parameter, all the members of the peer group inherit the characteristic configured with this command.

If you configure a password on one neighbor, but you have not configured a password for the neighboring router, the following message appears on the console while the routers attempt to establish a BGP session between them:

```
%RPM0-P:RP1 %KERN-6-INT: No BGP MD5 from [peer's IP address]:179 to [local router's IP address]:65524
```

Also, if you configure different passwords on the two routers, the following message appears on the console:

```
%RPM0-P:RP1 %KERN-6-INT: BGP MD5 password mismatch from [peer's IP address] : 11502 to [local router's IP address] :179
```

**neighbor peer-group (assigning peers)**

Allows you to assign one peer to an existing peer group.

**Syntax**

```
neighbor {ip-address | peer-group peer-group-name} dmzlink-bw
```

To delete a peer from a peer group, use the `no neighbor {ip-address | peer-group peer-group-name}` command.
To disable dmzlink-dw for the peer group, use the `no neighbor ip-address dmzlink-dw` command.

**Parameters**

- **ip-address**
  - Enter the IP address of the router to be included in the peer group.

- **peer-group-name**
  - Enter the name of a configured peer group.

- **dmzlink-bw**
  - Enter the keyword `dmzlink-bw` to attach a link bandwidth to received routes.

**NOTE:** If dmzlink-bw is configured for a peer, in order for the BGP peer to advertise the prefixes with dmzlink-bw attached to it, you must reset the peer or peer-group using the `clear ip bgp session` command.

**Defaults**

Not configured.

**Command Modes**

- `ROUTER BGP`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

You can assign up to 256 peers to one peer group.

When you add a peer to a peer group, it inherits all the peer group’s configured parameters. A peer cannot become part of a peer group if any of the following commands are configured on the peer:

- `neighbor advertisement-interval`
- `neighbor distribute-list`
- `neighbor route-map`
- `neighbor route-reflector-client`
if a neighbor’s configuration is more specific than its peer group’s configuration, the neighbor may retain its configuration after it is added to the peer group. The neighbor’s configuration does not affect outgoing updates.

A peer group must exist (be enabled) before you add a peer to it. If the peer group is disabled (shutdown), the peers within that group are also disabled (shutdown).

In BGP, you cannot associate a peer to a peer-group without configuring the remote-as for Internal BGP (IBGP) or External BGP (EBGP).

This command automatically restarts the neighbor session for the configuration to take effect.

Related Commands

- `clear ip bgp` — reset BGP sessions.
- `neighbor peer-group (creating group)` — create a peer group.
- `show ip bgp peer-group` — view BGP peers.
- `show ip bgp neighbors` — view BGP neighbors configurations.

neighbor peer-group (creating group)

Allows you to create a peer group and assign it a name.

Syntax

```plaintext
neighbor peer-group-name peer-group
```

To delete a peer group, use the **no neighbor peer-group-name peer-group** command.

Parameters

- `peer-group-name` Enter a text string up to 16 characters long as the name of the peer group.

Defaults

Not configured.

Command Modes

- ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>

</tbody>
</table>
When you create a peer group, it is disabled (Shut mode).

**Related Commands**

- `neighbor peer-group (assigning peers)` — assign routers to a peer group.
- `neighbor remote-as` — assign a indirectly connected AS to a neighbor or peer group.
- `neighbor shutdown` — disable a peer or peer group.

### neighbor peer-group passive

Enable passive peering on a BGP peer group, that is, the peer group does not send an OPEN message, but responds to one.

**Syntax**

```
neighbor peer-group-name peer-group passive [limit sessions]
```

To delete a passive peer-group, use the `no neighbor peer-group-name peer-group passive` command.

**Parameters**

- `peer-group-name` Enter a text string up to 16 characters long as the name of the peer group.
- `limit` (Optional) Enter the keyword `limit` to constrain the numbers of sessions for this peer-group. The range is from 2 to 256. The default is 256.

**Defaults**

Not configured.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
</tbody>
</table>
### Version Description
- **8.3.8.0**: Introduced the `limit` keyword on the S4810.
- **8.3.7.0**: Introduced on the S4810.
- **7.8.1.0**: Introduced on the S-Series.
- **7.7.1.0**: Introduced on the C-Series.

### Usage Information
After you configure a peer group as passive, assign it a subnet using the `neighbor soft-reconfiguration inbound` command.

For passive eBGP limits, the Remote AS must be different from the AS for this neighbor.

### Related Commands
- `neighbor soft-reconfiguration inbound` — assign a subnet to a dynamically configured BGP neighbor.
- `neighbor remote-as` — assign an indirectly connected AS to a neighbor or peer group.

### neighbor remote-as

Create and specify the remote peer to the BGP neighbor.

**Syntax**
```
neighbor {ip-address | peer-group-name} remote-as number
```

To delete a remote AS entry, use the `no neighbor {ip-address | peer-group-name} remote-as number` command.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip-address</code></td>
<td>Enter the IP address of the neighbor to enter the remote AS in its routing table.</td>
</tr>
<tr>
<td><code>peer-group-name</code></td>
<td>Enter the name of the peer group to enter the remote AS into routing tables of all routers within the peer group.</td>
</tr>
<tr>
<td><code>number</code></td>
<td>Enter a number of the AS. The range is from 0 to 65535 (2 byte) or from 1 to 4294967295 (4 byte).</td>
</tr>
</tbody>
</table>

**Defaults**
Not configured.

**Command Modes**
- `ROUTER BGP`

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
</tbody>
</table>
### Version Description

- **9.7(0.0)**: Introduced on the S6000-ON.
- **9.2(1.0)**: Introduced on the Z9500.
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.11.1**: Introduced on the Z9000.
- **8.3.7.0**: Introduced on the S4810.
- **7.8.1.0**: Introduced on the S-Series.
- **7.7.1.0**: Introduced on the C-Series. Added 4-byte support.

### Usage Information

To accept 4-byte formats before entering a 4 byte AS Number, configure your system. If the `number` parameter is the same as the AS number used in the `router bgp` command, the remote AS entry in the neighbor is considered an internal BGP peer entry.

This command creates a peer and the newly created peer is disabled (Shutdown).

This command automatically restarts the neighbor session for the configuration to take effect.

### Related Commands

- `router bgp` — enter ROUTER BGP mode and configures routes in an AS.
- `bgp four-octet-as-support` — enable 4-byte support for the BGP process.

### neighbor remove-private-as

Remove private AS numbers from the AS-PATH of outgoing updates.

**Syntax**

```
neighbor {ip-address | peer-group-name} remove-private-as
```

To return to the default, use the `no neighbor {ip-address | peer-group-name} remove-private-as` command.

**Parameters**

- `ip-address`: Enter the IP address of the neighbor to remove the private AS numbers.
- `peer-group-name`: Enter the name of the peer group to remove the private AS numbers.

**Defaults**

Disabled (that is, private AS number are not removed).

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- **9.10(0.1)**: Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)**: Introduced on the S3148.
- **9.10(0.0)**: Introduced on the S6100-ON.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100-ON.
Usage Information
Applies to EBGP neighbors only.

Configure your system to accept 4-byte formats before entering a 4 byte AS Number.

If the AS-PATH contains both public and private AS number or contains AS numbers of an EBGP neighbor, the private AS numbers are not removed.

If a confederation contains private AS numbers in its AS-PATH, the software removes the private AS numbers only if they follow the confederation numbers in the AS path.

Private AS numbers are from 64512 to 65535 (2 byte).

neighbor route-map
Apply an established route map to either incoming or outbound routes of a BGP neighbor or peer group.

Syntax
neighbor {ip-address | peer-group-name} route-map map-name {in | out}
To remove the route map, use the no neighbor {ip-address | peer-group-name} route-map map-name {in | out} command.

Parameters
ip-address Enter the IP address of the neighbor in dotted decimal format.
peer-group-name Enter the name of the peer group.
map-name Enter the name of an established route map.

If the Route map is not configured, the default is deny (to drop all routes).

in Enter the keyword in to filter inbound routes.
out Enter the keyword out to filter outbound routes.

NOTE: This command sends routes to peers only if an outbound policy is configured and if there is a change in the existing outbound policy.
neighbor route-reflector-client

Configure the router as a route reflector and the specified neighbors as members of the cluster.

Syntax

```
neighbor {ip-address | peer-group-name} route-reflector-client
```

To remove one or more neighbors from a cluster, use the `no neighbor {ip-address | peer-group-name} route-reflector-client` command. If you delete all members of a cluster, you also delete the route-reflector configuration on the router.

Parameters

- `ip-address`: Enter the IP address of the neighbor in dotted decimal format.
- `peer-group-name`: Enter the name of the peer group.
All routers in the peer group receive routes from a route reflector.

Defaults
Not configured.

Command Modes
ROUTER BGP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>7.8.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

Usage Information
A route reflector reflects routes to the neighbors assigned to the cluster. Neighbors in the cluster do not need not to be fully meshed. By default, when you use no route reflector, the internal BGP (IBGP) speakers in the network must be fully meshed.

The first time you enter this command, the router configures as a route reflector and the specified BGP neighbors configure as clients in the route-reflector cluster.

When you remove all clients of a route reflector using the no neighbor route-reflector-client command, the router no longer functions as a route reflector.

If the clients of a route reflector are fully meshed, you can configure the route reflector to not reflect routes to specified clients by using the no bgp client-to-client reflection command.

This command automatically restarts the neighbor session for the configuration to take effect.

Related Commands
- bgp client-to-client reflection — enable route reflection between the route reflector and the clients.
neighbor send-community

Send a COMMUNITY attribute to a BGP neighbor or peer group. A COMMUNITY attribute indicates that all routes with that attribute belong to the same community grouping.

Syntax

neighbor \{ip-address | peer-group-name\} send-community [extended | standard]

To disable sending a COMMUNITY attribute, use the no neighbor \{ip-address | peer-group-name\} send-community command.

Parameters

- **ip-address**: Enter the IP address of the peer router in dotted decimal format.
- **peer-group-name**: Enter the name of the peer group to send a COMMUNITY attribute to all routers within the peer group.
- **extended** (OPTIONAL): Enter the keyword extended to send extended community attribute.
- **standard** (OPTIONAL): Enter the keyword standard to send standard community attribute.

Defaults

Not configured and COMMUNITY attributes are not sent to neighbors.

Command Modes

ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tr>
<td>7.8.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

Usage Information

To configure a COMMUNITY attribute, use the set community command in ROUTE-MAP mode.
In order that settings corresponding to the neighbor send-community command take effect, you must execute the clear ip bgp command immediately after you execute the neighbor send-community command.

If you do not set any of the optional parameters (standard or extended), then both standard as well as extended attributes are sent. If you set either the standard or extended parameter, only the attribute that is specified is sent.

**neighbor sender-side-loopdetect**

Enables sender-side loop detection for BGP.

**Syntax**

neighbor {ip-address | peer-group-name} sender-side-loopdetect

To disable sender-side loop detection, use the no neighbor {ip-address | peer-group-name} sender-side-loopdetect command.

**Parameters**

- **ip-address**: Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name**: Enter the name of the peer group to enable or disable all routers with in the peer group. All routers in the peer group receive routes from a route reflector.

**Defaults**

Enabled.

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>

</tr>
</tbody>
</table>

**Usage Information**

This command enables sender-side-loopdetect for a specified BGP neighbor. BGP does not advertise a route to a peer if the AS-Path of the route already contains the peer’s AS.

**NOTE:** If you configure a neighbor to accept such routes using the neighbor allowas-in command, you must disable sender-side loop detection for that neighbor.

**Related Commands**

- bgp client-to-client reflection — enable route reflection between the route reflector and the clients.
neighbor shutdown

Disable a BGP neighbor or peer group.

**Syntax**

```
neighbor {ip-address | peer-group-name} shutdown
```

To enable a disabled neighbor or peer group, use the `neighbor {ip-address | peer-group-name} no shutdown` command.

**Parameters**

- `ip-address`: Enter the IP address of the neighbor in dotted decimal format.
- `peer-group-name`: Enter the name of the peer group to disable or enable all routers within the peer group.

**Defaults**

Disabled (that is, BGP neighbors and peer groups are disabled.)

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant **Dell EMC Networking OS Command Line Reference Guide**.

</table>

**Usage Information**

Peers that are enabled within a peer group are disabled when their peer group is disabled.

The `neighbor shutdown` command terminates all BGP sessions on the BGP neighbor or BGP peer group. Use this command with caution as it terminates the specified BGP sessions. When a neighbor or peer group is shut down, use the `show ip bgp summary` command to confirm its status.

**Related Commands**

- `show ip bgp summary` — display the current BGP configuration.
neighbor soft-reconfiguration inbound

Enable soft-reconfiguration for BGP.

Syntax
neighbor (ip-address | peer-group-name) soft-reconfiguration inbound
To disable, use the no neighbor (ip-address | peer-group-name) soft-reconfiguration inbound command.

Parameters
- **ip-address**: Enter the IP address of the neighbor in dotted decimal format.
- **peer-group-name**: Enter the name of the peer group to disable or enable all routers within the peer group.

Defaults
Disabled

Command Modes
ROUTER BGP

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced.</td>
</tr>
</tbody>
</table>

Usage Information
This command enables soft-reconfiguration for the BGP neighbor specified. BGP stores all the updates the neighbor receives but does not reset the peer-session.

You cannot set this configuration for a peer that is associated with a peer group. Similarly, you cannot associate a peer to a peer group if that peer is already configured with these settings.
CAUTION: Inbound update storage is a memory-intensive operation. The entire BGP update database from the neighbor is stored in memory regardless of the inbound policy results applied on the neighbor.

Related Commands
- `show ip bgp neighbors` — display routes received by a neighbor.

**neighbor timers**

Set keepalive and hold time timers for a BGP neighbor or a peer group.

**Syntax**
```
neighbor {ip-address | peer-group-name} timers keepalive holdtime
```

To return to the default values, use the `no neighbor {ip-address | peer-group-name} timers` command.

**Parameters**
- `ip-address` Enter the IP address of the peer router in dotted decimal format.
- `peer-group-name` Enter the name of the peer group to set the timers for all routers within the peer group.
- `keepalive` Enter a number for the time interval, in seconds, between keepalive messages sent to the neighbor routers. The range is from 1 to 65535. The default is **60 seconds**.
- `holdtime` Enter a number for the time interval, in seconds, between the last keepalive message and declaring the router dead. The range is from 3 to 65535. The default is **180 seconds**.

**Defaults**
- `keepalive = 60 seconds`
- `holdtime = 180 seconds`

**Command Modes**
- `ROUTER BGP`

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

</tbody>
</table>
Version | Description
---|---
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.

**Usage Information**

Timer values configured with the `neighbor timers` command override the timer values configured with any other command.

When two neighbors, configured with different `keepalive` and `holdtime` values, negotiate for new values, the resulting values are as follows:

- the lower of the `holdtime` value is the new `holdtime` value, and
- whichever is the lower value: one-third of the new `holdtime` value, or the configured `keepalive` value, is the new `keepalive` value.

### neighbor timers extended

Set idle hold time for a BGP neighbor or a peer group.

**Syntax**

```
neighbor {ip-address | ipv6-address | peer-group-name} timers extended idle holdtime
```

To return to the default values, use the `no neighbor {ip-address | ipv6-address | peer-group-name} timers extended idle holdtime` command.

**Parameters**

- `ip-address` Enter the IP address of the peer router in dotted decimal format.
- `ipv6-address` Enter the IPv6 address of the peer router in `X::X::X::X` format.
- `peer-group-name` Enter the name of the peer group to set the timers for all routers within the peer group.
- `timers extended idle holdtime` Enter a number for the time interval, in seconds, for the peer to be idle state. The range is from 1 to 32767. The default is **15 seconds**.

**Defaults**

The default idle holdtime is **15 seconds**.

**Command Modes**

`ROUTER BGP`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

**Version** | **Description**
---|---
9.14(0.0) | Introduced on the C9010, MXL, FN IOM, S3100 series, S3048–ON, S4048–ON, S4048T-ON, S5048F-ON, S6000, S6010–ON, S6100–ON, Z9100–ON, and S6000–ON.

**Usage Information**

- The peer remains in idle state based on the configured `idle holdtime`. The less the idle `holdtime`, less the peer in idle state.
- For the new `idle holdtime` to take effect, you need to shutdown the respective peer manually using `neighbor shutdown` command and enable the peer again.
**neighbor update-source**

Enable the E-Series software to use Loopback interfaces for TCP connections for BGP sessions.

**Syntax**

```plaintext
neighbor {ip-address | peer-group-name} update-source interface
To use the closest interface, use the no neighbor {ip-address | peer-group-name} update-source interface command.
```

**Parameters**

- `ip-address`: Enter the IP address of the peer router in dotted decimal format.
- `peer-group-name`: Enter the name of the peer group to disable all routers within the peer group.
- `interface`: Enter the keyword `loopback` then a number of the Loopback interface. The range is from 0 to 16383.

**Defaults**

Not configured.

**Command Modes**

Router BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.

**Usage Information**

Loopback interfaces are up constantly and the BGP session may need one interface constantly up to stabilize the session. The `neighbor update-source` command is not necessary for directly connected internal BGP sessions.

Neighbors are sorted according to the source and destination ip addresses. If an update-source ip address exists, then the source ip address determines the order in which the neighbors are displayed.
**neighbor weight**

Assign a weight to the neighbor connection, which is used to determine the best path.

**Syntax**

```
neighbor {ip-address | peer-group-name} weight weight
```

To remove a weight value, use the `no neighbor {ip-address | peer-group-name} weight` command.

**Parameters**

- **ip-address**: Enter the IP address of the peer router in dotted decimal format.
- **peer-group-name**: Enter the name of the peer group to disable all routers within the peer group.
- **weight**: Enter a number as the weight. The range is from 0 to 65535. The default is 0.

**Defaults**

0

**Command Modes**

ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

In the Dell EMC Networking OS best path selection process, the path with the highest weight value is preferred.

**NOTE**: In the Dell EMC Networking OS best-path selection process, the path with the highest weight value is preferred.

If you configure the `set weight` command in a route map applied to this neighbor, the weight set in that command overrides the weight set in the `neighbor weight` command.
Related Commands

- **set weight** — assign a weight to all paths meeting the route map criteria.

**network**

Specify the networks for the BGP process and enter them in the BGP routing table.

**Syntax**

```
network ip-address mask [route-map map-name]
```

To remove a network, use the `no network ip-address mask [route-map map-name]` command.

**Parameters**

- **ip-address**
  - Enter an IP address in dotted decimal format of the network.

- **mask**
  - Enter the mask of the IP address in the slash prefix length format (for example, /24).
  - The mask appears in command outputs in dotted decimal format (A.B.C.D).

- **route-map map-name**
  - (OPTIONAL) Enter the keyword route-map then the name of an established route map.
  - Only the following ROUTE-MAP mode commands are supported:
    - match ip address
    - set community
    - set local-preference
    - set metric
    - set next-hop
    - set origin
    - set weight
  - If the route map is not configured, the default is `deny` (to drop all routes).

**Defaults**

Not configured.

**Command Modes**

- ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
Usage Information
Dell EMC Networking OS software resolves the network address the `network` command configures with the routes in the main routing table to ensure that the networks are reachable using non-BGP routes and non-default routes.

As BGP does not query next-hop information corresponding to locally originated routes, a local route with an unreachable next-hop is chosen as the best route.

When a combination of locally originated and peer originated routes occurs, both these routes will exist in the RTM. However, only the best route is kept active in the RTM and the remaining route is rendered in-active.

It is possible to keep only one locally originated route in the BGP database. Network command has preference over the re-distributed routes. When the locally originated route is no longer present in the database the other route is automatically installed.

In BGP, the next-hop for the route is calculated from the information that is acquired through IGP or static routes.

Related Commands
- `redistribute` — redistribute routes into BGP.

**network backdoor**

Specify this IGP route as the preferred route.

**Syntax**

```plaintext
network ip-address mask backdoor
```

To remove a network, use the `no network ip-address mask backdoor` command.

**Parameters**

- `ip-address`:
  - Enter an IP address in dotted decimal format of the network.

- `mask`:
  - Enter the mask of the IP address in the slash prefix length format (for example, /24).
  - The mask appears in command outputs in dotted decimal format (A.B.C.D).

**Defaults**

- Not configured.

**Command Modes**

- `ROUTER BGP`
permit bandwidth

Enables you to specify link band width extended-community attribute as the matching criteria to permit incoming or outgoing traffic.

Syntax

permit bandwidth

To disable this setting, enter the no permit bandwidth command.

Parameters

bandwidth

Enter the keyword bandwidth to specify extended-community attribute as the matching criteria for permitting traffic. The range is from 0 to 102400.

Defaults

N/A

Command Modes

EXTENDED COMMUNITY LIST

Command History

</tbody>
</table>

Usage Information

Although Dell EMC Networking OS does not generate a route due to the backdoor config, there is an option for injecting/sourcing a local route in the presence of network backdoor config on a learned route.
### Version Description

9.10(0.0)  
Introduced on the S6100-ON.

9.8(2.0)  
Introduced on the S3100 series.

9.8(1.0)  
Introduced on the Z9100-ON.

9.8(0.0P5)  
Introduced on the S4048-ON.

9.8(0.0P2)  
Introduced on the S3048-ON.

9.7(0.0)  
Introduced on the S-Series.

### Related Commands

- `deny bandwidth`  
  - link band width extended-community attribute as the matching criteria to deny incoming or outgoing traffic.

### redistribute

Redistribute routes into BGP.

**Syntax**

```
redistribute {connected | static} [route-map map-name]
```

To disable redistribution, use the `no redistribute {connected | static}` command.

**Parameters**

- `connected`  
  - Enter the keyword `connected` to redistribute routes from physically connected interfaces.

- `static`  
  - Enter the keyword `static` to redistribute manually configured routes.  
  - These routes are treated as incomplete routes.

- `route-map map-name`  
  - (OPTIONAL) Enter the keyword `route-map` then the name of an established route map.

  Only the following ROUTE-MAP mode commands are supported:

  - `match ip address`
  - `set community`
  - `set local-preference`
  - `set metric`
  - `set next-hop`
  - `set origin`
  - `set weight`

  If the route map is not configured, the default is `deny` (to drop all routes).

**Defaults**

Not configured.

**Command Modes**

- ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Version | Description
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.3.1.0 | Introduced the ability to substitute IGP cost for MED when a peer/peer-group outbound route-map is set as `internal`.
7.8.1.0 | Introduced on the S-Series.
7.7.1.0 | Introduced on the C-Series.

Usage Information

You can use the `redistribute` command to advertise the IGP cost as the MED on redistributed routes. When you set the route-map with metric-type internal and applied outbound to an EBGP peer/peer-group, the advertised routes corresponding to those peer/peer-groups have the IGP cost set as `MED`.

If you do not configure the `default-metric` command, in addition to the `redistribute` command, or there is no route map to set the metric, the metric for redistributed static and connected is "0".

To redistribute the default route (0.0.0.0/0), configure the `neighbor default-originate` command.

As BGP does not query next-hop information corresponding to locally originated routes, a local route with an unreachable next-hop is chosen as the best route.

When a combination of locally originated and peer originated routes occurs, both these routes will exist in the RTM. However, only the best route is kept active in the RTM and the remaining route is rendered in-active.

It is possible to keep only one locally originated route in the BGP database. Network command has preference over the re-distributed routes. When the locally originated route is no longer present in the database the other route is automatically installed.

Related Commands

- `neighbor default-originate` — inject the default route.
**redistribute ospf**

Redistribute OSPF routes into BGP.

**Syntax**

```
redistribute ospf process-id [[match external {1 | 2}] [match internal]] [route-map map-name]
```

To stop redistribution of OSPF routes, use the `no redistribute ospf process-id` command.

**Parameters**

- **process-id**
  - Enter the number of the OSPF process. The range is from 1 to 65535.

- **match external {1 | 2}**
  - (OPTIONAL) Enter the keywords `match external` to redistribute OSPF external routes. You can specify 1 or 2 to redistribute those routes only.

- **match internal**
  - (OPTIONAL) Enter the keywords `match internal` to redistribute OSPF internal routes only.

- **route-map map-name**
  - (OPTIONAL) Enter the keywords `route-map` then the name of a configured route map.

**Defaults**

Not configured.

**Command Modes**

- ROUTER BGP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>8.3(1.0)</td>
<td>Introduced the ability to substitute IGP cost for MED when a peer/peer-group outbound route-map is set as internal.</td>
</tr>
<tr>
<td>7.8(1.0)</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7(1.0)</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>
Usage Information

You can use the redistribute command to advertise the IGP cost as the MED on redistributed routes. When you set the route-map with metric-type internal and apply outbound to an EBGP peer/peer-group, the advertised routes corresponding to those peer/peer-groups have the IGP cost set as MED.

When you enter the redistribute isis process-id command without any other parameters, Dell EMC Networking OS redistributes all OSPF internal routes, external type 1 routes, and external type 2 routes. RFC does not support this feature.

**router bgp**

To configure and enable BGP, enter ROUTER BGP mode.

**Syntax**

```
router bgp as-number
```

To disable BGP, use the no router bgp as-number command.

**Parameters**

- **as-number**
  
  Enter the AS number. The range is from 1 to 65535 (2 byte), from 1 to 4294967295 (4 byte), or from 0.1 to 65535.65535 (dotted format).

**Defaults**

Not enabled.

**Command Modes**

- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
At least one interface must be in Layer 3 mode for the `router bgp` command to be accepted. If all interfaces are configured under VRF, at least one interface should be in the default VRF for the `router bgp` command to be accepted. If no interfaces are enabled for Layer 3, an error message appears:

```
% Error: No router id configured
```

BGP does not allow 23456 (AS-TRANS) as a configured AS number.

**Example**

```
DellEMC(conf)# router bgp 3
DellEMC(conf-router_bgp)#
```

### shutdown all

Disables all the BGP neighbors.

**Syntax**

```
shutdown all
```

Use the `no shutdown all` command to enable all the configured BGP neighbors.

**Command Modes**

- ROUTER BGP

**Command History**

<table>

</tr>
</tbody>
</table>

**Usage Information**

You can use this command to disable all the configured BGP neighbors.

This command is global for all VRFs.

### shutdown address-family-ipv4–unicast

Disables all the BGP neighbors corresponding to the multicast IPv4 address families.

**Syntax**

```
shutdown address-family-ipv4-unicast
```

Use the `no shutdown address-family-ipv4-unicast` command to enable all the configured BGP neighbors corresponding to the multicast IPv4 address families.

**Command Modes**

- ROUTER BGP
  - CONFIGURATION

**Usage Information**

You can use this command to disable all the configured BGP neighbors corresponding to the unicast IPv6 address families.

This command is global for all VRFs.
**set extcommunity bandwidth**

Enables you to set extended community bandwidth.

**Syntax**

```
set extcommunity bandwidth
```

To disable extended community bandwidth, enter the `no set extcommunity bandwidth` command.

**Parameters**

- **bandwidth**
  
  Enter the keyword `bandwidth` to enable extended community bandwidth. The range is from 0 to 102400.

**Defaults**

N/A

**Command Modes**

ROUTER MAP

</tr>
<tr>
<td>9.7(0.0)</td>
<td>Introduced on the S-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

A new policy command is introduced in order to attach the Link Bandwidth extended community only to the prefixes that are received from a neighbor that satisfy the desired conditions. This command is relevant for both inbound as well as outbound policy handling (for received prefixes). Also, there is no change to the set of supported conditions or filters.

During configuration, the bandwidth is specified in Mbps, not in bytes/second. While creating the actual LB extended community, the system will attach the AS number and encode the bandwidth in floating point format.

**show capture bgp-pdu neighbor**

Display BGP packet capture information for an IPv4 address on the system.

**Syntax**

```
show capture bgp-pdu neighbor ipv4-address
```

**Parameters**

- **ipv4-address**
  
  Enter the IPv4 address (in dotted decimal format) of the BGP address to display packet information for that address.

**Command Modes**

EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Example

DellEMC(conf-router_bgp)# show config
! router bgp 100
    network 1.1.11.1/32
    network 1.1.12.1/32
    network 1.1.13.1/32
    neighbor 10.1.1.2 remote-as 200
    neighbor 10.1.1.2 no shutdown
DellEMC(conf-router_bgp)#

show ip bgp

View the current BGP IPv4 routing table for the system.

Syntax

    show ip bgp [vrf vrf-name] [ipv4 {unicast | multicast} | ipv6 {unicast}]
    [network [network-mask] [longer-prefixes]] [cluster-list cluster-id] [community
    community-number] [community-list community-list-name] [dampened-paths]
Parameters

vrf vrf-name  (OPTIONAL) Enter the keyword vrf and then the name of the VRF to view ipv4-unicast route information corresponding to that VRF.

ipv4 unicast  (OPTIONAL) Enter the keywords ipv4 unicast to view information only related to ipv4 unicast routes.

ipv4 multicast  (OPTIONAL) Enter the keywords ipv4 multicast to view information only related to ipv4 multicast routes.

ipv6 unicast  (OPTIONAL) Enter the keywords ipv6 unicast to view information only related to ipv6 unicast routes.

network  (OPTIONAL) Enter the network address (in dotted decimal format) of the BGP network to view information only on that network.

network-mask  (OPTIONAL) Enter the network mask (in slash prefix format) of the BGP network address.

longer-prefixes  (OPTIONAL) Enter the keywords longer-prefixes to view all routes with a common prefix.

c cluster-list cluster-id  (OPTIONAL) Enter the keyword cluster-list then the cluster-ID to display the routes matching the cluster.

c community community-number  (OPTIONAL) Enter the keyword community then the community-number to display the routes matching the communities.

community-list community-list-name  (OPTIONAL) Enter the keyword community-list then the community-list-name to display the routes matching the community-list.

dampened-paths  (OPTIONAL) Enter the keyword dampened-paths to display the paths suppressed due to dampening.

extcommunity-list list name  (OPTIONAL) Enter the keyword extcommunity-list then the list name to display the routes matching the extended community-list.

filter-list as-path-name  (OPTIONAL) Enter the keyword filter-list then the as-path-name to display the routes conforming to the filter-list.

flap-statistics  (OPTIONAL) Enter the keyword flap-statistics to display flap statistics of the routes.

neighbors  (OPTIONAL) Enter the keyword neighbors to display the detailed information on TCP and BGP neighbor connections.

neighbors [all {received-routes}]  (OPTIONAL) Enter the keyword neighbors [all {received-routes}] to display all the received routes both accepted and rejected from all the IPv4 or IPv6 neighbors.

next-hop  (OPTIONAL) Enter the keyword next-hop to view all the next-hop information on the learnt routes.

paths  (OPTIONAL) Enter the keyword paths to view the BGP path attributes in the BGP database.

peer-group peer-group-name  (OPTIONAL) Enter the keyword peer-group then the peer-group-name to view the information on the BGP peers in a peer group.
**regexp regular-expression**

(Optional) Enter the keyword `regexp` then the regular expressions to display BGP information based on a regular expression.

**summary**

(Optional) Enter the keyword `summary` to display the summary of BGP neighbor status.

### Command Modes

<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

### Usage Information

When you enable the `bgp non-deterministic-med` command, the `show ip bgp` command output for a BGP route does not list the INACTIVE reason. In BGP, this command displays the exact reason why the route is discarded.

The following describes the `show ip bgp` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network</td>
<td>Displays the destination network prefix of each BGP route.</td>
</tr>
<tr>
<td>Next Hop</td>
<td>Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.</td>
</tr>
</tbody>
</table>
### Field Description
- **Metric**: Displays the BGP route's metric, if assigned.
- **LocPrf**: Displays the BGP LOCAL_PREF attribute for the route.
- **Weight**: Displays the route's weight.
- **Path**: Lists all the AS the route passed through to reach the destination network.

The `show ip bgp` command displays the dmzlink-dw details only if dmzlink-bw is enabled using the `bgp dmzlink-dw` command.

**Example**

```
DellEMC# show ip bgp
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
    n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

<table>
<thead>
<tr>
<th>Network</th>
<th>Next Hop</th>
<th>Metric</th>
<th>LocPrf</th>
<th>Weight</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>*&gt; 55.0.0.0/24</td>
<td>172.16.0.2</td>
<td>0</td>
<td>200</td>
<td></td>
<td>i</td>
</tr>
<tr>
<td>*&gt; 66.0.0.0/24</td>
<td>172.16.0.2</td>
<td>0</td>
<td>200</td>
<td></td>
<td>i</td>
</tr>
</tbody>
</table>
```

All the `show` and `debugs` commands display the link band width extended-community prefixed with DMZ-Link-bw along with other extended communities.

```
DellEMC# show ip bgp 3.3.3.0/24
BGP routing table entry for 3.3.3.0/24
Paths: (1 available, table Default-IP-Routing-Table.)
Not advertised to any peer
Received from :
    1.1.1.2 (3.3.3.1)    Best
    AS PATH : 
        Next-Hop : 1.1.1.2, Cost : 0
    Origin IGP, Metric 0, LocalPref 100, Weight 0, internal
    Extended Communities :
        DMZ-Link Bw: 2000 kbytes*
```

Following is the example for displaying all the received routes from all IPv4 neighbors:

```
DellEMC# show ip bgp vrf test ipv4 unicast neighbors all received-routes
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 1.1.1.1
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
    n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

<table>
<thead>
<tr>
<th>Network</th>
<th>Next Hop</th>
<th>Metric</th>
<th>LocPrf</th>
<th>Weight</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID 110.1.1.0/24</td>

**Related Commands**

- `show ip bgp community` — view the BGP communities.
- `neighbor maximum-prefix` — control the number of network prefixes received.
- `show ip bgp community-list` — view BGP neighbors in a specific cluster.
- `show ip bgp community` — view information on all routes with Community attributes or view specific BGP community groups.
- `show ip bgp community-list` — view routes that a specific community list affects.
- `show ip bgp dampened-paths` — view BGP routes that are dampened (non-active).
- `show ip bgp extcommunity-list` — view information on all routes with Extended Community attributes.
- `show ip bgp filter-list` — view the routes that match the filter lists.
- `show ip bgp flap-statistics` — view flap statistics on BGP routes.
- `show ip bgp neighbors` — allow you to view the information BGP neighbors exchange.
- `show ip bgp next-hop` — view all next hops (using learned routes only) with current reachability and flap status. This command only displays one path, even if the next hop is reachable by multiple paths.
- `show ip bgp paths` — view all the BGP path attributes in the BGP database.
- `show ip bgp peer-group` — allow you to view information on the BGP peers in a peer group.
- `show ip bgp regexp` — display the subset of the BGP routing tables matching the regular expressions specified.
- `show ip bgp summary` — allow you to view the status of all BGP connections.
show ip bgp cluster-list

View BGP neighbors in a specific cluster.

Syntax

show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] cluster-list [cluster-id]

Parameters

vrf vrf-name  (OPTIONAL) Enter the keyword vrf and then the name of the VRF to view cluster information of BGP neighbors corresponding to that VRF.

ipv4 multicast  (OPTIONAL) Enter the keywords ipv4 followed by the keyword multicast to view information related only to ipv4 multicast routes.

ipv4 unicast  (OPTIONAL) Enter the keyword ipv4 followed by the keyword unicast to view information related only to ipv4 multicast routes.

ipv6 unicast  (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to view information related to only to the ipv6 unicast routes.

cluster-id  (OPTIONAL) Enter the cluster id in dotted decimal format. The range is 1 — 4294967295.

Command Modes

•  EXEC
•  EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version  Description

9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the S6100-ON.
9.8(2.0)  Introduced on the S3100 series.
9.8(1.0)  Introduced on the Z9100-ON.
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.7(0.0)  Added the ipv4 multicast and ipv6 unicast parameters.
9.4.(0.0)  Added support for VRF.
9.2(1.0)  Introduced on the Z9500.
9.0.2.0  Introduced on the S6000.
8.3.19.0  Introduced on the S4820T.
8.3.11.1  Introduced on the Z9000.

482  Border Gateway Protocol
**show ip bgp community**

View information on all routes with Community attributes or view specific BGP community groups.

**Syntax**

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] community [community-number] [local-as] [no-export] [no-advertise]
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keywords `vrf` and then the name of the VRF to view information either on all routes with community attributes or specific BGP community routes corresponding to that VRF.
ipv4 unicast  (OPTIONAL) Enter the keywords ipv4 followed by the keyword unicast to view information related only to ipv4 unicast routes.

ipv4 multicast  (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view information related only to ipv4 multicast routes.

ipv6 unicast  (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to view information related only to ipv6 unicast routes.

community-number  Enter the community number in AA:NN format where AA is the AS number (2 bytes) and NN is a value specific to that autonomous system.

You can specify up to eight community numbers to view information on those community groups.

local-AS  Enter the keywords local-AS to view all routes with the COMMUNITY attribute of NO_EXPORT_SUBCONFED.

All routes with the NO_EXPORT_SUBCONFED (0xFFFFFF03) community attribute must not be advertised to external BGP peers.

no-advertise  Enter the keywords no-advertise to view all routes containing the well-known community attribute of NO_ADVERTISE.

All routes with the NO_ADVERTISE (0xFFFFFF02) community attribute must not be advertised to other BGP peers.

no-export  Enter the keywords no-export to view all routes containing the well-known community attribute of NO_EXPORT.

All routes with the NO_EXPORT (0xFFFFFF01) community attribute must not be advertised outside a BGP confederation boundary.

Command Modes

- EXEC
- EXEC Privilege

Command History

### Version Description

- **9.4.(0.0)** Added support for VRF.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **7.8.1.0** Introduced on the S-Series.
- **7.7.1.0** Introduced on the C-Series.

### Usage Information

To view the total number of COMMUNITY attributes found, use the `show ip bgp summary` command. The text line above the route table states the number of COMMUNITY attributes found.

The `show ip bgp community` command without any parameters lists BGP routes with at least one BGP community attribute and the output is the same as for the `show ip bgp` command output.

The following describes the `show ip bgp community` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network</td>
<td>Displays the destination network prefix of each BGP route.</td>
</tr>
<tr>
<td>Next Hop</td>
<td>Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.</td>
</tr>
<tr>
<td>Metric</td>
<td>Displays the BGP route’s metric, if assigned.</td>
</tr>
<tr>
<td>LocPrf</td>
<td>Displays the BGP LOCAL_PREF attribute for the route.</td>
</tr>
<tr>
<td>Weight</td>
<td>Displays the route’s weight.</td>
</tr>
<tr>
<td>Path</td>
<td>Lists all the ASs the route passed through to reach the destination network.</td>
</tr>
</tbody>
</table>

### Example

```
DellEMC# show ip bgp community ?
local-AS                Do not export outside local AS (well-known community)
no-advertise            Do not advertise to any peer (well-known community)
no-export               Do not export to next AS (well-known community)
aa:nn                   Community number in aa:nn format
|                       Pipe through a command

DellEMC# show ip bgp community

DellEMC#
```
show ip bgp community-list

View routes that a specific community list affects.

Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {unicast | multicast} | ipv6 unicast] community-list community-list-name [exact-match]
```

Parameters

- **vrf vrf-name**  (OPTIONAL) Enter the keywords vrf and then the name of the VRF to view routes affected by a specific community list corresponding to that VRF.
- **ipv4 unicast**  (OPTIONAL) Enter the keywords ipv4 unicast to view information only related to ipv4 unicast routes.
- **ipv4 multicast**  (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view information related only to ipv4 multicast routes.
- **ipv6 unicast**  (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to view information related only to ipv6 unicast routes.
- **community-list-name**  Enter the name of a configured IP community list (maximum 140 characters).
- **exact-match**  Enter the keyword for an exact match of the communities.

Command Modes

- EXEC
- EXEC Privilege

Command History

### Version Description

**8.3.11.1**
Introduced on the Z9000.

**8.3.7.0**
Introduced on the S4810.

**7.8.1.0**
Introduced on the S-Series.

**7.7.1.0**
Introduced on the C-Series.

### Usage Information

The `show ip bgp community-list` command without any parameters lists BGP routes matching the Community List and the output is the same as for the `show ip bgp` command output.

The following describes the `show ip bgp community-list pass` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network</td>
<td>Displays the destination network prefix of each BGP route.</td>
</tr>
<tr>
<td>Next Hop</td>
<td>Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.</td>
</tr>
<tr>
<td>Metric</td>
<td>Displays the BGP route’s metric, if assigned.</td>
</tr>
<tr>
<td>LocPrf</td>
<td>Displays the BGP LOCAL_PREF attribute for the route.</td>
</tr>
<tr>
<td>Weight</td>
<td>Displays the route’s weight.</td>
</tr>
<tr>
<td>Path</td>
<td>Lists all the ASs the route passed through to reach the destination network.</td>
</tr>
</tbody>
</table>

### Example

```
DellEMC# conf t
DellEMC(config)# ip community-list cl1
DellEMC(config-community-list)# permit 1000:1
DellEMC(config-community-list)# end
DellEMC# show ip bgp community-list cl1
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, v valid, > best

DellEMC#
```
show ip bgp dampened-paths

View BGP routes that are dampened (non-active).

Syntax

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] dampened-paths
```

Parameters

- **vrf vrf-name**: (OPTIONAL) Enter the keywords vrf and then the name of the VRF to view routes that are affected by a specific community list corresponding to that VRF.
- **ipv4 multicast**: (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view information related only to ipv4 multicast routes.
- **ipv4 unicast**: (OPTIONAL) Enter the keywords ipv4 followed by the keyword unicast to view information related only to ipv4 unicast routes.
- **ipv6 unicast**: (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to view information related only to ipv6 unicast routes.

Command Modes

</tr>
</tbody>
</table>
To determine a BGP session flap, both a route-down event and a subsequent route-up event corresponding to a single route are considered. As a result, a flap event is penalized only one time during the route-down event. The subsequent route-up event corresponding to the same route is not considered as a flap and is not penalized.

The history paths that the `show ip bgp` command displays contain only the prefix and the next-hop information. The next-hop information shows the IP address of the neighbor. It does not show the actual next-hop details.

The following describes the `show ip bgp damp` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network</td>
<td>Displays the network ID to which the route is dampened.</td>
</tr>
<tr>
<td>From</td>
<td>Displays the IP address of the neighbor advertising the dampened route.</td>
</tr>
<tr>
<td>Reuse</td>
<td>Displays the hour:minutes:seconds until the dampened route is available.</td>
</tr>
<tr>
<td>Path</td>
<td>Lists all the ASs the dampened route passed through to reach the destination network.</td>
</tr>
</tbody>
</table>

```

Border Gateway Protocol


show ip bgp extcommunity-list

View information on all routes with Extended Community attributes.

Syntax

show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] extcommunity-list [list name]

Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keywords vrf and then the name of the VRF to view information on all routes with extended community attributes corresponding to that VRF.
- **ipv4 multicast** (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view information related only to ipv4 multicast routes.
- **ipv4 unicast** (OPTIONAL) Enter the keywords ipv4 unicast to view information only related to ipv4 unicast routes.
- **ipv6 unicast** (OPTIONAL) Enter the keyword ipv6 unicast followed by the keyword unicast to view information related only to ipv6 unicast routes.
- **list name** Enter the extended community list name you wish to view. The range is 140 characters.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S6010-ON and S4048T-ON.</td>

<td>Added the ipv4 multicast and ipv6 unicast parameters.</td>
</tr>
</tbody>
</table>
### Usage Information

To view the total number of COMMUNITY attributes found, use the `show ip bgp summary` command. The text line above the route table states the number of COMMUNITY attributes found.

The `show ip bgp community` command without any parameters lists BGP routes with at least one BGP community attribute and the output is the same as for the `show ip bgp` command output.

### Example

```
DellEMC# show run extcommunity-list

1
ip extcommunity-list ecl1
  permit rt 100:4
  permit soo 40:4
DellEMC#show ip bgp extcommunity-list ecl1
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
    n - network, D - denied, S - stale
Origin codes: i - IGP, a - EGP, ? - incomplete

<table>

DellEMC#```

### show ip bgp filter-list

View the routes that match the filter lists.

**Syntax**

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] filter-list as-path-name
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to view route information that matches the filter lists corresponding to that VRF.
- `ipv4 multicast` (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.
- `ipv4 unicast` (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.
ipv6 unicast  (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to view information related only to ipv6 unicast routes.

as-path-name  Enter an AS-PATH access list name. The range is 140 characters.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
show ip bgp flap-statistics

View flap statistics on BGP routes.

Syntax

show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] flap-statistics [ip-address [mask]] [filter-list as-path-name] [regexp regular-expression]

Parameters

- **vrf vrf-name** (OPTIONAL) Enter the keywords vrf and then the name of the VRF to view flap statistics on BGP routes corresponding to that VRF.
- **ipv4 multicast** (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view information related only to ipv4 multicast routes.
- **ipv4 unicast** (OPTIONAL) Enter the keyword ipv4 followed by the keyword unicast to view information related only to ipv4 unicast routes.
- **ipv6 unicast** (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to view information related only to ipv6 unicast routes.
- **ip-address** (OPTIONAL) Enter the IP address (in dotted decimal format) of the BGP network to view information only on that network.
- **mask** (OPTIONAL) Enter the network mask (in slash prefix (/x) format) of the BGP network address.
- **filter-list as-path-name** (OPTIONAL) Enter the keyword filter-list then the name of a configured AS-PATH ACL. The range is 140 characters.
- **regexp regular-expression** Enter a regular expression then use one or a combination of the following characters to match. The range is 256 characters.
  - . = (period) any single character (including a white space).
- * (asterisk) the sequences in a pattern (zero or more sequences).
- + (plus) the sequences in a pattern (one or more sequences).
- ? (question mark) sequences in a pattern (either zero or one sequences).

**NOTE:** Enter an escape sequence (CTRL+v) prior to entering the ? regular expression.

- [ ] = (brackets) a range of single-character patterns.
- ( ) = (parenthesis) groups a series of pattern elements to a single element.
- { } = (braces) minimum and the maximum match count.
- ^ = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
- $ = (dollar sign) the end of the output string.

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</table>
### show ip bgp flap-statistics

View BGP flap statistics on interfaces and routes.

**Syntax**
```
show ip bgp [vrf vrf-name] flap-statistics
```

**Parameters**
- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf and then the name of the VRF to view statistics on interfaces and routes corresponding to the VRF.
- **ipv4 unicast** (OPTIONAL) Enter the keywords ipv4 unicast to view statistics on IPv4 unicast routes.

**Command Modes**
- EXEC
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.4.(0.0) | Added support for VRF.
Usage Information

The following describes the `show ip bgp inconsistent-as` command shown in the following example.

**Field**

**Description**

**Network**

Displays the destination network prefix of each BGP route.

**Next Hop**

Displays the next hop address of the BGP router. If 0.0.0.0 is listed in this column, then local routes exist in the routing table.

**Metric**

Displays the BGP route's metric, if assigned.

**LocPrf**

Displays the BGP LOCAL_PREF attribute for the route.

**Weight**

Displays the route's weight.

**Path**

Lists all the ASs the route passed through to reach the destination network.

**Example**

```
DellEMC# show ip bgp inconsistent-as
BGP table version is 280852, local router ID is 10.1.2.100
Status codes: s suppressed, d damped, h history, * valid, > best

```
show ip bgp neighbors

Allows you to view the information BGP neighbors exchange.

Syntax

show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] neighbors [ip-address] [advertised-routes | dampened-routes | detail | flap-statistics | routes | all {received-routes [network [network-mask]]} | {denied-routes [network [network-mask]]}]

Parameters

vrf vrf-name

(Optional) Enter the keyword vrf and then the name of the VRF to view information exchanged by BGP neighbors corresponding to that VRF.

NOTE: You can use this attribute to view information exchanged by BGP neighbors that correspond to either a default or a non-default VRF.

ipv4 multicast

(Optional) Enter the keyword ipv4 followed by the keyword multicast to view information related only to ipv4 multicast routes.

ipv4 unicast

(Optional) Enter the keyword ipv4 followed by the keyword unicast to view information related only to ipv4 unicast routes.

ipv6 unicast

(Optional) Enter the keyword ipv6 followed by the keyword unicast to view information related only to ipv6 unicast routes.

ip-address

(Optional) Enter the IP address of the neighbor to view only BGP information exchanged with that neighbor.

advertised-routes

(Optional) Enter the keywords advertised-routes to view only the routes the neighbor sent.

dampened-routes

(Optional) Enter the keywords dampened-routes to view information on dampened routes from the BGP neighbor.

detail

(Optional) Enter the keyword detail to view neighbor-specific internal information for the IPv4 Unicast address family.

flap-statistics

(Optional) Enter the keywords flap-statistics to view flap statistics on the neighbor's routes.

routes

(Optional) Enter the keyword routes to view only the neighbor's feasible routes.

all (received-routes [network [network-mask]])

(Optional) Enter the keywords all {received-routes} then either the network address alone (in dotted decimal format) or the network address along with the network mask (in slash prefix format) to view all the information received from neighbors.

NOTE: Configure the neighbor soft-reconfiguration inbound command prior to viewing all the information received from the neighbors.
denied-routes (OPTIONAL) Enter the keywords denied-routes then either the network address (in dotted decimal format) or the network mask (in slash prefix format) to view all information on routes denied via neighbor inbound filters.

Command Modes

- EXEC
- EXEC Privilege

Command History

<td>Added the received and denied route options.</td>
</tr>
<tr>
<td>6.3.10</td>
<td>The output is changed to display the total number of advertised prefixes.</td>
</tr>
</tbody>
</table>

Usage Information

After a peer reset, the contents of the notification log messages is displayed in hex values for debugging.

The neighbor information that this command displays does not include counts corresponding to ignored prefixes and updates. However, the martian case is an exception where neighbor information corresponding to ignored updates is displayed.

BGP shows the exact information that is exchanged between the BGP peers. It also indicates whether or not this information is received by the BGP peer.
The following describes the `show ip bgp neighbors` command shown in the following examples.

<table>
<thead>
<tr>
<th>The Lines Beginning with:</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BGP neighbor</td>
<td>Displays the BGP neighbor address and its AS number. The last phrase in the line indicates whether the link between the BGP router and its neighbor is an external or internal one. If they are located in the same AS, the link is internal; otherwise the link is external.</td>
</tr>
<tr>
<td>BGP version</td>
<td>Displays the BGP version (always version 4) and the remote router ID.</td>
</tr>
<tr>
<td>BGP state</td>
<td>Displays the neighbor’s BGP state and the amount of time in hours:minutes:seconds it has been in that state.</td>
</tr>
<tr>
<td>Last read</td>
<td>This line displays the following information:</td>
</tr>
<tr>
<td></td>
<td>• last read is the time (hours:minutes:seconds) the router read a message from its neighbor</td>
</tr>
<tr>
<td></td>
<td>• hold time is the number of seconds configured between messages from its neighbor</td>
</tr>
<tr>
<td></td>
<td>• keepalive interval is the number of seconds between keepalive messages to help ensure that the TCP session is still alive.</td>
</tr>
<tr>
<td>Received messages</td>
<td>This line displays the number of BGP messages received, the number of notifications (error messages), and the number of messages waiting in a queue for processing.</td>
</tr>
<tr>
<td>Sent messages</td>
<td>The line displays the number of BGP messages sent, the number of notifications (error messages), and the number of messages waiting in a queue for processing.</td>
</tr>
<tr>
<td>Received updates</td>
<td>This line displays the number of BGP updates received and sent.</td>
</tr>
<tr>
<td>Soft reconfiguration</td>
<td>This line indicates that soft reconfiguration inbound is configured.</td>
</tr>
<tr>
<td>Minimum time</td>
<td>Displays the minimum time, in seconds, between advertisements.</td>
</tr>
<tr>
<td>(list of inbound and</td>
<td>Displays the policy commands configured and the names of the Route map, AS-PATH ACL, or Prefix list configured for the policy.</td>
</tr>
<tr>
<td>outbound policies)</td>
<td>For address family: Displays the IPv4 Unicast as the address family.</td>
</tr>
<tr>
<td>BGP table version</td>
<td>Displays which version of the primary BGP routing table the router and the neighbor are using.</td>
</tr>
<tr>
<td>accepted prefixes</td>
<td>Displays the number of network prefixes the router accepts and the amount of memory used to process those prefixes.</td>
</tr>
<tr>
<td>Prefix advertised</td>
<td>Displays the number of network prefixes advertised, the number rejected, and the number withdrawn from the BGP routing table.</td>
</tr>
<tr>
<td>Connections established</td>
<td>Displays the number of TCP connections established and dropped between the two peers to exchange BGP information.</td>
</tr>
<tr>
<td>Last reset</td>
<td>Displays the amount of time since the peering session was last reset. Also states if the peer resets the peering session. If the peering session was never reset, the word never is displayed.</td>
</tr>
<tr>
<td>Local host:</td>
<td>Displays the peering address of the local router and the TCP port number.</td>
</tr>
<tr>
<td>Foreign host:</td>
<td>Displays the peering address of the neighbor and the TCP port number.</td>
</tr>
</tbody>
</table>

Example

```
DellEMC# show ip bgp neighbors 172.16.0.2
BGP neighbor is 172.16.0.2, remote AS 200, external link
Member of peer-group port0 for session parameters
BGP remote router ID 172.16.0.2
BGP state ESTABLISHED, in this state for 00:13:55
```
Hold time is 180, keepalive interval is 60 seconds
Received 50 messages, 0 in queue
  1 opens, 0 notifications, 34 updates
  15 keepalives, 0 route refresh requests
Sent 18 messages, 0 in queue
  1 opens, 0 notifications, 0 updates
  16 keepalives, 0 route refresh requests
Route refresh request: received 0, sent messages 1
Minimum time between advertisement runs is 30 seconds
Minimum time before advertisements start is 0 seconds
Capabilities received from neighbor for IPv4 Unicast:
  MULTIPROTO_EXT(1)
  ROUTE_REFRESH(2)

Capabilities advertised to neighbor for IPv4 Unicast:
  MULTIPROTO_EXT(1)
  ROUTE_REFRESH(2)
  ADD_PATH(69)
  CISCO_ROUTE_REFRESH(128)

For address family: IPv4 Unicast
BGP local RIB: Routes to be Added 0, Replaced 0, Withdrawn 0
InQ: Added 0, Replaced 0, Withdrawn 0
OutQ: Added 0, Withdrawn 0
  Allow local AS number 0 times in AS-PATH attribute
  Prefixes accepted 2, withdrawn 15 by peer, martian prefixes ignored 0
  Prefixes advertised 0, denied 0, withdrawn 0 from peer
Connections established 1; dropped 0
Last reset never
Local host: 172.16.0.1, Local port: 58145
Foreign host: 172.16.0.2, Foreign port: 179

DellEMC#
The following describes the `show ip bgp next-hop` command shown in the following example.

### Field Description
- **Next-hop**: Displays the next-hop IP address.
- **Via**: Displays the IP address and interface used to reach the next hop.
- **RefCount**: Displays the number of BGP routes using this next hop.
- **Cost**: Displays the cost associated with using this next hop.
- **Flaps**: Displays the number of times the next hop has flapped.
- **Flaps**: Displays the number of times the next hop has flapped.

### Example
```
DellEMC# show ip bgp next-hop
          Next-hop                Resolved
          172.16.0.2               YES
DellEMC#
```

## show ip bgp paths

View all the BGP path attributes in the BGP database.

### Syntax
```
show ip bgp [vrf vrf-name] paths [regexp regular-expression]
```
Parameters

vrf vrf-name

(Optional) Enter the keyword vrf to view all path attributes in the BGP database corresponding to that VRF.

**NOTE:** Description
You can use this attribute to view information on all path attributes in the BGP database that correspond to either a default or a non-default VRF.

regexp regular-expression

Enter a regular expression then use one or a combination of the following characters to match:

- . = (period) any single character (including a white space).
- * = (asterisk) the sequences in a pattern (zero or more sequences).
- + = (plus) the sequences in a pattern (one or more sequences).
- ? = (question mark) sequences in a pattern (either zero or one sequences).

**NOTE:** Enter an escape sequence (CTRL+v) prior to entering the regular expression.

- [ ] = (brackets) a range of single-character patterns.
- ( ) = (parenthesis) groups a series of pattern elements to a single element.
- { } = (braces) minimum and the maximum match count.
- ^ = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
- $ = (dollar sign) the end of the output string.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
The following describes the `show ip bgp path` command shown in the following example.

### Field | Description
--- | ---
Total | Displays the total number of BGP path attributes.
Address | Displays the internal address where the path attribute is stored.
Hash | Displays the hash bucket where the path attribute is stored.
Refcount | Displays the number of BGP routes using this path attribute.
Metric | Displays the MED attribute for this path attribute.
Path | Displays the AS path for the route, with the origin code for the route listed last. Numbers listed between braces {} are AS_SET information.

**Example**

```
DellEMC# show ip bgp paths ?
community       Display community information
extcommunity    Display extended community information
regexp          Display path information based on a regular expression
|                Pipe through a command
```

```
DellEMC# show ip bgp paths
Total 2 Paths
Refcount Metric Path
1   0     200 i
1   0     200 i
DellEMC#
```

### `show ip bgp paths community`

View all unique COMMUNITY numbers in the BGP database.

**Syntax**

```
show ip bgp [vrf vrf-name] paths community
```

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
The following describes the `show ip bgp paths community` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>Address</td>
<td>Displays the internal address where the path attribute is stored.</td>
</tr>
<tr>
<td>Hash</td>
<td>Displays the hash bucket where the path attribute is stored.</td>
</tr>
<tr>
<td>Refcount</td>
<td>Displays the number of BGP routes using these communities.</td>
</tr>
<tr>
<td>Community</td>
<td>Displays the community attributes in this BGP path.</td>
</tr>
</tbody>
</table>

**Example**

```
DellEMC# show ip bgp paths community
Total 2 communities
Refcount Community
 1 NO-ADVERTISE
 1 200:1 1000:1 3000:1
DellEMC#
```

**show ip bgp peer-group**

Allows you to view information on the BGP peers in a peer group.

**Syntax**

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] peer-group [peer-group-name [detail | summary]]
```

**Parameters**

- **vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` to view information on BGP peers in a peer group corresponding to that VRF.
NOTE: You can use this attribute to view information on BGP peers in a peer
group that correspond to either a default or a non-default VRF.

ipv4 multicast  (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view
information related only to ipv4 multicast routes.

ipv4 unicast  (OPTIONAL) Enter the keyword ipv4 followed by the keyword unicast to view
information related only to ipv4 unicast routes.

ipv6 unicast  (OPTIONAL) Enter the keyword ipv6 followed by the keyword unicast to view
information related only to ipv6 unicast routes.

peer-group-name  (OPTIONAL) Enter the name of a peer group to view information about that peer group
only.

detail  (OPTIONAL) Enter the keyword detail to view detailed status information of the peers
in that peer group.

summary  (OPTIONAL) Enter the keyword summary to view status information of the peers in that
peer group. The output is the same as that found in the show ip bgp summary
command.

Command Modes

- EXEC
- EXEC Privilege

<td>Lists the IP addresses of the peers in the peer group. If the address is outbound optimized, an * is displayed next to the IP address.</td>
</tr>
</tbody>
</table>

**Example**
```
DellEMC# show ip bgp peer-group
Peer-group port0, remote AS 200
BGP version 4
Minimum time between advertisement runs is 30 seconds
For address family: IPv4 Unicast
BGP neighbor is port0, peer-group external
Update packing has 4_OCTET_AS support enabled

Number of peers in this group 1
Maximum limit on the accepted connections 256

Peer-group members (* - outbound optimized):
172.16.0.2
DellEMC#
```

**Related Commands**
- `neighbor peer-group (assigning peers)` — assign a peer to a peer-group.
- `neighbor peer-group (creating group)` — create a peer group.

---

**show ip bgp regexp**

Display the subset of the BGP routing tables matching the regular expressions specified.

**Syntax**
```
show ip bgp [vrf vrf-name] regexp regular-expression [character]
```

**Parameters**
- `vrf vrf-name`: Enter the keyword `vrf` and then the name of the VRF to view the subset of BGP routing tables that match the regular expression specified on that VRF.

**NOTE:** You can use this attribute to view the subset of BGP routing tables that match the regular expression that is specified on either a default or a non-default VRF.
**regular-expression**

Enter a regular expression then use one or a combination of the following characters to match:

- . = (period) any single character (including a white space).
- * = (asterisk) the sequences in a pattern (zero or more sequences).
- + = (plus) the sequences in a pattern (one or more sequences).
- ? = (question mark) sequences in a pattern (either zero or one sequences).

**NOTE:** Enter an escape sequence (CTRL+v) prior to entering the regular expression.

- { } = (brackets) a range of single-character patterns.
- ( ) = (parenthesis) groups a series of pattern elements to a single element.
- ^ = (caret) the beginning of the input string. If you use the caret at the beginning of a sequence or range, it matches on everything BUT the characters specified.
- $ = (dollar sign) the end of the output string.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

</tr>
</tbody>
</table>

**Usage Information**

In BGP, route attributes are maintained at different locations. When attributes that correspond to multiple routes change, then attribute counts that the `show ip bgp summary` command displays are calculated as summations of attributes corresponding to all the associated routes. For example, if cluster_id is an attribute associated with thousand routes that contain exactly the same set of attributes, then the cluster_id count is 1. If these thousand routes are set with different attribute values with the same cluster_id, then the cluster_id count is 1000, since the same value is stored for thousand different attribute records.

The attribute next-hop is a part of the BGP attribute data structure.

If two peers send the same route that contains similar path attributes, then two entries are maintained in the back-end, as both these entries have different next-hops. If this same route is sent to a different peer, an entry for each peer is created, as the next-hop is different. As a result, the BGP attributes count in the summary output will differ accordingly.

The following describes the `show ip bgp summary` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BGP router identifier</td>
<td>Displays the local router ID and the AS number.</td>
</tr>
<tr>
<td>BGP table version</td>
<td>Displays the BGP table version and the main routing table version.</td>
</tr>
<tr>
<td>network entries</td>
<td>Displays the number of network entries, route paths, and the amount of memory used to process those entries.</td>
</tr>
<tr>
<td>paths</td>
<td>Displays the number of paths and the amount of memory used.</td>
</tr>
<tr>
<td>denied paths</td>
<td>Displays the number of denied paths and the amount of memory used.</td>
</tr>
<tr>
<td>BGP path attribute entries</td>
<td>Displays the number of BGP path attributes and the amount of memory used to process them.</td>
</tr>
<tr>
<td>BGP AS-PATH entries</td>
<td>Displays the number of BGP AS_PATH attributes processed and the amount of memory used to process them.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>BGP community entries</td>
<td>Displays the number of BGP COMMUNITY attributes processed and the amount of memory used to process them. The <code>show ip bgp community</code> command provides more details on the COMMUNITY attributes.</td>
</tr>
<tr>
<td>Dampening enabled</td>
<td>Displayed only when you enable dampening. Displays the number of paths designated as history, dampened, or penalized.</td>
</tr>
<tr>
<td>Neighbor</td>
<td>Displays the BGP neighbor address.</td>
</tr>
<tr>
<td>AS</td>
<td>Displays the AS number of the neighbor.</td>
</tr>
<tr>
<td>MsgRcvd</td>
<td>Displays the number of BGP messages that neighbor received.</td>
</tr>
<tr>
<td>MsgSent</td>
<td>Displays the number of BGP messages that neighbor sent.</td>
</tr>
<tr>
<td>TblVer</td>
<td>Displays the version of the BGP table that was sent to that neighbor.</td>
</tr>
<tr>
<td>InQ</td>
<td>Displays the number of messages from that neighbor waiting to be processed.</td>
</tr>
<tr>
<td>OutQ</td>
<td>Displays the number of messages waiting to be sent to that neighbor. If a number appears in parentheses, the number represents the number of messages waiting to be sent to the peer group.</td>
</tr>
<tr>
<td>Up/Down</td>
<td>Displays the amount of time that the neighbor is in the Established stage. If the neighbor has never moved into the Established stage, the word never is displayed.</td>
</tr>
</tbody>
</table>

The output format is:

<table>
<thead>
<tr>
<th>Time</th>
<th>Display Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Established</td>
<td></td>
</tr>
<tr>
<td>&lt; 1 day</td>
<td>00:12:23 (hours:minutes:seconds)</td>
</tr>
<tr>
<td>&lt; 1 week</td>
<td>1d21h (Days Hours)</td>
</tr>
<tr>
<td>&gt; 1 week</td>
<td>11w2d (Weeks Days)</td>
</tr>
</tbody>
</table>

State/Pfxrcd

If the neighbor is in Established stage, the number of network prefixes received.

If a maximum limit was configured with the `neighbor maximum-prefix` command, (prfxd) appears in this column.

If the neighbor is not in Established stage, the current stage is displayed (Idle, Connect, Active, OpenSent, OpenConfirm). When the peer is transitioning between states and clearing the routes received, the phrase (Purging) may appear in this column.

If the neighbor is disabled, the phrase (Admin shut) appears in this column.

Example

```bash
DellEMC# show ip bgp summary
BGP router identifier 192.168.11.5, local AS number 100
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
2 network entrie(s) using 152 bytes of memory
2 paths using 208 bytes of memory
BGP-RIB over all using 210 bytes of memory
2 BGP path attribute entrie(s) using 144 bytes of memory
1 BGP AS-PATH entrie(s) using 10 bytes of memory
2 neighbor(s) using 16384 bytes of memory

Neighbor  AS  MsgRcvd  MsgSent  TblVer  InQ  OutQ  Up/Down  State/Pfx

Example

DellEMC# show running-config bgp
!
router bgp 100
  network 1.1.11.1/32
  network 1.1.12.1/32
  network 1.1.13.1/32
  neighbor 10.1.1.2 remote-as 200
  neighbor 10.1.1.2 no shutdown
DellEMC#
**timers bgp**

Adjust the BGP Keep Alive and Hold Time timers.

**Syntax**

```
timers bgp keepalive holdtime
```

To return to the default, use the `no timers bgp` command.

**Parameters**

- **keepalive**: Enter a number for the time interval, in seconds, between keepalive messages sent to the neighbor routers. The range is from 1 to 65535. The default is **60 seconds**.
- **holdtime**: Enter a number for the time interval, in seconds, between the last keepalive message and declaring the router dead. The range is from 3 to 65535. The default is **180 seconds**.

**Defaults**

None

**Command Modes**

EXEC Privilege

</tbody>
</table>
**timers bgp extended**

Adjust the BGP idle holdtime for all the BGP neighbors.

**Syntax**

timers bgp extended idle-holdtime

To return to the default, use the no timers bgp extended command.

**Parameters**

- **extended idle-holdtime**
  
  Enter a number for the time interval, in seconds, for the peer to be idle state. The range is from 1 to 32767. The default is 15 seconds.

**Defaults**

The default idle-holdtime is 15 seconds.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.14(0.0)</td>
<td>Introduced on the C9010, MXL, FN IOM, S3100 series, S3048–ON, S4048–ON, S4048T-ON, S5048F-ON, S6000, S6010–ON, S6100–ON, Z9100–ON, Z9500, and S6000–ON.</td>
</tr>
</tbody>
</table>

**Usage Information**

The peer remains in idle state based on the configured idle-holdtime. The less the idle-holdtime, lesser the peer in idle state.

For the new idle-holdtime to take effect, you need to shutdown all the peers manually using neighbor shutdown command and enable the peers again.

**MBGP Commands**

Multiprotocol BGP (MBGP) is an enhanced BGP that enables multicast routing policy throughout the internet and connecting multicast topologies between BGP and autonomous systems (ASs).

Dell EMC Networking OS MBGP is implemented as per IETF RFC 1858.

BGPv4 is supported in the following:

<table>
<thead>
<tr>
<th>Dell EMC Networking OS Version</th>
<th>Platform Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.8.1.0, MBGP for IPv4 Multicast Only</td>
<td>S-Series</td>
</tr>
</tbody>
</table>
debug ip bgp dampening

View information on routes being dampened.

Syntax

deb ug ip bgp [vrf vrf-name] [ipv4 {unicast | multicast} | ipv6 unicast] dampening

To disable debugging, use the no debug ip bgp dampening command.

Parameters

vrf vrf-name
    Enter the keyword vrf followed by the name of the VRF to view information on dampened routes corresponding to that VRF.

ipv4 multicast
    (OPTIONAL) Enter the keyword ipv4 followed by the keyword multicast to view dampened-route information related only to ipv4 multicast routes.

ipv4 unicast
    (OPTIONAL) Enter the keyword ipv4 followed by the keyword unicast to view dampened-route information related only to ipv4 unicast routes.

ipv6 unicast
    (OPTIONAL) Enter the keyword ipv4 followed by the keyword unicast to view dampened-route information related only to ipv6 unicast routes.

</tr>
</tbody>
</table>
distance bgp

Configure three administrative distances for routes.

Syntax

```
distance bgp external-distance internal-distance local-distance
```

To return to default values, use the `no distance bgp` command.

Parameters

- **external-distance** Enter a number to assign to routes learned from a neighbor external to the AS. The range is from 1 to 255. The default is **20**.
- **internal-distance** Enter a number to assign to routes learned from a router within the AS. The range is from 1 to 255. The default is **200**.
- **local-distance** Enter a number to assign to routes learned from networks listed in the network command. The range is from 1 to 255. The default is **200**.

Defaults

- external-distance = **20**
- internal-distance = **200**
- local-distance = **200**

Command Modes

- ROUTER BGP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(0.0P6)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.2(1.0)</td>
<td>Introduced on the Z9500.</td>
</tr>
<tr>
<td>8.3(19.0)</td>
<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3(7.0)</td>
<td>Introduced on the S4810.</td>

<tr>
<td>7.8(1.0)</td>
<td>Introduced on the S-Series.</td>
</tr>
<tr>
<td>7.7(1.0)</td>
<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

Usage Information

**CAUTION:** Dell EMC Networking recommends not changing the administrative distance of internal routes. Changing the administrative distances may cause routing table inconsistencies.
The higher the administrative distance assigned to a route means that your confidence in that route is low. Routes assigned an administrative distance of 255 are not installed in the routing table. Routes from confederations are treated as internal BGP routes.

Related Commands

- `router bgp` — enter ROUTER mode on the switch.

**show ip bgp dampened-paths**

View BGP routes that are dampened (non-active).

**Syntax**

```
show ip bgp [vrf vrf-name] [ipv4 {multicast | unicast} | ipv6 unicast] dampened-paths
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keywords `vrf` and then the name of the VRF to view routes that are affected by a specific community list corresponding to that VRF.
- `ipv4 multicast` (OPTIONAL) Enter the keyword `ipv4` followed by the keyword `multicast` to view information related only to ipv4 multicast routes.
- `ipv4 unicast` (OPTIONAL) Enter the keywords `ipv4` followed by the keyword `unicast` to view information related only to ipv4 unicast routes.
- `ipv6 unicast` (OPTIONAL) Enter the keyword `ipv6` followed by the keyword `unicast` to view information related only to ipv6 unicast routes.

**Command Modes**

<td>Introduced on the Z9500.</td>
</tr>
</tbody>
</table>
Usage Information

To determine a BGP session flap, both a route-down event and a subsequent route-up event corresponding to a single route are considered. As a result, a flap event is penalized only one time during the route-down event. The subsequent route-up event corresponding to the same route is not considered as a flap and is not penalized.

The history paths that the show ip bgp command displays contain only the prefix and the next-hop information. The next-hop information shows the ip address of the neighbor. It does not show the actual next-hop details.

The following describes the show ip bgp damp command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network</td>
<td>Displays the network ID to which the route is dampened.</td>
</tr>
<tr>
<td>From</td>
<td>Displays the IP address of the neighbor advertising the dampened route.</td>
</tr>
<tr>
<td>Reuse</td>
<td>Displays the hour:minutes:seconds until the dampened route is available.</td>
</tr>
<tr>
<td>Path</td>
<td>Lists all the ASs the dampened route passed through to reach the destination network.</td>
</tr>
</tbody>
</table>

Example

DellEMC# show ip bgp dampened-paths
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
BGP local router ID is 192.168.11.5
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
    n - network, D - denied, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete

<table>
<thead>

<td>172.16.0.2</td>
<td>00:36:23</td>
<td>200</td>
</tr>
</tbody>
</table>

DellEMC#

BGP Extended Communities (RFC 4360)

BGP Extended Communities, as defined in RFC 4360, is an optional transitive BGP attribute. BGP Extended Communities provides two major advantages over Standard Communities:

- The range is extended from 4-octet (AA:NN) to 8-octet (Type:Value) to provide enough number communities.
- Communities are structured using a new “Type” field (1 or 2-octets), allowing you to provide granular control/filter routing information based on the type of extended communities.
**set extcommunity rt**

To set Route Origin community attributes in Route Map, use this feature.

**Syntax**
```
set extcommunity rt {as4 ASN4:NN [non-trans] | ASN:NNNN [non-trans] | IPADDR:NN [non-trans]} [additive]
```

To delete the Route Origin community, use the `no set extcommunity` command.

**Parameters**
- **as4 ASN4:NN**
  - Enter the keyword `as4` then the 4-octet AS specific extended community number in the format `ASN4:NN` (4-byte AS number:2-byte community value).

- **ASN:NNNN**
  - Enter the 2-octet AS specific extended community number in the format `ASN:NNNN` (2-byte AS number:4-byte community value).

- **IPADDR:NN**
  - Enter the IP address specific extended community in the format `IPADDR:NN` (4-byte IPv4 Unicast Address:2-byte community value).

- **additive**
  - (OPTIONAL) Enter the keyword `additive` to add to the existing extended community.

- **non-trans**
  - (OPTIONAL) Enter the keywords `non-trans` to indicate a non-transitive BGP extended community.

**Defaults**
none

**Command Modes**
ROUTE MAP (config-route-map)

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
<tr>
<td>9.2(1.0)</td>
<td>Introduced on the Z9500.</td>
</tr>
<tr>
<td>8.3(19.0)</td>
<td>Introduced on the S4820T</td>
</tr>
<tr>
<td>8.3(11.1)</td>
<td>Introduced on the Z-9000.</td>
</tr>
<tr>
<td>8.3(7.0)</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>

<td>7.7(1.0)</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>7.6(1.0)</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**
If the `set community rt` and `soo` are in the same route-map entry, the behavior defines as:

- If the `rt` option comes before `soo`, with or without the `additive` option, `soo` overrides the communities `rt` sets.
- If the `rt` option comes after `soo`, without the `additive` option, `rt` overrides the communities `soo` sets.
set extcommunity soo

To set extended community site-of-origin in Route Map, use this feature.

Syntax

```
set extcommunity soo {as4 ASN4:NN | ASN:NNNN | IPADDR:NN [non-trans]}
```

To delete the site-of-origin community, use the no set extcommunity command.

Parameters

- **as4 ASN4:NN**: Enter the keyword as4 then the 4-octet AS specific extended community number in the format ASN4:NN (4-byte AS number:2-byte community value).
- **ASN:NNNN**: Enter the 2-octet AS specific extended community number in the format ASN:NNNN (2-byte AS number:4-byte community value).
- **IPADDR:NN**: Enter the IP address specific extended community in the format IPADDR:NN (4-byte IPv4 Unicast Address:2-byte community value).
- **non-trans**: (OPTIONAL) Enter the keywords non-trans to indicate a non-transitive BGP extended community.

Defaults

none

DellEMC#
IPv6 BGP Commands

IPv6 border gateway protocol (IPv6 BGP) is supported on the platform.

BGP is an external gateway protocol that transmits interdomain routing information within and between Autonomous Systems (AS).

Basically, two routers (called neighbors or peers) exchange information including full routing tables and periodically send messages to update those routing tables.

**clear ip bgp ipv6 unicast soft**

Clear and reapply policies for IPv6 unicast routes without resetting the TCP connection; that is, perform BGP soft reconfiguration.

**Syntax**

```
clear ip bgp {* | as-number | ipv4-neighbor-addr | ipv6-neighbor-addr | peer-group name} ipv6 unicast soft [in | out]
```

**Parameters**

- `*` - Clear and reapply policies for all BGP sessions.
- `as-number` - Clear and reapply policies for all neighbors belonging to the AS. The range is from 0 to 65535 (2 Byte), from 1 to 4294967295 (4 Byte), or from 0.1 to 0.65535.65535 (Dotted format).
- `ipv4-neighbor-addr | ipv6-neighbor-addr` - Clear and reapply policies for a neighbor.
- `peer-group name` - Clear and reapply policies for all BGP routers in the specified peer group.
- `ipv6 unicast` - Clear and reapply policies for all IPv6 unicast routes.
- `in` - Reapply only inbound policies.
  
  **NOTE:** If you enter `soft`, without an `in` or `out` option, both inbound and outbound policies are reset.
- `out` - Reapply only outbound policies.
  
  **NOTE:** If you enter `soft`, without an `in` or `out` option, both inbound and outbound policies are reset.

**Command Modes**

EXEC Privilege

**Command History**

</tbody>
</table>
**debug ip bgp ipv6 unicast soft-reconfiguration**

Enable soft-reconfiguration debugging for IPv6 unicast routes.

**Syntax**

ddebug ip bgp [ipv4-address | ipv6-address | peer-group-name] ipv6 unicast soft-reconfiguration

To disable debugging, use the no debug ip bgp [ipv4-address | ipv6-address | peer-group-name] ipv6 unicast soft-reconfiguration command.

**Parameters**

- **ipv4-address | ipv6-address**
  
Enter the IP address of the neighbor on which you want to enable soft-reconfiguration debugging.

- **peer-group-name**
  
Enter the name of the peer group on which you want to enable soft-reconfiguration debugging.

- **ipv6 unicast**
  
Debug soft reconfiguration for IPv6 unicast routes.

**Defaults**

Disabled.

**Command Modes**

EXEC Privilege

**Command History**

</tr>
</tbody>
</table>

**Usage Information**

This command turns on BGP soft-reconfiguration inbound debugging for IPv6 unicast routes. If no neighbor is specified, debug is turned on for all neighbors.
ipv6 prefix-list

Configure an IPv6 prefix list.

Syntax
ipv6 prefix-list prefix-list name

Parameters
prefix-list name
  Enter the name of the prefix list.

NOTE: There is a 140-character limit for prefix list names.

Defaults
none

Command Modes
CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.8(0.0P5)  Introduced on the S4048-ON.
9.8(0.0P2)  Introduced on the S3048-ON.
9.0.0.0     Introduced on the Z9000.
8.3.19.0    Introduced on the S4820T.
8.3.10.0    Introduced on the S4810.

neighbor soft-reconfiguration inbound

Enable a BGP soft-reconfiguration and start storing updates for inbound IPv6 unicast routes.

Syntax
neighbor {ipv4-address | ipv6-address | peer-group-name} soft-reconfiguration inbound

Parameters
ipv4-address | ipv6-address
  Enter the IP address of the neighbor for which you want to start storing inbound routing updates.

peer-group-name
  Enter the name of the peer group for which you want to start storing inbound routing updates.

Defaults
Disabled.

Command Modes
ROUTER BGPv6 ADDRESS FAMILY (conf-router_bgpv6_af)
show ipv6 prefix-list

Displays the specified IPv6 prefix list.

Syntax

show ipv6 prefix-list detail {prefix-list name} | summary

Parameters

detail
prefix-list name

Display a detailed description of the selected IPv6 prefix list.
Enter the name of the prefix list.

NOTE: There is a 140-character limit for prefix list names.

summary

Display a summary of RPF routes.

Command Modes

EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
8.4.1.0 Added support for IPv4 multicast and IPv4 unicast address families.
8.3.19.0 Introduced on the S4820T.
7.8.1.0 Introduced on the S4810.
7.7.1.0 Introduced on the C-Series.
7.4.1.0 Introduced

Usage Information

This command enables soft-reconfiguration for the specified BGP neighbor. BGP stores all updates for inbound IPv6 unicast routes the neighbor receives but does not reset the peer-session.

CAUTION: Inbound update storage is a memory-intensive operation. The entire BGP update database from the neighbor is stored in memory regardless of the inbound policy results applied on the neighbor.

Border Gateway Protocol
IPv6 MBGP Commands

Multiprotocol BGP (MBGP) is an enhanced BGP that enables the multicast routing policy throughout the internet and connecting multicast topologies between BGP and autonomous systems (AS). FTOS MBGP is implemented as per IETF RFC 1858.

show ipv6 mbgproutes

Display the selected IPv6 MBGP route or a summary of all MBGP routes in the table.

Syntax

```
show ipv6 mbgproutes ipv6-address prefix-length | summary
```

Parameters

- `ipv6-address prefix-length` (OPTIONAL) Enter the IPv6 address in the x:x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128.

- `summary` Display a summary of RPF routes.

Command Modes

`EXEC`

Command History

</table>
You can use content addressable memory (CAM) commands to configure the amount of memory allocated to CAM memory partitions.

**NOTE:** Not all CAM commands are supported on all platforms. Be sure to note the platform when looking for a command.

**WARNING:** If you are using these features for the first time, contact Dell EMC Networking Technical Assistance Center (TAC) for guidance.

Topics:
1. CAM Profile Commands
2. Unified Forwarding Table Modes

## CAM Profile Commands

The CAM profiling feature allows you to partition the CAM to best suit your application. For example:

- Configure more Layer 2 forwarding information base (FIB) entries when the system is deployed as a switch.
- Configure more Layer 3 FIB entries when the system is deployed as a router.
- Configure more access control lists (ACLs) (when IPv6 is not employed).
- Hash multi-protocol label switching (MPLS) packets based on source and destination IP addresses for link aggregation groups (LAGs).
- Hash based on bidirectional flow for LAGs.
- Optimize the virtual local area network (VLAN) ACL Group feature, which permits group VLANs for IP egress ACLs.

### Important Points to Remember

- Dell EMC Networking OS supports CAM allocations on the S-Series.
- The CAM configuration is applied to the entire system when you use the CONFIGURATION mode commands. Save the running-configuration to affect the change.
- When budgeting your CAM allocations for ACLs and quality of service (QoS) configurations, remember that ACL and QoS rules might consume more than one CAM entry depending on complexity. For example, transmission control protocol (TCP) and user datagram protocol (UDP) rules with port range options might require more than one CAM entry.
- You MUST save your changes and reboot the system for CAM profiling or allocations to take effect.

### cam-acl (Configuration)

Select the default CAM allocation settings or reconfigure a new CAM allocation for Layer 2, IPv4, and IPv6 ACLs, Layer 2 and Layer 3 (IPv4) QoS, Layer 2 Protocol Tunneling (L2PT), IP and MAC source address validation for DHCP, Ethernet Connectivity Fault Management (CFM) ACLs, OpenFlow, and Policy-based Routing (PBR).

**Syntax**

```
cam-acl {default | 12acl number ipv4acl number ipv6acl number ipv4qos number 12qos number 12pt number ipmacacl number [vman-qos | vman-dual-qos number] ecfmacl number [nlbclusteracl number] ipv4pbr number | openflow number | fcce
```
number) [iscsiOptacl number] [ipv4udfmiracl number] [ipv4mirracl number]] [vrfv4acl number]

**Parameters**

<table>
<thead>
<tr>
<th><strong>default</strong></th>
<th>Use the default CAM profile settings and set the CAM as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• L2Acl : 6</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>• vrfv4Acl : 0</td>
</tr>
<tr>
<td></td>
<td>• Openflow : 0</td>
</tr>
<tr>
<td></td>
<td>• fedgovacl : 0</td>
</tr>
</tbody>
</table>

**l2acl number**  
Enter the keyword l2acl and then the number of l2acl blocks. The range is from 1 to 8.

**ipv4acl number**  
Enter the keyword ipv4acl and then the number of FP blocks for IPv4 ACL. The range is from 0 to 8.

**ipv6acl number**  
Enter the keyword ipv6acl and then the number of FP blocks for IPv6 ACL. The range is from 0 to 4.

**ipv4qos number**  
Enter the keyword ipv4qos and then the number of FP blocks for IPv4 QoS. The range is from 0 to 8.

**l2qos number**  
Enter the keyword l2qos and then the number of FP blocks for L2 QoS. The range is from 1 to 8.

**l2pt number**  
Enter the keyword l2pt and then the number of FP blocks for l2 protocol tunnelling. The range is from 0 to 1.

**ipmacacl number**  
Enter the keyword ipmacacl and then the number of FP blocks for IP and MAC ACL. The range is from 0 to 6.

**ecfmAcl number**  
Enter the keyword ecfmAcl and then the number of FP blocks for ECFM ACL. The range is from 0 to 5.

**nlbclusteracl number**  
Enter the keyword nlbclusteracl and then the number of FP blocks for nlbcluster ACL. The range is from 0 to 2. By default, the value is 0 and it supports 8 NLB arp entries reserved for internal functionality.
NOTE: When you reconfigure CAM allocation, use the `nlbclusteracl number` command to change the number of NLB ARP entries. The range is from 0 to 2. The default value is 0. At the default value of 0, eight NLB ARP entries are available for use. This platform supports up to 512 CAM entries. Select 1 to configure 256 entries. Select 2 to configure 512 entries. Even though you can perform CAM carving to allocate the maximum number of NLB entries, Dell EMC Networking recommends that you use a maximum of 64 NLB ARP entries.

- **vman-qos**
  - **Enter the keyword `vman-qos` and then the number of FP blocks for VMAN QoS. The range is from 0 to 6.**

- **vman-dual-qos number**
  - **Enter the keyword `vman-dual-qos` and then the number of FP blocks for VMAN dual QoS. The range is from 0 to 4.**

- **ipv4pbr number**
  - **Enter the keyword `ipv4pbr` and then the number of FP blocks for ipv4pbr ACL. The range is from 0 to 8.**

- **openflow number**
  - **Enter the keyword `openflow` and then the number of FP blocks for open flow (multiples of 4). The range is from 0 to 8.**

- **fcoeacl number**
  - **Enter the keyword `fcoeacl` and then the number of FP blocks for FCOE ACL. The range is from 0 to 6.**

- **iscsioptacl number**
  - **Enter the keyword `iscsioptacl` and then the number of FP blocks for iSCSI optimization ACL. The range is from 0 to 2.**

- **ipv4udfmirracl**
  - **Enter the keyword `ipv4udfmirracl` and then the number of FP blocks for IPv4 UDF mirror ACL. The range is from 0 to 8.**

- **ipv4mirracl**
  - **Enter the `ipv4mirracl` keyword and then the number of FP blocks for IPv4 mirror ACL. The range is from 0 to 8. You cannot use the `ipv4mirracl` and `ipv4udfmirracl` commands at the same time.**

- **ipv6mirracl**
  - **Enter the `ipv6mirracl` keyword and then the number of FP blocks for IPv6 mirror ACL. The range is from 0 to 4, in multiples of 2.**

<td>Introduced on the C-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Save the new CAM settings to the startup-config (write-mem or copy run start) then reload the system for the new settings to take effect.

The total amount of space allowed is 16 FP Blocks. System flow requires three blocks; these blocks cannot be reallocated. Only number of blocks can be configured by the user.

If allocation values are not entered for the CAM regions, the value is 0.

If you enable BMP, to perform a reload on the chassis to upgrade any configuration changes that have changed the NVRAM content, use the command `reload conditional nvram-cfg-change`.

**cam-acl-egress**

Allocate CAM for egress ACLs.

**Syntax**

```
cam-acl-egress default | l2acl number ipv4acl number ipv6acl number
```

**Parameters**

- `default` : Reset the egress CAM ACL entries to default settings.
- `l2acl number` : Set the number of blocks for L2 egress ACL entries.
- `ipv4acl number` : Set the number of blocks for IPv4 egress ACL entries.
- `ipv6acl number` : Set the number of blocks for IPv6 egress ACL entries. It must be a multiple of 2.

### cam-threshold

Configure CAM threshold value for sending the syslog message on CAM usage. Configure silence period for stop receiving syslog message on CAM usage.

**Syntax**

```plaintext
cam-threshold threshold {default | threshold-percent} silence-period {default | silence-period-value}
```

**Defaults**

Enabled

**Parameters**

- **threshold default**
  - Enter the keyword `default` for CAM usage threshold for notification of the CAM usage through syslog message. The default threshold value is 90 percent.

- **threshold threshold-percent**
  - Enter the threshold percent for notification of the CAM usage through syslog message. The range is from 1 to 100 percent.

- **silence-period default**
  - Enter the keyword `default` to set the silence period for receiving syslog message regarding CAM usage for CAM region, slot/portpipe. The default silence period is 0 seconds.

- **silence-period silence-period-value**
  - Enter the silence period for stop receiving syslog message for the respective CAM region, slot/portpipe. The range is from 0 to 65535 seconds.

**Command Modes**

- CONFIGURATION

---

**Usage Information**

When you enable this command, if a Policy Map containing classification rules (ACL and/or dscp/ ip-precedence rules) is applied to more than one physical interface on the same port pipe, only a single copy of the policy is written (only one FP entry is used).

---

**NOTE:** An ACL itself may still require more that a single FP entry, regardless of the number of interfaces. For more information, refer to the “IP Access Control Lists”, “Prefix Lists”, and “Route-map” sections in the Dell EMC Networking OS Configuration Guide.
## Supported Modes

**Command History**

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.13.0.0</td>
<td>Introduced on the MXL, FN IOM, S5000, S4048-ON, S6000, S6000-ON, S3048-ON, S3100 Series, C9010, S4048T-ON, Z9500, Z9100-ON, S6100-ON, S6100-ON.</td>
</tr>
</tbody>
</table>

## Usage Information

The `no cam-threshold` command will set the CAM threshold to 90 percent and silence period to 0.

The CAM threshold and silence period configuration is applicable only for Ingress L2, IPv4, IPv6 and Egress L2, IPv4, and IPv6 ACL CAM groups. For other ACL CAM regions, the CAM threshold and silence period is not configurable and the values are fixed to 90 percent and 0 respectively.

## Example

```
DellEMC(conf)#cam-threshold threshold 2 silence-period 2
DellEMC(conf)#do show running-config | g cam-threshold
show cam-acl threshold 2 silence-period 2
```

## show cam-acl

Display the details of the CAM profiles on the chassis and all stack units.

**Syntax**

```
show cam-acl
```

**Defaults**

```
none
```

**Command Modes**

```
EXEC Privilege
```

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

show cam-usage

Display the amount of memory space used and available in each CAM partition (including Layer 2 ACL, Layer 3 ACL, and IPv4Flow)

Syntax

show cam-usage [acl | router | switch]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>(OPTIONAL) Enter the keyword acl to display Layer 2 and Layer 3 ACL CAM usage.</td>
</tr>
<tr>
<td>router</td>
<td>(OPTIONAL) Enter the keyword router to display Layer 3 CAM usage.</td>
</tr>
<tr>
<td>switch</td>
<td>(OPTIONAL) Enter the keyword switch to display Layer 2 CAM usage.</td>
</tr>
</tbody>
</table>

Defaults

none

Command Modes

EXEC Privilege

Command History

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.14(0.0)</td>
<td>Updated to display IPv6 flow-based mirroring information on the S5048F-ON, S6100-ON, Z9100-ON, S6000, and S6000-ON. Updated to display the shared region between IPv4 QoS and IPv6 ACL entries on the S5048F-ON, S6100-ON, and Z9100-ON.</td>
</tr>
<tr>
<td>9.12(1.0)</td>

</tr>
<tr>
<td>Used CAM</td>
<td>Amount of CAM space that is currently in use</td>
</tr>
<tr>
<td>Available CAM</td>
<td>Amount of CAM space that is free and remaining to be allocated for ACLs</td>
</tr>
</tbody>
</table>

**Example**

```
DellEMC#show cam-usage
Stackunit|Portpipe| CAM Partition | Total CAM | Used CAM | Available CAM
---------|--------|---------------|-----------|----------|----------------
        |        | IN-L2 ACL     | 1024      | 0        | 1024
        |        | IN-L3 ACL     | 1024      | 1        | 1023
        |        | IN-L3 FIB     | 163840    | 16       | 163824
        |        | IN-L3 ECMP GRP| 1024      | 0        | 1024
        |        | IN-V6 ACL     | 0         | 0        | 0
        |        | IN-NLB ACL    | 0         | 0        | 0
        |        | IPMAC ACL     | 0         | 0        | 0
        |        | OUT-L2 ACL    | 206       | 9        | 197
        |        | OUT-L3 ACL    | 102       | 9        | 93
        |        | OUT-V6 ACL    | 102       | 4        | 98
```

**Example (show cam-usage router)**

```
DellEMC#show cam-usage router
Stackunit|Portpipe| CAM Partition | Total CAM | Used CAM | Available CAM
---------|--------|---------------|-----------|----------|----------------
        |        | IN-L3 ACL     | 1024      | 1        | 1023
        |        | IN-L3 ECMP GRP| 1024      | 0        | 1024
        |        | IN-V6 ACL     | 0         | 0        | 0
        |        | IN-L3-MIRR ACL| 0         | 0        | 0
        |        | IN-L3 FIB     | 163840    | 15       | 163825
```
**test cam-usage**

Verify that enough CAM space is available for the IPv6 ACLs you have created.

**Syntax**
```
test cam-usage service-policy input input policy name stack-unit {number | all}
```

**Parameters**
- `policy-map name`: Enter the name of the policy-map to verify. Maximum is 32 characters.
- `number`: Enter all to get information for all the stack-units or enter the stack-unit number to get information for a specific stack-unit.

**Defaults**
none

<tr>
<td>7.8.1.0</td>
<td>Introduced.</td>
</tr>
</tbody>
</table>

**Usage Information**
This command applies to both IPv4 and IPv6 CAM Profiles, but is best used when verifying QoS optimization for IPv6 ACLs.

QoS Optimization for IPv6 ACLs does not impact the CAM usage for applying a policy on a single (or the first of several) interfaces. It is most useful when a policy is applied across multiple interfaces; it can reduce the impact to CAM usage across subsequent interfaces.

The following describes the `test cam-usage` command shown in the following example.
Term | Explanation
--- | ---
Stack-Unit | Lists the stack unit or units that are checked. Entering all shows the status for all stacks.
Portpipe | Lists the portpipe (port-set) or port pipes (port-sets) that are checked. Entering all shows the status for stack-units and port-pipes in the chassis. The port set value is from 0 to 0.
CAM Partition | Shows the CAM profile of the CAM.
Available CAM | Identifies the amount of CAM space remaining for that profile.
Estimated CAM per Port | Estimates the amount of CAM space the listed policy will require.
Status | Indicates whether or not the policy will be allowed in the CAM.

Example
```
DellEMC# test cam-usage service-policy input In stack-unit all
Stack-Unit|Portpipe|CAM Partition|Available CAM|Estimated CAM per Port|Status
----------------------------------------------------------------------------
1 | 0 | IPv4Flow | 102 | 0| Allowed
DellEMC#
```

DellEMC# test cam-usage service-policy input In stack-unit 1 port-set 0
```
Stack-Unit|Portpipe|CAM Partition|Available CAM|Estimated CAM per Port|Status
-----------------------------------------------------------------------------
1 | 0 | IPv4Flow | 102 | 0| Allowed
DellEMC#
```

Unified Forwarding Table Modes

Unified Forwarding Table (UFT) consolidates the resources of several search tables (Layer 2, Layer 3 Hosts, and Layer 3 Route [Longest Prefix Match — LPM]) into a single flexible resource. The system supports several UFT modes to extract the forwarding tables, as required. By default, Dell EMC Networking OS initializes the table sizes to UFT mode 2 profile, as it provides a reasonable shared memory for all the tables. The other supported UFT modes are scaled-l3–hosts (UFT mode 3) and scaled-l3–routes (UFT mode 4).

**Important Points to Remember**

- All line cards/Stack Members within a single system must have the same UFT mode profiles. This profile must match the system UFT mode profile (the profile on the primary route processor module [RPM]/Master Unit of the Stack).
- Apply the UFT mode configuration to the entire system when you use the CONFIGURATION mode commands. Save the running-configuration to affect the change.
- Save the changes and reboot the system for UFT mode profiling to take effect.

**hardware forwarding-table mode**

Select a mode to initialize the maximum scalability size for L2 MAC table or L3 Host table or L3 Route table.

**Syntax**
```
hardware forwarding-table mode {scaled-l3-hosts | scaled-l3-routes}
```

**Parameters**
- `scaled-l3-hosts` Enter the keywords `scaled-l3-hosts` to select the forwarding table mode for scaling L3 host entries.
- `scaled-l3-routes` Enter the keywords `scaled-l3-routes` to select the forwarding table mode for scaling L3 route entries.

**Defaults**
UFT mode 2

Control Plane Policing (CoPP)

Control plane policing (CoPP) uses access control list (ACL) rules and quality of service (QoS) policies to create filters for a system's control plane. The CoPP filters prevent traffic that is not identified as legitimate from reaching the control plane, and rate-limit traffic to an acceptable level.

Topics:
- control-plane-cpuqos
- service-policy rate-limit-cpu-queues
- service-policy rate-limit-protocols
- ip unknown-unicast
- ipv6 unknown-unicast
- show cpu-queue rate cp
- show ip protocol-queue-mapping
- show ipv6 protocol-queue-mapping
- show mac protocol-queue-mapping

control-plane-cpuqos

To manage control-plane traffic, enter control-plane mode and configure the switch.

Syntax
control-plane-cpuqos

Defaults
Not configured.

</tbody>
</table>

**Usage Information**
Create a policy-map by associating a queue number with the qos-policy.
Create QoS policies prior to enabling this command.
For CoPP, use the keyword `cpu-qos` when creating `qos-policy-input`.

**Related Commands**

- `qos-policy-input` — create a QoS input policy map.
- `policy-map-input` — create an input policy map.

## service-policy rate-limit-protocols

Apply a policy for the system to rate limit control protocols on a per-protocol basis.

**Syntax**

```
service-policy rate-limit-protocols policy-name
```

**Parameters**

- `policy-name` Enter the service-policy name, using a string up to 32 characters.

**Defaults**

Not configured.

**Command Modes**

CONTROL-PLANE-CPUQOS

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>

<tr>
<td>8.3.8.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

**Usage Information**

This command applies the service-policy based on the type of protocol defined in the ACL rules.

Create ACL and QoS policies prior to enabling this command.

For CoPP, use the keyword `cpu-qos` when creating `qos-policy-input`.

**Related Commands**

- `ip access-list extended` — creates an extended IP ACL.
ip unknown-unicast

Enable IPv4 catch-all route.

Syntax

ip unknown-unicast [vrf vrf-name]

To remove the IPv4 catch-all route (0.0.0.0/0) from the LPM route forwarding table in hardware which gets added as a default configuration after the initialization of FIB Agent module, use the no ip unknown-unicast command.

Defaults

None

Parameters

- **vrf vrf-name**
  - (Optional) Enter the keyword vrf followed by the name of the VRF to enable catch-all routes corresponding to that VRF.

Command Modes

- CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Usage Information

Use this command to add the IPv4 catch-all route (0.0.0.0/0) in the LPM route forwarding table if it was deleted using the no ip unknown-unicast command previously. This will be the default configuration after reload.
ipv6 unknown-unicast

Disable soft forwarding of unknown IPv6 destination packets.

Syntax

[no] ipv6 unknown-unicast

Defaults

Soft forwarding is enabled.

Command Modes

DellEMC#

show ip protocol-queue-mapping

Display the queue mapping for each configured protocol.

Syntax

show ip protocol-queue-mapping

Defaults

Not configured.

Command Modes

EXEC Privilege

Command History

This command applies the service-policy based on the type of protocol defined in the ACL rules.

Create ACL and QoS policies prior to enabling this command.

Usage Information

Example
### show ipv6 protocol-queue-mapping

Display the queue mapping for each configured IPv6 protocol.

**Syntax**

```
show ipv6 protocol-queue-mapping
```

**Defaults**

Not configured.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**  
**Description**

- **9.11(3.0)**  
  Modified the output to display MCAST data packet information.

- **9.10(0.1)**  
  Introduced on the S6010-ON and S4048T-ON.

- **9.10(0.0)**  
  Introduced on the S3148.

- **9.10(0.0)**  
  Introduced on the S6100-ON.

- **9.8(2.0)**  
  Introduced on the S3100 series.

- **9.8(1.0)**  
  Introduced on the Z9100-ON.

- **9.8(0.0P5)**  
  Introduced on the S4048-ON.

- **9.8(0.0P2)**  
  Introduced on the S3048-ON.

- **9.7(0.0)**  
  Introduced on the S6000-ON.

- **9.2(1.0)**  
  Introduced on the Z9500.

- **9.0.2.0**  
  Introduced on the S6000.

- **8.3.19.0**  
  Introduced on the S4820T.

- **8.3.11.1**  
  Introduced on the Z9000.

- **8.3.8.0**  
  Introduced on the S4810.

DellEMC#
Data Center Bridging (DCB)

Data center bridging (DCB) refers to a set of IEEE Ethernet enhancements that provide data centers with a single, robust, converged network to support multiple traffic types, including local area network (LAN), server, and storage traffic.

The Dell EMC Networking OS commands for data center bridging features include 802.1Qbb priority-based flow control (PFC), 802.1Qaz enhanced transmission selection (ETS), and the data center bridging exchange (DCBX) protocol.

This section includes the following:

- DCB Command
- PFC Commands
- ETS Commands
- DCBX Commands

Topics:

- DCB Command
- PFC Commands
- ETS Commands
- DCBX Commands
  - dcb-map
  - priority-pgid
  - pfc mode on
  - priority-group bandwidth pfc
  - dcb-map stack-unit all stack-ports all
  - show qos dcb-map
  - dcb pfc-shared-buffer-size
  - dcb-buffer-threshold
  - priority
  - qos-policy-buffer
  - dcb-policy buffer-threshold (Interface Configuration)
  - dcb-policy buffer-threshold (Global Configuration)
  - show qos dcb-buffer-threshold
  - dcb pfc-total-buffer-size
  - show running-config dcb-buffer-threshold
  - service-class buffer shared-threshold-weight
  - dcb pfc-queues
  - dcb (ets | pfc) enable

DCB Command

The following DCB command is supported on the Dell EMC Networking OS.
**dcb-enable**

Enable data center bridging.

**Syntax**

```
dcb enable [pfc-queues 1-4]
```

To disable DCB, use the `no dcb enable` command.

**Parameters**

- `pfc-queues` Enter the pfc-queue range. To disable DCB, use the `no dcb enable` command. The range is from 1 to 4.

**Defaults**

None

**Command Modes**

`CONFIGURATION`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
| 8.3.16.0 | Introduced on the MXL 10/40GbE Switch IO Module.

**Usage Information**

By default, iSCSI is enabled on the unit and the flow control is enabled on all of the interfaces. It is also acts as defaults when the link-level flow control is enabled on one or more interfaces.

Enables priority flow control or enhance transmission selection on interface.

**Related Commands**

- `dcb <ets | pfc> enable` — enable priority flow control or enhanced transmission selection on interface.

**PFC Commands**

The following PFC commands are supported on the Dell EMC Networking OS.
clear pfc counters

Clear the PFC TLV counters and PFC statistics on an interface or stack unit.

Syntax

```
clear pfc counters [interface-type | stack-unit {unit number | all } all stack-ports all]
```

Parameters

- `interface`  
  - `interface-type` Enter the keywords `port-type` then the interface information.
- `stack-unit`  
  - `unit number` Enter the keywords `stack-unit` then the stack-unit number to be cleared.
- `statistics` Enter the keyboard `statistics` to clear the hardware PFC counters.
- `stack-ports all` Enter the keywords `stack-ports all` to clear the counters on all stack ports.

Defaults

None

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S6100-ON.

9.8(1.0) Introduced on the Z9100–ON.

9.8(0.0) Introduced on the S3048-ON and S4048-ON.

9.7(0.0) Introduced on the S6000-ON and Z9500.

9.0.2.0 Introduced on the S6000.

8.3.19.0 Introduced on the S4820T.

8.3.12.0 Introduced on the S4810.

8.3.16.0 Introduced on the MXL 10/40GbE Switch IO Module.

Usage Information

If you do not use the statistics parameter, both hardware and DCBx counters clear.

description

Enter a text description of the DCB policy (PFC input or ETS output).

Syntax

```
description text
```

To remove the text description, use the no description command.

Parameters

- `text` Enter the description of the output policy. The maximum is 32 characters.

Defaults

None
Command Modes

- DCB INPUT POLICY
- DCB OUTPUT POLICY

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

</tbody>
</table>

**pfc mode on**

Enable the PFC configuration on the port so that the priorities are included in DCBX negotiation with peer PFC devices.

**Syntax**

```
pfc mode on

To disable the PFC configuration, use the no pfc mode on command.
```

**Defaults**

PFC mode is on.

**Command Modes**

DCB INPUT POLICY

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.16.0</td>
<td>Introduced on the MXL 10/40GbE Switch IO Module.</td>
</tr>
</tbody>
</table>

**Usage Information**

**NOTE:** Please note that Dell Networking does not recommend to use this command as it has been deprecated in the current 9.4.(0.0) release. A warning message appears when you try to run this command indicating that you have to use the dcb-map commands in the future.

By applying a DCB input policy with PFC enabled, you enable PFC operation on ingress port traffic. To achieve complete lossless handling of traffic, also enable PFC on all DCB egress ports or configure the dot1p priority-queue assignment of PFC priorities to lossless queues (refer to pfc no-drop queues).

To disable PFC operation on an interface, enter the no pfc mode on command in DCB Input Policy Configuration mode. PFC is enabled and disabled as global DCB operation is enabled (dcb-enable) or disabled (no dcb-enable).
You cannot enable PFC and link-level flow control at the same time on an interface.

**pfc no-drop queues**

Configure the port queues that still function as no-drop queues for lossless traffic.

**Syntax**

```
pfc no-drop queues queue-range
```

To remove the no-drop port queues, use the `no pfc no-drop queues` command.

**Parameters**

- `queue-range` Enter the queue range. Separate the queue values with a comma; specify a priority range with a dash; for example, `pfc no-drop queues 1,3` or `pfc no-drop queues 7` or `pfc no-drop queues 0,7`. The range is from 0 to 3.

**Defaults**

No lossless queues are configured.

**Command Modes**

`INTERFACE`

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S6010-ON and S4048T-ON.</td>

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.16.0</td>
<td>Introduced on the MXL 10/40GbE Switch IO Module.</td>
</tr>
</tbody>
</table>

**Usage Information**

- When you configure lossless queues on an interface, PFC priority configuration is not allowed on the `dcb-map` profile applied on the interface.
- The maximum number of lossless queues globally supported on the switch is two.

The following lists the dot1p priority-queue assignments.

<table>
<thead>
<tr>
<th>dot1p Value in the Incoming Frame</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>

</tr>
</tbody>
</table>
Before configuring the port queues to function as no-drop queues, you must first apply the dcb-map map with pfc mode off. To apply the dcb-map with pfc mode off, use the following commands: dcb-map pfcoff and no pfc mode on.

show dcb

Displays the data center bridging status, the number of PFC-enabled ports, and the number of PFC-enabled queues.

Syntax

show dcb

Command Modes
EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S6100-ON.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0) Introduced on the S3048-ON and S4048-ON.
9.7(0.0) Introduced on the S6000-ON and Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.16.0 Introduced on the MXL 10/40GbE Switch IO Module.

Usage Information
Specify a stack-unit number on the Master switch in a stack.

Example

DellEMC# show dcb
stack-unit 1 port-set 0
    DCB Status : Enabled
    PFC Port Count : 56 (current), 56 (configured)
PFC Queue Count : 2 (current), 2 (configured)
DellEMC#

show interface pfc

Displays the PFC configuration applied to ingress traffic on an interface, including priorities and link delay.

Syntax

show interface port-type slot/port[/subport] pfc {summary | statistics | detail | buffer-threshold)
Parameters

- **port-type slot/port[/subport] pfc**: Enter the port-type slot and port PFC information. Enter the subport number if a port is fanned-out into 10G ports.
- **(summary | statistics | detail | buffer-threshold)**: Enter the keyword summary for a summary list of results or enter the keyword detail for a full list of results. Enter the keyword statistics to view PFC statistics. Use the keyword buffer-threshold to display the buffer threshold details.

**NOTE**: This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port[/subport] - slot/port/ [subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

**Command Modes**

- EXEC Privilege
- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### show interface pfc statistics

Displays counters for the PFC frames received and transmitted (by dot1p priority class) on an interface.

**Syntax**

```
show interface port-type pfc statistics
```

**Parameters**

- `port-type` Enter the port type and the interface information.
NOTE: This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as slot/port-range. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1 - 4.
- For ON platforms, you can specify multiple ports as slot/port/[subport] - slot/port/[subport]. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1/1 - 1/1/4.

  Admin is enabled, Priority list is 4-5
  Local is enabled, Priority list is 4-5
  Link Delay 45556 pause quantum
    0 Pause Tx pkts, 0 Pause Rx pkts
Dell#
```

ETS Commands

The following ETS commands are supported on the Dell EMC Networking OS.

**NOTE:** Before configuring ETS, assign the etsacl space, using the cam-acl l2acl 2 ipv4acl 0 ipv6acl 0 ipv4qos 2 l2qos 0 12pt 0 ipmacacl 0 vman-qos 0 fcoeacl 2 etsacl 1 iscsi 2 command.

**bandwidth-percentage**

Configure the bandwidth percentage allocated to priority traffic in port queues.

**Syntax**

`bandwidth-percentage percentage`

To remove the configured bandwidth percentage, use the `no bandwidth-percentage` command.

**Parameters**

- `percentage` (Optional) Enter the bandwidth percentage. The percentage range is from 1 to 100% in units of 1%.

**Defaults**

none

**Command Modes**

QOS-POLICY-OUT-ETS
Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

Usage Information

By default, equal bandwidth is assigned to each port queue and each dot1p priority in a priority group. To configure bandwidth amounts in associated dot1p queues, use the bandwidth-percentage command. When specified bandwidth is assigned to some port queues and not to others, the remaining bandwidth (100% minus assigned bandwidth amount) is equally distributed to unassigned non-strict priority queues in the priority group. The sum of the allocated bandwidth to all queues in a priority group must be 100% of the bandwidth on the link.

ETS-assigned bandwidth allocation applies only to data queues, not to control queues.

The configuration of bandwidth allocation and strict-queue scheduling is not supported at the same time for a priority group. If you configure both, the configured bandwidth allocation is ignored for priority-group traffic when you apply the output policy on an interface.

By default, equal bandwidth is assigned to each priority group in the ETS output policy applied to an egress port if you did not configure bandwidth allocation. The sum of configured bandwidth allocation to dot1p priority traffic in all ETS priority groups must be 100%. Allocate at least 1% of the total bandwidth to each priority group and queue. If bandwidth is assigned to some priority groups but not to others, the remaining bandwidth (100% minus assigned bandwidth amount) is equally distributed to nonstrict-priority groups which have no configured scheduler.

Related Commands

- qos-policy-output ets — create a GoS output policy.
- scheduler — schedule priority traffic in port queues.

clear ets counters

Clear all ETS TLV counters on an interface.

Syntax

clear ets counters port-type slot/port[/subport]

Parameters

port-type Enter the keywords port-type then the slot/port information.

Defaults

None

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
dcb-enable

Enable data center bridging.

Syntax
dcb enable[pfc-queues 1-4]

To disable DCB, use the no dcb enable command.

Parameters

pfc-queues

Enter the pfc-queue range. To disable DCB, use the no dcb enable command. The range is from 1 to 4.

Defaults

None

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S6100-ON.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0) Introduced on the S3048-ON and S4048-ON.
9.7(0.0) Introduced on the S6000-ON and Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.12.0 Introduced on the S4810.
8.3.16.0 Introduced on the MXL 10/40GbE Switch IO Module.

Usage Information

By default, iSCSI is enabled on the unit and the flow control is enabled on all of the interfaces. It is also acts as defaults when the link-level flow control is enabled on one or more interfaces.
Enables priority flow control or enhance transmission selection on interface.

Related Commands

- `dcb <ets | pfc> enable` — enable priority flow control or enhanced transmission selection on interface.

### description

Enter a text description of the DCB policy (PFC input or ETS output).

**Syntax**

```
description text
```

To remove the text description, use the `no description` command.

**Parameters**

- `text` Enter the description of the output policy. The maximum is 32 characters.

**Defaults**

None

**Command Modes**

- DCB INPUT POLICY
- DCB OUTPUT POLICY

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

### priority-list

Configure the 802.1p priorities for the traffic on which you want to apply an ETS output policy.

**Syntax**

```
priority-list value
```

To remove the priority list, use the `no priority-list` command.

**Parameters**

- `value` Enter the priority list value. Separate priority values with a comma; specify a priority range with a dash; for example, priority-list 3,5-7. The range is from 0 to 7.

**Defaults**

None

**Command Modes**

PERIODIC-GROUP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.
### Version and Description

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(0.0)</td>
<td>Introduced on the S3048-ON and S4048-ON.</td>
</tr>
<tr>
<td>9.7(0.0)</td>
<td>Introduced on the Z9500.</td>
</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.12.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.16.0</td>
<td>Introduced on the MXL 10/40GbE Switch IO Module.</td>
</tr>
</tbody>
</table>

### Usage Information

By default:

- All 802.1p priorities are grouped in priority group 0.
- 100% of the port bandwidth is assigned to priority group 0. The complete bandwidth is equally assigned to each priority class so that each class has 12 to 13%.

### qos-policy-output ets

To configure the ETS bandwidth allocation and scheduling for priority traffic, create a QoS output policy.

**Syntax**

```text
qos-policy-output policy-name ets
```

To remove the QoS output policy, use the `no qos-policy-output ets` command.

**Parameters**

- `policy-name` Enter the policy name. The maximum is 32 characters.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.12.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.16.0</td>
<td>Introduced on the MXL 10/40GbE Switch IO Module.</td>
</tr>
</tbody>
</table>

**Usage Information**

If an error occurs in an ETS output-policy configuration, the configuration is ignored and the scheduler and bandwidth allocation settings are reset to the ETS default values (all priorities are in the same ETS priority group and bandwidth is allocated equally to each priority).

If an error occurs when a port receives a peer’s ETS configuration, the port’s configuration is reset to the previously configured ETS output policy. If no ETS output policy was previously applied, the port is reset to the default ETS parameters.

You can only associate output QoS policy profiles with the priority groups in the DCB output profile context; output QoS policy profiles are not permitted on output policy-maps.

WRED, ECN, rate shaping, and rate limiting are not supported in output policies because DCBx does not negotiate these parameters with peer devices. You can apply a QoS output policy with WRED and/or rate shaping on a DCBx CIN-enabled interface.
If you enable the `scheduler` command for a QoS ETS output policy, no bandwidth percentage is assigned to the policy.

**Related Commands**
- `scheduler` — schedule the priority traffic in port queues.
- `bandwidth-percentage` — bandwidth percentage allocated to the priority traffic in port queues.

### scheduler

Configure the method used to schedule priority traffic in port queues.

**Syntax**
```
scheduler value
```

To remove the configured priority schedule, use the `no scheduler` command.

**Parameters**
- `value` 
  - Enter schedule priority value. The range: strict: strict-priority traffic is serviced before any other queued traffic.

**Defaults**
Weighted Elastic Round Robin (WERR) scheduling is used to queue priority traffic.

**Command Modes**
POLICY-MAP-OUT-ETS

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(0.0)</td>
<td>Introduced on the S3048-ON and S4048-ON.</td>

<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.3.16.0</td>
<td>Introduced on the MXL 10/40GbE Switch IO Module.</td>
</tr>
</tbody>
</table>

**Usage Information**
- dot1p priority traffic on the switch is scheduled to the current queue mapping. dot1p priorities within the same queue must have the same traffic properties and scheduling method.
- ETS-assigned scheduling applies only to data queues, not to control queues.
- The configuration of bandwidth allocation and strict-queue scheduling is not supported at the same time for a priority group. If you configure both, the configured bandwidth allocation is ignored for priority-group traffic when you apply the output policy on an interface.
- If you enable this command for a QoS ETS output policy, no bandwidth percentage is assigned to the policy.

**Related Commands**
- `qos-policy-output ets` — configure the ETS bandwidth allocation.
- `bandwidth-percentage` — bandwidth percentage allocated to priority traffic in port queues.
show interface ets

Displays the ETS configuration applied to egress traffic on an interface, including priority groups with priorities and bandwidth allocation.

Syntax

```
show interface port-type slot/port[/subport] ets {summary | detail}
```

Parameters

- **port-type slot/port[/subport] ets**: Enter the port-type slot and port ETS information. Enter the subport number if a port is fanned-out into 10G ports.
- **(summary | detail)**: Enter the keyword `summary` for a summary list of results or enter the keyword `detail` for a full list of results.

**NOTE**: This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as `slot/port/[subport] - slot/port/ [subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

Command Modes

- EXEC Privilege

**Example (Summary)**

```
Dell# show qos priority-groups
priority-group ipc
  priority-list 4
    set-pgid 2
```

show stack-unit stack-ports ets details

Displays the ETS configuration applied to egress traffic on stacked ports, including ETS Operational mode on each unit and the configured priority groups with dot1p priorities, bandwidth allocation, and scheduler type.

**Syntax**

```
show stack-unit (all | stack-unit) stack-ports (all | port-number) ets details
```

**Parameters**

- `stack-unit`: Enter the stack unit identification.
- `port-number`: Enter the port number.

**Command Modes**

EXEC Privilege

**Command History**

**DCBX Commands**

The following DCBX commands are supported on the Dell EMC Networking OS.

**advertise dcbx-app-tlv**

Configure DCBX to send iSCSI TLV advertisements.

**Syntax**

advertise dcbx-app-tlv iscsi

To disable DCBX iSCSI TLV advertisements, use the **no advertise dcbx-app-tlv iscsi** command.
Defaults
   Enabled

Command Modes
   PROTOCOL LLDP

Command History
   This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

   Version       Description
   9.8(0.0)      Introduced on the S3048-ON and S4048-ON.
   8.3.19.0      Introduced on the S4820T.
   8.3.12.0      Introduced on the S4810.
   8.3.16.0      Introduced on MXL 10/40GbE Switch IO Module.

Usage Information
   You can configure iSCSI TLVs to send either globally or on a specified interface. The interface configuration takes priority over global configuration.

advertise dcbx-appln-tlv

On a DCBX port with a manual role, configure the application priority TLVs advertised on the interface to DCBX peers.

Syntax
   advertise dcbx-appln-tlv {fcoe | iscsi}

   To remove the application priority TLVs, use the no advertise dcbx-appln-tlv {fcoe | iscsi} command.

Parameters
   {fcoe | iscsi}      Enter the application priority TLVs, where:

   • fcoe: enables the advertisement of FCoE in application priority TLVs.
   • iscsi: enables the advertisement of iSCSI in application priority TLVs.

Defaults
   Application priority TLVs are enabled to advertise FCoE and iSCSI.

Command Modes
   PROTOCOL LLDP

Command History
   This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

   Version       Description
   9.8(0.0)      Introduced on the S3048-ON and S4048-ON.
   9.7(0.0)      Introduced on the S6000-ON and Z9500.
   9.0.2.0       Introduced on the S6000.
   8.3.19.0      Introduced on the S4820T.
   8.3.12.0      Introduced on the S4810.
   8.3.16.0      Introduced on the MXL 10/40GbE Switch IO Module.

Usage Information
   To disable TLV transmission, use the no form of the command; for example, no advertise dcbx-appln-tlv iscsi.
advertise dcbx-tlv

On a DCBX port with a manual role, configure the PFC and ETS TLVs advertised to DCBX peers.

Syntax

```
advertise dcbx-tlv {ets-conf | ets-reco | pfc} [ets-conf | ets-reco | pfc]
[ets-conf | ets-reco | pfc]
```

To remove the advertised ETS TLVs, use the no advertise dcbx-tlv command.

Parameters

(ets-conf | ets-reco | pfc) Enter the PFC and ETS TLVs advertised, where:

- ets-conf: enables the advertisement of ETS configuration TLVs.
- ets-reco: enables the advertisement of ETS recommend TLVs.
- ets-reco: enables the advertisement of PFC TLVs.

Defaults

All PFC and ETS TLVs are advertised.

Command Modes

PROTOCOL LLDP

</tr>
<tr>
<td>8.3.16.0</td>
<td>Introduced on the MXL 10/40GbE Switch IO Module.</td>
</tr>
</tbody>
</table>

Usage Information

You can configure the transmission of more than one TLV type at a time; for example:

```
advertise dcbx-tlv ets-conf ets-reco
```

You can enable ETS recommend TLVs (ets-reco) only if you enable ETS configuration TLVs (ets-conf). To disable TLV transmission, use the no form of the command; for example:

```
no advertise dcbx-tlv pfc ets-reco
```

DCBX requires that you enable LLDP to advertise DCBX TLVs to peers.

Configure DCBX operation at the INTERFACE level on a switch or globally on the switch. To verify the DCBX configuration on a port, use the show interface dcbx detail command.
**dcbx port-role**

Configure the DCBX port role the interface uses to exchange DCB information.

**Syntax**

dcbx port-role {config-source | auto-downstream | auto-upstream | manual}

To remove DCBX port role, use the no dcbx port-role {config-source | auto-downstream | auto-upstream | manual} command.

**Parameters**

<table>
<thead>

**Usage Information**

DCBX requires that you enable LLDP to advertise DCBX TLVs to peers.

Configure DCBX operation at the INTERFACE level on a switch or globally on the switch. To verify the DCBX configuration on a port, use the show interface dcbx detail command.
dcbx version

Configure the DCBX version used on the interface.

Syntax

dcbx version {auto | cee | cin | ieee-v2.5}

To remove the DCBX version, use the dcbx version {auto | cee | cin | ieee-v2.5} command.

Parameters

  auto | cee | cin | ieee-v2.5

Enter the DCBX version type used on the interface, where:

  • auto: configures the port to operate using the DCBX version received from a peer.
  • cee: configures the port to use CDD (Intel 1.01).
  • cin: configures the port to use Cisco-Intel-Nuova (DCBX 1.0).

  | NOTE: For CIN, priority-group/traffic-class group wise bandwidth works and priority wise bandwidth configuration is ignored.
  • ieee-v2: configures the port to use IEEE 802.1az (Draft 2.5).

Defaults

Auto

Usage Information

DCBX requires that you enable LLDP to advertise DCBX TLVs to peers.

Configure DCBX operation at the INTERFACE level on a switch or globally on the switch. To verify the DCBX configuration on a port, use the show interface dcbx detail command.
**debug dcbx**

Enable DCBX debugging.

Syntax:
```
debug dcbx {all | auto-detect-timer | config-exchng | fail | mgmt | resource | sem | tlv}
```

To disable DCBX debugging, use the `no debug dcbx` command.

Parameters:
- `all`: enables all DCBX debugging operations.
- `auto-detect-timer`: enables traces for DCBX auto-detect timers.
- `config-exchng`: enables traces for DCBX configuration exchanges.
- `fail`: enables traces for DCBX failures.
- `mgmt`: enables traces for DCBX management frames.
- `resource`: enables traces for DCBX system resource frames.
- `sem`: enables traces for the DCBX state machine.
- `tlv`: enables traces for DCBX TLVs.

Defaults:
None

Command Modes:
EXEC Privilege

**fcoe priority-bits**

Configure the FCoE priority advertised for the FCoE protocol in application priority TLVs.

Syntax:
```
fcoe priority-bits priority-bitmap
```
To remove the configured FCoE priority, use the `no fcoe priority-bits` command.

**Parameters**

- `priority-bitmap` Enter the priority-bitmap range. The range is from 1 to FF.

**Defaults**

- 0x8

**Command Modes**

- PROTOCOL LLDP

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

show interface dcbx detail

Displays the DCBX configuration on an interface.

Syntax

    show interface port-type dcbx detail

Parameters

port-type  Enter the port type along with the port number.

NOTE: This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as slot/port-range. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1 - 4.
- For ON platforms, you can specify multiple ports as slot/port/[subport] - slot/port/[subport]. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1/1 - 1/1/4.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version          Description

9.10(0.1)         Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)         Introduced on the S6100-ON.
9.9(0.0)          Added support to display the interface configurations corresponding to a range of ports.
9.8(1.0)          Introduced on the Z9100-ON.
9.8(0.0P5)        Introduced on the S4048-ON.
9.8(0.0P2)        Introduced on the S3048-ON.
9.7(0.0)          Introduced on the S6000-ON and Z9500.
9.0.2.0           Introduced on the S6000.
9.2.(0.0)         Down status messages added.
8.3.19.0          Introduced on the S4820T.
8.3.12.0          Introduced on the S4810.
8.3.16.0          Introduced on the MXL 10/40GbE Switch IO Module.
To clear DCBX frame counters, use the `clear dcbx counters interface stack-unit/port` command.

The following describes the `show interface dcbx detail` command shown in the following example.

<table>

```
**dcb-map**

Create a DCB map to configure priority flow control (PFC) and enhanced transmission selection (ETS) on Ethernet ports that support converged Ethernet traffic. Apply the DCB map to an Ethernet interface.

**Syntax**

dcb-map map-name

To remove a DCB map from an ethernet interface, use the no dcb-map command.

**Parameters**

map-name

Enter a DCB map name. The maximum number of alphanumeric characters is 32.

**Defaults**

None.

**Command Modes**

CONFIGURATION

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

A DCB map is a template used to configure DCB parameters and apply them on converged Ethernet interfaces. DCB parameters include priority-based flow control (PFC) and enhanced traffic selection (ETS).

To display the PFC and ETS settings in DCB maps, enter the show qos dcb-map name command.

Use the dcb-map command to create a DCB map to specify PFC and ETS settings and apply it on Ethernet ports. After you apply a DCB map to an interface, the PFC and ETS settings in the map are applied when the Ethernet port is enabled. DCBx is enabled on Ethernet ports by default.

The dcb-map command is supported only on physical Ethernet interfaces.

To remove a DCB map from an interface, enter the no dcb-map map-name command in Interface configuration mode.

You can enable or disable pfc mode on the DCB mode using the pfc mode on or pfc mode off command.

**priority-pgid**

Assign 802.1p priority traffic to a priority group in a DCB map.

**Syntax**

priority-pgid dot1p0_group-num dot1p1_group-num dot1p2_group-num dot1p3_group-num dot1p4_group-num dot1p5_group-num dot1p6_group-num dot1p7_group-num
Parameters

dot1p0–7_group-num

Enter the priority group number for each 802.1p class of traffic in a DCB map.

Defaults

None

Command Modes

DCB MAP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S6100-ON.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0) Introduced on the S3048-ON and S4048-ON.
9.7(0.0) Introduced on the S6000-ON and Z9500.
9.3(0.0) Introduced on the S4810, S6000 platforms.

Usage Information

PFC and ETS settings are not pre-configured on Ethernet ports. You must use the dcb-map command to configure different groups of 802.1p priorities with PFC and ETS settings.

Using the priority-pgid command, you assign each 802.1p priority to one priority group. A priority group consists of 802.1p priority values that are grouped together for similar bandwidth allocation and scheduling, and that share latency and loss requirements. All 802.1p priorities mapped to the same queue must be in the same priority group. For example, the priority-pgid 0 0 0 1 2 4 4 4 command creates the following groups of 802.1p priority traffic:

- Priority group 0 contains traffic with dot1p priorities 0, 1, and 2.
- Priority group 1 contains traffic with dot1p priority 3.
- Priority group 2 contains traffic with dot1p priority 4.
- Priority group 4 contains traffic with dot1p priority 5, 6, and 7.

To remove a priority-pgid configuration from a DCB map, enter the no priority-pgid command.

For PFC enabled priorities, it is recommended to map single priority per Priority group.

pfc mode on

Enable the PFC configuration on the port so that the priorities are included in DCBX negotiation with peer PFC devices.

Syntax

pfc mode on

To disable the PFC configuration, use the no pfc mode on command.

Defaults

PFC mode is on.

Command Modes

DCB MAP
priority-group bandwidth pfc

Configure the ETS bandwidth allocation and PFC mode used to manage port traffic in an 802.1p priority group.

Syntax

priority-group group-num {bandwidth percentage| strict-priority} pfc {on | off}

Parameters

priority-group

group-num

Enter the keyword priority-group followed by the number of an 802.1p priority group. Use the priority-pgid command to create the priority groups in a DCB map.

bandwidth

percentage

Enter the keyword bandwidth followed by a bandwidth percentage allocated to the priority group. The range of valid values is 1 to 100. The sum of all allocated bandwidth percentages in priority groups in a DCB map must be 100%.

strict-priority

Configure the priority-group traffic to be handled with strict priority scheduling. Strict-priority traffic is serviced first, before bandwidth allocated to other priority groups is made available.

pfc (on | off)

Configure whether priority-based flow control is enabled (on) or disabled (off) for port traffic in the priority group.

Defaults

None

Command Modes

DCB MAP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S6100-ON.
<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Usage Information**

Use the `dcb-map` command to configure priority groups with PFC and/or ETS settings and apply them to Ethernet interfaces.

Use the `priority-pgid` command to map 802.1p priorities to a priority group. You can assign each 802.1p priority to only one priority group. A priority group consists of 802.1p priority values that are grouped together for similar bandwidth allocation and scheduling, and that share latency and loss requirements. All 802.1p priorities mapped to the same queue must be in the same priority group.

Repeat the `priority-group bandwidth pfc` command to configure PFC and ETS traffic handling for each priority group in a DCB map.

You can enable PFC on a maximum of two priority queues.

If you configure more than one priority group as strict priority, the higher numbered priority queue is given preference when scheduling data traffic.

If a priority group does not use its allocated bandwidth, the unused bandwidth is made available to other priority groups.

To remove a priority-group configuration in a DCB map, enter the `no priority-group bandwidth pfc` command.

By default, equal bandwidth is assigned to each dot1p priority in a priority group. Use the `bandwidth` parameter to configure the bandwidth percentage assigned to a priority group. The sum of the bandwidth allocated to all priority groups in a DCB map must be 100% of the bandwidth on the link. You must allocate at least 1% of the total port bandwidth to each priority group.

**dcb-map stack-unit all stack-ports all**

Apply the specified DCB map on all ports of the switch stack.

**Syntax**

```
dcb-map stack-unit all stack-ports all dcb-map-name
```

To remove the PFC and ETS settings in a DCB map from all stack units, use the `no dcb-map stack-unit all stack-ports all` command.

**Parameters**

- `dcb-map-name`: Enter the name of the DCB map.

**Defaults**

None

**Command Modes**

CONFIGURATION
show qos dcb-map

Display the DCB parameters configured in a specified DCB map.

Syntax

```
show qos dcb-map map-name
```

Parameters

`map-name` Displays the PFC and ETS parameters configured in the specified map.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.8(0.0)   Introduced on the S3048-ON and S4048-ON.
9.7(0.0)   Introduced on the S6000-ON.
9.3(0.0)   Introduced on the S4810 and S6000 platforms.

9.3(0.0)   Introduced on the FC Flex IO module installed in the MXL 10/40GbE Switch.

Usage Information

Use the `show qos dcb-map` command to display the enhanced transmission selection (ETS) and priority-based flow control (PFC) parameters used to configure server-facing Ethernet ports. S5000 Ethernet ports are DCBx-enabled by default.

The following table describes the `show qos dcb-map` output shown in the example below.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>Complete: All mandatory DCB parameters are correctly configured. In progress: The DCB map configuration is not complete. Some mandatory parameters are not configured.</td>
</tr>
<tr>
<td>PFC Mode</td>
<td>PFC configuration in DCB map: On (enabled) or Off.</td>
</tr>
</tbody>
</table>
### Field | Description
---|---
PG | Priority group configured in the DCB map.
TSA | Transmission scheduling algorithm used by the priority group: Enhanced Transmission Selection (ETS).
BW | Percentage of bandwidth allocated to the priority group.
PFC | PFC setting for the priority group: On (enabled) or Off.
Priorities | 802.1p priorities configured in the priority group.

**Example**

```plaintext
Dell# show qos dcb-map dcbmap2
State :Complete
PfcMode:ON
--------------------
PG:0 TSA:ETS  BW:50  PFC:OFF
Priorities:0 1 2 4 5 6 7
PG:1 TSA:ETS  BW:50  PFC:ON
Priorities:3
```

### dcb pfc-shared-buffer-size

Configure the maximum amount of shared buffer size for PFC packets in kilobytes.

**Syntax**

```
dcb pfc-shared-buffer-size buffer-size
```

**Parameters**

- **buffer-size**: Enter a number in the range of 0 to 7787.

**Default**

The default is 832KB.

**Command Modes**

CONFIGURATION mode

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>9.3(0.0)</td>
<td>Introduced on the S4810, S4820T, and S6000 platforms.</td>
</tr>
</tbody>
</table>

**Usage Information**

Configure the maximum shared buffer available for PFC traffic. You can choose to increase or decrease the shared buffer that is allocated in the system by default. Configure the shared buffer size less than the total PFC buffer.
size. If the shared buffer size is more than the total PFC buffer size value, the configuration is not saved and a system logging message is generated.

DellEMC(conf)#dcb pfc-shared-buffer-size 3000
% Error: Shared buffer size cannot be greater than the available buffer in the system
DellEMC(conf)#

Enter a smaller value for the shared buffer size or increase the total buffer size appropriately by using the `dcb pfc-total-buffer-size` command.

Example

DellEMC(conf)#dcb pfc-shared-buffer-size 800

**dcb-buffer-threshold**

Configure the profile name for the DCB buffer threshold.

**Syntax**

```
dcb buffer-threshold profile-name
```

**Parameters**

- `profile-name` Enter the name of the profile, which can be a string of up to 32 characters in length.

**Default**

None

**Command Modes**

CONFIGURATION mode

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

When you enter the profile name, you enter the DCB buffer threshold configuration mode. You can specify the shared buffer threshold limit, the ingress buffer size, buffer limit for pausing the acceptance of packets, and the buffer offset limit for resuming the acceptance of received packets.

Example

DellEMC(conf)#dcb-buffer-threshold test

Example of commands in `dcb buffer-threshold` mode

```
priority value buffer-size size pause-threshold threshold-value resume-offset threshold-value shared-threshold-weight size
```

DellEMC(conf-dcb-buffer-thr)#priority 0 buffer-size 52 pause-threshold 16 resume-offset 10 shared-threshold-weight 7
priority

Configure the priority for the PFC threshold to be allocated to the buffer space parameters.

Syntax

```
priority value buffer-size size pause-threshold threshold-value peak-headroom headroom-value resume-offset threshold-value shared-threshold-weight size
```

Parameters

- **priority**
  - Specify the priority of the queue for which the buffer space settings apply.
- **value**
  - Enter a number in the range of 0 to 7 to denote the priority to be allocated to the dynamic buffer control mechanism.
- **buffer-size**
  - Ingress buffer size.
- **size**
  - Size of the ingress buffer in KB. Enter a number in the range of 0 to 7787. The default is 45 KB.
- **pause-threshold**
  - Buffer limit for pause frames to be sent.
  - **NOTE:** In addition to the specified pause-threshold value, pause frames are sent only when the buffer usage exceeds some percentage of the shared buffer.
- **threshold-value**
  - Buffer limit at which the port sends the pause to peer in KB. Enter a number in the range of 0 to 7787. The default is 10 KB.
- **resume-offset**
  - Buffer offset limit for stopping the transmission of pause frames.
- **threshold-value**
  - Buffer offset limit at which the port resumes the peer in KB. Enter a number in the range of 1 to 7787. The default is 10 KB.
- **shared-threshold-weight**
  - Buffer shared threshold weight
- **size**
  - Weightage of the priorities on the shared buffer size in the system. Enter a number in the range of 0 to 9. The default shared threshold weight is 10.

Command Modes

- DCB-BUFFER-THRESHOLD mode

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>

</tr>
<tr>
<td>9.8(0.0)</td>
<td>Introduced on the S3048-ON and S4048-ON.</td>
</tr>
</tbody>
</table>
**Usage Information**

For each priority, you can specify the shared buffer threshold limit, the ingress buffer size, buffer limit for pausing the acceptance of packets, and the buffer offset limit for resuming the acceptance of received packets. When PFC detects congestion on a queue for a specified priority, it sends a pause frame for the 802.1p priority traffic to the transmitting device.

You can use the `priority` command to set up both the administrative and peer-related PFC priorities. For example, you can configure the intended buffer configuration for all eight priorities. If you configure the number of lossless queues as 4 and if the administrator-configured priorities configured within the DCB input policy is applied, then the configuration for those priorities are pre-designed. However, if the peer-provided priorities are applied, although a DCB input policy is present, the peer-provided priorities become effective for buffer configuration. This method of configuration provides an easy and flexible technique to accommodate both administratively-configured and peer-configured priorities.

**Example**

```plaintext
DellEMC(conf-dcb-buffer-thr)# priority 0 buffer-size 52 pause-threshold 16 resume-offset 10 shared-threshold-weight 7
```

### qos-policy-buffer

Create a QoS policy buffer and enter the configuration mode to configure the no-drop queues, ingress buffer size, buffer limit for pausing, and buffer offset limit for resuming.

**Syntax**

```plaintext
qos-policy-buffer queue queue-num pause no-drop queue buffer-size size pause-threshold threshold-value resume-offset threshold-value shared-threshold-weight size
```

**Parameters**

- `policy-name` Name of the QoS policy buffer that is applied to an interface for this setting to be effective in conjunction with the DCB input policy. You can specify the shared buffer threshold limit, the ingress buffer size, buffer limit for pausing the acceptance of packets, and the buffer offset limit for resuming the acceptance of received packets. This method of configuration enables different peer-provided and administrative priorities to be set up because the intended queue is directly configured instead of determining the priority to queue mapping for local and remote parameters.

- `queue 0 to queue 7` Specify the queue number to which the QoS policy buffer parameters apply.

- `pause` Pause frames to be sent at the specified buffer limit levels and pause packet settings.

- `no-drop` The packets for this queue must not be dropped.

- `value` Enter a number in the range of 0 to 7 to denote the priority to be allocated to the dynamic buffer control mechanism.

- `buffer-size` Ingress buffer size.

- `size` Size of the ingress buffer in KB. Enter a number in the range of 0 to 7787. The default is 45 KB.

- `pause-threshold` Buffer limit for pause frames to be sent.

- `threshold-value` Buffer limit at which the port sends the pause to peer in KB. Enter a number in the range of 0 to 7787. The default is 10 KB.
resume-offset  Buffer offset limit for resuming in KB
threshold-value  Buffer offset limit at which the port resumes the peer in KB. Enter a number in the range of 1 to 7787. The default is 10 KB.
shared-threshold-weight  Buffer shared threshold weight
size  Weightage of the priorities on the shared buffer size in the system. Enter a number in the range of 0 to 9. The default shared threshold weight is 10.

Default
The default size of the ingress buffer is 45 KB. The default buffer limit at which the port sends the pause to peer and recommences the sending of packets to the peer is 10 KB. The default threshold weight of the shared buffer space is 10.

Command Modes
DCB-BUFFER-THRESHOLD mode

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

</tr>
<tr>
<td>9.3(0.0)</td>
<td>Introduced on the S4810, S4820T, S6000, and MXL platforms.</td>
</tr>
</tbody>
</table>

Usage Information
You must apply this buffer policy at the interface level for the attributes to be applicable in conjunction with the DCB input policy.

For each QoS policy buffer, you can specify the shared buffer threshold limit, the ingress buffer size, buffer limit for pausing the acceptance of packets, and the buffer offset limit for resuming the acceptance of received packets. When PFC detects congestion on a queue for a specified priority, it sends a pause frame for the 802.1p priority traffic to the transmitting device.

You can use set up both the administrative and peer-related PFC priorities. For example, you can configure the intended buffer configuration for all 8 priorities. If you configure the number of lossless queues as 4 and if the administrator-configured priorities configured within the DCB input policy is applied, then the configuration for those priorities are pre-designed. However, if the peer-provided priorities are applied, although a DCB input policy is present, the peer-provided priorities become effective for buffer configuration. This method of configuration provides an easy and flexible technique to accommodate both administratively-configured and peer-configured priorities.

Example
```
Dell(conf)# qos-policy-buffer test
Dell(conf-qos-policy-buffer)#queue 0 pause no-drop buffer-size 128000 pause-threshold 103360 resume-threshold 83520
Dell(conf-qos-policy-buffer)# queue 4 pause no-drop buffer-size 128000 pause-threshold 103360 resume-threshold 83520
```
**dcb-policy buffer-threshold (Interface Configuration)**

Assign the DCB policy to the DCB buffer threshold profile on interfaces. This setting takes precedence over the global buffer-threshold setting.

**Syntax**

```
dcb-policy buffer-threshold profile-name
```

**Parameters**

- **buffer-threshold**  
  Configure the profile name for the DCB buffer threshold

- **profile-name**  
  Enter the name of the profile, which can be a string of up to 32 characters in length.

**Default**

None

**Command Modes**

INTERFACE mode

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.1)  
  Introduced on the S6010-ON and S4048T-ON.

- 9.10(0.0)  
  Introduced on the S6100-ON.

- 9.8(1.0)  
  Introduced on the Z9100-ON.

- 9.8(0.0)  
  Introduced on the S3048-ON and S4048-ON.

- 9.7(0.0)  
  Introduced on the S6000-ON and Z9500.

- 9.3(0.0)  
  Introduced on the S4810, S4820T, and S6000 platforms.

**Usage Information**

You can configure up to a maximum of four lossless (PFC) queues. By configuring four lossless queues, you can configure four different priorities and assign a particular priority to each application that your network is used to process. For example, you can assign a higher priority for time-sensitive applications and a lower priority for other services, such as file transfers. You can configure the amount of buffer space to be allocated for each priority and the pause or resume thresholds for the buffer. This method of configuration enables you to effectively manage and administer the behavior of lossless queues.

**Example**

```
DellEMC(conf-if-te-1/1)# dcb-policy buffer-threshold test
```

---

**dcb-policy buffer-threshold (Global Configuration)**

Assign the dcb buffer threshold policy on the stack ports. To apply the dcb buffer threshold policy on the stack-units, use the configuration mode. To apply on front-end ports, use the interface mode.

**Syntax**

```
dcb-policy buffer-threshold stack-unit all stack-ports all profile-name
```

**Parameters**

- **dcb-buffer-threshold**  
  Configure the profile name for the DCB buffer threshold

- **profile-name**  
  Enter the name of the profile, which can be a string of up to 32 characters in length.

- **stack-unit all**  
  Enter the stack unit identification. Indicates the specific the stack unit or units. Entering all shows the status for all stacks.
stack-port all

Enter the port number of a port in a switch stack.

Default
None

Command Modes

Usage Information
You can configure up to a maximum of four lossless (PFC) queues. By configuring four lossless queues, you can configure four different priorities and assign a particular priority to each application that your network is used to process. For example, you can assign a higher priority for time-sensitive applications and a lower priority for other services, such as file transfers. You can configure the amount of buffer space for each priority and the pause or resume thresholds for the buffer. This method of configuration enables you to manage and administer the behavior of lossless queues.

Example for Configuration Mode
Dell(conf)# dcb-policy buffer-threshold stack-unit all stack-ports all test

Example for Interface Mode
Dell(conf-if-te-1/1)# dcb-policy buffer-threshold test

show qos dcb-buffer-threshold

Displays the DCB buffer threshold assigned to a QoS policy.

Syntax
show qos dcb buffer-threshold {name}

Parameters
name
Enter the name of the profile, which can be a string of up to 32 characters in length.

Command Modes
EXEC

EXEC Privilege

Usage Information
The following table describes the output fields displayed for the show command:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the DCB buffer threshold profile</td>
</tr>
<tr>
<td>Buffer threshold parameters</td>
<td>Buffer size allocated for the PFC priority queue and the priority of the queue</td>

**dcb pfc-total-buffer-size**

Configure the total buffer size for PFC in kilobytes.

**Syntax**
```
dcb pfc-total-buffer-size buffer-size
```

**Parameters**
- `buffer-size`: Enter a number in the range of 0 to 7787.

**Default**
The default is 6592KB.

</tr>
</tbody>
</table>

**Usage Information**
Configure the maximum buffer available for PFC traffic. You can choose to increase or decrease the buffer size that is allocated in the system by default. However, if you modify the PFC buffer size lower than the previously configured size, the system determines whether this reduction in size is valid without disrupting the existing configuration. In such a scenario, disable and re-enable DCB.

The lossless queue limit per port is validated based on the `dcb pfc-queues` command. PFC queue configuration identifies the maximum number of queues a port can support. Although the queue limit per port is a baseline when dynamic buffering is enabled, the limit per port for queues depends on the availability of the buffer.

**Example**
```
DellEMC(conf)#dcb pfc-total-buffer-size 2800
DellEMC(conf)#
DellEMC#show dcb
DCB Status: Enabled, PFC Queue Count: 2
```
Total Buffer: Total available buffer excluding the buffer pre-allocated for guaranteed services like global headroom, queue's min guaranteed buffer and CPU queues.

PFC Total Buffer: Maximum buffer available for lossless queues.

PFC Shared Buffer: Buffer used by ingress priority groups for shared usage.

PFC Headroom Buffer: Buffer used by ingress priority group for shared headroom usage.

PFC Available Buffer: Current buffer available for new lossless queues to be Provisioned.

<table>

% Error: Total buffer size should not be less than the buffer consumed already in the system.

show running-config dcb-buffer-threshold

Displays the DCB buffer threshold details in the running configuration.

**Syntax**

show running-config dcb-buffer-threshold

**Command Modes**

EXEC

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.10(0.1)  Introduced on the S6010-ON and S4048T-ON.
- 9.10(0.0)  Introduced on the S6100-ON.
- 9.8(1.0)   Introduced on the Z9100-ON.
- 9.7(0.0)   Introduced on the S6000-ON and Z9500.
- 9.3(0.0)   Introduced on the S6000 platform.

**Usage Information**

The following table describes the output fields displayed for the show running-config dcb-buffer-threshold command:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Profile name</td>
<td>Name of the DCB buffer threshold profile</td>
</tr>
<tr>
<td>Priority</td>
<td>The priority of the queue for which the buffer space settings apply</td>
</tr>
<tr>
<td>buffer-size</td>
<td>Ingress buffer size</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
pause-threshold-value | Buffer limit at which the port sends the pause to peer in KB.
resume-threshold-value | Buffer offset limit at which the port resumes the peer in KB.

Example

```bash
DellEMC# show running-configuration dcb-buffer-threshold
!
dcb-buffer-threshold test1
  pfc priority 0 buffer-size 40
  pfc priority 3 buffer-size 50
!
dcb-buffer-threshold test2
  pfc priority 0 buffer-size 80 pause-threshold 50
!
dcb-buffer-threshold test3
  pfc priority 0 buffer-size 80 pause-threshold 60 resume-threshold 30
```

On interface on which PFC is enabled:

```bash
DellEMC# show interface tengigabitethernet 1/1 pfc buffer-threshold
```

<table>
<thead>
<tr>
<th>Queue#</th>
<th>Lossless</th>
<th>Buffer-size</th>
<th>Pause-threshold</th>
<th>Resume-offset</th>
<th>Shared threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>1</td>
<td>No</td>
<td>-</td>

</tr>
<tr>
<td>2</td>
<td>Yes</td>
<td>20</td>
<td>20</td>
<td>9</td>
<td>-</td>
</tr>
<tr>
<td>3</td>
<td>Yes</td>
<td>52</td>
<td>25</td>
<td>15</td>
<td>0</td>
</tr>
<tr>
<td>4</td>
<td>Yes</td>
<td>45</td>
<td>25</td>
<td>0</td>
<td>5</td>
</tr>
<tr>
<td>5</td>
<td>No</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>6</td>
<td>No</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>7</td>
<td>No</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Denotes dynamic buffering is enabled in respective queues.

On interface in which PFC is not enabled:

```bash
DellEMC# show interface tengigabitethernet 1/20 pfc buffer-threshold
```

The following table describes the output fields displayed for the `show interface pfc buffer-threshold` command:

Field | Description
--- | ---
queue | Number of the queue
lossless | Whether the queue is a lossy or lossless queue for which buffer threshold is configured
buffer-size | Ingress buffer size
pause-threshold-value | Buffer limit at which the port sends the pause to peer in KB.
resume-threshold-value | Buffer offset limit at which the port resumes the peer in KB.
shared-threshold-weight | Weightage of the priorities on the shared buffer size in the system.

**service-class buffer shared-threshold-weight**

Create a service class and associate the threshold weight of the shared buffer with each of the queues per port in the egress direction.

**Syntax**

```
[No] Service-class buffer shared-threshold-weight {
  queue0 number
  | queue1 number
  | queue2 number
  | queue3 number
  | queue4 number
  | queue5 number
  | queue6 number
  | queue7 number
}
```
Parameters

buffer
Define the shared buffer settings

shared-threshold-weight
Specify the weight of a queue for the shared buffer space

queue 0 to queue 7
To apply the shared-threshold weight, specify the queue number

number
Enter a weight for the queue on the shared buffer as a number in the range of 1 to 11.

Default
The default threshold weight on the shared buffer for each queue is 9. Therefore, each queue can consume up to 66.67 percent of available shared buffer by default.

Command Modes
INTERFACE mode

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S6100-ON.
9.8(1.0) Introduced on the Z9100-ON.
9.9(0.0) Introduced on the Z9500, S4810, S4820T, S5000, and S4048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.3(0.0) Introduced on the S6000.

Usage Information
You can configure all the data queues. You can configure queues 0-7.

The following table describes the mapping between the threshold weight of the shared buffer on the queue. It also shows the percentage of the available shared buffer used by the queues for each of the corresponding threshold weights of the shared buffer:

<table>
<thead>
<tr>
<th>shared-threshold-weight on the queue</th>
<th>% of available shared buffer that can be consumed by the queue</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No dynamic sharing; shared buffer = 0.</td>
</tr>

<tr>
<td>9</td>
<td>66.67%</td>
</tr>
<tr>
<td>10</td>
<td>80%</td>
</tr>
</tbody>
</table>

Data Center Bridging (DCB)
shared-threshold-weight on the queue

| 11 | 88.89% |

Example

DellEMC(conf-if-te-1/8)# Service-class buffer shared-threshold-weight queue5 4 queue7 6

**dcb pfc-queues**

Configure the number of PFC queues.

**Syntax**

```
dcb pfc-queues value
```

**Parameters**

- **value**: Enter the number of PFC queues in the range of 0 through 4. The number of ports supported based on lossless queues configured will depend on the buffer.

**Default**

The default number of PFC queues in the system is 2 for S4810 and 1 for S6000 platforms.

**Command Modes**

CONFIGURATION mode

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.8(1.0) 
  Introduced on the Z9100-ON.
- 9.8(0.0) 
  Introduced on the S3048-ON and S4048-ON.
- 9.7(0.0) 
  Introduced on the S6000-ON and Z9500.
- 9.3(0.0) 
  Introduced on the S4810 and S6000 platforms.

**Usage Information**

You can configure up to a maximum of four lossless (PFC) queues. By configuring four lossless queues, you can configure four different priorities and assign a particular priority to each application that your network is used to process. For example, you can assign a higher priority for time-sensitive applications and a lower priority for other services, such as file transfers. You can configure the amount of buffer space to be allocated for each priority and the pause or resume thresholds for the buffer. This method of configuration enables you to effectively manage and administer the behavior of lossless queues.

**Example**

DellEMC(conf)# dcb pfc-queues 4

**dcb {ets | pfc} enable**

Enable priority flow control or enhanced transmission selection on interface.

**Syntax**

```
dcb {ets | pfc} enable
```

- To disable ETS on interface, use “no dcb ets enable” command.
- To disable PFC on interface, use “no dcb pfc enable” command.
Defaults

Enable

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>

</tr>
<tr>
<td>9.3 (0.1)</td>
<td>Introduced on S6000, S4810, and S4820T.</td>
</tr>
</tbody>
</table>

Usage Information

PFC and ETS are enabled by default on the interfaces when DCB is globally enabled (refer to dcb enable). In some network topology, you may want to disable PFC on an interface and apply link level flow control; Similarly you may want to disable ETS on an interface and apply QoS bandwidth configurations.

Limitations

- “dcb-map” CLI on interface is mutually exclusive to “no dcb ets enable” and “no dcb pfc enable”.
- “pfc priority” CLI is mutually exclusive to “no dcb pfc enable” command.
The basic debugging and diagnostic commands are supported by the Dell EMC Networking OS.

Topics:
- Diagnostics and Monitoring Commands
- Offline Diagnostic Commands
- Hardware Commands

## Diagnostics and Monitoring Commands

The following section describes the diagnostics and monitoring commands.
For similar commands, refer to the Control and Monitoring chapter.

### logging coredump stack-unit

Enable coredump on a stack.

**Syntax**

```
logging coredump stack-unit {stack-unit-number | all}
```

**Parameters**

- `stack-unit stack-unit-number`
  - Enter the stack-unit id to enable coredump in a particular stack-unit.
- `all`
  - Enable coredump on all stack-unit.

**Defaults**

Enabled.

**Command Modes**

- **CONFIGURATION**

**Command History**

### Offline Diagnostic Commands

The offline diagnostics test suite is useful for isolating faults and debugging hardware. While tests are running, Dell EMC Networking OS results are saved as a text file (TestReport-SU-X.txt) in the flash directory. This show file command is available only on master and standby.

### Important Points to Remember

- Offline diagnostics can only be run when the unit is offline.
- You can only run offline diagnostics on a unit to which you are connected via the console. In other words, you cannot run diagnostics on a unit to which you are connected to via a stacking link.
- The system stores the diagnostic results in the flash directory (TestReport-SU-X.txt). The system displays the following message after the diagnostic test is over:
  
  ```
  05:37:17 : Diagnostic test results are stored on file: flash:/TestReport-SU-1.txt
  05:37:22: %S3048-ON:1 %DIAGAGT-6-DA_DIAG_DONE: Diags finished on stack-unit 1
  ```
- Diagnostics only test connectivity, not the entire data path.

### diag stack-unit

Run offline diagnostics on a stack unit.

**Syntax**

```
diag stack-unit number [alllevels | level0 | level1 | level2] verbose [testname | no-reboot]
```

**Parameters**

- **number**
  
  Enter the stack-unit id.

- **alllevels**
  
  Enter the keyword alllevels to run the complete set of offline diagnostic tests.

- **level0**
  
  Enter the keyword level0 to run Level 0 diagnostics. Level 0 diagnostics check for the presence of various components and perform essential path verifications. In addition, they verify the identification registers of the components on the board.

- **level1**
  
  Enter the keyword level1 to run Level 1 diagnostics. Level 1 diagnostics is a smaller set of diagnostic tests with support for automatic partitioning. They perform status/self test for all the components on the board and test their registers for appropriate values. In addition, they perform extensive tests on memory devices (for example, SDRAM, flash,
NVRAM, EEPROM, and CPLD) wherever possible. There are no tests on 10G links. At this level, stack ports are shut down automatically.

**level2**  
Enter the keyword `level2` to run Level 2 diagnostics. Level 2 diagnostics are a full set of diagnostic tests with no support for automatic partitioning. Level 2 diagnostics are used primarily for on-board loopback tests and more extensive component diagnostics. Various components on the board are put into Loopback mode and test packets are transmitted through those components. These diagnostics also perform snake tests using VLAN configurations. To test 10G links, physically remove the unit from the stack.

**verbose**  
Enter the keyword `verbose` to run the diagnostic in Verbose mode. Verbose mode gives more information in the output than Standard mode.

**testname**  
Enter the keyword `testname` to run a specific test case. Enclose the test case name in double quotes (" "). For example: `diag stack-unit 1 level1 testname “first”`. You can use this option only for interactive tests.

**no-reboot**  
Enter the keyword `no-reboot` to prevent the system from rebooting after the test. To bring the stack unit to online state, use the `online stack-unit stack-unit-number` command.

**Defaults**  
None

**Command Modes**  
EXEC Privilege

**Command History**  
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Usage Information**

You cannot enter this command on a Master or Standby unit.

The system reboots when the off-line diagnostics complete. This reboot is an automatic process. A warning message appears when the `offline stack-unit` command is implemented.

```
Warning - Diagnostic execution will cause stack-unit to reboot after completion of diags.
Proceed with Offline-Diags [confirm yes/no]:y
```
Hardware Commands

These commands display information from a hardware sub-component or ASIC.

clear hardware stack-unit

Clear statistics from selected hardware components.

Syntax

```
clear hardware stack-unit id {counters | cpu {data-plane statistics | i2c statistics | management statistics | party-bus statistics | sata-interface statistics} | unit number counters | stack-port stack-port-number}
```

Parameters

- **stack-unit id**: Enter the keywords `stack-unit` then a number to select a particular stack member and then enter one of the following command options to clear a specific collection of data. The range is from 1 to 6.
  - **counters**: Enter the keyword `counters` to clear the counters on the selected stack member.
  - **cpu data-plane statistics**: Enter the keywords `cpu data-plane statistics` to clear the data plane statistics.
  - **cpu i2c statistics**: Enter the keywords `cpu i2c statistics` to clear the i2c devices statistics.
  - **cpu party-bus statistics**: Enter the keywords `cpu party-bus statistics` to clear the management statistics.
  - **cpu sata-interface statistics**: Enter the keywords `cpu sata-interface statistics` to clear the sata interface statistics.
  - **stack-port**: Enter the keywords `stack-port` then the port number of the stacking port to clear the statistics of the particular stacking port. The range is from 1 to 72.

clear hardware system-flow

Clear system-flow statistics from selected hardware components.

Syntax

```
clear hardware system-flow layer2 stack-unit number port-set 0–0 counters
```

Parameters

- **stack-unit number**: Enter the keywords stack-unit then a number to select a particular stack member and then enter one of the following command options to clear a specific collection of data.
- **port-set 0–0 counters**: Enter the keywords port-set along with a port-pipe number, then the keyword counters to clear the system-flow counters on the selected port-pipe. The range is from 0 to 0.

Defaults

None

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.0 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
clear hardware vlan-counters

Clear VLAN statistics.

Syntax

```
clear hardware vlan-counters vlan-id
```

Parameters

`vlan-id` Enter the interface VLAN number. The range is from 1 to 4094.

Defaults

None

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>
This command enables a hardware watchdog mechanism that automatically reboots an Dell EMC Networking OS switch/ router with a single unresponsive unit. This behavior is a last-resort mechanism intended to prevent a manual power cycle.

**show hardware mac**

Display MAC ACL entries for the specified stack-unit, port-pipe and pipeline ID.

**Syntax**

```plaintext
show hardware mac {eg-acl | in-acl} stack-unit id port-set 0–0
```

**Parameters**

- `eg-acl | in-acl`: Enter either the keyword `eg-acl` or the keyword `in-acl` to select between ingress or egress ACL data.
- `stack-unit id`: Enter the keyword `stack-unit` to select the stack unit ID.
- `port-set 0–0`: Enter the keywords `port-set` with a port-pipe number to display the MAC ACL entries for the specified port-pipe number. The range is from 0 to 0.

**Defaults**

None

### show hardware ip

Display ACL or QoS data for the selected stack member and stack member port-pipe.

**Syntax**

```
show hardware layer3 {acl | qos} stack-unit number port-set 0–0
```

**Parameters**

- **acl | qos**
  - Enter either the keyword `acl` or the keyword `qos` to select between ACL or QoS data.

- **stack-unit number**
  - Enter the keywords `stack-unit` then a number to select a stack ID.

- **port-set 0–0**
  - Enter the keyword `port-set` with a port-pipe number. The range is from 0 to 0.

**Defaults**

None

**Command Modes**

EXEC Privilege

**Command History**

show hardware stack-unit

Display the data plane or management plane input and output statistics of the designated component of the designated stack member.

Syntax

```
stack-unit stack-unit-number {buffer [unit 0] total buffer | buffer unit 0 interface all queue [(0-14) | all] buffer-info}{cpu data-plane statistics | cpu management statistics | drops [unit number] | fpga register | party-bus statistics | stack-port | ti-monitor | unit 0-1 {counters | details | port-stats [detail] | register}}
```

Parameters

- **stack-unit stack-unit-number (command-option)**: Enter the keywords `stack-unit` to select a particular stack member and then enter one of the following command options to display a collection of data based on the option entered. The range is from 1 to 6.
- **buffer**: Enter the keyword `buffer`. To display the total buffer statistics for the stack unit, enter the keyword `total-buffer`. To display buffer statistics for a all interface, enter the keyword `interface` followed by the keyword `all`. To display total buffer information for the port, enter the keywords `buffer-info`. To display a queue range, enter 0 to 14 for a specific queue or all.
- **cpu data-plane statistics**: Enter the keywords `cpu data-plane statistics` then the keywords `stack port` and its number, from 1 to 72 to display the data plane statistics, which shows the High Gig (Higig) port raw input/output counter statistics to which the stacking module is connected.
- **cpu management statistics**: Enter the keywords `cpu management statistics` to display the counters of the management port.
- **cpu party-bus statistics**: Enter the keywords `cpu party-bus statistics` to display the Management plane input/output counter statistics of the pseudo party bus interface.
- **cpu sata-interface statistics**: Enter the keywords `cpu sata-interface statistics` to display the sata interface error counter statistics.
- **drops [unit unit-number]**: Enter the keyword `drops` to display internal drops on the selected stack member. Enter the optional keyword `unit unit-number` to display the internal drop counters of the specified port pipe.
- **fpga register**: Enter the keyword to display the register value of the fpga register.
- **unit unit-number (counters | details | port-stats [detail] | register)**: Enter the keyword `unit` then a number and then enter one of the keywords to troubleshoot errors on the selected port-pipe and to give status on why a port is not coming up to register level.
- **TI monitor**: Enter the unit keyword to show information regarding the TI register.

Related Commands

• clear hardware system-flow — clear the statistics from selected hardware components.
• show interfaces stack-unit — display information on all interfaces on a specific S-Series stack member.
• show processes cpu (S-Series) — display the CPU usage information based on the processes running in an S-Series.
• show system — display the current status of all the stack members or a specific member.

show hardware system-flow

Display Layer 3 ACL or QoS data for the selected stack member and stack member port-pipe.

Syntax

show hardware system-flow stack-unit id port-set number [counters]

Parameters

stack-unit id Enter the keywords stack-unit to select a stack member ID.
port-set number Enter the keywords port-set with a port-pipe number.
[counters] (OPTIONAL) Enter the keyword counters for the specified port-pipe.

Defaults

None

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
7.8.1.0 Introduced on the S-Series.

Example

DellEMC# show hardware system-flow stack-unit 1 port-set 0 counters

```
show hardware vlan-counters

Display the hardware VLAN statistics.

Syntax

show hardware vlan-counters vlan-id

Parameters

vlan-id

Enter the interface VLAN number. The range is from 1 to 4094.

Defaults

None

Command Modes

• EXEC
• EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.7(0.0) Introduced this command.

Example

DellEMC# show hardware vlan-counters 1
Counters for vlanid: 1
----------------------------------------
Total number of inpackets: 0
Total number of inbytes: 0
Total number of outpackets: 0
Total number of outbytes: 0
DellEMC#

Related Commands

• clear hardware system-flow — clear the statistics from selected hardware components.
show hardware counters interface

Display the counter information for a specific interface.

**Syntax**

```
show hardware counters interface interface
```

**Parameters**

- **counters**
  - Enter the keywords `counters` to display counter value for the specified stack-member the port-pipe.

- **interface interface**
  - Enter any of the following keywords and the interface information:
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults**

None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**show hardware drops**

Displays internal drops on the specified interface or for a range of interface.

**Syntax**

```
show hardware drops interface interface
```

**Parameters**

- **drops**
  - Enter the keyword drops to display internal drops.

- **interface**
  - Enter any of the following keywords and the interface or interface range information:
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
    - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

show hardware stack-unit buffer-stats-snapshot (Total Buffer Information)

View the buffer statistics tracking resource information depending on the type of buffer information, such as device-level details, port-level counters, queue-based snapshots, or priority group-level snapshot in the egress and ingress direction of traffic.

Syntax

```
show hardware stack-unit <id> buffer-stats-snapshot unit <id> resource x
```

Parameters

- **stack-unit stack-unit-number**: Unique ID of the stack unit to select a particular stack member and then enter one of the following command options to display a collection of data based on the option entered.
- **buffer-stats-snapshot unit number**: Display the historical snapshot of buffer statistical values unit Enter the keyword unit along with a port-pipe number. The range is from 0 to 0.
- **buffer-info**: Buffer and traffic manager resources usage, where X can be one of the following:
  - All - Displays ingress and egress device, port, and queue snapshots
  - Interface all queue (all) - egress queue-level snapshot for both unicast and multicast packets
  - Interface all queue ucast (id | all) - egress queue-level snapshot for unicast packets only
  - Interface all queue mcast (id | all) - egress queue-level snapshot for multicast packets only

EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.8(0.0) Added the keyword interface all.
9.7(0.0) Introduced on the S6000-ON.
9.6(0.0) Introduced on the S5000.
9.3(0.0) Introduced on the S6000, S4810, and S4820T.

Usage Information
The following information is displayed based on the buffer-info type, such as device-level details, queue-based snapshots, or priority group-level snapshot in the egress and ingress direction of traffic:

• Device-ingress – Displays total buffer accounting usage for the unit.
• Device-egress – Display total buffer usage for the unit, total multicast buffer usage for the unit and also on per-service-pool basis. Counters will be displayed for the 2 service-pools – one for normal traffic and other for DCB traffic.

When the buffer-stats-snapshot is disabled, the following informational message is displayed when you run the show command:

%Info: Buffer-stats-snapshot feature is disabled.

Example

DellEMC# show hardware buffer-stats-snapshot resource interface fortyGigE 0/0 priority-group 7
Unit 0 unit: 0 port: 1 (interface Fo 0/0)
--------------------------------------------------
PG# PRIORITIES     SHARED CELLS     HEADROOM CELLS
--------------------------------------------------
7   0-2,5          0                0

DellEMC# show hardware buffer-stats-snapshot resource interface fortyGigE 0/0 priority-group 7
Unit 0 unit: 0 port: 1 (interface Fo 0/0)
--------------------------------------------------
PG# PRIORITIES     SHARED CELLS     HEADROOM CELLS
--------------------------------------------------
0   -              0                0
1   -              0                0
2   -              0                0
3   7              0                0
4   6              0                0
5   4              0                0
6   3              0                0
7   0-2,5          0                0
show hardware buffer interface

Display buffer statistics for a specific interface.

**Syntax**

```
show hardware buffer interface interface{priority-group { id | all } | queue { id| all } } buffer-info
```

**Parameters**

- **interface interface**
  
  Enter any of the following keywords and slot/port[/subport] or number information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

- **priority-group**
  
  Enter the keyword priority-group followed by id for specific priority-group or keyword all.

- **queue**
  
  Enter the keyword queue followed by id for specific queue or keyword all.

- **buffer-info**
  
  To display total buffer information for the interface, enter the keywords buffer-info.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

show hardware buffer-stats-snapshot

Displays buffer statistics tracking resource information for a specific interface.

**Syntax**

```
show hardware buffer-stats-snapshot resource {headroom-pool [detail] | service-pool [detail] interface interface {{priority-group {id | all} | queue ucast {id | all} mcast {id | all} | all} [detail]}}
```

**Parameters**

- **headroom-pool**
  - Enter the keyword headroom-pool followed by the keyword detail to view detailed information about the headroom pool usage.
- **service-pool**
  - Enter the keyword service-pool followed by the keyword detail to view detailed information about the service pool usage.
- **interface interface**
  - Enter any of the following keywords and the interface information:
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port information.
    - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- **queue**
  - Enter the keyword queue followed by all for displaying details of all queues, ucast queue-id or all for displaying Unicast queue details, and mcast queue-id or all for displaying Multicast queue details.
- **priority-group**
  - Enter the keyword priority-group followed by id for specific priority-group or keyword all.

**Command Modes**

- EXEC
- EXEC Privilege

628 Debugging and Diagnostics
Dynamic Host Configuration Protocol (DHCP)

Dynamic host configuration protocol (DHCP) is an application layer protocol that dynamically assigns IP addresses and other configuration parameters to network end-stations (hosts) based on the configuration policies the network administrators determine.

Topics:
- Commands to Configure the System to be a DHCP Server
- Commands to Configure Secure DHCP
- Commands to Configure DNS

Commands to Configure the System to be a DHCP Server

To configure the system to be a DHCP server, use the following commands.

**clear ip dhcp**

Reset the DHCP counters.

**Syntax**

```
clear ip dhcp [binding {address} | conflict | server statistics]
```

**Parameters**

- `binding` Enter the keyword binding to delete all entries in the binding table.
- `address` Enter the IP address to clear the binding entry for a single IP address.
- `conflicts` Enter the keyword conflicts to delete all of the log entries created for IP address conflicts.
- `server statistics` Enter the keywords server statistics to clear all the server counter information.

**Defaults**

None

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

<table>
<thead>
<tr>

</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>
</tr>
</tbody>
</table>
**debug ip dhcp server**

Display Dell OS debugging messages for DHCP.

**Syntax**

```
debug ip dhcp server [events | packets]
```

**Parameters**

- `events` Enter the keyword `events` to display the DHCP state changes.
- `packet` Enter the keyword `packet` to display packet transmission/reception.

**Defaults**

None

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Usage Information**

Press Enter after the `clear ip dhcp binding` command clears all the IPs from the binding table.
debug ipv6 dhcp

To enable debug logs for DHCPv6 relay agent transactions.

Syntax
default-router

Assign a default gateway to clients based on the address pool.

Syntax

default-router address [address2...address8]
Parameters

address

Enter a list of routers that may be the default gateway for clients on the subnet. You may specify up to eight routers. List them in order of preference.

Defaults
None

Command Modes
DHCP <POOL>

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

disable

Disable the DHCP server.

Syntax
disable

DHCP Server is disabled by default. To enable the system to be a DHCP server, use the no disable command.

Defaults
Disabled

Command Modes
CONFIGURATION

DHCP <POOL>
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

## dns-server

Assign a DNS server to clients based on address pool.

### Syntax

dns-server address [address2...address8]

### Parameters

- **address**
  
Enter a list of DNS servers that may service clients on the subnet. You may list up to eight servers, in order of preference.

### Defaults

None

### Command Modes

DHCP <POOL>

### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

excluded-address

Prevent the server from leasing an address or range of addresses in the pool.

Syntax

```
excluded-address [address | low-address high-address]
```

Parameters

- **address**: Enter a single address to be excluded from the pool.
- **low-address**: Enter the lowest address in a range of addresses to be excluded from the pool.
- **high-address**: Enter the highest address in a range of addresses to be excluded from the pool.

Defaults

None

Command Modes

DHCP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.2.1.0 | Introduced on the C-Series and S-Series.
**hardware-address**

For manual configurations, specify the client hardware address.

**Syntax**

```plaintext
hardware-address address
```

**Parameters**

- `address`  
Enter the hardware address of the client.

**Defaults**

None

**Command Modes**

DHCP <POOL>

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

lease

Specify a lease time for the addresses in a pool.

**Syntax**

`lease {days [hours] [minutes] | infinite}`

**Parameters**

- **days**
Enter the number of days of the lease. The range is from 0 to 31.
- **hours**
Enter the number of hours of the lease. The range is from 0 to 23.
- **minutes**
Enter the number of minutes of the lease. The range is from 0 to 59.
- **infinite**
Specify that the lease never expires.

**Defaults**

24 hours

**Command Modes**

**netbios-name-server**

Specify the NetBIOS Windows Internet Naming Service (WINS) name servers, in order of preference, that are available to Microsoft Dynamic Host Configuration Protocol (DHCP) clients.

**Syntax**

```
netbios-name-server address [address2...address8]
```

**Parameters**

- `address` Enter the address of the NETBIOS name server. You may enter up to eight, in order of preference.

**Defaults**

None

**Command Modes**

DHCP <POOL>

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant `Dell EMC Networking OS Command Line Reference Guide`.

**netbios-node-type**

Specify the NetBIOS node type for a Microsoft DHCP client. Dell EMC Networking recommends specifying clients as **hybrid**.

**Syntax**

```
netbios-node-type type
```

**Parameters**

- **type**
  - Enter the NETBIOS node type:
    - Broadcast: Enter the keyword **b-node**.
    - Hybrid: Enter the keyword **h-node**.
    - Mixed: Enter the keyword **m-node**.
    - Peer-to-peer: Enter the keyword **p-node**.

**Defaults**

Hybrid

**Command Modes**

DHCP <POOL>

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

network

Specify the range of addresses in an address pool.

Syntax

```
network network /prefix-length
```

Parameters

```
network/ prefix-length
```

- Specify a range of addresses. Prefix-length range is from 17 to 31.

Defaults

None

Command Modes

DHCP <POOL>

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1)
- Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)
- Introduced on the S3148.
9.10(0.0)
- Introduced on the S6100-ON.
9.8(2.0)
- Introduced on the S3100 series.
9.8(1.0)
- Introduced on the Z9100-ON.
9.8(0.0P5)
- Introduced on the S4048-ON.
9.8(0.0P2)
- Introduced on the S3048-ON.
9.7(0.0)
- Introduced on the S6000-ON.
9.2(1.0)
- Introduced on the Z9500.
9.0.2.0
- Introduced on the S6000.
8.3.19.0
- Introduced on the S4820T.
8.3.11.1
- Introduced on the Z9000.
8.3.7.0
- Introduced on the S4810.
8.2.1.0
- Introduced on the C-Series and S-Series.
## pool

Create an address pool.

### Syntax

```
pool name
```

### Parameters

- **name**
  
  Enter the address pool’s identifying name.

### Defaults

None

### Command Modes

DHCP

### Command History

Commands to Configure Secure DHCP

DHCP, as defined by RFC 2131, provides no authentication or security mechanisms. Secure DHCP is a suite of features that protects networks that use dynamic address allocation from spoofing and attacks.

arp inspection

Enable dynamic arp inspection (DAI) on a VLAN.

Syntax

arp inspection

Defaults

Disabled

Command Modes

INTERFACE VLAN

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### clear ip dhcp snooping

Clear the DHCP binding table.

**Syntax**

```
clear ip dhcp snooping {binding | source-address-validation discard-counters [interface interface]}
```

**Parameters**

- **binding**
  - Clears the binding table.

- **source-address-validation discard-counters**
  - Clears discard counters from all the interfaces configured with IP Source Guard.

- **Interface interface**
  - (OPTIONAL) Specifies an interface to clear the discard counters.

**Defaults**

None

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- **9.10(0.1)**
  - Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)**
  - Introduced on the S3148.
- **9.10(0.0)**
  - Introduced on the S6100-ON.
- **9.8(2.0)**
  - Introduced on the S3100 series.
- **9.8(1.0)**
  - Introduced on the Z9100-ON.
- **9.8(0.0P5)**
  - Introduced on the S4048-ON.
- **9.8(0.0P2)**
  - Introduced on the S3048-ON.
- **9.7(0.0)**
  - Introduced on the S6000-ON.
## clear ip dhcp snooping source-address-validation discard-counters

Add the keywords discard-counters, interface, and the variable interface on the S4810, S4820T, S5000, S6000, Z9000, Z9500.

**Example**

The following example shows how to clear the discard counters globally:

```plaintext
DellEMC> clear ip dhcp snooping source-address-validation discard-counters
```

The following example shows how to clear the discard counters on an interface:

```plaintext
DellEMC> clear ip dhcp snooping source-address-validation discard-counters
interface TenGigE 1/10
```

The following example shows how to clear the discard counters on a port channel interface:

```plaintext
DellEMC> clear ip dhcp snooping source-address-validation discard-counters
interface portchannel 1
```

## clear ipv6 dhcp snooping binding

Clear all the DHCPv6 snooping binding database entries.

**Syntax**

```plaintext
clear ipv6 dhcp snooping binding
```

**Defaults**

None

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant **Dell EMC Networking OS Command Line Reference Guide**.

ip dhcp relay

Enable Option 82.

Syntax

```
ip dhcp relay information-option [remote-id {port | hostname:port | mac} | circuit-id {port | hostname:port | mac} | trust-downstream]
```

Parameters

- `remote-id` Enter the keyword `remote-id` to configure the system to enable the remote-id string in option-82.
- `remote-id port` Enter the keywords `remote-id port` to configure the port as the remote id in option-82.
- `remote-id hostname:port` Enter the keywords `remote-id hostname:port` to configure the format of the hostname and port attributes.
- `remote-id mac` Enter the keywords `remote-id mac` to configure the chassis MAC address as the remote-id in option-82.
- `circuit-id` Enter the keyword `circuit-id` to configure the system to enable the circuit-id string in option-82.
- `circuit-id port` Enter the keywords `circuit-id port` to configure the port as the circuit-id in option-82.
- `circuit-id hostname:port` Enter the keywords `circuit-id hostname:port` to configure the circuit-id format that is sent to the server.
- `circuit-id mac` Enter the keywords `circuit-id mac` to configure the chassis MAC address as the circuit-id in option-82.
- `trust-downstream` Configure the system to trust Option 82 when it is received from the previous-hop router.

Defaults

Disabled

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the S6100-ON.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100-ON.

Example

```
DellEMC# clear ipv6 dhcp snooping?
binding Clear the snooping binding database
```

Dynamic Host Configuration Protocol (DHCP)
**ip dhcp snooping**

Enable DHCP snooping globally.

Syntax

```
[no] ip dhcp snooping
```

Defaults Disabled

Command Modes CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the S6100-ON.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100-ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Introduced on the S6000-ON.

9.2(1.0) Introduced on the Z9500.

9.2(0.0) Introduced on the S4810 and S4820T.

9.0.2.0 Introduced on the S6000.

8.3.11.1 Introduced on the Z9000.

8.3.1.0 Introduced on the E-Series.

8.2.1.0 Introduced on the C-Series and S-Series on Layer 2 interfaces.
ipv6 dhcp snooping

Enable DHCPv6 snooping globally for ipv6.

Syntax

[no] ipv6 dhcp snooping

To disable the snooping globally, use the no ipv6 dhcp snooping command.

Defaults
Disabled

Command Modes
CONFIGURATION

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S4810, S4820T, S6000, S6000-ON, and Z-Series.

ipv6 dhcp snooping vlan

Enable ipv6 DHCP Snooping on VLAN or range of VLANs.

Syntax

[no] ip dhcp snooping vlan vlan-id

To disable the ipv6 dhcp snooping on VLAN basis or range of VLAN, use the no ipv6 dhcp snooping vlan <vlan-id> command.

Parameters

vlan-id Enter the name of a VLAN id or list of the VLANs to enable DHCP Snooping.
ip dhcp snooping binding

Create a static entry in the DHCP binding table.

Syntax

[no] ip dhcp snooping binding mac address vlan-id vlan-id ip ip-address interface interface-type lease number

Parameters

- **mac address**: Enter the keyword `mac` then the MAC address of the host to which the server is leasing the IP address.
- **vlan-id vlan-id**: Enter the keywords `vlan-id` then the VLAN to which the host belongs. The range is from 2 to 4094.
- **ip ip-address**: Enter the keyword `ip` then the IP address that the server is leasing.
- **interface type**: Enter the keyword `interface` then the type of interface to which the host is connected:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- **lease time**: Enter the keyword `lease` then the amount of time the IP address are leased. The range is from 1 to 4294967295.

Defaults

- **None**

Command Modes

- EXEC
- EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Usage Instructions

You can map multiple IP addresses to the same MAC address.

### Related Commands

- show ip dhcp snooping — display the contents of the DHCP binding table.

### IPv6 DHCP Snooping Binding

Create a static DHCP snooping binding entry in the snooping database.

#### Syntax

```plaintext
[no] ipv6 dhcp snooping binding mac address vlan-id vlan-id ipv6 ipv6-address interface interface-type | interface-number lease value
```

To delete the DHCP snooping binding entry from DHCP snooping database, use the `[no]` ipv6 dhcp snooping binding mac address vlan-id vlan-id ipv6 ipv6-address interface interface-type | interface-number lease value command.

#### Parameters

`mac address` Enter the keyword `mac` then the MAC address of the host to which the server is leasing the IPv6 address.
ip dhcp snooping database

Delay writing the binding table for a specified time.

Syntax

```
ip dhcp snooping database write-delay minutes
```

Parameters

```
minutes
```

The range is from 5 to 21600.

Defaults

None

**ipv6 dhcp snooping database write-delay**

To set time interval for storing the snooping binding entries in a file.

**Syntax**

```
[no] ipv6 dhcp snooping database write-delay value
```

To disable the storing of snooping binding entries in a file, use the `no ipv6 dhcp snooping write-delay` command.

**Parameters**

- `value`  
  The range is from 5 to 21600. The value of the minutes range is from 5 min. to 15 days.

**Defaults**

None

</tbody>
</table>

Usage Information
Allocate at least one FP block to ipmacacl before you can enable IP+MAC Source Address Validation and SAV with VLAN option.

1. Use the cam-acl 12acl command from CONFIGURATION mode.
2. Save the running-config to the startup-config.
3. Reload the system.
ip dhcp relay information-option

Enable Option 82.

Syntax

```
ip dhcp relay information-option [remote-id {hostname | mac | WORD}] [circuit-id {hostname:port}] [trust-downstream] [vpn]
```

Parameters

- **remote-id**
  - Enter the keyword `remote-id` to configure the system to enable the remote-id string in option-82.

- **remote-id hostname**
  - Enter the keywords `remote-id hostname` to configure the port as the remote id in option-82.

- **remote-id mac**
  - Enter the keywords `remote-id mac` to configure the chassis MAC address as the remote-id in option-82.

- **remote-id WORD**
  - Enter the `remote-id WORD` option to configure the system to enable the remote-id string in option 82.

- **circuit-id**
  - Enter the keyword `circuit-id` to configure the system to enable the circuit-id string in option-82.

- **circuit-id hostname:port**
  - Enter the keywords `circuit-id hostname:port` to configure the circuit-id format that is sent to the server.

- **trust-downstream**
  - Configure the system to trust Option 82 when it is received from the previous-hop router.

- **vpn**
  - Enter the keyword `vpn` to add VPN/VRF related sub-option to relay agent information Option 82.

**NOTE:** Adds the VPN/VRF related sub-options into the relay agent information option(82). When DHCP broadcasts are forwarded by the relay agent from clients to DHCP server.

Default

Disabled.

**ip helper-address**

Configures the destination broadcast address or the host address for DHCP server requests.

**Syntax**

```plaintext
ip helper-address [vrf vrf-name] ip-address
```

To disable the destination broadcast address or the host address for DHCP server requests, use the `ip helper-address [vrf vrf-name] ip-address` command.

**Parameters**

- `vrf vrf-name` (Optional) Enter the keyword `vrf` and then the name of the VRF through which the host address can be reached.
- `ip-address` Enter an IP address through which the host address can be reached.

**Default**

Disabled.

**Command Modes**

INTERFACE
ipv6 helper-address

Configures the ipv6 DHCP helper addresses without VRF.

**Syntax**

```
[no] ipv6 helper-address ipv6-address
```

To delete the ipv6 helper address, use the `[no] ipv6 helper-address ipv6-address` command.

**Parameters**

- **ipv6-address**: Enter the keyword `ipv6-address` through which the server address can be reached.

**Default**

Disabled.

**Command Modes**

INTERFACE

show ip dhcp snooping

Display the contents of the DHCP binding table or display the interfaces configured with IP Source Guard.

Syntax

show ip dhcp snooping [binding | source-address-validation [discard-counters [interface interface]]]

Parameters

Parameters Description

binding Display the binding table.

source-address-validation Display the interfaces configured with IP Source Guard.

discard-counters (OPTIONAL) Display the number of dropped packets.

interface interface (OPTIONAL) Specifies an interface to show the discard counters.

Enter any of the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.

Defaults

None

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

664 Dynamic Host Configuration Protocol (DHCP)
### Version Description
- **9.10(0.0)**: Introduced on the S6100-ON.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100-ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Introduced on the S6000–ON.
- **9.6(0.0)**: Added the discard-counters, interface keywords, and the interface variable.
- **9.2(1.0)**: Introduced on the Z9500.
- **9.0.2.0**: Introduced on the S6000.
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.11.1**: Introduced on the Z9000.
- **8.3.7.0**: Introduced on the S4810.
- **8.3.1.0**: Introduced on the E-Series.
- **7.8.1.0**: Introduced on the C-Series and S-Series.

#### Example

The following example displays the interfaces configured with IP Source Guard:

```text
DellEMC> show ip dhcp snooping source-address-validation
ip sav access-list on TenGigabitEthernet 1/1
Total cam count 3
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit host 10.1.1.252 count (0 packets)
permit host 10.1.1.253 count (0 packets)
ipmac-vlan sav access-list on TenGigabitEthernet 1/2
Total cam count 4
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 10.1.1.1 host 00:00:00:aa:00:01 count (0 packets)
permit vlan 10 host 10.1.1.2 host 00:00:00:aa:00:02 count (0 packets)
permit vlan 20 host 10.2.2.1 host 00:00:00:aa:00:03 count (0 packets)
permit vlan 20 host 10.2.2.2 host 00:00:00:aa:00:04 count (0 packets)
```

The following example displays the port channel interfaces configured with IP Source Guard:

```text
DellEMC> show ip dhcp snooping source-address-validation interface portchannel 10
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 1
Total cam count 5
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:01:01 count (0 packets)
permit vlan 10 host 1.1.1.2 host 00:00:00:01:02 count (0 packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:01:03 count (0 packets)
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 2
Total cam count 5
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:01:01 count (0 packets)
permit vlan 10 host 1.1.1.2 host 00:00:00:01:02 count (0 packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:01:03 count (0 packets)
ipmac-vlan sav access-list on Port-channel 10 on stack-unit 3
Total cam count 5
permit host 0.0.0.0 host 00:00:00:00:00:00 count (0 packets)
permit vlan 10 host 1.1.1.1 host 00:00:00:01:01 count (0 packets)
```

permit vlan 10 host 1.1.1.2 host 00:00:00:00:01:02 count (0 packets)
permit vlan 10 host 1.1.1.3 host 00:00:00:00:01:03 count (0 packets)

**NOTE:** The output for port-channel interfaces does not display the physical interface.

The following example displays the SAV discard counters on all interfaces:

```
DellEMC> show ip dhcp snooping source-address-validation discard-counters
deny access-list on TenGigabitEthernet 1/1
Total cam count 1
deny count (0 packets)
deny access-list on TenGigabitEthernet 1/2
Total cam count 2
deny vlan 10 count (0 packets)
deny vlan 20 count (0 packets)
```

The following example displays the SAV discard counters on a particular interface:

```
DellEMC> show ip dhcp snooping source-address-validation discard-counters
interface TenGigabitEthernet 1/1
deny access-list on TenGigabitEthernet 1/1
Total cam count 2
deny vlan 10 count (0 packets)
deny vlan 20 count (0 packets)
```

The following example displays the SAV discard counters on a port channel interface:

```
DellEMC> show ip dhcp snooping source-address-validation discard-counters
interface portchannel 10
deny access-list on Port-channel 10 on stack-unit 1
Total cam count 1
deny vlan 10 count (0 packets)
deny access-list on Port-channel 10 on stack-unit 2
Total cam count 1
deny vlan 10 count (0 packets)
deny access-list on Port-channel 10 on stack-unit 3
Total cam count 1
deny vlan 10 count (0 packets)
```

**NOTE:** The output for port-channel interfaces does not display the physical interface. If the LAG member interfaces belong to different stack-units, the counters are displayed per stack-unit for that port channel.

### show ipv6 dhcp snooping

Display the DHCPv6 snooping binding database.

#### Syntax

```
show ipv6 dhcp snooping
```

#### Defaults

None

#### Command Modes

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Commands to Configure DNS

To configure the Domain Names Systems (DNS) on the system, use the following commands:

#### ip name-server

Configures one or more name server (DNS) IP addresses. You can configure up to six IP addresses.

**Syntax**

```
ip name-server [vrf vrf-name] ip-address [ip-address2] [ip-address3] [ip-address4] [ip-address5] [ip-address6]
```

To undo the name server ip address configuration for VRF, use the `no ip name-server [vrf vrf-name] ip-address` command.

**Parameters**

- `vrf vrf-name`
  - (Optional) Enter the key word `vrf` and then the name of the VRF to configure the name server IP addresses for that VRF.
  - Enter the IP address of the name server in dotted decimal format.

- `ip-address [ip-address2] [ip-address3] [ip-address4] [ip-address5] [ip-address6]`
  - **NOTE:** Use the additional `ip-address parameters (ip-address2 to ip-address6)` in a sequential order to specify up to a maximum of six IP addresses per VRF.

**Defaults**

None

**Command Modes**

CONFIGURATION
Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant Dell EMC Networking OS Command Line Reference Guide.

The following is a list of the Dell EMC Networking OS version history for this command.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(1.0)</td>
<td>Introduced on the Z9100-ON.</td>
</tr>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>

<td>Introduced on the S6000-ON.</td>
</tr>
<tr>
<td>9.4.(0.0)</td>
<td>Introduced on the S-Series and Z-Series.</td>
</tr>
</tbody>
</table>

Usage Information

Use this command to associate the system with one or more DNS servers.

In a dual stack setup, the system sends both A (request for IPv4 — RFC 1035) and AAAA (request for IPv6 — RFC 3596) record requests to a DNS server even if only the `ip name-server` command is configured.

Example

```
• DellEMC(conf)#ip name-server vrf jay 2.2.2.2
• DellEMC(conf)#ip name-server vrf jay 2.2.2.2 3.3.3.3 4.4.4.4 5.5.5.5 6.6.6.6 7.7.7.7
```

ip domain-name

Configures the default domain corresponding to a specific VRF. This domain is appended to the incomplete DNS requests corresponding to the specified VRF.

Syntax

```
ip domain-name [vrf vrf-name] name
```

To undo the domain name configuration corresponding to a specific VRF, use the `no ip domain-name [vrf vrf-name] name` command.

Parameters

- **vrf vrf-name**  
  (Optional) Enter the key word `vrf` and then the name of the VRF to configure the domain corresponding to that VRF.

- **name**  
  Enter the name of the domain to be appended to the incomplete DNS requests corresponding to the specified VRF.

Defaults

- None

Command Modes

- EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the S6010-ON and S4048T-ON.</td>
</tr>
</tbody>
</table>
### ip domain-name

Use this command to configure a domain name corresponding to a VRF. This domain is appended to the incomplete DNS requests corresponding to the specified VRF.

**Example**

```
DellEMC(conf)# ip domain-name vrf jay dell.com
```

#### ip domain-list

Adds a domain name to the DNS list. This domain name is appended to incomplete host names in DNS requests corresponding to a specific VRF.

**Syntax**

```
ip domain-list [vrf vrf-name] name
```

To remove a domain name from DNS list, use the `no ip domain-list [vrf vrf-name] name` command.

**Parameters**

- **vrf vrf-name**
  - (Optional) Enter the key word `vrf` and then the name of the VRF to add a domain name to the DNS list corresponding to that VRF.
- **name**
  - Enter the name of the domain to be appended to the DNS list corresponding to the VRF.

**Defaults**

None

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

#### Version Description

- **9.10(0.1)**
  - Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)**
  - Introduced on the S3148.
- **9.10(0.0)**
  - Introduced on the S6100.
- **9.8(2.0)**
  - Introduced on the S3100 series.
- **9.8(1.0)**
  - Introduced on the Z9100-ON.
- **9.8(0.0P5)**
  - Introduced on the S4048-ON.
- **9.8(0.0P2)**
  - Introduced on the S3048-ON.
- **9.7(0.0)**
  - Introduced on the S6000-ON.
- **9.4.(0.0)**
  - Introduced on the S-Series and Z-Series.
**ip domain-list**

Use this command to add domain names to the DNS lists corresponding to a specific VRF. You can add up to a maximum of six domain names to the DNS list corresponding to a VRF. This domain is used to complete the unqualified host names.

**Example**

```bash
DellEMC(conf)# ip domain-list vrf jay dell.com
DellEMC(conf)# ip domain-list vrf jay force10.com
```

**ip host**

Configures a mapping between the host name server and the IP address for a specific VRF. This mapping information is used by the name-to-IP address table to resolve host names.

**Syntax**

```
ip host [vrf vrf-name] name ip-address
```

**Parameters**

- `vrf vrf-name` (Optional) Enter the keyword `vrf` and then the name of the VRF to configure the name server to IP address mapping for that VRF.
- `name` Enter the name of the host to be associated with an IP address.
- `ip-address` Enter the IP address of the name server in dotted decimal format.

**Defaults**

None

### clear host

Removes one or all dynamically learned host table entries for a specific VRF.

**Syntax**
```
clear host [vrf vrf-name] {* | host-name}
```

**Parameters**
- **vrf vrf-name**  
  (Optional) Enter the key word `vrf` and then the name of the VRF to delete dynamically learned host table entries corresponding to that VRF.
- **host-name**  
  Enter the name of the host corresponding to which you want to delete the dynamically learnt host table entries.
- *****  
  Enter * to delete all host table entries.

**Defaults**
None

**Command Modes**
EXEC

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<table>
<thead>
<tr>

<td>Introduced on the S6000-ON.</td>
</tr>
<tr>
<td>9.4.(0.0)</td>
<td>Introduced on the S-Series and Z-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**
Use this command to delete one or all dynamically learned host table entries corresponding to a specific VRF.

**Example**
```
DellEMC# clear host vrf jay dell
DellEMC# clear host vrf jay *
```
Equal Cost Multi-Path (ECMP)

Equal cost multi-path (ECMP) supports multiple "best paths" in next-hop packet forwarding to a destination device.

Topics:
- ecmp-group
- hash-algorithm
- hash-algorithm ecmp
- hash-algorithm seed
- ip ecmp-group
- ip ecmp weighted
- link-bundle-monitor enable
- link-bundle-distribution trigger-threshold
- show config
- show link-bundle distribution

ecmp-group

Provides a mechanism to monitor traffic distribution on an ECMP link bundle. A system log is generated when the standard deviation of traffic distribution on a member link exceeds a defined threshold.

Syntax
```
ecmp-group {ecmp-group-id interface interface | link-bundle-monitor}
```
To remove the selected interface, use the ecmp-group no interface command.

To disable link bundle monitoring, use the ecmp-group no link-bundle-monitor command.

Parameters
- **ecmp-group ID**
  - Enter the identifier number for the ECMP group. The range is from 2 to 64.

- **interface**
  - Enter the following keywords and the interface information to add the interface to the ECMP group:
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport information.
    - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
    - For a LAG interface, enter the keywords port-channel then the slot/port information.

Defaults
- Off
Command Modes

- CONFIGURATION
- CONFIGURATION ECMP-GROUP

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>

</tr>
<tr>
<td>9.0.0.0</td>
<td>Introduced on the Z9000.</td>
</tr>
<tr>
<td>8.3.19.0</td>
<td>Introduced on the S4820T.</td>
</tr>
<tr>
<td>8.3.10.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

Usage Information

Using CONFIGURATION mode, create an ECMP group ID. You can then assign interfaces to the ECMP group using CONFIGURATION ECMP-GROUP mode. You can also enable on the port-channel configuration using the CONFIGURATION ECMP-GROUP command mode.

hash-algorithm

Changes the hash algorithm used to distribute traffic flows across a Port Channel and ECMP. The ECMP and LAG options are supported on the S-Series and Z-Series.

Syntax

hash-algorithm {ecmp {crc16 | crc16cc | crc32MSB | crc32LSB | crc-upper | dest-ip | flow-based-hashing {crc16|crc16cc|crc32MSB|crc32LSB|xor1|xor2|xor4|xor8|xor16}|lsb | xor1 | xor2 | xor4 | xor8 | xor16} ![hg {crc16 | crc16cc | crc32MSB | crc32LSB | xor1 | xor2 | xor4 | xor8 | xor16} | lag {crc16 | crc16cc | crc32MSB | crc32LSB | xor1 | xor2 | xor4 | xor8 | xor16} ![stack-unit|linecard number | port-set number] | [hg—seed value] | [seedvalue]}

To return to the default hash algorithm, use the no hash-algorithm command.

To return to the default ECMP hash algorithm, use the no hash-algorithm ecmp algorithm-value command.
Parameters

**ecmp**
- **crc16**: Use CRC16_BISYNC — 16 bit CRC16-bisync polynomial (default)
- **crc16cc**: Use CRC16_CCITT — 16 bit CRC16 using CRC16-CCITT polynomial
- **crc32MSB**: Use CRC32_UPPER — MSB 16 bits of computed CRC32
- **crc32LSB**: Use CRC32_LOWER — LSB 16 bits of computed CRC32
- **crc-upper**: Uses the upper 32 bits of the key for the hash computation
- **dest-ip**: Uses the destination IP for ECMP hashing
- **flow-based-hashing**: Enter the keywords flow-based-hashing followed by the algorithm
  - **crc16|crc16cc|crc32MSB|crc32LSB|xor1|xor2|xor4|xor8|xor16**: Use CRC16_BISYNC_AND_XOR1 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor1
  - **xor2**: Use CRC16_BISYNC_AND_XOR2 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor2
  - **xor4**: Use CRC16_BISYNC_AND_XOR4 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor4
  - **xor8**: Use CRC16_BISYNC_AND_XOR8 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor8
  - **xor16**: Use CRC16 — 16 bit XOR

**hg**
- **crc16|crc16cc|crc32MSB|crc32LSB|xor1|xor2|xor4|xor8|xor16**: Use CRC16_BISYNC — 16 bit CRC16-bisync polynomial (default)
- **crc16cc**: Use CRC16_CCITT — 16 bit CRC16 using CRC16-CCITT polynomial
- **crc32MSB**: Use CRC32_UPPER — MSB 16 bits of computed CRC32
- **crc32LSB**: Use CRC32_LOWER — LSB 16 bits of computed CRC32
- **xor1**: Use CRC16_BISYNC_AND_XOR1 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor1
- **xor2**: Use CRC16_BISYNC_AND_XOR2 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor2
- **xor4**: Use CRC16_BISYNC_AND_XOR4 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor4
- **xor8**: Use CRC16_BISYNC_AND_XOR8 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor8
- **xor16**: Use CRC16 — 16 bit XOR

**lag**
- **crc16|crc16cc|crc32MSB|crc32LSB|xor1|xor2|xor4|xor8|xor16**: Use CRC16_BISYNC — 16 bit CRC16-bisync polynomial (default)
- **crc16cc**: Use CRC16_CCITT — 16 bit CRC16 using CRC16-CCITT polynomial
- **crc32MSB**: Use CRC32_UPPER — MSB 16 bits of computed CRC32
- **crc32LSB**: Use CRC32_LOWER — LSB 16 bits of computed CRC32
- **xor1**: Use CRC16_BISYNC_AND_XOR1 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor1
- **xor2**: Use CRC16_BISYNC_AND_XOR2 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor2
xor4: Use CRC16_BISYNC_AND_XOR4 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor4
xor8: Use CRC16_BISYNC_AND_XOR8 — Upper 8 bits of CRC16-BISYNC and lower 8 bits of xor8
xor16: Use CR16 — 16 bit XOR

hg-seed seed-value (This option is available in stack-unit and linecard provisioned devices): Enter the keywords hg-seed then the hash algorithm seed value. The range is from 0 to 2147483646.

stack-unit number (OPTIONAL) : Enter the keyword stack-unit then the stack-unit slot number.

linecard number (OPTIONAL) : Enter the keyword linecard then the linecard slot number.

port-set number (OPTIONAL) Enter the keyword port-set then the port-set slot number.

Defaults IPSA and IPDA mask value is FF for the stack-unit.

<td>7.8.1.0</td>
<td>Added the nh-ecmp option.</td>
</tr>
<tr>
<td>7.7.1.1</td>
<td>Added the nh-ecmp option.</td>
</tr>
</tbody>
</table>

Usage Information To ensure that CRC is not used for LAG, set the default hash-algorithm method on E-Series systems. For example, hash-algorithm ecmp xor lag checksum nh-ecmp checksum.
The hash value calculated with the hash-algorithm command is unique to the entire unit. The hash algorithm command with the stack-unit option changes the hash for a particular stack-unit by applying the mask specified in the IPSA and IPDA fields.

The stack-unit option is applicable with the lag-hash-align microcode only. Any other microcode returns an error message as follows:

- DellEMC(conf)#hash-algorithm linecard 5 ip-sa-mask ff ip-da-mask ff
  % Error: This command is not supported in the current microcode configuration

In addition, the linecard number ip-sa-mask value ip-da-mask value option has the following behavior to maintain bi-directionality:

- When hashing is done on both IPSA and IPDA, the ip-sa-mask and ip-da-mask values must be equal. (Single Linecard).
- When hashing is done only on IPSA or IPDA, Dell EMC Networking OS maintains bi-directionality with masks set to XX 00 for stack-unit 1 and 00 XX for stack-unit 2 (ip-sa-mask and ip-da-mask). The mask value must be the same for both stack-units when using multiple stack-units as ingress (where XX is any value from 00 to FF for both stack-units). For example, assume that traffic is flowing between linecard 1 and linecard 2:
  - hash-algorithm linecard 1 ip-sa-mask aa ip-da-mask 00
  - hash-algorithm linecard 2 ip-sa-mask 00 ip-da-mask aa

The different hash algorithms are based on the number of Port Channel members and packet values. The default hash algorithm (number 0) yields the most balanced results in various test scenarios, but if the default algorithm does not provide a satisfactory distribution of traffic, use the hash-algorithm command to designate another algorithm.

When a Port Channel member leaves or is added to the Port Channel, the hash algorithm is recalculated to balance traffic across the members.

**hash-algorithm ecmp**

Change the hash algorithm used to distribute traffic flows across an ECMP (equal-cost multipath routing) group.

</tr>
</tbody>
</table>

**Usage Information**
The hash value calculated with the `hash-algorithm` command is unique to the entire chassis. The default ECMP hash configuration is `crc-lower`. This command takes the lower 32 bits of the hash key to compute the egress port and is the “fall-back” configuration if you have not configured anything else.

The different hash algorithms are based on the number of ECMP group members and packet values. The default hash algorithm yields the most balanced results in various test scenarios, but if the default algorithm does not provide satisfactory distribution of traffic, use this command to designate another algorithm.

When a member leaves or is added to the ECMP group, the hash algorithm is recalculated to balance traffic across the members.

**hash-algorithm seed**
Select the seed value for the ECMP, LAG, and NH hashing algorithm.

**Syntax**
```
hash-algorithm seed value [stack-unitslot/port] [port-set number]
```

**Parameters**
- `seed value` Enter the keyword `seed` then the seed value. The range is from 0 to 2,147,483,646.
- `stack-unitslot/port` Enter the keyword `stack-unit` then the slot/port[subport] number.
- `port-set number` Enter the keyword `port-set` then the port-pipe number. The value is 0.

**Defaults**
None

**Command Modes**
CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant *Dell Networking OS Command Line Reference Guide*.
Version Description
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.3.1.0 Introduced on the E-Series.

Usage Information
Deterministic ECMP sorts ECMPs in order even though RTM provides them in a random order. However, the hash algorithm uses as a seed the lower 12 bits of the chassis MAC, which yields a different hash result for every chassis. This behavior means that for a given flow, even though the prefixes are sorted, two unrelated chassis select different hops.

Dell provides a CLI-based solution for modifying the hash seed to ensure that on each configured system, the ECMP selection is same. When configured, the same seed is set for ECMP, LAG, and NH, and is used for incoming traffic only.

NOTE: While the seed is stored separately on each port-pipe, the same seed is used across all CAMs.

You cannot separate LAG and ECMP but you can use different algorithms across the chassis with the same seed. If LAG member ports span multiple port-pipes and line cards, set the seed to the same value on each port-pipe to achieve deterministic behavior.

If the hash algorithm configuration is removed, the hash seed does not go to the original factory default setting.

**ip ecmp-group**

Enable and specify the maximum number of ecmp that the L3 CAM hold for a route. By default, when maximum paths are not configured, the CAM can hold a maximum of 16 ecmp per route.

**Syntax**
```
ip ecmp-group {maximum-paths | (number) | {path-fallback}}
```
To negate a command, use the `no ip ecmp-group maximum-paths {number} command`

**Parameters**
- **maximum-paths** Specify the maximum number of ECMP for a route. The range is 2 to 64.
- **path-fallback** Use the keywords `path-fallback` to enable this feature. If you enable the feature, re-enter this keyword to disable the feature.

**Defaults**
- 16

**Command Modes**
- CONFIGURATION
ip ecmp weighted

Enables weighted ECMP calculations.

Syntax

    ip ecmp weighted

To disable weighted ECMP calculations, enter the no ip ecmp weighted command.

Defaults

    N/A

<td>Introduced on the Z9000.</td>
</tr>
<tr>
<td>8.3.10.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

Usage Information

    You must save the new ECMP settings to the startup-config (write-mem) then reload the system for the new settings to take effect.
<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.7(0.0)</td>
<td>Introduced on the S-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

Enabling this CLI would inform the FIB to re-program the destination prefix paths with weights in the HW/CAM on the fly.

If disabled, the CLI would inform the FIB to re-program the destination prefix paths with no weights or regular ECMP.

**Example**

```
DellEMC(conf)# ip ecmp ?
weighted                Enables Weighted ECMP
DellEMC(conf)# ip ecmp weighted
DellEMC(conf)# do show running-config | grep ecmp
ip ecmp weighted
DellEMC(conf)#
DellEMC(conf)# no ip ecmp ?
weighted                Disables Weighted ECMP
DellEMC(conf)# no ip ecmp weighted
DellEMC(conf)# do show running-config | grep ecmp
```

---

**link-bundle-monitor enable**

Provides a mechanism to enable monitoring of traffic distribution on an ECMP link bundle.

**Syntax**

```
link-bundle-monitor enable
```

To exit from ECMP group mode, use the `exit` command.

**Command Modes**

- ECMP-GROUP
- PORT-CHANNEL INTERFACE

**Command History**

link-bundle-distribution trigger-threshold

Provides a mechanism to set the threshold to trigger when traffic distribution begins being monitored on an ECMP link bundle.

Syntax

`link-bundle-distribution trigger-threshold [percent]`

To exit from ecmp group mode, use the `exit` command.

Parameters

`percent`  Indicate the threshold value when traffic distribution starts being monitored on an ECMP link bundle. The range is from 1 to 90%. The default is 60%.

Command Modes

- EXEC Privilege

group1-shal,diffie-hellman-group14-shal.
Password Authentication     : enabled.
Hostbased Authentication    : disabled.
RSA Authentication         : disabled.
Vty                      | Encryption | HMAC | Remote IP
0 3des-cbc hmac-shal-96    |           |     | 10.1.20.48
1 3des-cbc hmac-shal-96    |           |     | 10.1.20.48
```

### ssh

Open an SSH connection specifying the hostname, username, port number, and version of the SSH client.

**Syntax**

```
ssh {hostname|ipv4 address|ipv6 address} [-c encryption cipher|-l username|-m HMAC alogorithm|-p port-number|-v {1|2}]
```

---

**FIPS Cryptography**

686
Parameters

- **hostname**  
  (OPTIONAL) Enter the IP address or the hostname of the remote device.

- **ipv4 address**  
  (OPTIONAL) Enter the IP address in dotted decimal format A.B.C.D.

- **ipv6 addressprefix**  
  (OPTIONAL) Enter the IPv6 address in the x:x:x::x format then the prefix length in the /x format. The range is from /0 to /128

  **NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

- **-c encryption cipher**  
  Enter the following encryption cipher to use. (For v2 clients only.)
  - 3des-cbc: Force ssh to use 3des-cbc encryption cipher.

  FIPS mode is enabled or disabled:
  - aes256-ctr: Force ssh to use the aes256-ctr encryption cipher.
  - aes256-cbc: Force ssh to use the aes128-cbc encryption cipher.
  - aes192-ctr: Force ssh to use the aes128-cbc encryption cipher.
  - aes192-cbc: Force ssh to use the aes256-cbc encryption cipher.
  - aes128-ctr: Force ssh to use the aes256-cbc encryption cipher.
  - aes128-cbc: Force ssh to use the aes128-cbc encryption cipher.
  - 3des-cbc: Force ssh to use 3des-cbc encryption cipher.

- **-l username**  
  (OPTIONAL) Enter the keyword -l then the user name used in this SSH session. The default is the user name of the user associated with the terminal.

- **-m HMAC algorithm**  
  Enter one of the following HMAC algorithms to use. (For v2 clients only.)
  Without the FIPS mode enabled:
  - hmac-shal-96: Force ssh to use the hmac-sha1-96 HMAC algorithm.
  - hmac-sha1: Force ssh to use the hmac-sha1 HMAC algorithm.
  - hmac-md5-96: Force ssh to use the hmac-md5-96 HMAC algorithm.
  - hmac-md5: Force ssh to use the hmac-md5 HMAC algorithm.

  With the FIPS mode enabled:
  - hmac-sha2-256: Force ssh to use the hmac-sha2-256 HMAC algorithm.
  - hmac-shal-96: Force ssh to use the hmac-sha1-96 HMAC algorithm.
  - hmac-sha1: Force ssh to use the hmac-sha1 HMAC algorithm.
  - hmac-md5-96: Force ssh to use the hmac-md5-96 HMAC algorithm.
  - hmac-md5: Force ssh to use the hmac-md5 HMAC algorithm.

- **-p port-number**  
  (OPTIONAL) Enter the keyword -p then the port number.
  The range is 1 to 65535.

- **-v (1|2)**  
  (OPTIONAL) Enter the keyword -v then the SSH version 1 or 2.
  The default: The version from the protocol negotiation.

  **NOTE:** If the FIPS mode is enabled, this option does not display in the output.

**Defaults**  
See Parameters.

### Related Commands

- `ip ssh server` Configure an SSH server.
- `show ip ssh client-pub-keys` Display the client-public keys.

### Usage Information

Dell EMC Networking OS supports both inbound and outbound SSH sessions using IPv4 or IPv6 addressing. Inbound SSH supports accessing the system through the management interface as well as through a physical Layer 3 interface.

**NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell EMC Networking representative.

### Example

**If FIPS mode is not enabled:**

```bash
DellEMC# ssh 10.10.10.10 ?
-c Encryption cipher to use (for v2 clients only)
-l User name option
-m HMAC algorithm to use (for v2 clients only)
-p SSH server port option (default 22)
-v SSH protocol version
<cr>
DellEMC# ssh 10.10.10.10 -c ?
3des-cbc Force ssh to use 3des-cbc encryption cipher
aes128-cbc Force ssh to use aes128-cbc encryption cipher
aes192-cbc Force ssh to use aes192-cbc encryption cipher
aes256-cbc Force ssh to use aes256-cbc encryption cipher
aes128-ctr Force ssh to use aes128-ctr encryption cipher
aes192-ctr Force ssh to use aes192-ctr encryption cipher
aes256-ctr Force ssh to use aes256-ctr encryption cipher
DellEMC# ssh 10.10.10.10 -m ?
hmac-md5 Force ssh to use hmac-md5 HMAC algorithm
hmac-md5-96 Force ssh to use hmac-md5-96 HMAC algorithm
hmac-shal Force ssh to use hmac-shal HMAC algorithm
hmac-shal-96 Force ssh to use hmac-shal-96 HMAC algorithm
hmac-sha2-256 Force ssh to use hmac-sha2-256 HMAC algorithm
```

**With FIPS mode enabled:**

```bash
DellEMC# ssh 10.10.10.10 ?
-c Encryption cipher to use (for v2 clients only)
-l User name option
-m HMAC algorithm to use (for v2 clients only)
-p SSH server port option (default 22)
<cr>
DellEMC# ssh 10.10.10.10 -c ?
```

hmac-sha2-256   Force ssh to use hmac-sha2-256 HMAC algorithm
In a converged Ethernet network, a switch can operate as an intermediate Ethernet bridge to snoop on FIP packets during the login process on Fibre Channel over Ethernet (FCoE) forwarders (FCFs). Acting as a transit FIP snooping bridge, the switch uses dynamically created access control lists (ACLs) to permit only authorized FCoE traffic to transmit between an FCoE end-device and an FCF.

**clear fip-snooping database interface vlan**

Clear FIP snooping information on a VLAN for a specified FCoE MAC address, ENode MAC address, or FCF MAC address, and remove the corresponding ACLs FIP snooping generates.

**Syntax**
```
clear fip-snooping database interface vlan {vlan-id} enode {enode-mac-address} 
| fcf {fcf-mac-address} | session {session-mac-address}
```

**Parameters**
- `enode-mac-address`: Enter the ENode MAC address of the session which has to be cleared.
- `fcf-mac-address`: Enter the FCF MAC address of the session which has to be cleared.
- `session-mac-address`: Enter the MAC address of the session which has to be cleared.

**clear fip-snooping statistics**

Clears the statistics on the FIP packets snooped on all VLANs, a specified VLAN, or a specified port interface.

### Syntax

```
clear fip-snooping statistics [interface vlan vlan-id | interface port-type slot/port[/subport] | interface port-channel port-channel-number]
```

### Parameters

- **vlan-id**
  - Enter the VLAN ID of the FIP packet statistics to be cleared.

- **port-type slot/port**
  - Enter the slot number and port-type of the FIP packet statistics to be cleared. Enter the subport number if a 40G port is fanned-out into 10G ports.

- **port-channel-number**
  - Enter the port channel number of the FIP packet statistics to be cleared.

**debug fip snooping**

Enable debugging on FIP snooping.

### Syntax

```
disable fip-snooping [all | acl | error | ifm | info | ipc | ns | rscn | rx | tx]
```

### Parameters

- **all**
  - Enter the keyword all to enable debugging on all the options.

- **acl**
  - Enter the keyword acl for ACL-specific debugging.

- **error**
  - Enter the keyword error for error-specific debugging.
Enter the keyword **ifm** for IFM-specific debugging.

Enter the keyword **info** for information-specific debugging.

Enter the keyword **ipc** for IPC-specific debugging.

Enter the keyword **ns** for name-server-specific debugging.

Enter the keyword **rscn** for RSCN-specific debugging.

Enter the keyword **rx** for packet receive-specific debugging.

Enter the keyword **tx** for packet transmit-specific debugging.

**Command Modes**

EXEC Privilege

**debug fip snooping rx**

Enable debugging for FIP snooping receive-specific packets.

**Syntax**

debug fip-snooping rx packet-type [all | discovery | ns | virtual-link-instantiation | virtual-link-maintenance | vlan-discovery] [interface]

**Parameters**

- **packet-type**
  
  Enter the keyword packet-type and then the option type on which to enable debugging. The options are:
  
  - **all** — Enter the keyword all to enable debugging on all the options.
  - **discovery** — Enter the keyword discovery to enable debugging on FCF advertisements and ENode solicitation.
  - **ns** — Enter the keyword ns to enable debugging of the name-server packets.
  - **virtual-link-instantiation** — Enter the keywords virtual-link-instantiation to enable debugging on FLOGI, FDISC, and FLOGO packets.
  - **virtual-link-maintenance** — Enter the keywords virtual-link-maintenance to enable debugging on FIP clear virtual link frames and keepalives.
• **vlan-discovery** — Enter the keywords `vlan-discovery` to enable debugging on VLAN requests and notifications.

**interface**

Enter the following keywords and slot/port[/subport] or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

</tr>
</tbody>
</table>

**Usage Information**

Before enabling FIP snooping, assign the fcoeacl space using the `cam-acl` command. If not assigned, the following error message is displayed:

```
DellEMC(conf)#feature fip-snooping
% Error: Cannot enable fip snooping. CAM Region not allocated for Fcoe.
DellEMC(conf)#cam-acl l2acl 2 ipv4acl 0 ipv6acl 0 ipv4qos 2 12qos 0 12pt 0
ipmacacl 0 vman-qos 0 fcoeacl 2 etsacl 1 iscsi 2
DellEMC(conf)#feature fip-snooping
```

**fip-snooping enable**

Enable FIP snooping on all VLANs or on a specified VLAN.

**Syntax**

```
fip-snooping enable
```

To disable the FIP snooping feature on all or a specified VLAN, use the `no fip-snooping enable` command.

**Defaults**

FIP snooping is disabled on all VLANs.

**Command Modes**

- CONFIGURATION
- VLAN INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
---|---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S6100-ON.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0) | Introduced on the S3048-ON and S4048-ON.
9.7(0.0) | Introduced on the Z9500 and S6000-ON.
8.3.19.0 | Introduced on the S4820T.
8.3.12.0 | Introduced on the S4810.

694  FIP Snooping
Usage Information

The maximum number of FCFs supported per FIP snooping-enabled VLAN is 12. The default number of FIP snooping sessions supported per ENode server is 32. The maximum number of FIP snooping sessions supported per ENode server is 64.

fip-snooping fc-map

Configure the FC-MAP value FIP snooping uses on all VLANs.

Syntax

fip-snooping fc-map fc-map-value

To return the configured FC-MAP value to the default value, use the no fip-snooping fc-map command.

Parameters

fc-map-value

Enter the FC-MAP value FIP snooping uses. The range is from 0EFC00 to 0EFCFF.

Defaults

0x0EFC00

Command Modes

- CONFIGURATION

fip-snooping max-sessions-per-enodemac

Configure the maximum session limit per ENode MAC address.

Syntax

fip-snooping max-sessions-per-enodemac max-sessions-value

To return the configured maximum sessions to the default value, use the no fip-snooping max-sessions-per-enodemac command.
Parameters

**max-sessions-value**
Enter the maximum number of sessions allowed per ENode MAC address. The range is from 1 to 64.

 Defaults

32

</table>

Usage Information

The maximum number of FCFs supported per FIP snooping-enabled VLAN is four.
fip-snooping port-mode fcoe-trusted

Configure the port for bridge-to-bridge links. It is not recommended to use this command because multi-hop FSB is not supported.

Syntax

```
fip-snooping port-mode fcoe-trusted
```

To remove the bridge-to-bridge link configuration from the port, use the `no fip-snooping port-mode fcoe-trusted` command.

show fip-snooping enode

The following describes the show fip-snooping enode command shown in the following example.

Field | Description
--- | ---
ENode MAC | MAC address of the ENode.
ENode Interface | Slot/ port number of the interface connected to the ENode.
FCF MAC | MAC address of the FCF.
VLAN | VLAN ID number the session uses.
FC-ID | Fibre Channel session ID the FCF assigns.

Example

```
DellEMC# show fip-snooping enode
Enode MAC         Enode Interface FCF MAC           VLAN FC-ID
--------- --------------- ------- ---- ----- 54:7f:ee:37:34:40 100 62:00:11
```

show fip-snooping fcf

Display information on the FCFs in FIP-snooped sessions, including the FCF interface and MAC address, FCF interface, VLAN ID, FC-MAP value, FKA advertisement period, and number of ENodes connected.

Syntax

```
show fip-snooping fcf [fcf-mac-address]
```

Parameters

- **fcf-mac-address** Enter the MAC address of the FCF to display.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version | Description
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S6100-ON.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0) | Introduced on the S3048-ON and S4048-ON.
9.7(0.0) | Introduced on the Z9500 and S6000-ON.
8.3.19.0 | Introduced on the S4820T.
8.3.12.0 | Introduced on the S4810.
**Usage Information**

The following describes the `show fip-snooping fcf` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FCF MAC</td>
<td>MAC address of the FCF.</td>
</tr>
<tr>
<td>FCF Interface</td>
<td>Slot/port number of the interface to which the FCF is connected.</td>
</tr>
<tr>
<td>VLAN</td>
<td>VLAN ID number the session uses.</td>
</tr>
<tr>
<td>FC-MAP</td>
<td>FC-Map value the FCF advertises.</td>
</tr>
<tr>
<td>ENode Interface</td>
<td>Slot/number of the interface connected to the ENode.</td>
</tr>
<tr>
<td>FKA_ADV_PERIOD</td>
<td>Time (in milliseconds) during which FIP keep-alive advertisements transmit.</td>
</tr>
<tr>
<td>No of ENodes</td>
<td>Number of ENodes connected to the FCF.</td>
</tr>
<tr>
<td>FC-ID</td>
<td>Fibre Channel session ID the FCF assigns.</td>
</tr>
</tbody>
</table>

**Example**

```bash
DellEMC# show fip-snooping fcf
FCF MAC        FCF Interface VLAN FC-MAP FKA_ADV_PERIOD No. of Enodes
------- ------------- ---- ------ -------------- --------------
54:7f:ee:37:34:40 Po 22      100 0e:fc:00 4000                 2
```

**show fip-snooping statistics**

Display statistics on the FIP packets snooped on all interfaces, including VLANs, physical ports, and port channels.

**Syntax**

```
show fip-snooping statistics [interface vlan vlan-id | interface interface-type | interface port-channel port-channel-number]
```

**Parameters**

- `vlan-id` Enter the VLAN ID of the FIP packet statistics displays.
- `port-channel-number` Enter the port channel number of the FIP packet statistics displays.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
---|---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S6100-ON.
9.8(1.0)  | Introduced on the Z9100–ON.
9.8(0.0)  | Introduced on the S3048-ON and S4048-ON.
9.7(0.0)  | Introduced on the Z9500 and S6000-ON.
**Usage Information**

The following describes the show fip-snooping statistics command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of VLAN Requests</td>
<td>Number of FIP-snoop VLAN request frames received on the interface.</td>
</tr>
<tr>
<td>Number of VLAN Notifications</td>
<td>Number of FIP-snoop VLAN notification frames received on the interface.</td>
</tr>
<tr>
<td>Number of Multicast Discovery Solicits</td>
<td>Number of FIP-snoop multicast discovery solicit frames received on the interface.</td>
</tr>
<tr>
<td>Number of Unicast Discovery Solicits</td>
<td>Number of FIP-snoop unicast discovery solicit frames received on the interface.</td>
</tr>
<tr>
<td>Number of FLOGI</td>
<td>Number of FIP-snoop FLOGI request frames received on the interface.</td>
</tr>
<tr>
<td>Number of FDISC</td>
<td>Number of FIP-snoop FDISC request frames received on the interface.</td>
</tr>
<tr>
<td>Number of FLOGO</td>
<td>Number of FIP-snoop FLOGO frames received on the interface.</td>
</tr>
<tr>
<td>Number of ENode Keep Alives</td>
<td>Number of FIP-snoop ENode keep-alive frames received on the interface.</td>
</tr>
<tr>
<td>Number of VN Port Keep Alives</td>
<td>Number of FIP-snoop VN port (Virtual N-port) keep-alive frames received on the interface.</td>
</tr>
<tr>
<td>Number of Multicast Discovery Advertisements</td>
<td>Number of FIP-snoop multicast discovery advertisements received on the interface.</td>
</tr>
<tr>
<td>Number of Unicast Discovery Advertisements</td>
<td>Number of FIP-snoop unicast discovery advertisements received on the interface.</td>
</tr>
<tr>
<td>Number of FLOGI Accepts</td>
<td>Number of FIP FLOGI accept frames received on the interface.</td>
</tr>
<tr>
<td>Number of FLOGI Rejects</td>
<td>Number of FIP FLOGI reject frames received on the interface.</td>
</tr>
<tr>
<td>Number of FDISC Accepts</td>
<td>Number of FIP FDISC accept frames received on the interface.</td>
</tr>
<tr>
<td>Number of FDISC Rejects</td>
<td>Number of FIP FDISC reject frames received on the interface.</td>
</tr>
<tr>
<td>Number of FLOGO Accepts</td>
<td>Number of FIP FLOGO accept frames received on the interface.</td>
</tr>
<tr>
<td>Number of FLOGO Rejects</td>
<td>Number of FIP FLOGO reject frames received on the interface.</td>
</tr>
<tr>
<td>Number of CVLs</td>
<td>Number of FIP clear virtual link frames received on the interface.</td>
</tr>
<tr>
<td>Number of FCF Discovery Timeouts</td>
<td>Number of FCF discovery timeouts that occurred on the interface.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Number of VN Port Session Timeouts</td>
<td>Number of VN port session timeouts that occurred on the interface.</td>
</tr>
<tr>
<td>Number of Session failures due to Hardware Config</td>
<td>Number of session failures due to hardware configuration that occurred on the interface.</td>
</tr>
</tbody>
</table>

**Example**

DellEMC# show fip-snooping statistics interface vlan 100
Number of Vlan Requests                      :0
Number of Vlan Notifications                :0
Number of Multicast Discovery Solicits      :2
Number of Unicast Discovery Solicits        :0

Number of FDISC Rejects                  :0
Number of FLOGO Accepts                  :0
Number of FLOGO Rejects                  :0
Number of CVL                             :0
Number of FCF Discovery Timeouts          :0
Number of VN Port Session Timeouts        :0
Number of Session failures due to Hardware Config :0

**Example (Port Channel)**

DellEMC# show fip-snooping statistics interface port-channel 22
Number of Vlan Requests                   :0
Number of Vlan Notifications             :2
Number of Multicast Discovery Solicits    :0
Number of Unicast Discovery Solicits      :0
Number of FLOGI                           :0
Number of FDISC                           :0
Number of FLOGO                           :0
Number of Enode Keep Alive               :0
Number of VN Port Keep Alive             :0
Number of Multicast Discovery Advertisement :4451
show fip-snooping system

Display information on the status of FIP snooping on the switch (enabled or disabled), including the number of FCoE VLANs, FCFs, ENodes, and currently active sessions.

Syntax

show fip-snooping system

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Force10 Resilient Ring Protocol (FRRP)

FRRP is a proprietary protocol for that offers fast convergence in a Layer 2 network without having to run the spanning tree protocol (STP). The resilient ring protocol is an efficient protocol that transmits a high-speed token across a ring to verify the link status. All the intelligence is contained in the master node with practically no intelligence required of the transit mode.

Important Points to Remember

- FRRP is media- and speed-independent.
- FRRP is a Dell EMC Networking proprietary protocol that does not interoperate with any other vendor.
- Spanning Tree must be disabled on both primary and secondary interfaces before Resilient Ring protocol is enabled.
- A VLAN configured as the control VLAN for a ring cannot be configured as a control or member VLAN for any other ring.
- Member VLANs across multiple rings are not supported in Master nodes.
- If multiple rings share one or more member VLANs, they cannot share any links between them.
- Each ring can have only one Master node; all others are Transit nodes.

Topics:
- clear frpp
- debug frpp
- description
- disable
- interface
- member-vlan
- mode
- protocol frpp
- show frpp
- timer

clear frpp

Clear the FRRP statistics counters.

Syntax

```
clear frpp [ring-id]
```

Parameters

- **ring-id**  
  (Optional) Enter the ring identification number. The range is from 1 to 255.

Defaults

None
Command Modes
EXEC

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced.</td>
</tr>
</tbody>
</table>

Usage Information
Executing this command without the optional ring-id command clears the statistics counters on all the available rings. Dell EMC Networking OS requires a command line confirmation before the command executes. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

Example
DellEMC# clear frrp
Clear frrp statistics counter on all ring [confirm] yes
DellEMC#clear frrp 4
Clear frrp statistics counter for ring 4 [confirm] yes
DellEMC#

Related Commands
- show frrp — display the Resilient Ring Protocol configuration.
**debug frrp**

Clear the FRRP statistics counters.

**Syntax**

```plaintext
debug frrp {event | packet | detail} [ring-id] [count number]
```

To disable debugging, use the `no debug frrp {event | packet | detail} {ring-id} [countnumber]` command.

**Parameters**

- `event`  
  Enter the keyword `event` to display debug information related to ring protocol transitions.

- `packet`  
  Enter the keyword `packet` to display brief debug information related to control packets.

- `detail`  
  Enter the keyword `detail` to display detailed debug information related to the entire ring protocol packets.

- `ring-id`  
  (Optional) Enter the ring identification number. The range is from 1 to 255.

- `count number`  
  Enter the keyword `count` then the number of debug outputs. The range is from 1 to 65534.

**Defaults**

Disabled.

**Command Modes**

- **CONFIGURATION (conf-frrp)**

9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000–ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.2.1.0 Introduced on the C-Series.
7.4.1.0 Introduced.

interface

Configure the primary, secondary, and control-vlan interfaces.

Syntax
interface {primary interface secondary interface control-vlan vlan-id}
To return to the default, use the `no interface {primary interface secondary interface control-vlan vlan-id}` command.

**Parameters**

- **primary interface**
  Enter the keyword `primary` to configure the primary interface then one of the following interfaces and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.

- **secondary interface**
  Enter the keyword `secondary` to configure the secondary interface then one of the following interfaces and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.

- **control-vlan vlan-id**
  Enter the keyword `control-vlan` then the VLAN ID. The range is from 1 to 4094.

**Defaults**

None

**Command Modes**

</tbody>
</table>
This command causes the Ring Manager to take ownership of the two ports after IFM validates the configuration. Ownership is relinquished for a port only when the interface does not play a part in any control VLAN, that is, the interface does not belong to any ring.

**Related Commands**
- `show frrp` — display the Resilient Ring Protocol configuration information.

### member-vlan

Specify the member VLAN identification numbers.

**Syntax**

```
member-vlan {vlan-range}
```

To return to the default, use the `no member-vlan [vlan-range]` command.

**Parameters**

- `vlan-range`
  
  Enter the member VLANs using VLAN IDs (separated by commas), a range of VLAN IDs (separated by a hyphen), a single VLAN ID, or a combination. For example: VLAN IDs (comma-separated): 3, 4, 6. Range (hyphen-separated): 5-10. Combination: 3, 4, 5-10, 8.

**Defaults**

None

mode

Set the Master or Transit mode of the ring.

Syntax

mode {master | transit}

To reset the mode, use the no mode {master | transit} command.

Parameters

- **master**
  - Enter the keyword master to set the Ring node to Master mode.

- **transit**
  - Enter the keyword transit to set the Ring node to Transit mode.

Defaults

**Mode None**

**Usage Information**

This command places you into the resilient ring protocol. After executing this command, the command line prompt changes to `conf-frrp`. 
**show frrp**

Display the resilient ring protocol configuration.

**Syntax**

```
show frrp [ring-id [summary]] | [summary]
```

**Parameters**

- `ring-id` Enter the ring identification number. The range is from 1 to 255
- `summary` (OPTIONAL) Enter the keyword `summary` to view just a summarized version of the Ring configuration.

**Defaults**

None

**Command Modes**

EXEC

**Command History**

**Usage Information**

Executing this command without the optional `ring-id` command clears the statistics counters on all the available rings. Dell EMC Networking OS requires a command line confirmation before the command executes. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
The number of state change counters

Usage Information

Executing this command without the optional `ring-id` command clears the statistics counters on all the available rings. Dell EMC Networking OS requires a command line confirmation before the command is executed. This command clears the following counters:

- hello Rx and Tx counters
- Topology change Rx and Tx counters
- The number of state change counters

Example (Summary)

```
DellEMC# show frrp summary

```

Related Commands

- **protocol frrp** — enter the resilient ring protocol and designate a ring identification.
timer

Set the hello interval or dead interval for the Ring control packets.

Syntax

timer \{hello-interval milliseconds\} | \{dead-interval milliseconds\}

To remove the timer, use the no timer \{hello-interval milliseconds\} | \{dead-interval milliseconds\} command.

Parameters

- **hello-interval milliseconds**
  - Enter the keyword hello-interval then the time, in milliseconds, to set the hello interval of the control packets. The milliseconds must be entered in increments of 50 millisecond; for example, 50, 100, 150, and so on. If an invalid value is entered, an error message is generated. The range is from 50 to 2000 ms. Default: 500 ms.

- **dead-interval milliseconds**
  - Enter the keyword dead-interval then the time, in milliseconds, to set the dead interval of the control packets. The range is from 50 to 6000 ms. Default: 1500 ms.

**NOTE:** The configured dead interval must be at least three times the hello interval.

Defaults

- 500 ms for hello-interval milliseconds
- 1500 ms for dead-interval milliseconds

Command Modes

- CONFIGURATION (conf-frrp)

**Usage Information**

The `hello interval` command is the interval at which ring frames are generated from the primary interface of the master node. The `dead interval` command is the time that elapses before a time-out occurs.
GARP VLAN Registration (GVRP)

The Dell EMC Networking operating system supports the basic GVRP commands on the Dell EMC Networking OS.

The generic attribute registration protocol (GARP) mechanism allows the configuration of a GARP participant to propagate through a network quickly. A GARP participant registers or de-registers its attributes with other participants by making or withdrawing declarations of attributes. At the same time, based on received declarations or withdrawals, GARP handles attributes of other participants.

GVRP enables a device to propagate local VLAN registration information to other participant devices and dynamically update the VLAN registration information from other devices. The registration information updates local databases regarding active VLAN members and through which port the VLANs can be reached.

GVRP ensures that all participants on a bridged LAN maintain the same VLAN registration information. The VLAN registration information propagated by GVRP includes both manually configured local static entries and dynamic entries from other devices.

GVRP participants have the following components:

- The GVRP application
- GARP information propagation (GIP)
- GARP information declaration (GID)

Important Points to Remember

- GVRP is supported on Layer 2 ports only.
- All VLAN ports added by GVRP are tagged.
- GVRP is supported on untagged ports belonging to a default VLAN and tagged ports.
- GVRP cannot be enabled on untagged ports belonging to a non-default VLAN unless native VLAN is turned on.
- GVRP requires end stations with dynamic access NICs.
- Based on updates from GVRP-enabled devices, GVRP allows the system to dynamically create a port-based VLAN (unspecified) with a specific VLAN ID and a specific port.
- On a port-by-port basis, GVRP allows the system to learn about GVRP updates to an existing port-based VLAN with that VLAN ID and IEEE 802.1Q tagging.
- GVRP allows the system to send dynamic GVRP updates about your existing port-based VLAN.
- GVRP updates are not sent to any blocked spanning tree protocol (STP) ports. GVRP operates only on ports that are in the forwarding state.
- GVRP operates only on ports that are in the STP forwarding state. If you enable GVRP, a port that changes to the STP Forwarding state automatically begin to participate in GVRP. A port that changes to an STP state other than forwarding no longer participates in GVRP.
- VLANs created dynamically with GVRP exist only as long as a GVRP-enabled device is sending updates. If the devices no longer send updates, or GVRP is disabled, or the system is rebooted, all dynamic VLANs are removed.
- GVRP manages the active topology, not non-topological data such as VLAN protocols. If a local bridge must classify and analyze packets by VLAN protocols, manually configure protocol-based VLANs, and simply rely on GVRP for VLAN updates. But if the local bridge must know only how to reach a given VLAN, then GVRP provides all necessary information.
- The VLAN topologies that GVRP learns are treated differently from VLANs that are statically configured. The GVRP dynamic updates are not saved in NVRAM, while static updates are saved in NVRAM. When GVRP is disabled, the system deletes all VLAN interfaces that were learned through GVRP and leaves unchanged all VLANs that were manually configured.
clear gvrp statistics

Clear GVRP statistics on an interface.

Syntax

```
clear gvrp statistics interface interface
```

Parameters

- `interface interface` Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.

Defaults

None

Command Modes

EXEC

### Related Commands
- `gvrp enable` — enable GVRP on physical interfaces and LAGs.
- `protocol gvrp` — access GVRP protocol.

### garp timers

Set the intervals (in milliseconds) for sending GARP messages.

**Syntax**
```
garp timers {join | leave | leave-all}
```

To return to the previous setting, use the `no garp timers {join | leave | leave-all}` command.

**Parameters**
- **join**
  - Enter the keyword `join` then the number of milliseconds to configure the join time. The range is from 100 to 147483647 milliseconds. The default is **200 milliseconds**.
  - **NOTE:** Designate the milliseconds in multiples of 100.

- **leave**
  - Enter the keyword `leave` then the number of milliseconds to configure the leave time. The range is from 100 to 2147483647 milliseconds. The default is **600 milliseconds**.
  - **NOTE:** Designate the milliseconds in multiples of 100.

- **leave-all**
  - Enter the keywords `leave-all` then the number of milliseconds to configure the leave-all time. The range is from 100 to 2147483647 milliseconds. The default is 1000 milliseconds.
  - **NOTE:** Designate the milliseconds in multiples of 100.

**Defaults**
As above.

**Command Modes**
- **CONFIGURATION-GVRP**

</tbody>
</table>

Usage Information

- **Join Timer** — Join messages announce the willingness to register some attributes with other participants. For reliability, each GARP application entity sends a Join message twice and uses a join timer to set the sending interval.
- **Leave Timer** — Leave announces the willingness to de-register with other participants. Together with Join, Leave messages help GARP participants complete attribute reregistration and de-registration. The leave timer starts after receipt of a leave message sent for de-registering some attribute information. If a Join message is not received before the Leave time expires, the GARP application entity removes the attribute information as requested.
- **Leave All Timer** — The Leave All timer starts when a GARP application entity starts. When this timer expires, the entity sends a Leave-all message so that other entities can reregister their attribute information. Then the Leave-all time begins again.

Related Commands

- `show garp timers` — display the current GARP times.

**gvrp enable**

Enable GVRP on physical interfaces and LAGs.

**Syntax**

```
gvrp enable
```

To disable GVRP on the interface, use the `no gvrp enable` command.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION-INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Related Commands

- disable — globally disable GVRP.

**gvrp registration**

Configure the GVRP register type.

Syntax

```
gvrp registration {fixed | normal | forbidden}
```

To return to the default, use the `gvrp register normal` command.

Parameters

- `fixed` Enter the keyword `fixed` then the VLAN range in a comma-separated VLAN ID set.
- `normal` Enter the keyword `normal` then the VLAN range in a comma-separated VLAN ID set. This setting is the default.
- `forbidden` Enter the keyword `forbidden` then the VLAN range in a comma-separated VLAN ID set.

Defaults

- `normal`

Command Modes

</tbody>
</table>

**Usage Information**

Fixed registration prevents an interface, configured using the command line, to belong to a VLAN (static configuration) from being unconfigured when it receives a Leave message. Therefore, Registration mode on that interface is fixed.

Normal registration is the default registration. The port’s membership in the VLAN depends on GVRP. The interface becomes a member of a VLAN after learning about the VLAN through GVRP. If the VLAN is removed from the port that sends GVRP advertisements to this device, the port stops being a member of the VLAN.

To advertise or learn about VLANs through GVRP, use the `forbidden` command when you do not want the interface.

**Related Commands**

- `show gvrp` — display the GVRP configuration including the registration.

**protocol gvrp**

Access GVRP protocol — (config-gvrp)#.

**Syntax**

```
protocol gvrp
```

**Defaults**

Disabled.

</tbody>
</table>
**show garp timers**

Display the GARP configuration.

**Syntax**

```
show garp [brief | interface]
```

**Parameters**

- **brief** (OPTIONAL) Enter the keyword brief to display a brief summary of the GVRP configuration.
- **interface** (OPTIONAL) Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.

**Defaults**

None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<td>Introduced on the Z9000.</td>
</tr>
<tr>
<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>7.6.1.0</td>
<td>Introduced on C-Series, E-Series, and S-Series</td>
</tr>
</tbody>
</table>

**Usage Information**

If no ports are GVRP participants, the message output changes from GVRP Participants running on <port_list> to GVRP Participants running on no ports.

**Example**

```markdown
dellEMC# show gvrp brief
GVRP Feature is currently enabled.
Port | GVRP Status | Edge-Port
-----|-------------|-----------
Te 3/1| Disabled    | No        
Te 3/2| Enabled     | No        
Te 3/3| Disabled    | No        
Te 3/4| Disabled    | No        
Te 3/5| Disabled    | No        
Te 3/6| Disabled    | No        
Te 3/7| Disabled    | No        
Te 3/8| Disabled    | No        
```

**Related Commands**

- `show gvrp statistics` — display the GVRP statistics.

---

**show gvrp statistics**

Display the GVRP configuration statistics.

**Syntax**

```
show gvrp statistics {interface interface | summary}
```

**Parameters**

- `interface interface` (OPTIONAL) Enter the keyword `interface` then one of the interface keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

`summary` Enter the keyword `summary` to display just a summary of the GVRP statistics.

**Defaults**

None

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>7.6.1.0</td>
<td>Introduced on C-Series, E-Series, and S-Series</td>
</tr>
</tbody>
</table>

**Usage Information**

Invalid messages/attributes skipped can occur in the following cases:

- The incoming GVRP PDU has an incorrect length.
- "End of PDU" was reached before the complete attribute could be parsed.
- The Attribute Type of the attribute that was being parsed was not the GVRP VID Attribute Type (0x01).
- The attribute that was being parsed had an invalid attribute length.
- The attribute that was being parsed had an invalid GARP event.
- The attribute that was being parsed had an invalid VLAN ID. The valid range is from 1 to 4095.

A failed registration can occur for the following reasons:

- Join requests were received on a port that was blocked from learning dynamic VLANs (GVRP Blocking state).
- An entry for a new GVRP VLAN could not be created in the GVRP database.

**Example**

```
DellEMC# show gvrp statistics int tengigabitethernet 1/1
Join Empty Received: 0
Join In Received: 0
Empty Received: 0
LeaveIn Received: 0
Leave Empty Received: 0
Leave All Received: 40
```
Join Empty Transmitted: 156
Join In Transmitted: 0
Empty Transmitted: 0
Leave In Transmitted: 0
Leave Empty Transmitted: 0
Leave All Transmitted: 41
Invalid Messages/Attributes skipped: 0
Failed Registrations: 0
DellEMC#
High Availability (HA) in the Dell EMC Networking OS is the configuration synchronization to minimize recovery time in the event of a route processor module (RPM) failure.

In general, a protocol is defined as “hitless” in the context of an RPM failure/failover and not failures of a line card, SFM, or power module. A protocol is defined as hitless if an RPM failover has no impact on the protocol.

You must specifically enable some protocols for HA. Some protocols are only hitless if related protocols are also enabled as hitless (for example, using the redundancy protocol command).

Topics:
- redundancy disable-auto-reboot
- redundancy force-failover
- redundancy primary
- redundancy protocol
- show redundancy

**redundancy disable-auto-reboot**

Prevent the system from auto-rebooting the failed module.

**Syntax**

redundancy disable-auto-reboot stack-unit [stack-unit ID| members] [rpm| card number | all]

To return to the default, use the no redundancy disable-auto-reboot stack-unit rpm command.

**Parameters**

- **rpm**
  Enter the keyword rpm to disable auto-reboot of the failed RPM.
- **stack-unit**
  Enter the keyword stack-unit then the stack-unit ID number.

**Default**

Disabled — the failed module is automatically rebooted.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
<tr>
<td>9.8(0.0P2)</td>
<td>Introduced on the S3048-ON.</td>
</tr>
</tbody>
</table>
### Usage Information
Enabling this command keeps the failed RPM in the failed state. If there are two RPMs in the system, enabling this command prevents the failed RPM from becoming a working Standby RPM. If there is only one RPM in the system, the failed RPM does not recover and affects the system.

### redundancy force-failover

Force the secondary stack unit to become the primary stack unit. You can also use this command to upgrade the software on one stack unit from the other when the other has been loaded with the upgraded software.

**Syntax**

```
redundancy force-failover stack-unit
```

**Parameters**

- `stack-unit` Enter the keyword `stack-unit` then the stack-unit ID number.

**Default**
Not configured.

**Command Modes**
EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>
To provide a hitless or warm upgrade, use this command. A hitless upgrade means that a software upgrade does not require a reboot of the line cards. A warm upgrade means that a software upgrade requires a reset of the line cards. A warm upgrade is possible for major releases and lower, while a hitless upgrade can only support patch releases.

**redundancy primary**

Set an RPM as the primary RPM.

**Syntax**

```
redundancy primary [rpm0 | rpm1]
```

To delete a configuration, use the `no redundancy primary` command.

**Parameters**

- **rpm0**
  - Enter the keyword `rpm0` to set the RPM in slot R0 as the primary RPM.

- **rpm1**
  - Enter the keyword `rpm1` to set the RPM in slot R1 as the primary RPM.

**Default**

The RPM in slot R0 is the Primary RPM.

**Command Modes**

</tbody>
</table>

**redundancy protocol**

Enable hitless protocols.

**Syntax**

```
redundancy protocol {lacp | xstp}
```
To disable a hitless protocol, use the `no redundancy protocol {lacp | xstp}` command.

**Parameters**
- `lacp`  
Enter the keyword `lacp` to make LACP hitless.
- `xstp`  
Enter the keyword `xstp` to invoke hitless STP (all STP modes — MSTP, PVST+, RSTP, and STP).

**Default**  
Disabled

DellEMC#
ICMP Message Types

This section lists and describes the possible ICMP message type resulting from a ping. The first three columns list the possible symbol or type/code. For example, you would receive a ! or 03 as an echo reply from your ping.

Internet Group Management Protocol (IGMP)

The IGMP commands are supported on the Dell EMC Networking OS.

Topics:
- IGMP Commands
- IGMP Snooping Commands

IGMP Commands

Dell EMC Networking OS supports IGMPv1/v2/v3 and is compliant with RFC-3376.

Important Points to Remember

- Dell EMC Networking OS supports protocol-independent multicast-sparse (PIM-SM) and protocol-independent source-specific multicast (PIM-SSM) include and exclude modes.
- IGMPv2 is the default version of IGMP on interfaces. You can configure IGMPv3 on interfaces. It is backward compatible with IGMPv2.
- The maximum number of interfaces supported 95.
- There is no hard limit on the maximum number of groups supported.
- IGMPv3 router interoperability with IGMPv2 and IGMPv1 routers on the same subnet is not supported.
- An administrative command (ip igmp version) is added to manually set the IGMP version.
- All commands previously used for IGMPv2 are compatible with IGMPv3.

**clear ip igmp groups**

Clear entries from the group cache table.

**Syntax**

```
clear ip igmp [vrf vrf-name] groups [group-address | interface]
```

**Parameters**

- **vrf vrf-name**
  - (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to configure this setting on that VRF.
  - **NOTE:** Applies to specific VRF if input is provided, else applies to default VRF.

- **group-address**
  - (OPTIONAL) Enter the IP multicast group address in dotted decimal format.

- **interface interface**
  - Enter the following keywords and the interface information:
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

### Command Modes

- EXEC

### Command History

E-Series legacy command

### debug ip igmp

Enable debugging of IGMP packets.

#### Syntax

debug ip igmp [vrf vrf-name] [group address | interface]

- To disable IGMP debugging, use the no debug ip igmp [vrf vrf-name] [group address | interface] command.
- To disable all debugging, use the undebug all command.
Parameters

vrf vrf-name

(OPTIONAL) Enter the keyword vrf followed by the name of the VRF to enable debugging of IGMP packets corresponding to that VRF.

NOTE: Applies to specific VRF if input is provided, else applies to Default VRF.

group-address

(OPTIONAL) Enter the IP multicast group address in dotted decimal format.

interface interface

Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.

Defaults

Disabled.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

9.10(0.0) Introduced on the S3148.

9.10(0.0) Introduced on the S6100–ON.

9.8(2.0) Introduced on the S3100 series.

9.8(1.0) Introduced on the Z9100–ON.

9.8(0.0P5) Introduced on the S4048-ON.

9.8(0.0P2) Introduced on the S3048-ON.

9.7(0.0) Added support for VRF. Introduced on the S6000-ON.

9.5(0.1) Introduced on the Z9500.

9.0.2.0 Introduced on the S6000.

8.3.19.0 Introduced on the S4820T.

8.3.11.1 Introduced on the Z9000.

8.3.7.0 Introduced on the S4810.

7.6.1.0 Introduced on the S-Series.

7.5.1.0 Introduced on the C-Series.

E-Series legacy command

Usage Information

IGMP commands accept only non-VLAN interfaces — specifying VLAN does not yield results. This command displays packets for IGMP and IGMP snooping.
### ip igmp access-group

To specify access control for packets, use this feature.

**Syntax**

```
ip igmp access-group access-list
```

To remove the feature, use the `no ip igmp access-group access-list` command.

**Parameters**

- **access-list**
  Enter the name of the extended ACL (16 characters maximum).

**Defaults**
Not configured

**Command Modes**

 INTERFACE (conf-if-slot/port)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the C-Series and S-Series.
7.6.1.0 | Introduced on E-Series.

**Usage Information**

The access list accepted is an extended ACL. To block IGMP reports from hosts, on a per-interface basis based on the group address and source address that you specify in the access list, use this feature.
ip igmp immediate-leave

Enable IGMP immediate leave.

Syntax

```
ip igmp immediate-leave [group-list prefix-list-name]
```

To disable ip igmp immediate leave, use the no ip igmp immediate-leave command.

Parameters

- `group-list prefix-list-name`:
  - Enter the keywords `group-list` then a string up to 16 characters long of the prefix-list-name.

Defaults

Not configured.

</tbody>
</table>

Usage Information

Querier normally sends some group-specific queries when a leave message is received for a group prior to deleting a group from the membership database. There may be situations when you require immediate deletion of a group from the membership database. This command provides a way to achieve the immediate deletion. In addition, this command provides a way to enable immediate-leave processing for specified groups.
ip igmp last-member-query-interval

Change the last member query interval, which is the Max Response Time inserted into Group-Specific Queries sent in response to Leave Group messages. This interval is also the interval between Group-Specific Query messages.

Syntax

```
ip igmp last-member-query-interval milliseconds
```

To return to the default value, use the `no ip igmp last-member-query-interval` command.

Parameters

- `milliseconds`: Enter the number of milliseconds as the interval. For IGMP version 2, the range is from 100 to 25599. For IGMP version 3, the range is from 100 to 65535. The default value is 1000 milliseconds.

Defaults

1000 milliseconds

ip igmp query-interval

Change the transmission frequency of IGMP general queries the Querier sends.

Syntax

ip igmp query-interval seconds
To return to the default values, use the no ip igmp query-interval command.

Parameters

seconds
Enter the number of seconds between queries sent out. The range is from 1 to 18000. The default is 60 seconds.

Defaults

60 seconds

**ip igmp query-max-resp-time**

Set the maximum query response time advertised in general queries.

**NOTE:** The IGMP query-max-resp-time value must be less than the IGMP query-interval value.

**Syntax**

```
ip igmp query-max-resp-time seconds
```

To return to the default values, use the `no ip igmp query-max-resp-time` command.

**Parameters**

- `seconds` Enter the number of seconds for the maximum response time. The range is from 1 to 25. The default is **10 seconds**.

**Defaults**

10 seconds

- 8.3.19.0 Introduced on the S4820T.
## ip igmp ssm-map

To translate (*,G) memberships to (S,G) memberships, use a statically configured list.

### Syntax

```
ip igmp [vrf vrf-name] ssm-map std-access-list source-address
```

Undo this configuration, that is, remove SSM map (S,G) states and replace them with (*,G) state, use the `ip igmp [vrf vrf-name] ssm-map std-access-list source-address` command.

### Parameters

- **vrf vrf-name**
  - (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.
  - **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- **std-access-list**
  - Specify the standard IP access list that contains the mapping rules for multicast groups.

- **source-address**
  - Specify the multicast source address to which the groups are mapped.

**show ip igmp groups**

View the IGMP groups.

**Syntax**

```
show ip igmp [vrf vrf-name] groups [group-address [detail] | detail | interface [group-address [detail]]]
```

**Parameters**

- **vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to configure this setting on that VRF.
- **group-address** (OPTIONAL) Enter the group address in dotted decimal format to view information on that group only.
- **interface** (OPTIONAL) Enter the interface type and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.
- **detail** (OPTIONAL) Enter the keyword detail to display the IGMPv3 source information.

**Command Modes**

- EXEC
- EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

E-Series legacy command.

### Usage Information

This command displays the IGMP database, including configured entries for either all groups on all interfaces, all groups on specific interfaces, or specific groups on specific interfaces.

The following describes the `show ip igmp groups` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Address</td>
<td>Lists the multicast address for the IGMP group.</td>
</tr>
<tr>
<td>Interface</td>
<td>Lists the interface type, slot and port number.</td>
</tr>
<tr>
<td>Mode</td>
<td>Displays the IGMP version used.</td>
</tr>
<tr>
<td>Uptime</td>
<td>Displays the amount of time the group has been operational.</td>
</tr>
<tr>
<td>Expires</td>
<td>Displays the amount of time until the entry expires.</td>
</tr>
<tr>
<td>Last Reporter</td>
<td>Displays the IP address of the last host to be a member of the IGMP group.</td>
</tr>
</tbody>
</table>

### Example

```
DellEMC# show ip igmp groups
Total Number of Groups: 5
IGMP Connected Group Membership
Group Address  Interface  Uptime       Expires
225.0.0.0      Vlan 100   00:00:05     00:02:04
225.0.0.1      Vlan 100   00:00:05     00:02:04
225.0.0.2      Vlan 100   00:00:05     00:02:04
225.0.0.3      Vlan 100   00:00:05     00:02:04
```
Example (VLT)

NOTE: The asterisk (*) after the port channel number (Po 2) highlighted in the following example indicates the port channel is VLT, that the local VLT port channel is down and the remote VLT port is up.

DellEMC# show ip igmp groups
Total Number of Groups: 5
IGMP Connected Group Membership
Group Address Interface Mode Uptime Expires Last Reporter
225.0.0.0  Vlan 100  IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.1  Vlan 100  IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.2  Vlan 100  IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.3  Vlan 100  IGMPv2 00:00:05 00:02:04 3.0.0.51
225.0.0.4  Vlan 100  IGMPv2 00:00:05 00:02:04 3.0.0.51

Example (Details)

DellEMC# show ip igmp group details
Interface                  Vlan 20
Group                         232.1.1.5
Uptime                      00:11:22
Expires                       Never
Router mode           INCLUDE
Last reporter            35.0.0.2
Group source list
Source address          Expires
65.0.0.1                         00:01:22
65.0.0.2                         00:01:22
65.0.0.3                         00:01:22
65.0.0.4                         00:01:22
65.0.0.5                         00:01:22

show ip igmp interface

View information on the interfaces participating in IGMP.

Syntax

```
show ip igmp [vrf vrf-name] interface [interface]
```

Parameters

- **vrf vrf-name**  
  (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to view IGMP interfaces associated with that VRF.

- **interface**  
  (OPTIONAL) Enter the interface type and the interface information:
  
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  
  - For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
  
  - For a port channel interface, enter the keywords port-channel then a number.
For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<td></td>
</tr>
</tbody>
</table>

**Usage Information**

IGMP commands accept only non-VLAN interfaces — specifying VLAN does not yield results.

The `show ip igmp interface` command does not display information corresponding to the loop-back interfaces.

**Example**

```
DellEMC# show ip igmp interface
TenGigabitEthernet 1/1 is down, line protocol is down
  Internet protocol processing disabled
TenGigabitEthernet 1/5 is down, line protocol is down
  Internet protocol processing disabled
TenGigabitEthernet 1/6 is down, line protocol is down
  Internet protocol processing disabled
TenGigabitEthernet 1/7 is up, line protocol is down
  Internet protocol processing disabled
Vlan 20
  Inbound IGMP access group is not set
  Internet address is 35.0.0.1/24
  IGMP is enabled on interface
  IGMP query interval is 60 seconds
  IGMP querier timeout is 125 seconds
  IGMP max query response time is 10 seconds
```
IGMP last member query response interval is 1000 ms
IGMP immediate-leave is enabled for all groups
IGMP activity: 0 joins
IGMP querying router is 35.0.0.1 (this system)
IGMP version is 2

Example (VRF)

DellEMC# show ip igmp vrf BLUE interface
TenGigabitEthernet 1/20
Inbound IGMP access group is not set
Internet address is 50.10.4.1/24
IGMP is up on the interface
IGMP query interval is 60 seconds
IGMP querier timeout is 0 seconds
IGMP max query response time is 10 seconds
IGMP last member query response interval is 1000 ms
IGMP immediate-leave is disabled
IGMP activity: 0 joins
IGMP querying router is 50.10.4.1 (this system)
IGMP version is 3
Vlan 4007
Inbound IGMP access group is not set
Internet address is 50.30.124.4/24
IGMP is up on the interface
IGMP query interval is 60 seconds
IGMP querier timeout is 83 seconds
IGMP max query response time is 10 seconds
IGMP last member query response interval is 1000 ms
IGMP immediate-leave is disabled
IGMP activity: 0 joins
IGMP querying router is 50.30.124.1
IGMP version is 3
DellEMC#

show ip igmp ssm-map

Display is a list of groups that are currently in the IGMP group table and contain SSM mapped sources.

Syntax

```
show ip igmp [vrf vrf-name] ssm-map [group]
```

Parameters

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

  **NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

- `group` (OPTIONAL) Enter the multicast group address in the form A.B.C.D to display the list of sources to which this group is mapped.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Version | Description
------- | -----------------------------------------------
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Added support for VRF. Introduced on the S6000-ON.
9.5(0.1) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
7.8.1.0 | Introduced on the C-Series and S-Series.
7.7.1.0 | Introduced on the E-Series.

Example

DellEMC# show ip igmp ssm-map
Interface                  Vlan 20
Group                      232.1.1.5
Uptime                      00:11:22
Expires                     Never
Router mode           INCLUDE
Last reporter            35.0.0.2
Group source list
Source address          Expires
65.0.0.1                         00:01:22
65.0.0.2                         00:01:22
65.0.0.3                         00:01:22
65.0.0.4                         00:01:22
65.0.0.5                         00:01:22

Related Commands

•  ip igmp ssm-map — use a statically configured list to translate (*,G) memberships to (S,G) memberships.

IGMP Snooping Commands

Dell EMC Networking OS supports IGMP Snooping version 2 and 3 on all Dell EMC Networking systems.

Important Points to Remember for IGMP Snooping

• Dell EMC Networking OS supports version 1, version 2, and version 3 hosts.
• Dell EMC Networking OS IGMP snooping implementation is based on IP multicast address (not based on Layer 2 multicast mac address) and the IGMP snooping entries are in Layer 3 flow table not in Layer 2 forwarding information base (FIB).
• Dell EMC Networking OS IGMP snooping implementation is based on draft-ietf-magma-snoop-10.
• Dell EMC Networking OS supports IGMP snooping on JUMBO-enabled cards.
IGMP snooping is not enabled by default on the switch.

A maximum of 1800 groups and 600 VLAN are supported.

IGMP snooping is not supported on a default VLAN interface.

IGMP snooping is not supported over VLAN-Stack-enabled VLAN interfaces (you must disable IGMP snooping on a VLAN interface before configuring VLAN-Stack-related commands).

IGMP snooping does not react to Layer 2 topology changes triggered by spanning tree protocol (STP).

IGMP snooping reacts to Layer 2 topology changes multiple spanning tree protocol (MSTP) triggers by sending a general query on the interface that comes in the FWD state.

Important Points to Remember for IGMP Querier

- The IGMP snooping Querier supports version 2.
- You must configure an IP address to the VLAN interface for IGMP snooping Querier to begin. The IGMP snooping Querier disables itself when a VLAN IP address is cleared, and then it restarts itself when an IP address is reassigned to the VLAN interface.
- When enabled, IGMP snooping Querier does not start if there is a statically configured multicast router interface in the VLAN.
- When enabled, IGMP snooping Querier starts after one query interval in case no IGMP general query (with IP SA lower than its VLAN IP address) is received on any of its VLAN members.
- When enabled, IGMP snooping Querier periodically sends general queries with an IP source address of the VLAN interface. If it receives a general query on any of its VLAN member, it checks the IP source address of the incoming frame.
  
  If the IP SA in the incoming IGMP general query frame is lower than the IP address of the VLAN interface, the switch disables its IGMP snooping Querier functionality.

  If the IP SA of the incoming IGMP general query is higher than the VLAN IP address, the switch continues to work as an IGMP snooping Querier.

clear ip igmp snooping groups

Clear snooping entries from the group cache table.

Syntax

clear ip igmp snooping groups [group-address interface | interface]

Parameters

- **group-address** (OPTIONAL) Enter the IP multicast group address in dotted decimal format.
- **interface** Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/ port information.
  - For a port channel interface, enter the keywords port-channel then a number.

Command Modes

EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
IGMP commands accept only non-VLAN interfaces — specifying VLAN does not yield results.

**debug ip igmp snooping**

Enable debugging of IGMP snooping packets on interfaces and groups.

**Syntax**

```
depug ip igmp snooping [group address | interface]
```

- To disable debugging of IGMP snooping, use the `no debug ip igmp snooping [group address | interface]` command.
- To disable all debugging, use the `undebug all` command.

**Parameters**

- **snooping** Enter the keyword snooping to enable debugging of IGMP snooping.
- **group-address** (OPTIONAL) Enter the IP multicast group address in dotted decimal format.
- **interface** Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.

**Defaults**

- Disabled.

**Command Modes**

- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version | Description
---|---
8.3.7.0 | Introduced on the S4810.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.

Usage Information
To enable IGMP snooping, enter this command. When you enable this command from CONFIGURATION mode, IGMP snooping enables on all VLAN interfaces (except the default VLAN).

**NOTE:** Execute the `no shutdown` command on the VLAN interface for IGMP Snooping to function.

**ip igmp snooping fast-leave**

Enable IGMP snooping fast-leave for this VLAN.

Syntax
```
ip igmp snooping fast-leave
```

To disable IGMP snooping fast leave, use the `no ip igmp snooping fast-leave` command.

Defaults
Not configured.

Command Modes
```
INTERFACE VLAN — (conf-if-vl-n)
```

</tr>
</tbody>
</table>
Queriers normally send some queries when a leave message is received prior to deleting a group from the membership database. There may be situations when you require a fast deletion of a group. When you enable IGMP fast leave processing, the switch removes an interface from the multicast group as soon as it detects an IGMP version 2 leave message on the interface.

**ip igmp snooping flood**

This command controls the flooding behavior of unregistered multicast data packets.

**Syntax**

```
ip igmp snooping flood
```

To undo this configuration, use the `no ip igmp snooping flood` command.

**Defaults**

Enabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<td>Introduced on the C-Seris and S-Seris.</td>
</tr>
<tr>
<td>7.7(1.0)</td>
<td>Introduced on the E-Seris.</td>
</tr>
</tbody>
</table>

**Usage Information**

On the C-Seris and S-Seris, unregistered multicast data traffic drops when you disable flooding; they do not forward the packets to multicast router ports. On the C-Seris and S-Seris, in order to disable Layer 2 multicast flooding, disable Layer 3 multicast (no ip multicast-routing).
**ip igmp snooping last-member-query-interval**

The last member query interval is the maximum response time inserted into Group-Specific queries sent in response to Group-Leave messages.

**Syntax**

```
ip igmp snooping last-member-query-interval milliseconds
```

To return to the default value, use the `no ip igmp snooping last-member-query-interval` command.

**Parameters**

- `milliseconds` Enter the interval in milliseconds. The range is from 100 to 65535. The default is 1000 milliseconds.

**Defaults**

1000 milliseconds

**Command Modes**

INTERFACE VLAN

**Command History**

E-Series legacy command
Usage Information
This last-member-query-interval is also the interval between successive Group-Specific Query messages. To change the last-member-query interval, use this command.

**ip igmp snooping mrouter**

Statically configure a VLAN member port as a multicast router interface.

**Syntax**
```
ip igmp snooping mrouter interface interface
```
To delete a specific multicast router interface, use the no igmp snooping mrouter interface interface command.

**Parameters**

- **interface**
  
Enter the following keywords and the interface information:
  
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number. The range is from 1 to 128.

**Defaults**
Not configured.

**Command Modes**
INTERFACE VLAN — (conf-if-vl-n)

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

The Dell EMC Networking OS provides the capability of statically configuring the interface to which a multicast router is attached. To configure a static connection to the multicast router, enter the `ip igmp snooping mrouter interface` command in the VLAN context. The interface to the router must be a part of the VLAN where you are entering the command.

**ip igmp snooping querier**

Enable IGMP querier processing for the VLAN interface.

**Syntax**

```
ip igmp snooping querier
```

To disable IGMP querier processing for the VLAN interface, use the `no ip igmp snooping querier` command.

**Defaults**

Not configured.

**Command Modes**

INTERFACE VLAN — (conf-if-vl-n)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**show ip igmp snooping groups**

Display snooping related information for all the IGMP groups, interface or one group of one interface.

**Syntax**

```
show ip igmp snooping groups [group-address [detail] | detail | interface [group-address [detail]]]
```

**Parameters**

- `snooping` (OPTIONAL) Enter the keyword `snooping` to display snooping related information.
- `group-address` (OPTIONAL) Enter the group address in dotted decimal format to view information on that group only.
- `interface` (OPTIONAL) Enter the interface type and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- `detail` (OPTIONAL) Enter the keyword `detail` to display the IGMPv3 source information.

**Command Modes**

- EXEC
- EXEC Privilege

</table>
Version    Description
9.10(0.0)  Introduced on the S3148.
9.10(0.0)  Introduced on the S6100-ON.
9.8(2.0)   Introduced on the S3100 series.
9.8(1.0)   Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0)   Introduced on the S4810, S4820T, S5000, S6000, Z9000, and Z9500.

Usage Information
This command displays the IGMP database, including configured entries for either all groups on all interfaces, all groups on specific interfaces, or specific groups on specific interfaces.

The following describes the `show ip igmp groups` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Address</td>
<td>Lists the multicast address for the IGMP group.</td>
</tr>
<tr>
<td>Interface</td>
<td>Lists the interface type, slot and port number.</td>
</tr>
<tr>
<td>Mode</td>
<td>Displays the IGMP version used.</td>
</tr>
<tr>
<td>Uptime</td>
<td>Displays the amount of time the group has been operational.</td>
</tr>
<tr>
<td>Expires</td>
<td>Displays the amount of time until the entry expires.</td>
</tr>
<tr>
<td>Last Reporter</td>
<td>Displays the IP address of the last host to be a member of the IGMP group.</td>
</tr>
<tr>
<td>Member Ports</td>
<td>Indicates the port channel. If the port channel is VLT, an asterisk (*) after the port channel number indicates the port channel is locally down and that a remote VLT port is up.</td>
</tr>
</tbody>
</table>

Example
```
DellEMC# show ip igmp snooping groups
Total Number of Groups: 1
IGMP Connected Group Membership
Group Address     Interface     Mode          Uptime    Expires   Last Reporter
225.1.1.1          Vlan 10       IGMPv2-Compat  00:00:07  00:02:09  1.1.1.2
Member Ports: Te 1/17
DellEMC#
```

**show ip igmp snooping mrouter**

Display multicast router interfaces.

**Syntax**
```
show ip igmp snooping mrouter [vlan number]
```

**Parameters**
- `vlan number` Enter the keyword `vlan` then the vlan number. The range is from 1 to 4094.

**Command Modes**
- EXEC
EXEC Privilege

Command History

</tr>
<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>E-Series legacy command.</td>
<td></td>
</tr>
</tbody>
</table>

Usage Information
If the port channel is a VLT port channel, an asterisk (*) after the port channel number (Po 100*) indicates the port channel is locally down and that a remote VLT port is up.

Example

```bash
DellEMC# show ip igmp snooping mrouter
Interface Router Ports
Vlan 2 Te 1/3, Po 1
Vlan 2, Po 1
DellEMC#
```

Related Commands

- `ip igmp snooping mrouter` — configure a static connection to the multicast router.
- `show ip igmp groups` — view groups.
Interfaces

To configure egress, port channel, time domain, and UDP, use these interface commands.

Topics:
- Basic Interface Commands
- Egress Interface Selection (EIS) Commands
- Port Channel Commands
- Time Domain Reflectometer (TDR) Commands
- UDP Broadcast Commands
- ip http source-interface

Basic Interface Commands

The following commands are for Physical, Loopback, and Null interfaces.

clear counters

Clear the counters displayed in the show interfaces commands for all virtual router redundancy protocol (VRRP) groups, virtual local area networks (VLANs), and physical interfaces, or selected ones.

Syntax

`clear counters [interface | vrrp {vr-id | ipv6 vr-id} | learning-limit | vlan vlan-id]`

Parameters

`interface` (OPTIONAL) Enter any of the following keywords and the interface information to clear counters from a specified interface:

- For IPv4 access-group counters, enter the keyword `ip`.
- For IPv6 access-group counters, enter the keyword `ipv6`.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For MAC access-group counters, enter the keyword `mac`.
- For a Port Channel interface, enter the keywords `port-channel` then a number.
- For the management interface, enter the keyword `ManagementEthernet` then slot/port information.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a tunnel interface, enter the keyword `tunnel`. The range is from 1 to 16383.
NOTE: This command also enables you to clear the port configurations corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

- For non-ON platforms, you can specify multiple ports as slot/port-range. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
- For ON platforms, you can specify multiple ports as slot/port/[subport] - slot/port/[subport]. For example, if you want to clear the port configurations corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

```
vrrp [ipv6 (vr-id) | vr-id] (OPTIONAL) Enter the keyword vrrp to clear the counters of all VRRP groups. To clear the counters of VRRP groups on all IPv6 interfaces, enter ipv6. To clear the counters of a specified group, enter a VRID number from 1 to 255.
```

```
learning-limit (OPTIONAL) Enter the keywords learning-limit to clear unknown source address (SA) drop counters when MAC learning limit is configured on the interface.
```

```
vlan vlan-id Enter the keyword vlan followed by the interface VLAN number. The range is from 1 to 4094.
```

Defaults

Without an interface specified, the command clears all interface counters.

**clear counters**

Clear the dampening counters on all the interfaces or just the specified interface.

**Syntax**

```
clear dampening [interface]
```

**Parameters**

- `interface` (OPTIONAL) Enter any of the following keywords and the interface information to clear counters from a specified interface:
  - For a Port Channel interface, enter the keywords `port-channel` then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults**

Without an interface specified, the command clears all interface dampening counters.

- **7.6.1.0** Introduced on the S-Series.
- **7.5.1.0** Introduced on the C-Series.
- **7.4.1.0** Introduced on the E-Series.

###Example

```
DellEMC#clear dampening tengigabitethernet 1/10
Clear dampening counters on TeGi 1/10 [confirm] y
DellEMC#
```

###Related Commands

- `show interfaces dampening` — display interface dampening information.
- `dampening` — configure dampening on an interface.

###dampening

Configure dampening on an interface.

**Syntax**

```
dampening [[[half-life] [reuse-threshold]] [suppress-threshold]] [max-suppress-time]]
```

**Parameters**

- **half-life** Enter the number of seconds after which the penalty is decreased. The penalty decreases half after the half-life period expires. The range is from 1 to 30 seconds. The default is 5 seconds.
- **reuse-threshold** Enter a number as the reuse threshold, the penalty value below which the interface state is changed to “up”. The range is from 1 to 20000. The default is 750.
- **suppress-threshold** Enter a number as the suppress threshold, the penalty value above which the interface state is changed to “error disabled”. The range is from 1 to 20000. The default is 2500.
- **max-suppress-time** Enter the maximum number for which a route can be suppressed. The default is four times the half-life value. The range is from 1 to 86400. The default is 20 seconds.

**Defaults**

Disabled.

**Command Modes**

- INTERFACE (conf-if-)

</table>

Usage Information

With each flap, Dell EMC Networking OS penalizes the interface by assigning a penalty (1024) that decays exponentially depending on the configured half-life. After the accumulated penalty exceeds the suppress threshold value, the interface moves to the Error-Disabled state. This interface state is deemed as “down” by all static/dynamic Layer 2 and Layer 3 protocols. The penalty is exponentially decayed based on the half-life timer. After the penalty decays below the reuse threshold, the interface enables. The configured parameters are as follows:

- suppress-threshold should be greater than reuse-threshold
- max-suppress-time should be at least 4 times half-life

**NOTE:** You cannot apply dampening on an interface that is monitoring traffic for other interfaces.

Example

```
DellEMC(conf-if-te-1/10)# dampening 20 800 4500 120
DellEMC(conf-if-te-1/10)#
```

Related Commands

- `clear dampening` — clear the dampening counters on all the interfaces or just the specified interface.
- `show interfaces dampening` — display interface dampening information.
default interface

Reset a physical interface to its factory default settings.

Syntax

```
default interface interface-type slot/port[/subport] - range
```

Parameters

- **interface-type slot/port[/subport]**
  - Enter the interface type and slot/port [/subport] information:
    - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
    - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

- **range**
  - For non-ON platforms, you can specify multiple ports as slot/port-range. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
  - For ON platforms, you can specify multiple ports as `slot/port[/subport] - slot/port[/subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

Defaults

None

</tr>
</tbody>
</table>

Usage Information

Use the `default interface` command to set a Gigabit Ethernet, 10-Gigabit Ethernet, or 40-Gigabit Ethernet interface to its factory-default state. By default, a physical interface is disabled (shutdown) with no assigned IP address or switchport (no ip address). This command removes all software settings and all L3, VLAN, VXLAN, and port-channel configurations on a physical interface.

Example

```
DellEMC(conf-if-te-1/5)# show config
!
interface TenGigabitEthernet 1/5
   description testconfig
   no ip address
   portmode hybrid
   switchport
   rate-interval 8
   mac learning-limit 10 no-station-move
   no shutdown
DellEMC(conf-if-te-1/5)#
```
DellEMC(conf)# default interface tengigabitethernet 1/5
DellEMC(conf-if-te-1/5)# show config
!
interface TenGigabitEthernet 1/5
  no ip address
  shutdown

Related Commands
- **show running-config** — display the current configuration.

---

**description**

Assign a descriptive text string to the interface.

**Syntax**

```
description desc_text
```

To delete a description, use the `no description` command.

**Parameters**

- **desc_text**
  
  Enter a text string up to 240 characters long.

**Defaults**

None

Usage Information

Important Points to Remember:

- To use special characters as a part of the description string, you must enclose the whole string in double quotes.
- Spaces between characters are not preserved after entering this command unless you enclose the entire description in quotation marks ("desc_text").
- Entering a text string after the description command overwrites any previous text string that you previously configured as the description.
- The shutdown and description commands are the only commands that you can configure on an interface that is a member of a port-channel.
- Use the show interfaces description command to display descriptions configured for each interface.

duplex (10/100 Interfaces)

Configure duplex mode on the Management Interface interfaces where the speed is set to 10/100.

Syntax
duplex {half | full}

To return to the default setting, use the no duplex command.

Parameters

half Enter the keyword half to set the physical interface to transmit only in one direction.

full Enter the keyword full to set the physical interface to transmit in both directions.

Defaults

Not configured.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
Version Description
8.3.7.0 Introduced on the S4810.
8.1.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
6.4.1.0 Introduced

Usage Information
This command applies to any physical interface with speed set to 10/100.

**NOTE:** Starting with Dell EMC Networking OS version 7.8.1.0, when you use a copper SFP2 module with catalog number GP-SFP2-1T in the S25P model of the S-Series, you can manually set its speed with the speed command. When you set the speed to 10 Mbps or 100 Mbps, you can also execute the duplex command.

Related Commands
- negotiation auto — enable or disables auto-negotiation on an interface.

### disable stack-unit phy temp polling

Disable physical temperature polling for 10GBase-T optical ports.

**Syntax**

```
disable stack-unit unit-number port port-number phy temp polling
```

To enable physical temperature polling, use the enable stack-unit unit-number port port-number phy temp polling command.

**Parameters**

- **stack-unit unit-number**
  - Enter the keyword stack-unit then the unit-number for which you want to disable temperature polling. The range is from 1 to 6.

- **port port-number**
  - Enter the keyword port then the port-number for which you want to disable temperature polling. The range is from 1 to 48.

**Defaults**

Enabled

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**

- 9.14(0.0) Introduced on the S4048-ON and S5048F-ON.

**Usage Information**

This feature is applicable only for 10GBase-T optical ports.

**NOTE:** It is not supported for stacking ports.
**enable stack-unit phy temp polling**

Enable physical temperature polling for 10GBase-T optical ports.

**Syntax**

```plaintext
enable stack-unit unit-number port port-number phy temp polling
```

To disable physical temperature polling, use the `disable stack-unit unit-number port port-number phy temp polling` command.

**Parameters**

<table>

errdisable recovery cause

Enable automatic recovery of an interface from the Err-disabled state.

Syntax

```plaintext
errdisable recovery cause {bpduguard | fefd | maclearnlimit}
```

To disable the automatic recovery, use the `no errdisable recovery cause {bpduguard | fefd | maclearnlimit}` command.

Parameters

- **bpduguard**
  
Enter the keyword `bpduguard` to enable the timer to recover the interface from BPDU Guard error.

- **fefd**
  
Enter the keyword `fefd` to enable the timer to recover the interface from FEFD error.

- **maclearnlimit**
  
Enter the keyword `maclearnlimit` to enable the timer to recover the interface from MAC learning limit error.

Defaults

Disabled

</tr>
<tr>
<td>9.13(0.2P2)</td>
<td>Introduced on the S3100.</td>
</tr>
</tbody>
</table>

Usage Information

This command has to be configured before the interface moves to Err-disabled state. If not, the recovery action is not performed.

Related Commands

- `errdisable recovery interval` — Configure recovery timer interval for an interface.

errdisable recovery interval

Configure recovery time interval to move an interface from the Err-disabled state.

Syntax

```plaintext
errdisable recovery interval seconds
```

To remove the configured recovery time interval, use the `no errdisable recovery interval seconds` command.

Parameters

- **interval seconds**
  
Enter the keyword `interval` and the number of seconds to recover the interface from Err-disabled state. The range is from 30 to 86,400 seconds. The default is 300 seconds.
Defaults

- 300 seconds.

Command Modes

- CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>

<tr>
<td>9.14(0.0)</td>
<td>Introduced on the platforms S4048-ON, S6100-ON, Z9100-ON, S4048T-ON, S3048-ON, S6000, S6010-ON, S5048F-ON, FN-IOM, and MXL.</td>
</tr>
<tr>
<td>9.13(0.2P2)</td>
<td>Introduced on the S3100.</td>
</tr>
</tbody>
</table>

Usage Information

Whenever the Err-disable recovery timer is reconfigured, it will get effective only after the current timer expires. Following message is displayed after each Err-disable recovery timer configuration:

```
DellEMC(conf)# errdisable recovery interval 30
New timer interval will be effective from the next timer instance only.
```

Related Commands

- errdisable recovery cause — Enable automatic recovery of an interface from the error disabled state.

flowcontrol

Control how the system responds to and generates 802.3x pause flow control frames.

Syntax

```
flowcontrol {rx {off | on} tx {off | on} [negotiate | pause-threshold value | resume-offset value] | [monitor session-ID]}
```

To return to the default, use the no form of this command.

Parameters

- **rx on**
  - Enter the keywords `rx on` to process the received flow control frames on this port.
  - **NOTE:** Flow-control packets are mirrored only when flow-control `tx` is enabled on an interface.

- **rx off**
  - Enter the keywords `rx off` to ignore the received flow control frames on this port.

- **tx on**
  - Enter the keywords `tx on` to send control frames from this port to the connected device when a higher rate of traffic is received.

- **tx off**
  - Enter the keywords `tx off` so that flow control frames are not sent from this port to the connected device when a higher rate of traffic is received.

- **pause-threshold**
  - Enter the buffer threshold limit for generating PAUSE frames.

- **resume-offset**
  - Enter the offset value for generating PAUSE frames to resume traffic.

- **negotiate**
  - (Optional) Enter the keyword `negotiate` to enable the pause-negotiation with the egress port of the peer device. If the `negotiate` command is not used, pause-negotiation is disabled. 40-gigabit Ethernet interfaces do not support pause-negotiation.

- **monitor**
  - Enter the keyword `monitor` then the session-ID to enable mirror flow control frames on the interface. The range is from 0 to 65535.

Defaults

- `rx on tx off` 

Command Modes

- INTERFACE
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

### Usage Information

The globally assigned 48-bit multicast address 01-80-C2-00-00-01 is used to send and receive pause frames. To allow full-duplex flow control, stations implementing the pause operation instruct the MAC to enable the reception of frames with a destination address equal to this multicast address.

When a port receives traffic at a higher rate than it can process, the frames are stored in the port buffer. As a result, buffer usage increases. When the buffer usage reaches the value specified in the “pause-threshold” argument, the port sends PAUSE frame to the connected link partner to stop sending the traffic. Eventually this reduces the buffer usage. When the buffer usage drops by the value specified in the “resume-threshold”, the port again sends a PAUSE frame with 0 as wait-time. This results in resume of the paused traffic flow.

**Important Points to Remember**

- Do not enable tx pause when buffer carving is enabled. For information and assistance, consult Dell EMC Networking TAC.
- The only configuration applicable to half duplex ports is rx off tx off. The following error is returned:
  Can’t configure flowcontrol when half duplex is configure, config ignored
- Half duplex cannot be configured when the flow control configuration is on (default is rx on tx on). The following error is returned:
  Can’t configure half duplex when flowcontrol is on, config ignored

**NOTE:** The flow control must be off (rx off tx off) before configuring the half duplex.
• Speeds less than one Gig cannot be configured when the asymmetric flow control configuration is on. The following error is returned:
  
  Can’t configure speed <1G when Asymmetric flowcontrol is on, config ignored.
• Dell EMC Networking OS only supports rx on tx on and rx off tx off for speeds less than one Gig (Symmetric).

**NOTE:** If you use the disable rx flow control command, Dell EMC Networking recommends rebooting the system.

**NOTE:** Dell EMC Networking OS does not support mirroring of tx pause frames.

### Example

```
DellEMC(conf-if-Te-1/1)# show config
!
interface TenGigabitEthernet 1/1
  no ip address
  switchport
  no negotiation auto
  flowcontrol rx off tx on
  no shutdown
  ...
```

### Example (Monitor Session)

```
DellEMC(conf-if-te-1/5)# show config
!
interface TenGigabitEthernet 1/5
  no ip address
  shutdown
  flowcontrol monitor 5
```

### Example (Values)

This Example shows how Dell EMC Networking OS negotiates the flow control values between two Dell EMC Networking chassis connected back-to-back using 1G copper ports.

782 Interfaces
interface

Configure a physical or virtual interface on the switch.

Syntax

```
interface interface
```

Parameters

```
interface
```

Enter one of the following keywords and the interface information:

- For a null interface, enter the keyword `null` then the slot/port information. The Null interface number is 0.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Tunnel interface, enter the keyword `tunnel` then the tunnel ID. The range is from 1 to 16383.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a port channel interface, enter the keywords `port-channel` then a number.

Defaults

Not configured.

</tbody>
</table>
Version Description
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.5.1.0 Added support for 4-port 40G line cards on the E-Series.
8.1.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
6.4.1.0 Introduced

Usage Information
You cannot delete a physical interface.

By default, physical interfaces are disabled (`shutdown`) and are not assigned to an IP address or switchport. To place an interface in Layer 2 mode, ensure that the interface's configuration does not contain an IP address and enter the `switchport` command.

You can create up to 64 tunnel interfaces. The tunnel is added as a logical interface with no default configuration. To delete a tunnel interface, use the `no interface tunnel tunnel-id` command.

The tunnel interface operates as an ECMP (equal cost multi path) only when the next hop to the tunnel destination is over a physical interface. If you select any other interface as the next hop to the tunnel destination, the tunnel interface does not operate as an ECMP.

Example
```
DellEMC(conf)# int tengigabitethernet 1/10
DellEMC(conf-if-te-1/10)# exit
DellEMC(conf)#
```

Related Commands
- `interface loopback` — configure a Loopback interface.
- `interface null` — configure a Null interface.
- `interface port-channel` — configure a port channel.
- `interface vlan` — configure a VLAN.

interface group

Create or delete group of VLANs with a single command. You can also use this command to apply a set of configurations on a group of interfaces.

Syntax
```
interface group {interface | vlan vlanid {- vlanid} }
```

To delete a range of VLANs, use the following command:
```
no interface group vlan vlanid {- vlanid}
```
Enter the keywords `interface group` and one of the interfaces — slot/port or VLAN number. Select the range of interfaces for bulk configuration. Spaces are not required between the commas. Comma-separated ranges can include VLANs and physical interfaces.

Enter the member VLANs using VLAN IDs (separated by commas), a range of VLAN IDs (separated by a hyphen), a single VLAN ID, or a combination. For example: VLAN IDs (comma-separated): 3, 4, 6. Range (hyphen-separated): 5-10.

Slot/Port information need not contain a space before and after the dash. For example, both of the following commands are valid:

```
interface group
tengigabitethernet 1/1 - 1/5; interface group
tengigabitethernet 1/1-1/5.
```

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

</tr>
</tbody>
</table>

**Usage Information**

The `interface group` command will create all the non-existent VLANs specified in the range. On successful command execution, the CLI switches to the interface group context.

The configuration commands inside the group context will be similar to that of the existing range command.

Note: For release 9.4(0.0), the group command is supported only for VLANs and physical interfaces.

**Example**

```
DellEMC(conf)# interface group ?
fortyGigE   FortyGigabit Ethernet interface
gigabitethernet   GigabitEthernet interface IEEE 802.3z
tengigabitethernet   TenGigabit Ethernet interface
vlan   VLAN keyword

DellEMC(conf)# interface group vlan 1 - 2 , tengigabitethernet 1/10
DellEMC(conf-if-group-vl-1-2,te-1/10)# no shutdown
DellEMC(conf-if-group-vl-1-2,te-1/10)# end
```

**Related Commands**

- `interface range` — configure a range of interfaces.
interface loopback

Configure a Loopback interface.

Syntax

```
interface loopback number
```

To remove a loopback interface, use the `no interface loopback number` command.

Parameters

`number`  
Enter a number as the interface number. The range is from 0 to 16383.

Defaults  
Not configured.

Related Commands

- `interface` — configure a physical interface.
- `interface null` — configure a Null interface.
interface port-channel — configure a port channel.
interface vlan — configure a VLAN.

interface managementEthernet

Configure the Management port on the system (either the Primary or Standby RPM).

Syntax

```
interface managementEthernet slot/port
```  

Parameters

- `slot/port`  

Defaults

Not configured.

Command Modes

- CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Usage Information

- You cannot delete a Management port.

The Management port is enabled by default (no shutdown). To assign an IP address to the Management port, use the ip address command.

Example

```
DellEMC(conf)# interface managementethernet 1/1
DellEMC(conf-if-ma-1/1)#
```
interface null

Configure a Null interface on the switch.

Syntax  

interface null number

Parameters

number  
Enter zero (0) as the Null interface number.

Defaults  

Not configured; number = 0

Command Modes  

CONFIGURATION

Command History  

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version     Description

9.10(0.1)     Introduced on the S6010-ON and S4048T-ON.
9.10(0.0)     Introduced on the S3148.
9.10(0.0)     Introduced on the S6100–ON.
9.8(2.0)      Introduced on the S3100 series.
9.8(1.0)      Introduced on the Z9100–ON.
9.8(0.0P5)    Introduced on the S4048-ON.
9.8(0.0P2)    Introduced on the S3048-ON.
9.7(0.0)      Introduced on the S6000-ON.
9.2(1.0)      Introduced on the Z9500.
9.0.2.0       Introduced on the S6000.
8.3.19.0      Introduced on the S4820T.
8.3.11.1      Introduced on the Z9000.
8.3.7.0       Introduced on the S4810.
8.1.1.0       Introduced on the E-Series.
7.6.1.0       Introduced on the S-Series.
7.5.1.0       Introduced on the C-Series.
6.4.1.0       Introduced

Usage Information

You cannot delete the Null interface. The only configuration command possible in a Null interface is ip unreachable.

Example

DellEMC(conf)# interface null 0
DellEMC(conf-if-nu-0)#
Related Commands

- interface — configure a physical interface.
- interface loopback — configure a Loopback interface.
- interface port-channel — configure a port channel.
- interface vlan — configure a VLAN.
- ip unreachables — enable generation of internet control message protocol (ICMP) unreachable messages.

interface range

This command permits configuration of a range of interfaces to which subsequent commands are applied (bulk configuration). Using the interface range command, you can enter identical commands for a range of interfaces.

Syntax

```
interface range interface {slot/port[subport] | port} — {slot/port[subport] | port}, interface {slot/port[/subport] | port} — {slot/port[/subport] | port}, ...
```

Parameters

- `interface {slot/port[subport] | port} — {slot/port[subport] | port}, interface {slot/port[/subport] | port} — {slot/port[/subport] | port},...` Enter interface range and one of the interfaces and then the interface information. Select the range of interfaces for bulk configuration. You can enter up to six comma-separated ranges. Spaces are not required between the commas. The ranges can include VLANs, port-channels, and physical interfaces.

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a Tunnel interface, enter the keyword `Tunnel` then a number from 1 to 16383.

Defaults

None

Command Modes

- CONFIGURATION
- CONFIGURATION TERMINAL BATCH

<tr>
<td>6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

When creating an interface range, interfaces appear in the order they are entered; they are not sorted. The command verifies that interfaces are present (physical) or configured (logical).

**Important Points to Remember:**

- Bulk configuration is created if at least one interface is valid.
- Non-existing interfaces are excluded from the bulk configuration with a warning message.
- The interface range prompt includes interface types with slot/port[/subport] information for valid interfaces. The prompt allows for a maximum of 32 characters. If the bulk configuration exceeds 32 characters, it is represented by an ellipsis ( ... ).
- When the interface range prompt has multiple port ranges, the smaller port range is excluded from the prompt.
- If overlapping port ranges are specified, the port range is extended to the smallest start port and the biggest end port.

**Example (If atleast one port is configured)**

DellEMC(conf)# interface range tengigabitethernet 1/1 - 1/11, fortyGigE 3/50, tengigabitethernet 3/10
% Warning: Non-existing ports (not configured) are ignored by interface-range

**Example (If no ports are configured within the specified interface range)**

DellEMC(conf)# interface range tengigabitethernet 1/1 - 1/11, fortyGigE 3/50, tengigabitethernet 3/10
% Error: No port is configured in interface range

**Example (Configuration Terminal Batch Mode)**

DellEMC(conf-b)#interface range te 1/1-4
DellEMC(conf-if-range-te-1/1-4)#

**Example (Multiple Ports)**

DellEMC(conf)# interface range tengigabitethernet 2/10 - 2/23, tengigabitethernet 2/12 - 2/17
DellEMC(conf-if-range-te-2/10-2/23)#
Example (Overlapping Ports)

DellEMC(conf)# interface range tengigabitethernet 2/3 - 2/11,
tengigabitethernet 2/3 - 2/23
DellEMC(conf-if-range-te-2/3-2/23)#

Usage Information

Only VLAN and port-channel interfaces created using the `interface vlan` and `interface port-channel` commands can be used in the `interface range` command.

Use the `show running-config` command to display the VLAN and port-channel interfaces. VLAN or port-channel interfaces that are not displayed in the `show running-config` command cannot be used with the bulk configuration feature of the `interface range` command. You cannot create virtual interfaces (VLAN, Port-channel) using the `interface range` command.

**NOTE:** If a range has VLAN, physical and port-channel interfaces, only commands related to physical interfaces can be bulk configured. To configure commands specific to VLAN and port-channel only those respective interfaces should be configured in a particular range.

Example (Single Range)

This example shows a single range bulk configuration.

DellEMC(config)# interface range tengigabitethernet 5/3 - 5/23
DellEMC(config-if-range-te-5/3-5/23)# no shutdown
DellEMC(config-if-range-te-5/3-5/23)#

Example (Multiple Range)

This example shows how to use commas to add different interface types to a range of interfaces.

DellEMC(config-if)# interface range tengigabitethernet 5/1 - 5/23,
tengigabitethernet 1/1 - 1/2
DellEMC(config-if-range-te-1/1-1/2,te-5/1-5/23)# no shutdown
DellEMC(config-if-range-te-1/1-1/2,te-5/1-5/23)#

Example (Multiple Range)

This example shows how to use commas to add VLAN and port-channel interfaces to the range.

DellEMC(config-if)# interface range tengigabitethernet 5/1 - 1/23,
tengigabitethernet 1/1 - 1/2,
Vlan 2-100, Port 1-25
DellEMC(config-if-range-te-1/1-1/2,te-5/1-5/23,vl-2-100,po-1-25)# no shutdown
DellEMC(config-if-range)#

Example (Batch Mode Configuration)

Primary VLT

DellEMC(conf-b)#int range Tengigabitethernet 3/0 - 5
DellEMC(conf-if-range-te-3/0-5)#mtu 4500
DellEMC(conf-if-range-te-3/0-5)#exit
DellEMC(conf-b)#show conf
interface range tengigabitethernet 3/0 - 5
mtu 4500
DellEMC(conf-b)#commit
DellEMC(conf-b)#Dec 6 11:30:45 %RPM1-P:CP %CLIBATCH-6-
CLI_BATCH_CONFIG_IN_PROGRESS_TRAP: Batch configuration commit is in progress
Dec 6 11:30:45 %RPM1-P:CP %CLIBATCH-6-CLI_BATCH_CONFIG_COMPLETE_TRAP: Batch configuration commit is success

Secondary VLT

Dec 6 10:43:17 %RPM1-P:CP %CLIBATCH-6-CLI_BATCH_CONFIG_IN_PROGRESS_TRAP:
Batch configuration commit is in progress
Dec 6 10:43:18 %RPM1-P:CP %CLIBATCH-6-CLI_BATCH_CONFIG_COMPLETE_TRAP: Batch configuration commit is success

Related Commands

- `interface port-channel` — configure a port channel group.
• `interface vlan` — configure a VLAN interface.
• `show config (from INTERFACE RANGE mode)` — display the bulk configuration interfaces.
• `show range` — display the bulk configuration ranges.
• `interface range macro (define)` — define a macro for an interface-range.

## interface range macro (define)

Defines a macro for an interface range and then saves the macro in the running configuration.

**Syntax**

```plaintext
define interface range macro name interface , interface , ...```

**Parameters**

- `name` Enter up to 16 characters for the macro name.
- `interface, interface,...` Enter the keywords `interface range` and the interface information. Select the range of interfaces for bulk configuration. You can enter up to six comma-separated ranges. Spaces are not required between the commas. Comma-separated ranges can include VLANs, port-channels, and physical interfaces.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Tunnel interface, enter the keyword `tunnel` then the tunnel ID. The range is from 1 to 16383.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

Example (Single Range)

This example shows how to define an interface range macro named test. Execute the `show running-config` command to display the macro definition.

```
DellEMC(config)# define interface-range test tengigabitethernet 1/1 - 1/3, tengigabitethernet 5/1 - 5/22, tengigabitethernet 3/1 - 3/8
DellEMC# show running-config | grep define
define interface-range test tengigabitethernet 1/1 - 1/3, tengigabitethernet 5/1 - 5/22, tengigabitethernet 3/1 - 3/8
DellEMC(config)# interface range macro test
DellEMC(config-if-range-1/1-1/3,te-5/1-5/22,te-3/1-3/8)#
```

Related Commands

- `interface range` — configure a range of command (bulk configuration).
- `interface range macro name` — run an interface range macro.

### interface range macro name

Run the interface-range macro to automatically configure the pre-defined range of interfaces.

**Syntax**

```
interface range macro name
```

**Parameters**

- `name`  
  Enter the name of an existing macro.

**Defaults**

None

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100-ON.

9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
### Example (Single Range)

This example shows the macro named test that was defined earlier.

```
DellEMC(config)# interface range macro test
DellEMC(config-if-range-te-1/1-3,te-5/1-47,te-2/1-89)#
```

### Related Commands
- `interface range` — configure a range of command (bulk configuration).
- `interface range macro (define)` — define a macro for an interface range (bulk configuration).

### interface vlan

Configure a VLAN. You can configure up to 4094 VLANs.

**Syntax**

```
interface vlan vlan-id [of-instance[of-id]]
```

**Parameters**

- `vlan-id` : Enter a number as the VLAN Identifier. The range is from 1 to 4094.
- `of-instance[of-id]` : Enter the keyword `of-instance` then the OpenFlow instance ID to add the VLAN to the specified OpenFlow instance. The range is from 1 to 8.

**Defaults**

Not configured, except for the Default VLAN, which is configured as VLAN 1.

</tbody>
</table>

Usage Information

For more information about VLANs and the commands to configure them, see Virtual LAN (VLAN) Commands.

FTP, TFTP, and SNMP operations are not supported on a VLAN. MAC ACLs and IP ACLs are supported. For more information, see Access Control Lists (ACL).

The following features are not supported on VLANs associated with an OpenFlow instance:

- IPv4
- IPv6
- MTU

If OpenFlow VLANs are configured on the switch, spanning-tree protocols cannot be enabled simultaneously.

Example (Single Range)

```plaintext
DellEMC(conf)# int vlan 3
DellEMC(conf-if-vl-3)#
```

Related Commands

- `interface` — configure a physical interface.
- `interface loopback` — configure a loopback interface.
- `interface null` — configure a null interface.
- `interface port-channel` — configure a port channel group.
- `show vlan` — display the current VLAN configuration on the switch.
- `shutdown` — disable/enable the VLAN.
- `tagged` — add a Layer 2 interface to a VLAN as a tagged interface.
- `untagged` — add a Layer 2 interface to a VLAN as an untagged interface.

### intf-type cr4 autoneg

Set the interface type as CR4 with auto-negotiation enabled. To set the interface type as CR4 with autonegotiation disabled, use the no intf-type cr4 autoneg command.

**Syntax**

```
intf-type cr4 autoneg
```

**Defaults**

Not configured

</table>
| 8.3.16.1  | Introduced on the MXL 10/40GbE Switch IO Module.

Usage Information

You can configure the interface type as CR4 with auto-negotiation enabled. If a DAC cable link is down, you can resolve the issue by setting the interface type as CR4.

Auto-negotiation is disabled by default. If the CR4 optic fails to come up, use the autoneg option.

If a 40G CR4 interface does not come up, use the following commands:

- For ACU 40 G cables — use the no intf-type or intf-type cr4 command.
- For CU 40 G cables — use the intf-type cr4 autoneg command.

Related Commands

- Interfaces — configure a physical interface.
- interface loopback — configure a loopback interface.
- interface null — configure a null interface.
- interface port-channel — configure a port channel group.

keepalive

Send keepalive packets periodically to keep an interface alive when it is not transmitting data.

Syntax

Keepalive

To stop sending keepalive packets, use the no keepalive command.

Defaults

Enabled.

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
</tbody>
</table>

**Usage Information**

When you configure `keepalive`, the system sends a self-addressed packet out of the configured interface to verify that the far end of a WAN link is up. When you configure `no keepalive`, the system does not send keepalive packets and so the local end of a WAN link remains up even if the remote end is down.

### negotiation auto

Enable auto-negotiation on an interface.

**Syntax**

```
negotiation auto
```

To disable auto-negotiation, use the `no negotiation auto` command.

**Defaults**

Enabled.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

- **7.5.1.0** Introduced on the C-Series.
- **pre-6.2.1.0** Introduced on the E-Series.

### Usage Information

The `no negotiation auto` command is only available if you first manually set the speed of a port to **10Mbits** or **100Mbits**.

The `negotiation auto` command provides a `mode` option for configuring an individual port to forced-master/forced slave after you enable auto-negotiation.

**NOTE:** The `mode` option is not available on non-10/100/1000 Base-T systems.

If you do not use the `mode` option, the default setting is **slave**. If you do not configure forced-master or forced-slave on a port, the port negotiates to either a master or a slave state. Port status is one of the following:

- Forced-master
- Force-slave
- Master
- Slave
- Auto-neg Error — typically indicates that both ends of the node are configured with forced-master or forced-slave.

**CAUTION:** Ensure that one end of your node is configured as forced-master and one is configured as forced-slave. If both are configured the same (that is, forced-master or forced-slave), the `show interfaces` command flaps between an auto-neg-error and forced-master/slave states.

You can display master/slave settings with the `show interfaces` command.

You can use the `negotiation auto` command to turn autonegotiation on or off only on fiber interfaces operating at 1G speed.

If you use a 1 G SFP, disable autonegotiation on both peer ends. If you do not disable autonegotiation, the link does not come up.

**Example (Master/Slave)**

```bash
dellEMC(conf)# interface tengigabitethernet 1/1
dellEMC(conf-if)# neg auto
dellEMC(conf-if-autoneg)# ?
  end          Exit from configuration mode
  exit         Exit from autoneg configuration mode
  mode         Specify autoneg mode
  no           Negate a command or set its defaults
```
show autoneg configuration information
DellEMC(conf-if-autoneg)# mode ?
forced-master Force port to master mode
forced-slave Force port to slave mode
DellEMC(conf-if-autoneg)#

Example
DellEMC# show interfaces configured
TenGigabitEthernet 1/18 is up, line protocol is up
Hardware is DellEMCEth, address is 00:01:e8:05:f7:fc
  Current address is 00:01:e8:05:f7:fc
Interface index is 474791997
Internet address is 1.1.1.1/24
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 1000 Mbit, Mode full duplex, Master
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interfaces" counters 00:12:42
Queueing strategy: fifo
Input Statistics:
...

User Information
Both sides of the link must have auto-negotiation enabled or disabled for the link to come up.

The following details the possible speed and auto-negotiation combinations for a line between two 10/100/1000 Base-T Ethernet interfaces.

**Port 0**
- auto-negotiation enabled* speed 1000 or auto
- auto-negotiation enabled speed 100
- auto-negotiation disabled speed 100
- auto-negotiation disabled speed 100
- auto-negotiation enabled* speed 1000 or auto

**Port 1**
- auto-negotiation enabled* speed 1000 or auto
- auto-negotiation enabled speed 100
- auto-negotiation disabled speed 100
- auto-negotiation disabled speed 100
- auto-negotiation enabled speed 100
- auto-negotiation disabled speed 100

**Link Status Between Port 1 and Port 2**
- Up at 1000 Mb/s
- Up at 100 Mb/s
- Up at 100 Mb/s
- Down
- Down

* You cannot disable auto-negotiation when the speed is set to 1000 or auto.

**monitor interface**

Monitor counters on a single interface or all interfaces. The screen is refreshed every five seconds and the CLI prompt disappears.

**Syntax**

```
monitor interface [interface]
```
To disable monitoring and return to the CLI prompt, press the q key.

**Parameters**

```markdown
interface
```

(Optional) Enter the following keywords and the interface information:

- For the Management interface on the stack-unit, enter the keyword `managementEthernet` then the slot/port information.
- For a port channel interface, enter the keyword `port-channel` and then a number.
- For a Tunnel interface, enter the keyword `tunnel` then the slot/port. The range is from 1 to 16383.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Usage Information**

In the Example, the delta column displays changes since the last screen refresh.

The following are the `monitor` command menu options.
Key          Description

systest-3  Displays the host name assigned to the system.

monitor time Displays the amount of time since the monitor interface command was entered.
time        Displays the amount of time the chassis is up (since last reboot).
m          Change the view from a single interface to all interfaces on the line card or visa-versa.
c          Refresh the view.
b          Change the counters displayed from Packets on the interface to Bytes.
r          Change the [delta] column from change in the number of packets/bytes in the last interval to rate per second.
l          Change the view to the next interface on the line card, or if in line card mode, the next line card in the chassis.
a          Change the view to the previous interface on the line card, or if in line card mode, the previous line card in the chassis.
T          Increase the screen refresh rate.
t          Decrease the screen refresh rate.
q          Return to the CLI prompt.

Example (Single Interface)
systest-3 Monitor time: 00:00:06 Refresh Intvl.: 2s Time: 03:26:26
Interface: te 1/3, Enabled, Link is Up, Linespeed is 10000 Mbit

Traffic statistics: Current Rate Delta
| Input bytes: 9069828 43 Bps 86 |
| Output bytes: 606915800 43 Bps 86 |
| Input packets: 54001 0 pps 1 |
| Output packets: 9401589 0 pps 1 |

### mtu

Set the link maximum transmission unit (MTU) (frame size) for an Ethernet interface.

**Syntax**

```
mtu value
```

To return to the default MTU value, use the `no mtu` command.

**Parameters**

- `value`  
  Enter a maximum frame size in bytes. The range is from 592 to 9216.

**Defaults**

1554

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
---|---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Reduced the maximum size of the maximum transmission unit (MTU) to 9216 bytes on S6000, S6000-ON, S4048-ON, Z9500, and C9010. Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
**Version** | **Description**
--- | ---
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.1.1.0 | Introduced on the E-Series.
7.5.1.0 | Introduced on the C-Series.
pre-Version 6.2.1.0 | Introduced on the E-Series.

**Usage Information**

If the packet includes a Layer 2 header, the difference between the link MTU and IP MTU (ip mtu command) must be enough bytes to include the Layer 2 header.

When you enter the no mtu command, Dell EMC Networking OS reduces the IP MTU value to 1536 bytes.

Link MTU and IP MTU considerations for port channels and VLANs are as follows.

**port channels:**
- All members must have the same link MTU value and the same IP MTU value.
- The port channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU 2000, the port channel’s MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

**VLANs:**
- All members of a VLAN must have same IP MTU value.
- Members can have different Link MTU values. Tagged members must have a link MTU 4 bytes higher than untagged members to account for the packet tag.
- The VLAN link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the VLAN members. For example, the VLAN contains tagged members with Link MTU of 1522 and IP MTU of 1500 and untagged members with Link MTU of 1518 and IP MTU of 1500. The VLAN’s Link MTU cannot be higher than 1518 bytes and its IP MTU cannot be higher than 1500 bytes.

The following shows the difference between Link MTU and IP MTU.

<table>
<thead>
<tr>
<th>Layer 2 Overhead</th>
<th>Link MTU and IP MTU Delta</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet (untagged)</td>
<td>18 bytes</td>

</tr>
<tr>
<td>Untagged Packet with VLAN-Stack Header</td>
<td>22 bytes</td>
</tr>
<tr>
<td>Tagged Packet with VLAN-Stack Header</td>
<td>26 bytes</td>
</tr>
</tbody>
</table>
**portmode hybrid**

To accept both tagged and untagged frames, set a physical port or port-channel. A port configured this way is identified as a hybrid port in report displays.

**Syntax**

```
portmode hybrid
```

To return a port to accept either tagged or untagged frames (non-hybrid), use the `no portmode hybrid` command.

**Defaults**

non-hybrid

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

The following describes the `interface` command shown in the following example. This example sets a port as hybrid, makes the port a tagged member of VLAN 20, and an untagged member of VLAN 10, which becomes the native VLAN of the port. The port now accepts:

- untagged frames and classify them as VLAN 10 frames
- VLAN 20 tagged frames

The following describes the `do show interfaces` command shown in the following example. This example shows output with “Hybrid” as the newly added value for 802.1QTagged. The options for this field are:

- True — port is tagged
- False — port is untagged
• Hybrid — port accepts both tagged and untagged frames

The following describes the interface vlan command shown in the following example. This example shows unconfiguration of the hybrid port using the no portmode hybrid command.

**NOTE:** Remove all other configurations on the port before you can remove the hybrid configuration from the port.

**Example**

```
DellEMC(conf)# interface tengigabitethernet 1/1
DellEMC(conf-if-te-1/1)# portmode hybrid
DellEMC(conf-if-te-1/1)# interface vlan 10
DellEMC(conf-if-vl-10)# untagged tengigabitethernet 1/1
DellEMC(conf-if-vl-10)# tagged tengigabitethernet 1/1
DellEMC(conf-if-vl-20)#
```

**Example (Vlan)**

```
DellEMC(conf-if-vl-20)#
```

**rate-interval**

Configure the traffic sampling interval on the selected interface.

**Syntax**

```
rate-interval seconds
```

**Parameters**

- **seconds**
  
  Enter the number of seconds for which to collect traffic data. The range is from 5 to 299 seconds.

  **NOTE:** Because polling occurs every 15 seconds, the number of seconds designated here rounds to the multiple of 15 seconds lower than the entered value. For example, if 44 seconds is designated, it rounds to 30; 45 to 59 seconds rounds to 45.

**Defaults**

299 seconds

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
### Version & Description

- **9.10(0.0)**: Introduced on the S6100-ON.
- **9.8(2.0)**: Introduced on the S3100 series.
- **9.8(1.0)**: Introduced on the Z9100-ON.
- **9.8(0.0P5)**: Introduced on the S4048-ON.
- **9.8(0.0P2)**: Introduced on the S3048-ON.
- **9.7(0.0)**: Introduced on the S6000-ON.
- **9.2(1.0)**: Introduced on the Z9500.
- **9.0.2.0**: Introduced on the S6000.
- **8.3.19.0**: Introduced on the S4820T.
- **8.3.11.1**: Introduced on the S4810.
- **8.3.7.0**: Introduced on the S4810.
- **8.1.1.0**: Introduced on the E-Series.
- **7.6.1.0**: Introduced on the S-Series.
- **7.5.1.0**: Introduced on the C-Series.
- **6.1.1.0**: Introduced

### Usage Information

The output of the `show interfaces` command displays the configured rate interval, along with the collected traffic data.

### rate-interval (Configuration Mode)

Configure the traffic sampling interval for all physical and logical port-channel interfaces globally. The support to configure rate-interval globally enables you to modify the default interval rate for all physical and logical interfaces at one time.

**Syntax**

```
rate-interval seconds
```

Use the `no rate-interval` command to remove the sampling interval configuration.

**Parameters**

- **seconds**: Enter the number of seconds for which to collect traffic data. The range is from 5 to 299 seconds.

**Defaults**

- **299 seconds**

**Command Modes**

- **CONFIGURATION**

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Usage Information

The output of the `show interfaces` command displays the configured rate interval, along with the collected traffic data.

When `rate-interval` is not configured in the global configuration mode or interface mode, the default value of 299 seconds is applied.

When `rate-interval` is configured only in the global configuration mode and not in the interface mode, the global rate-interval value is applied at the interface level also.

When `rate-interval` is configured at the interface level and not in the global configuration mode, the interface level rate-interval value is applied for an interface.

When `rate-interval` is configured in both global configuration mode as well as interface mode, then the `rate-interval` value configured at interface level is applied as it takes precedence over the global value.

### show config

Display the interface configuration.

</table>
## show interfaces

Display information on a specific physical interface or virtual interface.

### Syntax

```
show interfaces interface-type[-range]
```

### Parameters

- **interface**
  - Enter one of the following keywords and the interface information:
    - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
    - For stack-units, enter the keywords `stack-unit` then the slot/port information.
    - For a Null interface, enter the keyword `null` then the Null interface number.
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
    - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
    - For a tunnel interface, enter the keyword `tunnel` then the tunnel ID. The range is from 1 to 16383.

- **-range**
  - (Optional) Enter the range of interfaces for which you want to view the information. The format is `interface-type slot/port/[subport]-slot/port/[subport]`

### Command Modes

- EXEC
- EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Command History

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.14(0.0)</td>
<td>Included the FEC counter details in the output for 25 and 50GG interfaces of the S5048-ON.</td>
</tr>
<tr>
<td>9.12(1.0)</td>
<td>Introduced on the S5048F-ON.</td>
</tr>
<tr>
<td>9.12(0.0)</td>
<td>Added the OUI value in the command output for the Z9100-ON.</td>
</tr>
<tr>
<td>9.11(0.0)</td>
<td>Included the FEC BER details in the output for 100G interfaces of S6100-ON and Z9100-ON. Added support to display 10GBASE-T information on the S4048, S4048T, S6000, S6000-ON, S6100, Z9500, S6010, and Z9100. Included display information about EEE on the S3048-ON.</td>
</tr>
<tr>
<td>9.10(0.1)</td>
<td>Introduced on the S6010-ON and S4048T-ON. Included display information about EEE on the S3100 series, S4820T, and S5000.</td>
</tr>
<tr>
<td>9.10(0.0)</td>
<td>Introduced on the S3148.</td>

<tr>
<td>9.2(0.2)</td>
<td>Added support for the tunnel interface type.</td>
</tr>
<tr>
<td>9.1(0.0)</td>
<td>Updated Management Ethernet output to include two global IPv6 addresses on S4810 and Z9000 and added output example showing OpenFlow instance ID.</td>
</tr>
<tr>
<td>8.3.12.1</td>
<td>Updated command output to support multiple IPv6 addresses on S4810.</td>
</tr>
<tr>
<td>8.3.11.4</td>
<td>Output expanded to support eSR4 optics in Z9000.</td>
</tr>
<tr>
<td>8.3.11.1</td>
<td>Introduced on the Z9000.</td>
</tr>
<tr>
<td>8.5.1.0</td>
<td>Added support for 4-port 40G line cards on the E-Series.</td>
</tr>
<tr>
<td>8.3.7.0</td>
<td>Introduced on the S4810.</td>
</tr>
<tr>
<td>8.2.1.2</td>
<td>Included SFP and SFP+ optics power detail in the E-Series and C-Series output.</td>
</tr>
<tr>
<td>8.2.1.0</td>
<td>Added support for 4093 VLANs on the E-Series. Prior releases supported 2094.</td>
</tr>
<tr>
<td>8.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
<tr>
<td>7.8.1.0</td>
<td>Output expanded to include SFP+ media on the C-Series.</td>
</tr>
<tr>
<td>7.6.1.0</td>
<td>Introduced on the S Series.</td>
</tr>
<tr>
<td>Version</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>7.5.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>6.4.1.0</td>
<td>Changed the organization of the display output.</td>
</tr>
<tr>
<td>6.3.1.0</td>
<td>Added the Pluggable Media Type field in the E-Series output.</td>
</tr>
</tbody>
</table>

**Usage Information**

Use the `show interfaces` command for details on a specific interface.

**NOTE:** In the CLI output, the power value is rounded to a 3-digit value. For receive/transmit power that is less than 0.000, an `snmp query` returns the corresponding dbm value even though the CLI displays as 0.000.

**NOTE:** After the counters are cleared, the line-rate continues to increase until it reaches the maximum line rate. When the maximum line rate is reached, there is no change in the line-rate.

**User Information**

The following table describes the `show interfaces` command shown in the 10G example.

<table>
<thead>
<tr>
<th>Line</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TenGigabitEthernet</td>
<td>Interface type and administrative and line protocol status.</td>
</tr>
<tr>
<td>1/1...</td>
<td>Interface hardware information, assigned MAC address, and current address.</td>
</tr>
<tr>
<td>Hardware is...</td>
<td>Present pluggable media wavelength, type, and rate. The error scenarios are:</td>
</tr>
<tr>
<td>Pluggable media</td>
<td>• Wavelength, unknown — Unable to determine the optics type</td>
</tr>
<tr>
<td>present...</td>
<td>• Unknown — If the wavelength is reading an error</td>
</tr>
<tr>
<td>Interface index...</td>
<td>Displays the interface index number the SNMP uses to identify the interface.</td>
</tr>
<tr>
<td>Internet address...</td>
<td>States whether an IP address is assigned to the interface. If an IP address is assigned, that address is displayed.</td>
</tr>
<tr>
<td>MTU 1554...</td>
<td>Displays link and IP MTU information.</td>
</tr>
<tr>
<td>LineSpeed</td>
<td>Displays the interface’s line speed, duplex mode, and negotiation mode.</td>
</tr>
<tr>
<td>Energy Efficient</td>
<td>Displays whether Energy Efficient Ethernet has been enabled or not.</td>
</tr>
<tr>
<td>Ethernet</td>
<td></td>
</tr>
<tr>
<td>ARP type...</td>
<td>Displays the ARP type and the ARP timeout value for the interface.</td>
</tr>
<tr>
<td>Last clearing...</td>
<td>Displays the time when the <code>show interfaces</code> counters where cleared.</td>
</tr>
<tr>
<td>Queuing strategy...</td>
<td>States the packet queuing strategy. FIFO means first in first out.</td>
</tr>
<tr>
<td>Input Statistics:</td>
<td>Displays all the input statistics including:</td>
</tr>
<tr>
<td></td>
<td>• Number of packets and bytes into the interface</td>
</tr>
<tr>
<td></td>
<td>• Number of packets with VLAN tagged headers</td>
</tr>
<tr>
<td></td>
<td>• Packet size and the number of those packets inbound to the interface</td>
</tr>
<tr>
<td></td>
<td>• Number of Multicast and Broadcast packets:</td>
</tr>
<tr>
<td>Line</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>Multicasts = number of MAC multicast packets</td>
</tr>
<tr>
<td></td>
<td>Broadcasts = number of MAC broadcast packets</td>
</tr>
<tr>
<td></td>
<td>Number of runts, giants, and throttles packets:</td>
</tr>
<tr>
<td></td>
<td>- runts = number of packets that are less than 64B</td>
</tr>
<tr>
<td></td>
<td>- giants = packets that are greater than the MTU size</td>
</tr>
<tr>
<td></td>
<td>- throttles = packets containing PAUSE frames</td>
</tr>
<tr>
<td></td>
<td>Number of CRC, overrun, and discarded packets:</td>
</tr>
<tr>
<td></td>
<td>- CRC = packets with CRC/FCS errors</td>
</tr>
<tr>
<td></td>
<td>- overrun = number of packets discarded due to FIFO overrun conditions</td>
</tr>
<tr>
<td></td>
<td>- discarded = the sum of runts, giants, CRC, and overrun packets discarded without any processing</td>
</tr>
</tbody>
</table>

**Output Statistics:** Displays output statistics sent out of the interface including:

- Number of packets, bytes, and underruns out of the interface
- Packet size and the number of the packets outbound to the interface
- Number of Multicast, Broadcast, and Unicast packets:
  - Multicasts = number of MAC multicast packets
  - Broadcasts = number of MAC broadcast packets
  - Unicasts = number of MAC unicast packets
- Number of VLANs, throttles, discards, and collisions:
  - Vlans = number of VLAN tagged packets
  - throttles = packets containing PAUSE frames
  - discarded = number of packets discarded without any processing
  - collisions = number of packet collisions
- wred = count both packets discarded in the MAC and in the hardware-based queues

**Rate information...** Estimate of the input and output traffic rate over a designated interval (30 to 299 seconds). Traffic rate is displayed in bits, packets per second, and percent of line rate.

**Time since...** Elapsed time since the last interface status change (hh:mm:ss format).

**Example**

DellEMC# show interfaces
TenGigabitEthernet 1/1 is down, line protocol is down
Hardware is DellEMCEth, address is 00:a0:c9:00:00:0b
  Current address is 00:a0:c9:00:00:0b
Pluggable media present, QSFP type is 40GBASE-CR4-1M
Interface index is 2097156
Internet address is not set
Mode of IPv4 Address Assignment : NONE
DHCP Client-ID :00a0c900000b
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 10000 Mbit
Flowcontrol rx off tx off
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 1d18h54m
Queuing strategy: fifo
Input Statistics:
  0 packets, 0 bytes
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts, 0 Unicasts
0 runts, 0 giants, 0 throttles
0 CRC, 0 overrun, 0 discarded

### Output Statistics:
- 0 packets, 0 bytes, 0 underruns
- 0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
- 0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
- 0 Multicasts, 0 Broadcasts, 0 Unicasts
- 0 throttles, 0 discarded, 0 collisions, 0 wreddrops

### Rate info (interval 299 seconds):
- Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
- Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate

Time since last interface status change: 1d18h54m

TenGigabitEthernet 1/1 is down, line protocol is down
Hardware is Eth, address is 00:a0:c9:00:00:0b
  Current address is 00:a0:c9:00:00:0b
Pluggable media present, QSFP type is 40GBASE-CR4-1M
Interface index is 2097284
Internet address is not set
Mode of IPv4 Address Assignment : NONE
DHCP Client-ID :00a0c900000b
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 10000 Mbit
Flowcontrol rx off tx off
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 1d18h54m

### Usage Information
The Management port is enabled by default (no shutdown). If necessary, use the `ip address` command to assign an IP address to the Management port. If two RPMs are installed in your system, use the `show redundancy` command to display which RPM is the Primary RPM.

### Example

```
DellEMC# show interfaces tengigabitethernet 1/1
TenGigabitEthernet 1/1 is up, line protocol is down
Hardware is DellEMCEth, address is 00:01:e8:41:77:95
  Current address is 00:01:e8:41:77:95
Pluggable media present, SFP type is 1000BASE-SX
  Wavelength is 850nm
Interface index is 100974648
Port will not be disabled on partial SFM failure
Internet address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 1000 Mbit
Flowcontrol rx on tx on
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 1w0d5h
Queueing strategy: fifo
Input Statistics:
  0 packets, 0 bytes
  0 Vlans
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts
  0 runts, 0 giants, 0 throttles
  0 CRC, 0 overrun, 0 discarded
Output Statistics:
  0 packets, 0 bytes, 0 underruns
  0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
  0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
  0 Multicasts, 0 Broadcasts, 0 Unicasts
  0 Vlans, 0 throttles, 0 discarded, 0 collisions, 0 wreddrops
Rate info (interval 299 seconds):
  Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
  Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
```
DellEMC# show interfaces managementethernet 1/1
ManagementEthernet 1/1 is up, line protocol is up
Hardware is DellEMCEth, address is 00:01:e8:0b:a9:4c
Current address is 00:01:e8:0b:a9:4c
Pluggable media not present
Interface index is 503595208
Internet address is 10.11.201.5/16
Link local IPv6 address: fe80::201:e8ff:fe0b:a94c/64
Global IPv6 address: 2222::5/64
Virtual-IP is not set
Virtual-IP IPv6 address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 10 Mbit, Mode full duplex
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 04:01:08
Queueing strategy: fifo
  Input 943 packets, 78347 bytes, 190 multicast
  Received 0 errors, 0 discarded
  Output 459 packets, 102388 bytes, 15 multicast
  Output 0 errors, 0 invalid protocol
Time since last interface status change: 00:03:09

DellEMC# show interfaces managementethernet 1/1
ManagementEthernet 1/1 is up, line protocol is up
Hardware is DellForce10Eth, address is 00:01:e8:a0:bf:f3
Current address is 00:01:e8:a0:bf:f3
Pluggable media not present
Interface index is 302006472
Internet address is 10.16.130.5/16
Link local IPv6 address: fe80::201:e8ff:fea0:bff3/64
Global IPv6 address: 1::1/
Global IPv6 address: 2::1/64
Virtual-IP is not set
Virtual-IP IPv6 address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 1000 Mbit, Mode full duplex
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 00:06:14
Queueing strategy: fifo
  Input 791 packets, 62913 bytes, 775 multicast
Received 0 errors, 0 discarded
Output 21 packets, 3300 bytes, 20 multicast
Output 0 errors, 0 invalid protocol
Time since last interface status change: 00:06:03

Example (OpenFlow instance)

DellEMC# show interfaces vlan 6
Vlan 6 is down, line protocol is down
Address is 00:01:e8:8a:e1:8c, Current address is 00:01:e8:8a:e1:8c
Interface index is 1107525638
of-instance: 2
Internet address is not set
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed auto
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 00:05:12
Queueing strategy: fifo
Time since last interface status change: 00:05:12

Related Commands

- show interfaces configured – display any interface with a non-default configuration.
- show ip interface – display Layer 3 information about the interfaces.
- show range – display all interfaces configured using the interface range command.

show interfaces configured

Display any interface with a non-default configuration.

Syntax

show interfaces configured

Command Modes

- EXEC
- EXEC Privilege

  Output 00.00 Mb/s, 0 packets/sec, 0.00% of line-rate
Time since last interface status change: 00:04:59
DellEMC#
show interfaces dampening

Display interface dampening information.

Syntax

```
show interfaces dampening [[interface] [summary] [detail]]
```

Parameters

- **interface** (Optional) Enter one of the following keywords and the interface information:
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the `slot/port[/subport]` information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the `slot/port` information.

- **summary** (OPTIONAL) Enter the keyword `summary` to display the current summary of dampening data, including the number of interfaces configured and the number of interfaces suppressed, if any.

- **detail** (OPTIONAL) Enter the keyword `detail` to display detailed interface dampening data.

Defaults

None

Command Modes

EXEC

</tbody>
</table>
Version | Description
------- | -----------
9.0.2.0  | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0  | Introduced on the S4810.
8.5.1.0  | Added support for 4-port 40G line cards on the E-Series.
8.1.1.0  | Introduced on the E-Series.
7.6.1.0  | Introduced on the S-Series.
7.5.1.0  | Introduced on the C-Series.
7.4.1.0  | Introduced

Example

```
DellEMC# show interfaces dampening
Interface Supp Flaps Penalty Half-Life Reuse Suppress Max-Sup State
gigs/ports 0 0 20 800 4500 120 Up

DellEMC#
```

Related Commands

- `dampening` — configure dampening on an interface.
- `show interfaces configured` — display any interface with a non-default configuration.

**show interfaces phy**

Display auto-negotiation and link partner information.

```
Syntax
show interfaces gigabitethernet slot/port phy

Parameters
- tengigabitethernet: Enter the keyword tengigabitethernet then the slot or port information.

- **NOTE**: This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

  - For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.

  - For ON platforms, you can specify multiple ports as `slot[port]/[subport] - slot[port]/[subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

Command Modes
- EXEC
- EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

The following describes the `show interfaces gigabitethernet` command following example.

**Mode Control**
Indicates if `auto negotiation` is enabled. If so, indicates the selected speed and duplex.

**Mode Status**
Displays auto negotiation fault information. When the interface completes auto negotiation successfully, the `autoNegComplete` field and the `linkstatus` field read “True.”

**AutoNegotiation Advertise**
Displays the control words the local interface advertises during negotiation. Duplex is either half or full. Asym- and Sym Pause is the types of flow control the local interface supports.

**AutoNegotiation Remote Partner’s Ability**
Displays the control words the remote interface advertises during negotiation. Duplex is either half or full. Asym- and Sym Pause is the types of flow control the remote interface supports.

**AutoNegotiation Expansion**
ParallelDetectionFault is the handshaking scheme in which the link partner continuously transmit an “idle” data packet using the Fast Ethernet MLT-3 waveform. Equipment that does not support auto-negotiation must be configured to exactly match the mode of operation as the link partner or else no link can be established.

**1000Base-T Control**
1000Base-T requires auto-negotiation. The IEEE Ethernet standard does not support setting a speed to 1000 Mbps with the `speed` command without auto-negotiation. E-Series line cards support both full-duplex and half-duplex 1000BaseT.

**Phy Specific Control**
Values are:
- 0 - Manual MDI
- 1 - Manual MDIX
- 2 - N/A
- 3 - Auto MDI/MDIX
Phy Specific Status Displays PHY-specific status information. Cable length represents a rough estimate in meters:

- 0 - < 50 meters
- 1 - 50 - 80 meters
- 2 - 80 - 110 meters
- 3 - 110 - 140 meters
- 4 - 140 meters

Link Status: Up or Down

Speed:

- Auto
- 1000MB
- 100MB
- 10MB

Example

DellEMC# show interfaces tengigabitethernet 1/1 phy
Mode Control:
  SpeedSelection: 10b
  AutoNeg: ON
  Loopback: False
  PowerDown: False
  Isolate: False
  DuplexMode: Full
Mode Status:
  AutoNegComplete: False
  RemoteFault: False
  LinkStatus: False
  JabberDetect: False
AutoNegotiation Advertise:
  100MegFullDplx: True
  100MegHalfDplx: True
  10MegFullDplx: False
  10MegHalfDplx: True
  Asym Pause: False
  Sym Pause: False
AutoNegotiation Remote Partner's Ability:
  100MegFullDplx: False
  100MegHalfDplx: False
  10MegFullDplx: False
  10MegHalfDplx: False
  Asym Pause: False
  Sym Pause: False
AutoNegotiation Expansion:
  ParallelDetectionFault: False
...

show interfaces stack-unit

Display information on all interfaces on a specific S-Series or Z-Series stack member.

Syntax

show interfaces stack-unit unit-number

Parameters

unit-number Enter the stack member number.
Command Modes

- EXEC
- EXEC Privilege

Example

DellEMC# show interfaces stack-unit 1
TenGigabitEthernet 1/1 is down, line protocol is down
Hardware is DellEMCEth, address is 00:01:e8:4c:f2:82
  Current address is 00:01:e8:4c:f2:82
  Pluggable media not present
Interface index is 34129154
  Internet address is not set
  MTU 1554 bytes, IP MTU 1500 bytes
  LineSpeed auto, Mode auto
  ARP type: ARPA, ARP Timeout 04:00:00
  Last clearing of "show interface" counters 3w0d17h
  Queueing strategy: fifo
  Input Statistics:
    0 packets, 0 bytes
    5144 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
    0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
    0 Multicasts, 0 Broadcasts
    0 runts, 0 giants, 0 throttles
    0 CRC, 0 overrun, 0 discarded
  Output Statistics:
    0 packets, 0 bytes, 0 underruns
    0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
    0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
    0 Multicasts, 0 Broadcasts, 0 Unicasts
    0 throttles, 0 discarded, 0 collisions
  Rate info (interval 299 seconds):
    Input 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
    Output 00.00 Mbits/sec, 0 packets/sec, 0.00% of line-rate
  Time since last interface status change: 3w0d17h
TenGigabitEthernet 1/2 is down, line protocol is down
Hardware is DellEMCEth, address is 00:01:e8:4c:f2:83
show interfaces status

To display status information on a specific interface only, display a summary of interface information or specify a stack-unit slot and interface.

Syntax

```
show interfaces [interface | stack-unit slot-number] status
```

Parameters

- **interface**
  
  (OPTIONAL) Enter one of the following keywords the interface information:
  
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

  **NOTE:** This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

  - For non-ON platforms, you can specify multiple ports as `slot/port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.
  - For ON platforms, you can specify multiple ports as `slot/port/ [subport] - slot/port/ [subport]`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1/1 - 1/1/4`.

- **stack-unit slot-number**
  
  (OPTIONAL) Enter the keyword `stack-unit` then the slot number. The range is from 0 to 5.

Defaults

None

Te 1/16              Down    Auto      Auto    --

show interfaces switchport

Display only virtual and physical interfaces in Layer 2 mode. This command displays the Layer 2 mode interfaces’ IEEE 802.1Q tag status and VLAN membership.

Syntax
show interfaces switchport [interface-type | stack-unit unit-id ]

Parameters
  interface-type  (OPTIONAL) Enter one of the following keywords and the interface information:
    • For a port channel interface, enter the keywords port-channel then a number.
    • For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

For a backup interface for this interface, enter the keyword `backup`.

**NOTE:** This command also enables you to view information corresponding to a range of ports.

For physical interfaces, you can specify multiple ports as slot/port-range. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1/1 - 4`.

For port-channel interfaces, you can specify multiple ports as port-range. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces port-channel 1 - 4`.

`stack-unit unit-id` (OPTIONAL) Enter the keywords `stack-unit` then the stack member number.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

## show interfaces switchport

The following describes the `show interfaces switchport` command for the following example.

### Items | Description
---|---
Name | Displays the interface's type, slot/port[/subport] number.
802.1QTagged | Displays whether if the VLAN tagged ("True"), untagged ("False"), or hybrid ("Hybrid"), which supports both untagged and tagged VLANs by the port.
Vlan membership | Lists the VLANs to which the interface is a member. Starting with Dell EMC Networking OS version 7.6.1, this field can display native VLAN membership by the port.

### Example

```
DellEMC# show interfaces switchport
Name: TenGigabitEthernet 1/1
  802.1QTagged: Hybrid
  Vlan membership:
    Vlan 2, Vlan 20
  Native VlanId: 20

Name: TenGigabitEthernet 1/2
  802.1QTagged: True
  Vlan membership:
    Vlan 2

Name: TenGigabitEthernet 1/3
  802.1QTagged: True
  Vlan membership:
    Vlan 2

Name: TenGigabitEthernet 1/4
  802.1QTagged: True
  Vlan membership:
    Vlan 2
```

### Related Commands

- `interface` — configure a physical interface on the switch.
- `show ip interface` — display Layer 3 information about the interfaces.
- `show interfaces transceiver` — display the physical status and operational status of an installed transceiver. The output also displays the transceiver’s serial number.

## show interfaces transceiver

Display the details of an installed transceiver.

### Syntax

```
show interfaces [interface number] transceiver
```

### Parameters

- **Interfaces interface number** (OPTIONAL) Enter one of the following keywords and then the interface information:
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
• For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

**NOTE:** This command also enables you to view information corresponding to a range of ports. However, for Open Networking (ON) platforms the notation for specifying port range in the command is different from how you specify in non-ON platforms.

• For non-ON platforms, you can specify multiple ports as slot/port-range. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1 - 4.

• For ON platforms, you can specify multiple ports as slot/port/[subport] - slot/port/[subport]. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as show interfaces interface-type 1/1/1 - 1/1/4.

**Command Modes**

- EXEC
- EXEC Privilege

Related Commands

- `interface` — configure a physical interface on the switch.
- `show ip interface` — display Layer 3 information about the interfaces.
show interfaces vlan

Display VLAN statistics.

Syntax

```
show interfaces vlan {vlan-id} [LINE] [description]
```

Parameters

- **vlan-id**: Enter the interface VLAN number. The range is from 1 to 4094.
- **LINE** *(OPTIONAL)*: Enter the name of the VLAN.
- **description**: Displays the VLAN interface information with description.

Command Modes

- EXEC
- EXEC Privilege

Command History

Usage Information

- **NOTE**: This command also enables you to view information corresponding to a range of ports.
- You can specify multiple ports as port-range. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces interface-type 1 - 4`.

Example

```
DellEMC# show interfaces vlan 10
Vlan 10 is up, line protocol is down
Address is 90:b1:1c:f4:99:ce, Current address is 90:b1:1c:f4:99:ce
Internet address is not set
Mode of IPv4 Address Assignment: NONE
DHCP Client-ID: 90b11cf499ce
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed auto
ARP type: ARPA, ARP Timeout 04:00:00
Last clearing of "show interface" counters 2d17h26m
Queueing strategy: fifo
Time since last interface status change: 2d17h26m
Input Statistics: 0 packets, 0 bytes
```
show range

Display all interfaces configured using the interface range command.

Syntax

show range

Command Modes INTERFACE RANGE (config-if-range)

</tbody>
</table>

E-Series legacy command

#### Usage Information

The `shutdown` command marks a physical interface as unavailable for traffic. To discover if an interface is disabled, use the `show ip interface brief` command. Disabled interfaces are listed as down.

Disabling a VLAN or a port channel causes different behavior. When a VLAN is disabled, the Layer 3 functions within that VLAN are disabled. Layer 2 traffic continues to flow. Entering the `shutdown` command on a port channel disables all traffic on the port channel and the individual interfaces within the port channel. To enable a port channel, enter `no shutdown` on the port channel interface and at least one interface within that port channel.

The `shutdown` and `description` commands are the only commands that you can configure on an interface that is a member of a port channel.

#### Related Commands
- `interface port-channel` — create a port channel interface.
- `interface vlan` — create a VLAN.
- `show ip interface` — display the interface routing status. Add the keyword `brief` to display a table of interfaces and their status.

### speed (for 10/100/1000/10000 interfaces)

Set the speed for 10/100/1000/10000 interfaces. Set both sides of a link to the same speed (10/100/1000/10000) or to auto or the link may not come up.

#### Syntax

```
speed {10 | 100 | 1000 | 10000 | auto}
```

To return to the default setting, use the `no speed {10 | 100 | 1000 | 10000}` command.

#### Parameters

- **10**
  - Enter the keyword `10` to set the interface’s speed to 10 Mb/s.

  **NOTE:** This interface speed is not supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card. If the command is entered for these interfaces, an error message appears.

- **100**
  - Enter the keyword `100` to set the interface’s speed to 10/100 Mb/s.

  **NOTE:** When this setting is enabled, only 100Base-FX optics are supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card.

- **1000**
  - Enter the keyword `1000` to set the interface’s speed to 1000 Mb/s. Auto-negotiation is enabled. For more information, refer to `negotiation auto`.

  **NOTE:** When this setting is enabled, only 1000Base-FX optics are supported on the LC-EH-GE-50P or the LC-EJ-GE-50P card.

- **10000**
  - Enter the keyword `10000` to set the interface’s speed to 10000 Mb/s. Auto-negotiation is enabled. For more information, refer to `negotiation auto`.  

Interfaces 835
auto

Enter the keyword auto to set the interface to auto-negotiate its speed. Auto-negotiation is enabled. For more information, refer to negotiation auto.

Defaults

auto

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Added support for fanned-out 1 Gigabit SFP port.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.3.1.0 Supported on LC-EH-GE-50P or the LC-EJ-GE-50P cards.
8.1.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.

E-Series legacy command

Usage Information

This command is found on the /1000/10000 Base-T Ethernet interfaces.

When you enable auto, the system performs an automatic discovery to determine the optics installed and configure the appropriate speed.

When you configure a speed for the 10/100/1000 interface, confirm the negotiation auto command setting. Both sides of the link must have auto-negotiation either enabled or disabled. For speed settings of 1000 or auto, the software sets the link to auto-negotiation and you cannot change that setting.

NOTE: Starting with Dell EMC Networking OS version 7.8.1.0, when you use a copper SFP2 module with catalog number GP-SFP2-1T in the S25P model of the S-Series, you can manually set its speed with the speed command. When you set the speed to 10 or 100 Mbps, you can also use the duplex command.

If you use an active optical cable (AOC), you can convert the QSFP+ port to a 10 Gigabit SFP+ port or 1 Gigabit SFP port. Use the speed command to enable the required speed.

NOTE: If the interface does not come up when you configure 10/100/1000G speed, configure the interface speed using the speed command manually on both the ends and disable autonegotiation if it is enabled.
Related Commands

- duplex (10/100 Interfaces) — configures duplex mode on physical interfaces.
- negotiation auto — enable or disable auto-negotiation on an interface.

speed (Management interface)

Set the speed for the Management interface.

Syntax

```
speed {10 | 100 | 1000 | auto}
```

To return to the default setting, use the `no speed` command.

Parameters

- **10**
  - Enter the keyword `10` to set the interface's speed to 10 Mb/s.
- **100**
  - Enter the keyword `100` to set the interface's speed to 100 Mb/s.
- **1000**
  - Enter the keyword `1000` to set the interface's speed to 1000 Mb/s.
- **auto**
  - Enter the keyword `auto` to set the interface to auto-negotiate its speed.

Defaults

```
auto
```

Command Modes

```
INTERFACE
```

Usage Information

This command is found on the Management interface only.
Related Commands

- `interface ManagementEthernet` — configure the Management port on the system (either the Primary or Standby RPM).
- `management route` — configure a static route that points to the Management interface or a forwarding router.

**stack-unit portmode quad**

Configures the list of dynamic fan-out capable ports.

**Syntax**

```
stack-unit [stack-unit number] port port-number portmode quad
```

To remove the quad-port configuration, use the command.

**Parameters**

- `stack-unit number` Enter the port number. The range is from 1 to 6.

**Defaults**

`49,50,51,52,53,54`

**Command Modes**

`CONFIGURATION`

**Command History**

<table>
<thead>
<tr>

down
TenGigabitEthernet 1/49/4     unassigned      NO  Manual administratively down
down
```

**switchport**

Place an interface in Layer 2 mode.

**Syntax**

```
switchport {[backup interface [interface | port-channel number]] | mode private-vlan {host | promisucous | trunk]}
```

838   Interfaces
To remove an interface from Layer 2 mode and place it in Layer 3 mode, enter the `no switchport` command. If a switchport backup interface is configured, first remove the backup configuration. To remove a switchport backup interface, enter the `no switchport backup interface` command.

**Parameters**

- **backup** (OPTIONAL) Use this option to configure a redundant Layer 2 link without using Spanning Tree. The keyword `backup` configures a backup port so that if the primary port fails, the backup port changes to the up state. If the primary later comes up, it becomes the backup.

- **interface interface** (OPTIONAL) Enter any of the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

- **port-channel** (OPTIONAL) Enter the keywords `port-channel` if the backup port is a static or dynamic port channel.

- **mode** (OPTIONAL) Enter the keyword `mode` to set the interface mode.

- **private-vlan** (OPTIONAL) Enter the keywords `private-vlan` to set the interface mode to private VLAN mode.

- **host** (OPTIONAL) Enter the keyword `host` to set the private VLAN interface to host mode.

- **promiscuous** (OPTIONAL) Enter the keyword `promiscuous` to set the private VLAN interface to promiscuous mode.

- **trunk** (OPTIONAL) Enter the keyword `trunk` to set the private VLAN interface to trunk mode.

**Defaults**

Disabled — interface is in Layer 3 mode.

**Command Modes**

INTERFACE

**Command History**

</tbody>
</table>
### Usage Information

If an IP address or VRRP group is assigned to the interface, you cannot use the `switchport` command on the interface. To use the `switchport` command on an interface, only the `no ip address` and `no shutdown` statements must be listed in the `show config` output.

When you enter the `switchport` command, the interface is automatically added to the default VLAN.

To use the `switchport backup interface` command on a port, first enter the `switchport` command. For more information, see “Configuring Redundant Links” in the Layer 2 section in the *Dell EMC Networking OS Configuration Guide*.

### wavelength

Set the wavelength for tunable 10–Gigabit SFP+ optics.

**Syntax**

```
wavelength
```

To retain the existing wavelength, use the `no wavelength` command.

**Defaults**

```
none
```

**Command Modes**

```
INTERFACE
```

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant *Dell EMC Networking OS Command Line Reference Guide*.

<table>
<thead>

<td>Introduced on the S6000, S6000-ON, S5000, S4810, S4820T, S3048-ON, S4048-ON, M I/O Aggregator, FN I/O Module, MXL, C9010, S3100 series, and Z9100-ON.</td>
</tr>
</tbody>
</table>

**Usage Information**

The wavelength can be configured only on a tunable 10–Gigabit SFP+ optic. The wavelength range is from 1528.3 nm to 1568.77 nm.

If you configure the wavelength on a non-tunable optic, there is no change to the existing wavelength. The configured wavelength is saved in the running configuration and is applicable, when a tunable optic is used.

If you do not configure the wavelength on an inserted tunable optic, the existing wavelength is used.
The following example shows the wavelength set for a tunable 10–Gigabit SFP+ optic:

```
DellEMC(conf-if-te-1/1)# wavelength 1528.30
```

**Related Commands**

- `show config` — displays the interface configuration.

---

**Egress Interface Selection (EIS) Commands**

The following commands are Egress Interface Selection (EIS) commands.

### application

Configure the management egress interface selection.

**Syntax**

```
application {all | application-type}
```

To remove a management application configuration, use the `no application {all | application-type}` command.

**Parameters**

- `application-type`  
  Enter any of the following keywords:
  - For DNS, enter the keyword `dns`.
  - For FTP, enter the keyword `ftp`.
  - For NTP, enter the keyword `ntp`.
  - For Radius, enter the keyword `radius`.
  - For sFlow collectors, enter the keyword `sflow-collector`.
  - For SNMP (traps and MIB responses), enter the keywords `snmp`.
  - For SSH, enter the keyword `ssh`.
  - For Syslog, enter the keyword `syslog`.
  - For TACACS, enter the keyword `tacacs`.
  - For Telnet, enter the keyword `telnet`.
  - For TFTP, enter the keyword `tftp`.

- `all`  
  Configure all applications.

**Defaults**

None.

**Command Modes**  
EIS Mode (conf-mgmt-eis)

show ip management-eis-route

Display the management routes used by EIS.

Syntax

show ip management-eis-route

Defaults

None.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
9.2(0.0) Introduced on the Z9000, S4810, and S4820T.

Example

DellEMC# show ip management-eis-route
Destination    Gateway                  State      Route Source
-----------    -------                 -----      ------------
10.11.0.0/16   ManagementEthernet 1/1  Connected  Connected
172.16.1.0/24  10.11.192.4             Active     Static

show management application pkt-cntr

Display the number of packets for each application type that have taken the management route.

Syntax

show management application pkt-cntr

Defaults

None.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
### show management application pkt-fallback-cntr

Display the number of packets for each application type that have been rerouted to the default routing table due to management port or route lookup failure.

#### Syntax

```
show management application pkt-fallback-cntr
```

#### Defaults

None.

#### Command Modes

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

#### Example

```
DellEMC# show management application pkt-fallback-cntr

dns : 0
ftp : 0
ntp : 0
radius : 0
sflow-collector : 0
snmp : 0
ssh : 2
syslog : 0
tacacs : 0
telnet : 0
tftp : 0
```
Port Channel Commands

A Link Aggregation Group (LAG) is a group of links that appear to a MAC client as if they were a single link according to IEEE 802.3ad. In Dell EMC Networking OS, a LAG is referred to as a Port Channel.

- The platform supports 128 port channels and 16 members per port channel.

As each port can be assigned to only one Port Channel, and each Port Channel must have at least one port, some of those nominally available Port Channels might have no function because they could have no members if there are not enough ports installed. But stack members can provide those ports.

NOTE: The Dell EMC Networking OS implementation of LAG or Port Channel requires that you configure a LAG on both switches manually. For information about Dell EMC Networking OS link aggregation control protocol (LACP) for dynamic LAGs, refer to the Link Aggregation Control Protocol (LACP) chapter. For more information about configuring and using Port Channels, refer to the Dell EMC Networking OS Configuration Guide.

channel-member

Add an interface to the Port Channel, while in INTERFACE PORTCHANNEL mode.

**Syntax**

```
channel-member  interface
```

To delete an interface from a Port Channel, use the `no channel-member interface` command.

**Parameters**

- **interface** (OPTIONAL) Enter any of the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults**

Not configured.

**Command Modes**

INTERFACE PORTCHANNEL

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
Version   Description
9.0.2.0    Introduced on the S6000.
8.3.19.0   Introduced on the S4820T.
8.3.11.1   Introduced on the Z9000.
8.5.1.0    Added support for 4-port 40G line cards on the E-Series.
8.3.7.0    Introduced on the S4810.
8.1.1.0    Introduced on the E-Series.
7.6.1.0    Introduced on the S-Series.
7.5.1.0    Introduced on the C-Series.
pre-Version 6.2.1.0 Introduced on the E-Series.

Usage Information
Use the `interface port-channel` command to access this command.

You cannot add an interface to a Port Channel if the interface contains an IP address in its configuration. Only the `shutdown`, `description`, `mtu`, and `ip mtu` commands can be configured on an interface if it is added to a Port Channel. The `mtu` and `ip mtu` commands are only available when the chassis is in Jumbo mode.

Link MTU and IP MTU considerations for Port Channels are:

- All members must have the same link MTU value and the same IP MTU value.
- The Port Channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU 2000, the Port Channel's MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

When an interface is removed from a Port Channel with the `no channel-member` command, the interface reverts to its configuration prior to joining the Port Channel.

An interface can belong to only one Port Channel.

Although the system allows you to assign more number of ports in a port channel, Dell EMC Networking recommends having a maximum of 16 interfaces per port channel.

The interfaces can be located on different line cards but must be the same physical type and speed (for example, all 10-Gigabit Ethernet interfaces).

For more information about Port Channels, refer to the Dell EMC Networking OS Configuration Guide.

Related Commands
- `description` — assign a descriptive text string to the interface.
- `interface port-channel` — create a Port Channel interface.
- `shutdown` — disable/enable the port channel.
Group two LAGs in a supergroup ("fate-sharing group" or "failover group").

**Syntax**

```
group group_number port-channel number port-channel number
```

To remove an existing LAG supergroup, use the `no group group_number` command.

**Parameters**

- `group_number` Enter an integer from 1 to 32 that uniquely identifies this LAG fate-sharing group.
- `port-channel number` Enter the keywords `port-channel` then an existing LAG number. Enter this keyword/variable combination twice, identifying the two paired LAGs.

**Defaults**

None

**Command Modes**

PORT-CHANNEL FAILOVER-GROUP (conf-po-failover-grp)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

- `show interfaces port-channel` — display information on configured Port Channel groups.
interface port-channel

Create a Port Channel interface, which is a link aggregation group (LAG) containing 16 physical interfaces on the S-Series.

**Syntax**

```
interface port-channel channel-number
```

To delete a Port Channel, use the `no interface port-channel channel-number` command.

**Parameters**

- `channel-number` For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

</tbody>
</table>

**Usage Information**

Port Channel interfaces are logical interfaces and can be either in Layer 2 mode (by using the `switchport` command) or Layer 3 mode (by configuring an IP address). You can add a Port Channel in Layer 2 mode to a VLAN.

The `shutdown`, `description`, and `name` commands are the only commands that you can configure on an interface while it is a member of a Port Channel. To add a physical interface to a Port Channel, the interface can
only have the shutdown, description, and name commands configured. The Port Channel’s configuration is applied to the interfaces within the Port Channel.

A Port Channel can contain any physical interface. Based on the first interface configured in the Port Channel and enabled, Dell EMC Networking OS determines the common speed. For more information, refer to channel-member.

If the line card is in a Jumbo mode chassis, you can also configure the mtu and ip mtu commands. The Link MTU and IP MTU values configured on the channel members must be greater than the Link MTU and IP MTU values configured on the Port Channel interface.

NOTE: In a Jumbo-enabled system, all members of a Port Channel must be configured with the same link MTU values and the same IP MTU values.

Example

DellEMC(conf)# int port-channel 2
DellEMC(conf-if-po-2)#

Related Commands

- channel-member — add a physical interface to the LAG.
- interface — configure a physical interface.
- interface loopback — configure a Loopback interface.
- interface null — configure a null interface.
- interface vlan — configure a VLAN.
- shutdown — disable/enable the port channel.

minimum-links

Configure the minimum number of links in a LAG (Port Channel) that must be in "oper up" status for the LAG to be also in "oper up" status.

Syntax

minimum-links number

Parameters

number Enter the number of links in a LAG that must be in "oper up" status. The range is from 1 to 16. The default is 1.

Defaults

1

Command Modes

INTERFACE

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
If you use this command to configure the minimum number of links in a LAG that must be in “oper up” status, the LAG must have at least that number of “oper up” links before it can be declared as up. For example, if the required minimum is four, and only three are up, the LAG is considered down.

**port-channel failover-group**

To configure a LAG failover group, access PORT-CHANNEL FAILOVER-GROUP mode.

**Syntax**

```plaintext
port-channel failover-group
```

To remove all LAG failover groups, use the `no port-channel failover-group` command.

**Defaults**

None

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
Usage Information

This feature groups two LAGs to work in tandem as a supergroup. For example, if one LAG goes down, the other LAG is taken down automatically, providing an alternate path to reroute traffic, avoiding oversubscription on the other LAG. You can use both static and dynamic (LACP) LAGs to configure failover groups. For more information, see the “Port Channel” section in the Dell EMC Networking OS Configuration Guide.

Related Command

- `group` — group two LAGs in a supergroup (“fate-sharing group”).
- `show interfaces port-channel` — display information on configured Port Channel groups.

### show config

Display the current configuration of the selected LAG.

**Syntax**

```
show config
```

**Command Modes**

```
INTERFACE PORTCHANNEL
```

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Example**

```
DellEMC(conf-if-po-1)# show config
!
interface Port-channel 1
  no ip address
```
**show interfaces port-channel**

Display information on configured Port Channel groups.

```
DellEMC(conf-if-po-1)#
```

**Syntax**

```
show interfaces port-channel [channel-number] [brief] [description]
```

**Parameters**

- `channel-number` For a Port Channel interface, enter the keyword `port-channel` then a number. The range is from 1 to 128.

  **NOTE:** This command also enables you to view information corresponding to a range of ports.

  - For port-channel interfaces, you can specify multiple ports as `port-range`. For example, if you want to display information corresponding to all ports between 1 and 4, specify the port range as `show interfaces port-channel 1 - 4`.

  - `brief` (OPTIONAL) Enter the keyword `brief` to display only the port channel number, the state of the port channel, and the number of interfaces in the port channel.

  - `description` (OPTIONAL) Displays the port-channel information with description.

**Command Modes**

- EXEC
- EXEC Privilege

### Version Description

- **8.3.7.0** Introduced on the S4810.
- **8.1.1.0** Introduced on the E-Series.
- **7.6.1.0** Introduced on the S-Series. Modified to display the LAG failover group status.
- **7.5.1.0** Introduced on the C-Series.

#### E-Series legacy command

### Usage Information

The following describes the `show interfaces port-channel` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port-Channel 1...</td>
<td>Displays the LAG's status. In the Example, the status of the LAG’s LAG fate-sharing group (“Failover-group”) is listed.</td>
</tr>
<tr>
<td>Hardware is...</td>
<td>Displays the interface’s hardware information and its assigned MAC address.</td>
</tr>
<tr>
<td>Port-channel is part...</td>
<td>Indicates whether the LAG is part of a LAG fate-sharing group (“Failover-group”).</td>
</tr>
<tr>
<td>Internet address...</td>
<td>States whether an IP address is assigned to the interface. If an IP address is assigned, that address is displayed.</td>
</tr>
<tr>
<td>MTU 1554...</td>
<td>Displays link and IP MTU.</td>
</tr>
<tr>
<td>LineSpeed</td>
<td>Displays the interface’s line speed. For a port channel interface, it is the line speed of the interfaces in the port channel.</td>
</tr>
<tr>
<td>Members in this...</td>
<td>Displays the interfaces belonging to this port channel.</td>
</tr>
<tr>
<td>ARP type...</td>
<td>Displays the ARP type and the ARP timeout value for the interface.</td>
</tr>
<tr>
<td>Last clearing...</td>
<td>Displays the time when the <code>show interfaces</code> counters were cleared.</td>
</tr>
<tr>
<td>Queueing strategy.</td>
<td>States the packet queuing strategy. FIFO means first in first out.</td>
</tr>
<tr>
<td>packets input...</td>
<td>Displays the number of packets and bytes into the interface.</td>
</tr>
<tr>
<td>Input 0 IP packets...</td>
<td>Displays the number of packets with IP headers, VLAN tagged headers, and MPLS headers. The number of packets may not add correctly because a VLAN tagged IP packet counts as both a VLAN packet and an IP packet.</td>
</tr>
<tr>
<td>0 64-byte...</td>
<td>Displays the size of packets and the number of those packets entering that interface. This information is displayed over two lines.</td>
</tr>
<tr>
<td>Received 0...</td>
<td>Displays the type and number of errors or other specific packets received. This information is displayed over three lines.</td>
</tr>
<tr>
<td>Output 0...</td>
<td>Displays the type and number of packets sent out the interface. This information is displayed over three lines.</td>
</tr>
<tr>
<td>Rate information...</td>
<td>Displays the traffic rate information into and out of the interface. Traffic rate is displayed in bits and packets per second.</td>
</tr>
<tr>
<td>Time since...</td>
<td>Displays the time since the last change in the configuration of this interface.</td>
</tr>
</tbody>
</table>

#### Example

```
DellEMC# show interfaces port-channel 20
Port-channel 20 is up, line protocol is up (Failover-group 1 is down)
Hardware address is 00:01:e8:01:46:fa
Port-channel is part of failover-group 1
Internet address is 1.1.120.1/24
```
MTU 1554 bytes, IP MTU 1500 bytes
LineSpeed 2000 Mbit
Members in this channel: Te 2/5 Te 2/18
ARP type: ARPA, ARP timeout 04:00:00
Last clearing of "show interfaces" counters 00:00:00
Queueing strategy: fifo
   44507301 packets input, 3563070343 bytes
   Input 44506754 IP Packets, 0 Vlans 0 MPLS
   41 64-byte pkts, 44502871 over 64-byte pkts, 249 over 127-byte pkts
   407 over 255-byte pkts, 3127 over 511-byte pkts, 606 over 1023-byte pkts
   Received 0 input symbol errors, 0 runts, 0 giants, 0 throttles
   0 CRC, 0 IP Checksum, 0 overrun, 0 discarded
   1218120 packets output, 100745130 bytes, 0 underruns
   Output 5428 Multicasts, 4 Broadcasts, 1212688 Unicasts
   1216142 IP Packets, 0 Vlans, 0 MPLS
   0 throttles, 0 discarded
Rate info (interval 299 sec):
   Input 01.50Mbits/sec, 2433 packets/sec
   Output 00.02Mbits/sec, 4 packets/sec
Time since last interface status change: 00:22:34

User Information
The following describes the `show interfaces port-channel brief` command shown in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LAG</td>
<td>Lists the port channel number.</td>
</tr>
<tr>
<td>Mode</td>
<td>Lists the mode:</td>
</tr>
<tr>
<td></td>
<td>• L3 — for Layer 3</td>
</tr>
<tr>
<td></td>
<td>• L2 — for Layer 2</td>
</tr>
<tr>
<td>Status</td>
<td>Displays the status of the port channel.</td>
</tr>
<tr>
<td></td>
<td>• down — if the port channel is disabled (shutdown)</td>
</tr>
<tr>
<td></td>
<td>• up — if the port channel is enabled (no shutdown)</td>
</tr>
<tr>
<td>Uptime</td>
<td>Displays the age of the port channel in hours:minutes:seconds.</td>
</tr>
<tr>
<td>Ports</td>
<td>Lists the interfaces assigned to this port channel.</td>
</tr>
<tr>
<td>(untitled)</td>
<td>Displays the status of the physical interfaces (up or down).</td>
</tr>
<tr>
<td></td>
<td>• In Layer 2 port channels, an * (asterisk) indicates which interface is the primary port of the port channel. The primary port sends out interface PDU.</td>
</tr>
<tr>
<td></td>
<td>• In Layer 3 port channels, the primary port is not indicated.</td>
</tr>
</tbody>
</table>

Example
```
DellEMC# show interfaces port-channel 1 brief

LAG    Mode  Status    Uptime      Ports
      1 L2     up   00:00:08  Te 3/1 (Up) *
         Te 3/2 (Down)         
         Te 3/3 (Up)              
DellEMC#
```

Related Commands
- `show lACP` — display the LACP matrix.
show port-channel-flow

Display an egress port in a given port-channel flow.

Syntax

```
show port-channel-flow outgoing-port-channel number incoming-interface interface {source-ip address destination-ip address} | {source-port number destination-port number} | {source-mac address destination-mac address {vlan vlanid | ether-type}}
```

Parameters

- **outgoing-port-channel number**: Enter the keywords outgoing-port-channel then the number of the port channel to display flow information.
  - For a Port Channel interface, enter the keywords port-channel then a number. The range is from 1 to 128.

- **incoming-interface interface**: Enter the keywords incoming-interface then the interface type and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

- **source-ip address**: Enter the keywords source-ip then the IP source address in IP address format.

- **destination-ip address**: Enter the keywords destination-ip then the IP destination address in IP address format.

- **source-port number**: Enter the keywords source-port then the source port number. The range is from 1 to 65536. The default is None.

- **destination-port number**: Enter the keywords destination-port then the destination port number. The range is from 1 to 65536. The default is None.

- **source-mac address**: Enter the keywords source-mac then the MAC source address in the nn:nn:nn:nn:nn:nn format.

- **destination-mac address**: Enter the keywords destination-mac then the MAC destination address in the nn:nn:nn:nn:nn:nn format.

- **vlan vlan-id**: Enter the keywords vlan then the VLAN-id. The range is from 0 to 4094.

- **ether-type**: Enter the keywords ether-type in the XX:XX format.

Command Modes

- EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

### Time Domain Reflectometer (TDR) Commands

TDR is useful for troubleshooting an interface that is not establishing a link; either it is flapping or not coming up at all. TDR detects open or short conditions of copper cables on 100/1000 Base-T modules.

### Important Points to Remember

- The interface and port must be enabled (configured—refer to the `interface` command) before running TDR. An error message is generated if you have not enabled the interface.
- The interface on the far-end device must be shut down before running TDR.
- Because TDR is an intrusive test on an interface that is not establishing a link, do not run TDR on an interface that is passing traffic.
- When testing between two devices, do not run the test on both ends of the cable.

**tdr-cable-test**

Test the condition of copper cables on 100/1000 Base-T modules.

**Syntax**

```
tdr-cable-test interface
```

**Parameters**

- `interface` Enter the keyword TenGigabitEthernet then the slot/port information for the 100/1000 Ethernet interface.

**Defaults**

None

**Command Modes**

EXEC

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tr>
<td>7.6.1.0</td>
<td>Introduced on the C-Series.</td>
</tr>
<tr>
<td>6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

The interface must be enabled to run the test or an error message is generated:

```
DellEMC# tdr-cable-test tengigabitethernet 11/1
% Error: Interface is disabled Te 11/1.
```

Syslog messages are generated when the link flaps during TDR tests.

**Related Commands**

- `show tdr` — display the results of the TDR test.
show tdr

Display the TDR test results.

Syntax

show tdr interface

Parameters

interface

Enter the keyword TenGigabitEthernet then the slot/port information for the 100/1000 Ethernet interface.

Defaults

None

Command Modes

EXEC

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.10(0.1) Introduced on the S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.9(0.0) Introduced on the C9010.
9.8(2.0) Introduced on the S3100 series.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S5000.
8.3.19.0 Introduced on the S4820T.

8.3.7.0 Introduced on the S4810.
8.2.1.0 Introduced on the E-Series.
7.7.1.0 Introduced on the S-Series.
7.6.1.0 Introduced on the C-Series.
6.1.1.0 Introduced.

Usage Information

If the TDR test has not been run, an error message is generated:

%Error: Please run the TDR test first

The following describes the TDR test status.

<table>
<thead>
<tr>
<th>Status</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK Status:</td>
<td>TDR test is complete, no fault is detected on the cable, and the test is terminated.</td>
</tr>
<tr>
<td>Terminated</td>
<td></td>
</tr>
<tr>
<td>Length: 92 (+/- 1) meters, Status: Shorted</td>
<td>A short is detected on the cable. The location, in this Example is 92 meters. The short is accurate to plus or minus one meter.</td>
</tr>
</tbody>
</table>
Status Definition
Length: 93 (+/- 1) meters, Status: Open
An opening is detected on the cable. The location, in this Example is 93 meters. The open is accurate to plus or minus one meter.
Status: Impedance Mismatch
There is an impedance mismatch in the cables.

Example
DellEMC# show tdr tengigabitethernet 11/2
Time since last test: 00:00:11
  Pair A, Length: OK Status: Terminated
  Pair B, Length: OK Status: Terminated
  Pair C, Length: OK Status: Terminated
  Pair D, Length: OK Status: Terminated

Related Commands
  • tdr-cable-test — run the TDR test.

UDP Broadcast Commands
The user datagram protocol (UDP) broadcast feature is a software-based method to forward low throughput (not to exceed 200 pps) IP/UDP broadcast traffic arriving on a physical or VLAN interface.

Important Points to Remember
• This feature is available only on the S4810, S4820T, S3048-ON, S4048-ON, Z9000 platforms.
• Routing information protocol (RIP) is not supported with the UDP Broadcast feature.
• If you configure this feature on an interface using the ip udp-helper udp-port command, the ip directed-broadcast command becomes ineffective on that interface.
• The existing show interface command has been modified to display the configured broadcast address.

debug ip udp-helper
Enable UDP debug and display the debug information on a console.

Syntax
debug ip udp-helper
To disable debug information, use the no debug ip udp-helper command.

Defaults
Debug disabled.

Command Modes
• EXEC
• EXEC Privilege

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.8(0.0P5) Introduced on the S4048-ON.
### ip udp-helper udp-port

Enable the UDP broadcast feature on an interface either for all UDP ports or a specified list of UDP ports.

#### Syntax

```
ip udp-helper udp-port [udp-port-list]
```

To disable the UDP broadcast on a port, use the `no ip udp-helper udp-port [udp-port-list]` command.

#### Parameters

- **udp-port-list**: (OPTIONAL) Enter up to 16 comma-separated UDP port numbers.

  **NOTE**: If you do not use this option, all UDP ports are considered by default.

#### Defaults

None

#### Command Modes

INTERFACE (config-if)

#### Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.8(0.0P5)</td>
<td>Introduced on the S4048-ON.</td>
</tr>
</tbody>
</table>
show ip udp-helper

Display the configured UDP helpers on all interfaces.

Syntax

show ip udp-helper

Defaults
None

Command Modes
EXEC

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(1.0) Introduced on the Z9500.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
Pre-version 8.3.7.0 Introduced on the E-Series.

Example

DellEMC# show ip udp-helper
---
Port UDP port list
---

ip http source-interface

Specify an interface as the source interface for HTTP connections.

Syntax

ip http source-interface interface

To delete an interface, use the no ip http source-interface interface command.

Parameters

interface

Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For a Loopback interface, enter the keyword loopback then a number from 0 to 16383.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

Defaults

The IP address on the system that is closest to the Telnet address is used in the outgoing packets.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Internet Protocol Security (IPSec)

Internet protocol security (IPSec) is an end-to-end security scheme for securing IP communications by authenticating and encrypting all packets in a session. Use IPSec between hosts, gateways, or hosts and gateways.

IPSec uses a series of protocol functions to achieve information security:

- **Authentication Headers (AH)** — Connectionless integrity and origin authentication for IP packets.
- **Encapsulating Security Payloads (ESP)** — Confidentiality, authentication, and data integrity for IP packets.
- **Security Associations (SA)** — Algorithm-provided parameters required for AH and ESP protocols.

IPSec capability is available on control (protocol) and management traffic; end-node support is required.

IPSec supports two operational modes: Transport and Tunnel.

- **Transport** is the default mode for IPSec and encrypts only the payload of the packet. Routing information is unchanged.
- **Tunnel** mode is used to encrypt the entire packet, including the routing information in the IP header. Tunnel mode is typically used in creating virtual private networks (VPNs).

Transport mode provides IP packet payload protection using ESP. You can use ESP alone or in combination with AH to provide additional authentication. AH protects data from modification but does not provide confidentiality.

SA is the configuration information that specifies the type of security provided to the IPSec flow. The SA is a set of algorithms and keys used to authenticate and encrypt the traffic flow. The AH and ESP use SA to provide traffic protection for the IPSec flow.

**NOTE:**
The Dell EMC Networking OS supports IPSec only for FTP and telnet protocols (ports 20, 21, and 23). The system rejects if you configure IPSec for other protocols.

Topics:

- crypto ipsec transform-set
- crypto ipsec policy
- management crypto-policy
- match
- session-key
- show crypto ipsec transform-set
- show crypto ipsec policy
- transform-set
crypto ipsec transform-set

Create a transform set, or combination of security algorithms and protocols, of cryptos.

Syntax

crypto ipsec transform-set name {ah-authentication {md5|sha1|null} | esp-authentication {md5|sha1|null} | esp-encryption {3des|cbc|des|null}}

To delete a transform set, use the no crypto ipsec transform-set name {ah-authentication {md5|sha1|null} | esp-authentication {md5|sha1|null} | esp-encryption {3des|cbc|des|null}} command.

Parameters

name

Enter the name for the transform set.

ah-authentication

Enter the keywords ah-authentication then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.

- md5 — Use Message Digest 5 (MD5) authentication.
- sha1 — Use Secure Hash Algorithm 1 (SHA-1) authentication.
- null — Causes an encryption policy configured for the area to not be inherited on the interface.

esp-authentication

Enter the keywords esp-authentication then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.

- md5 — Use Message Digest 5 (MD5) authentication.
- sha1 — Use Secure Hash Algorithm 1 (SHA-1) authentication.
- null — Causes an encryption policy configured for the area to not be inherited on the interface.

esp-encryption

Enter the keywords esp-encryption then the transform type of operation to apply to traffic. The transform type represents the encryption or authentication applied to traffic.

- 3des — Use 3DES encryption.
- cbc — Use CDC encryption.
- des — Use DES encryption.
- null — Causes an encryption policy configured for the area to not be inherited on the interface.

Defaults

None

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
Version | Description
--- | ---
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.2(0.2) | Introduced on the Z9000, S4810, and S4820T.
9.2(1.0) | Introduced on the Z9500.

Usage Information
- Both sides of the link must specify the same transform set.
- You can create up to 64 transform sets.

Example
Dell(conf)# do show crypto ipsec transform-set
Transform-Set Name : ts1
Transform-Set refCnt : 0
AH Transform : md5
ESP Auth Transform :
ESP Encry Transform :
Dell(conf)#

crypto ipsec policy
Create a crypto policy used by ipsec.

Syntax
```
crypto ipsec policy name seq-num ipsec-manual
```
To delete a crypto policy entry, use the `no crypto ipsec policy name seq-num ipsec-manual` command.

Parameters
- **name**
  - Enter the name for the crypto policy set.
- **seq-num**
  - Enter the sequence number assigned to the crypto policy entry.

Defaults
None

Command Modes
- CONFIGURATION

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version | Description
--- | ---
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.2(0.2) | Introduced on the Z9000, S4810, and S4820T.
9.2(1.0) | Introduced on the Z9500.
This command creates a crypto policy entry and enters the crypto policy configuration mode for configuring the flow parameters.

Example

```
Dell(conf)# crypto ipsec policy West 10 ipsec-manual
Dell(conf-crypto-policy)#
```

**management crypto-policy**

Apply the crypto policy to management traffic.

**Syntax**

```
management crypto-policy name
```

To remove the management traffic crypto policy, use the `no management crypto-policy name` command.

**Parameters**

- `name` Enter the name for the crypto policy.

**Defaults**

None

**Command Modes**

CONFIGURATION

</tr>
</tbody>
</table>

**match**

Apply an match filter to the crypto policy.

**Syntax**

```
match seq-num tcp [source ip address | ipv6 address [mask] {source-port number}] [destination ip address | ipv6 address [mask] {destination-port number}]
```

To remove the match filter for the crypto map, use the `no match seq-num tcp [source ip address | ipv6 address [mask] {source-port number}] [destination ip address | ipv6 address [mask] {destination-port number}]` command.

**Parameters**

- `seq-num` Enter the match command sequence number.
sourceip-address | ipv6 address
mask
source-port number
destination-port number

Enter the keyword source then the IPv4 or IPv6 address for the source.
Enter the mask prefix length in /nn format.
Enter the source port number.
Enter the destination port number.

Defaults
None

Command Modes
CONFIG-CRYPTO-POLICY

Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.2(0.2) Introduced on the Z9000, S4810, and S4820T.
9.2(1.0) Introduced on the Z9500.

Usage Information
- IPv4 addresses support only "/32" mask types.
- IPv6 addresses support only "/128" mask types.
- Configure match for bi-directional traffic for optimal routing.
- Only TCP is supported.

Example

<table>
<thead>
<tr>
<th>match</th>
<th>tcp</th>
<th>source</th>
<th>destination</th>
<th>source-port</th>
<th>destination-port</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>

</tr>
</tbody>
</table>

session-key

Specify the session keys used in the crypto policy entry.

Syntax
session-key {inbound | outbound} {ah spi hex-key-string | esp spi encrypt hex-key-string auth hex-key-string}

To delete the session key information from the crypto policy, use the no session-key {inbound | outbound} {ah | esp} command.

Parameters

name

Enter the name for the transform set.
inbound Specify the inbound session key for IPSec.
outbound Specify the outbound session key for IPSec.
ah Use the AH protocol when you select the AH transform set in the crypto policy.
esp Use the ESP protocol when you select the ESP transform set in the crypto policy.
spi Enter the security parameter index number.
hex-key-string Enter the session key in hex format (a string of 8, 16, or 20 bytes). For DES algorithms, specify at least 16 bytes per key. For SHA algorithms, specify at least 20 bytes per key.
encrypt Indicates the ESP encryption transform set key string.
auth Indicates the ESP authentication transform set key string.

Defaults None

Outbound ESP Encry SPI: 0
Outbound AH Key       : [0]::
Outbound ESP Auth Key : [0]::
Outbound ESP Encry Key : [0]::
```
transform-set

Specify the transform set the crypto policy uses.

**Syntax**

```
transform-set transform-set-name
```

To delete a transform set from the crypto policy, use the `no transform-set transform-set-name` command.

**Parameters**

- `transform-set-name` Enter the name for the crypto policy transform set.

**Defaults**

None

**Command Modes**

CONFIG-CRYPTO-POLICY

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.2(0.2) | Introduced on the Z9000, S4810, and S4820T.
9.2(1.0) | Introduced on the Z9500.
The basic IPv4 commands are supported by Dell EMC Networking OS on the platform.

Topics:
- arp
- arp backoff-time
- arp learn-enable
- arp max-entries
- arp retries
- arp timeout
- clear arp-cache
- clear host
- clear ip fib stack-unit
- clear ip route
- clear tcp statistics
- debug arp
- debug ip dhcp
- debug ipv6 dhcp
- debug ip icmp
- debug ip packet
- ip address
- ip directed-broadcast
- ip domain-list
- ip domain-lookup
- ip domain-name
- ip helper-address
- ip helper-address hop-count disable
- ip host
- ip icmp source-interface
- ipv6 icmp source-interface
- ip max-frag-count
- ip max-routes
- ip mtu
- ip name-server
- ip proxy-arp
- ip route
- ip source-route
- ip unreachable
- load-balance
- load-balance hg
arp

To associate an IP address with a MAC address in the switch, use address resolution protocol (ARP).

Syntax

```
arp [vrf vrf-name] ip-address mac-address interface
```

To remove an ARP address, use the no arp ip-address command.

Parameters

- **vrf vrf-name**: Enter a VRF name to configure an ARP entry for that VRF. Use the VRF option after the keyword `arp` to configure a static arp on that particular VRF.
- **ip-address**: Enter an IP address in dotted decimal format.
- **mac-address**: Enter a MAC address in nnnn.nnnn.nnnn format.
- **interface**: Enter any of the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport/subport information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.

Defaults

Not configured.

Command Modes

- **CONFIGURATION**

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
Version | Description
---|---
9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.4(0.0) | Added support for VRF.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.5.1.0 | Added support for 4-port 40G line cards on the E-Series.
8.3.7.0 | Introduced on the S4810.
8.1.1.0 | Introduced on the E-Series.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
pre-6.2.1.0 | Introduced on the E-Series.

Usage Information

You cannot use Class D or Class E IP addresses or zero IP address (0.0.0.0) when creating a static ARP. Zero MAC addresses (00:00:00:00:00:00) are also invalid.

You can use the `vrf` attribute of this command to create a static ARP entry on either a default or a non-default VRF. You cannot use this parameter to create any static ARPs corresponding to management VRFs. When a VRF is deleted using the `no ip vrf` command, all the static ARP configurations that belong to that VRF are removed automatically.

Although static ARP entries take precedence over dynamically-learnt ARP entries, a static ARP entry that points to a wrong port is not included in the FIB or ARP entries.

Related Commands

- `clear arp-cache` — clear dynamic ARP entries from the ARP table.
- `show arp` — display the ARP table.

arp backoff-time

Set the exponential timer for resending unresolved ARPs.

Syntax

```
arp backoff-time seconds
```
Parameters

seconds Enter the number of seconds an ARP entry is black-holed. The range is from 1 to 3600. The default is 30.

Defaults

30

Command Mode

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<tr>
<td>8.3.8.0</td>
<td>Introduced on the S4810.</td>
</tr>
</tbody>
</table>

Usage Information

This timer is an exponential backoff timer. Over the specified period, the time between ARP requests increases. This behavior reduces the potential for the system to slow down while waiting for a multitude of ARP responses.

Related Commands

- show arp retries — display the configured number of ARP retries.

**arp learn-enable**

Enable ARP learning using gratuitous ARP.

**Syntax**

arp learn-enable

**Defaults**

Disabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### Version Description
- **9.10(0.1)** Introduced on the S6010-ON and S4048T-ON.
- **9.10(0.0)** Introduced on the S3148.
- **9.10(0.0)** Introduced on the S6100–ON.
- **9.8(2.0)** Introduced on the S3100 series.
- **9.8(1.0)** Introduced on the Z9100–ON.
- **9.8(0.0P5)** Introduced on the S4048-ON.
- **9.8(0.0P2)** Introduced on the S3048-ON.
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the S4820T.
- **8.3.11.1** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **8.3.1.0** Introduced.

#### Usage Information
In Dell EMC Networking OS versions prior to 8.3.1.0, if a gratuitous ARP is received some time after an ARP request is sent, only RP2 installs the ARP information. For example:

1. At time t=0, Dell EMC Networking OS sends an ARP request for IP A.B.C.D.
2. At time t=1, Dell EMC Networking OS receives an ARP request for IP A.B.C.D.
3. At time t=2, Dell EMC Networking OS installs an ARP entry for A.B.C.D only on RP2.

Beginning with Dell EMC Networking OS version 8.3.1.0, when a gratuitous ARP is received, Dell EMC Networking OS installs an ARP entry on all three CPUs.

### arp max-entries

Enables you to configure the maximum number of ARP entries per VRF that are allowed for IPv4.

#### Syntax
```
arp max-entries [vrf vrf-name] max-number
```

#### Parameters
- **vrf vrf-name**
  
Enter the name of a specific VRF for which you want to configure maximum number of ARP entries that IPv4 allows.

- **max-number**
  
Enter the maximum number of ARP entries that a VRF RTM can hold. The range is from 0 to 65535.

#### Defaults
Not configured.

#### Command Modes
- **CONFIGURATION**

<tr>
<td>9.4(0.0)</td>
<td>Introduced on the S4810 and S4820T.</td>
</tr>
</tbody>
</table>

Usage Information

Use this command to specify the maximum number of ARP entries that the Route Table Manager can hold for a specific VRF. This command does not apply to the management VRFs.

arp retries

Set the number of ARP retries in case the system does not receive an ARP reply in response to an ARP request.

Syntax

arp retries number

Parameters

number Enter the number of retries. The range is from 1 to 20. The default is 5.

Defaults

5

**Usage Information**
Retries are 20 seconds apart.

**Related Commands**
- `show arp retries` — display the configured number of ARP retries.

### arp timeout

Set the time interval for an ARP entry to remain in the ARP cache.

**Syntax**

```
arp timeout minutes
```

**Parameters**

- `minutes` Enter the number of minutes. The range is from 0 to 35790. The default is 240 minutes.

**Defaults**

240 minutes (4 hours)

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

clear arp-cache

Clear the dynamic ARP entries from a specific interface or optionally delete (no-refresh) ARP entries from the content addressable memory (CAM).

Syntax

```
clear arp-cache [vrf vrf-name | interface | ip ip-address] [no-refresh]
```

Parameters

- **vrf vrf-name**  
  (OPTIONAL) Enter the keyword vrf and then the name of the VRF to clear the ARP cache corresponding to that VRF.

- **interface**  
  (OPTIONAL) Enter the following keywords and the interface information:
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/subport[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  - For the Management interface on the stack-unit, enter the keyword ManagementEthernet then the slot/port information.
  - For a port channel interface, enter the keywords port-channel then a number.
  - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

- **ip ip-address**  
  (OPTIONAL) Enter the keyword ip then the IP address of the ARP entry you wish to clear.

- **no-refresh**  
  (OPTIONAL) Enter the keywords no-refresh to delete the ARP entry from CAM. Or use this option with interface or ip ip-address to specify which dynamic ARP entries you want to delete.

**NOTE:** Transit traffic may not be forwarded during the period when deleted ARP entries are resolved again and re-installed in CAM. Use this option with extreme caution.

Command Modes

- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version | Description
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
clear host

Remove one or all dynamically learned host table entries.

Syntax

```
clear host name
```

Parameters

- **name**
  
Enter the name of the host to delete. Enter * to delete all host table entries.

Command Modes

- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

clear ip fib stack-unit

Clear all FIB entries in the specified stack unit (use this command with caution, refer to Usage Information.)

Syntax

```
clear ip fib stack-unit unit-number vrf vrf-name
```

Parameters

- `unit-number` Enter the number of the stack unit.
- `vrf vrf-name` Enter the keyword `vrf` followed by the name of the VRF to clear all FIB entries corresponding to that VRF.

Command Modes

EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version | Description
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.

9.10(0.0) | Introduced on the S6100-ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100-ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.7.0 | Introduced on the S4810.
8.1.1.0 | Introduced on the E-Series.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
clear ip route

Clear one or all routes in the routing table.

Syntax

```
clear ip route [vrf vrf-name] {* | ip-address mask}
```

Parameters

- `vrf vrf-name` (Optional) Enter the keyword `vrf` and then the name of the VRF to clear the routes corresponding to that VRF.
- `*` Enter an asterisk (*) to clear all learned IP routes.
- `ip-address mask` Enter a specific IP address and mask in dotted decimal format to clear that IP address from the routing table.

Command Modes

- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

- 9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
- 9.10(0.0) Introduced on the S3148.
- 9.10(0.0) Introduced on the S6100–ON.
- 9.8(2.0) Introduced on the S3100 series.
- 9.8(1.0) Introduced on the Z9100–ON.
- 9.8(0.0P6) Introduced on the S4048-ON.
- 9.8(0.0P2) Introduced on the S3048-ON.
- 9.7(0.0) Introduced on the S6000-ON.

Usage Information

To clear Layer 3 CAM inconsistencies, use this command.

⚠️ **CAUTION:** Executing this command causes traffic disruption.

Related Commands

- `show ip fib stack-unit` — show FIB entries on a specified stack-unit.
Use the `vrf vrf-name` attribute of this command to clear routes corresponding to either a specific VRF or the default VRF.

You cannot use this attribute to clear routes corresponding to a management VRF.

**Related Commands**
- `ip route` — assign an IP route to the switch.
- `show ip route` — view the routing table.
- `show ip route summary` — view a summary of the routing table.

### clear tcp statistics

Clear TCP counters.

**Syntax**
```
clear tcp statistics [all | cp]
```

**Parameters**
- `all` Enter the keyword `all` to clear all TCP statistics maintained on all switch processors.
- `cp` (OPTIONAL) Enter the `cp` to clear only statistics from the Control Processor.
- `rp` (OPTIONAL) Enter the keyword `rp` to clear only the statistics from Route Processor.

**Command Modes**
- EXEC Privilege

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version**
- 9.10(0.1) Introduced on the S6010-ON and S4048T-ON.

debug arp

View information on ARP transactions.

Syntax
debug arp [interface] [count value]

To stop debugging ARP transactions, use the no debug arp command.

Parameters

interface (OPTIONAL) Enter the following keywords and the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port/support[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
- For the Management interface on the stack-unit, enter the keyword ManagementEthernet then the slot/port information.
- For a port channel interface, enter the keywords port-channel then a number.
- For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

count value (OPTIONAL) Enter the keyword count then the count value. The range is from 1 to 65534.

Defaults
None

### Usage Information
To stop packets from flooding the user terminal when debugging is turned on, use the count option.

### debug ip dhcp
Enable debug information for dynamic host configuration protocol (DHCP) relay transactions and display the information on the console.

**Syntax**
```
debug ip dhcp
```

To disable debug, use the no debug ip dhcp command.

**Defaults**
Debug disabled

**Command Modes**
- EXEC Privilege
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**debug ip icmp**

View information on the internal control message protocol (ICMP).

**Syntax**

```
dbog ip icmp [interface] [count value]
```
To disable debugging, use the `no debug ip icmp` command.

**Parameters**

- **interface**
  - (OPTIONAL) Enter the following keywords and the interface information:
    - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport[/subport] information.
    - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
    - For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
    - For a port channel interface, enter the keywords `port-channel` then a number.
    - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

- **count value**
  - (OPTIONAL) Enter the keyword `count` then the count value. The range is from 1 to 65534. The default is `Infinity`.

**Command Modes**

- EXEC Privilege

**Command History**

**Example**

```
ICMP: echo request rcvd from src 40.40.40.40
ICMP: src 40.40.40.40, dst 40.40.40.40, echo reply
```
Usage Information

To stop packets from flooding the user terminal when debugging is turned on, use the count option.

**debug ip packet**

View a log of IP packets sent and received.

**Syntax**

```plaintext
ddebug ip packet [access-group name] [count value] [interface]
```

To disable debugging, use the no debug ip packet [access-group name] [count value] [interface] command.

**Parameters**

- **access-group name**
  - Enter the keyword access-group then the access list name (maximum 16 characters) to limit the debug output based on the defined rules in the ACL.

- **count value**
  - (OPTIONAL) Enter the keyword count then the count value. The range is from 1 to 65534. The default is Infinity.

- **interface**
  - (OPTIONAL) Enter the following keywords and the interface information:
    - For the Management interface on the stack-unit, enter the keyword ManagementEthernet then the slot/port information.
    - For a port channel interface, enter the keywords port-channel then a number.
    - For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100--ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100--ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.

890 IPv4 Routing

</tbody>
</table>

**Usage Information**

The following describes the `debug ip packet` command in the following example.

**Field** | **Description**
---|---
`s=` | Lists the source address of the packet and the name of the interface (in parentheses) that received the packet.

`d=` | Lists the destination address of the packet and the name of the interface (in parentheses) through which the packet is being sent out on the network.

`len` | Displays the packet’s length.

`sending, rcvd, fragment, sending broad/multicast proto, unroutable` | The last part of each line lists the status of the packet.

`TCP src=` | Displays the source and destination ports, the sequence number, the acknowledgement number, and the window size of the packets in that TCP packets.

`UDP src=` | Displays the source and destination ports for the UDP packets.

`ICMP type=` | Displays the ICMP type and code.

`IP Fragment` | States that it is a fragment and displays the unique number identifying the fragment (Ident) and the offset (in 8-byte units) of this fragment (fragment offset) from the beginning of the original datagram.

**Example**

| IP: s=10.1.2.62 (local), d=10.1.2.206 (Ma 1/1), len 54, sending  TCP src=23, dst=40869, seq=2112994894, ack=606901739, win=8191 ACK PUSH |   |
| IP: s=10.1.2.206 (Ma 1/1), d=10.1.2.62, len 40, rcvd TCP src=0, dst=0, seq=0, ack=0, win=0 |   |
| IP: s=10.1.2.62 (local), d=10.1.2.206 (Ma 1/1), len 226, sending TCP src=23, dst=40869, seq=2112994896, ack=606901739, win=8192 ACK PUSH |   |
| IP: s=10.1.2.216 (Ma 1/1), d=10.1.2.255, len 78, rcvd UDP src=0, dst=0 |   |
| IP: s=10.1.2.62 (local), d=10.1.2.3 (Ma 1/1), len 1500, sending fragment IP Fragment, Ident = 4741, fragment offset = 0 ICMP type=0, code=0 |   |
To stop packets from flooding the user terminal when debugging is turned on, use the `count` option.

The `access-group` option supports only the equal to (eq) operator in TCP ACL rules. Port operators not equal to (neq), greater than (gt), less than (lt), or range are not supported in access-group option (refer to the following example). ARP packets (arp) and Ether-type (ether-type) are also not supported in the access-group option. The entire rule is skipped to compose the filter.

The `access-group` option pertains to:

- IP protocol number: from 0 to 255
- Internet control message protocol (icmp) but not the ICMP message type (from 0 to 255)
- Any internet protocol (ip)
- Transmission Control Protocol (tcp) but not on the rst, syn, or urg bits
- User Datagram Protocol (udp)

In the case of ambiguous access control list rules, the `debug ip packet access-control` command is disabled. A message appears identifying the error (refer to the Example below).

**Example (Error Messages)**

```plaintext
DellEMC# debug ip packet access-group test
%Error: port operator GT not supported in access-list debug
%Error: port operator LT not supported in access-list debug
%Error: port operator RANGE not supported in access-list debug
%Error: port operator NEQ not supported in access-list debug
```

DellEMC#00:10:45: %RPM0-P:CP
%IPMGR-3-DEBUG_IP_PACKET_ACL_AMBIGUOUS_EXP: Ambiguous rules not supported in access-list debug, access-list debugging is turned off
DellEMC#

**ip address**

Assign a primary and secondary IP address to the interface.

**Syntax**

```
ip address ip-address mask [secondary]
```

To delete an IP address from an interface, use the `no ip address [ip-address]` command.

**Parameters**

- `ip-address`: Enter an IP address in dotted decimal format.
mask
Enter the mask of the IP address in slash prefix format (for example, /24).

secondary
(Optional) Enter the keyword secondary to designate the IP address as the secondary address.

Defaults
Not configured.

Usage Information
You must be in INTERFACE mode before you add an IP address to an interface. Assign an IP address to an interface prior to entering ROUTER OSPF mode.

ip directed-broadcast

Enables the interface to receive directed broadcast packets.

Syntax
ip directed-broadcast

To disable the interface from receiving directed broadcast packets, use the no ip directed-broadcast command.
 Defaults Disabled (that is, the interface does not receive directed broadcast packets)

 Command Modes INTERFACE

**ip domain-list**

Configure names to complete unqualified host names.

**Syntax**

```
ip domain-list name
```

To remove the name, use the `no ip domain-list name` command.

**Parameters**

- **name**

Enter a domain name to be used to complete unqualified names (that is, incomplete domain names that cannot be resolved).

**Defaults**

Disabled.

</tr>
</tbody>
</table>

Usage Information

To configure a list of possible domain names, configure the `ip domain-list` command up to six times.

If you configure both the `ip domain-name` and `ip domain-list` commands, the software tries to resolve the name using the `ip domain-name` command. If the name is not resolved, the software goes through the list of names configured with the `ip domain-list` command to find a match.

To enable dynamic resolution of hosts, use the following steps:

- specify a domain name server with the `ip name-server` command
- enable DNS with the `ip domain-lookup` command

To view current bindings, use the `show hosts` command. To view a DNS-related configuration, use the `show running-config resolve` command.

Related Commands

- `ip domain-name` — specify a DNS server.
ip domain-lookup

To address resolution (that is, DNS), enable dynamic host-name.

Syntax

ip domain-lookup

To disable DNS lookup, use the no ip domain-lookup command.

Defaults

Disabled.

Command Modes

CONFIGURATION

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Usage Information

To fully enable DNS, also specify one or more domain name servers with the ip name-server command.

Dell EMC Networking OS does not support sending DNS queries over a VLAN. DNS queries are sent out all other interfaces, including the Management port.

To view current bindings, use the show hosts command.

Related Commands

- ip name-server — specify a DNS server.
• show hosts — view the current bindings.

**ip domain-name**

Configure one domain name for the switch.

**Syntax**

```
ip domain-name name
```

To remove the domain name, use the `no ip domain-name` command.

**Parameters**

- `name`: Enter one domain name to be used to complete unqualified names (that is, incomplete domain names that cannot be resolved).

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

**Usage Information**

You can only configure one domain name with the `ip domain-name` command. To configure more than one domain name, configure the `ip domain-list` command up to six times.
To enable dynamic resolution of hosts, use the following steps:

- specify a domain name server with the `ip name-server` command
- enable DNS with the `ip domain-lookup` command

To view current bindings, use the `show hosts` command.

**Related Commands**

- `ip domain-list` — configure additional names.

---

**ip helper-address**

Specify the address of a DHCP server so that DHCP broadcast messages can be forwarded when the DHCP server is not on the same subnet as the client.

**Syntax**

```
ip helper-address ip-address
```

To remove a DHCP server address, use the `no ip helper-address` command.

**Parameters**

- `ip-address` Enter an IP address in dotted decimal format (A.B.C.D).

**Defaults**

Not configured.

**Command Modes**

INTERFACE

**Command History**

</tbody>
</table>
You can add multiple DHCP servers by entering the `ip helper-address` command multiple times. If multiple servers are defined, an incoming request is sent simultaneously to all configured servers and the reply is forwarded to the DHCP client.

Dell EMC Networking OS uses standard DHCP ports, that is UDP ports 67 (server) and 68 (client) for DHCP relay services. It listens on port 67 and if it receives a broadcast, the software converts it to unicast, and forwards to it to the DHCP-server with source port=68 and destination port=67.

The server replies with source port=67, destination port=67 and Dell EMC Networking OS forwards to the client with source port=67, destination port=68.

### ip helper-address hop-count disable

Disable the hop-count increment for the DHCP relay agent.

**Syntax**

```
ip helper-address hop-count disable
```

To re-enable the hop-count increment, use the `no ip helper-address hop-count disable` command.

**Defaults**

Enabled; the hops field in the DHCP message header is incremented by default.

**Command Modes**

CONFIGURATION

**Command History**

</tbody>
</table>

**Usage Information**

This command disables the incrementing of the hops field when boot requests are relayed to a DHCP server through Dell EMC Networking OS. If the incoming boot request already has a non-zero hops field, the message is relayed with the same value for hops. However, the message is discarded if the hops field exceeds 16, to comply with the relay agent behavior specified in RFC 1542.

**Related Commands**

- `ip helper-address` — specify the destination broadcast or host address for DHCP server requests.
- `show running-config` — display the current configuration and changes from the default values.

**ip host**

Assign a name and an IP address to the host-to-IP address mapping table.

**Syntax**

```
ip host name ip-address
```

To remove an IP host, use the `no ip host name [ip-address]` command.

**Parameters**

- `name` Enter a text string to associate with one IP address.
- `ip address` Enter an IP address, in dotted decimal format, to be mapped to the name.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>
Enable the ICMP error and unreachable messages to be sent with the source interface IP address, such as the loopback address, instead of the hops of the preceding devices along the network path to be used for easy debugging and diagnosis of network disconnections and reachability problems with IPv4 packets.

**Syntax**

```
ip icmp source-interface interface
```

**Parameters**

- `interface` Enter one of the following keywords and slot/port[/subport] or number information:
  - For a Management Ethernet interface, enter the keyword `managementethernet`.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**NOTE:**
- When you configure the capability to enable the loopback IP address to be sent for easy debugging and diagnosis (IP addresses of the devices for which the ICMP source interface is configured), the source IP address of the outgoing ICMP error message is modified, although the packets are not sent out using the configured interface. Because the management interface is configured without any parameters such as the IP address, it is treated to the management interface of the primary unit or the existing unit.
- For ICMP, a user can specify one source-interface for each VRF and let it be the default, management or any other VRF created. For other protocols (Telnet, SSH, FTP, TFTP), where the source interface can be specified, only one interface can be chosen. This is for all VRFs combined.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port/subport information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.

- For a port channel interface, enter the keywords `port-channel` then a number.

- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

`Not configured.`

**Command Modes**

</tr>
</tbody>
</table>

**Usage Information**

You can enable the mechanism to configure the source or the originating interface from which the packet (the device that generates the ICMP error messages) is received by the switch to send the loopback address instead of its source IP address to be used in the ICMP unreachable messages and in the `traceroute` command output. The loopback address must be unique in a particular domain.

In network environments that contain a large number of devices, ranging up to thousands of systems, and with each device configured for equal-cost multipath (ECMP) links, you cannot effectively and optimally use the `traceroute` and `ping` applications to examine the network reachability and identify any broken links for diagnostic purposes. In such cases, if the reply that is obtained from each hop on the network path contains the IP address of the adjacent, neighboring interface from which the packet is received, it is difficult to employ the `ping` and `traceroute` utilities. You can enable the ICMP unreachable messages to contain the loopback address of the source device instead of the previous hop's IP address to be able to easily and quickly identify the device and devices along the path because the DNS server maps the loopback IP address to the hostname and does not translate the IP address of every interface of the switch to the hostname.

**Example**

```
DellEMC(conf)# ip icmp source-interface tengigabitethernet 1/1
DellEMC(conf)#
```

**ipv6 icmp source-interface**

Enable the ICMP error and unreachable messages to be sent with the source interface IP address, such as the loopback address, instead of the hops of the preceding devices along the network path to be used for easy debugging and diagnosis of network disconnections and reachability problems with IPv6 packets.

**Syntax**

```
ipv6 icmp source-interface interface
```
### Parameters

**interface**

Enter one of the following keywords and slot/port[/subport] or number information:

- For a Management Ethernet interface, enter the keyword `managementethernet`.

**NOTE:** When you configure the capability to enable the loopback IP address to be sent for easy debugging and diagnosis (IP addresses of the devices for which the ICMP source interface is configured), the source IP address of the outgoing ICMP error message is modified, although the packets are not sent out using the configured interface. Because the management interface is configurable only without any parameters such as the IP address, it is treated to the management interface of the primary unit or the existing unit.

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

### Defaults

Not configured.

</tr>
</tbody>
</table>

### Usage Information

You can enable the mechanism to configure the source or the originating interface from which the packet (the device that generates the ICMP error messages) is received by the switch to send the loopback address instead of its source IP address to be used in the ICMP unreachable messages and in the `traceroute` command output. The loopback address must be unique in a particular domain.

In network environments that contain a large number of devices, ranging up to thousands of systems, and with each device configured for equal-cost multipath (ECMP) links, you cannot effectively and optimally use the `traceroute` and ping applications to examine the network reachability and identify any broken links for diagnostic purposes. In such cases, if the reply that is obtained from each hop on the network path contains the IP address of the adjacent, neighboring interface from which the packet is received, it is difficult to employ the ping and traceroute utilities. You can enable the ICMP unreachable messages to contain the loopback address of the source
device instead of the previous hop’s IP address to be able to easily and quickly identify the device and devices along the path because the DNS server maps the loopback IP address to the hostname and does not translate the IP address of every interface of the switch to the hostname.

Example

```
DellEMC(conf)# ipv6 icmp source-interface tengigabitethernet 1/1
DellEMC(conf)#
```

## ip max-frag-count

Set the maximum number of fragments allowed in one packet for packet re-assembly.

**Syntax**

```
ip max-frag-count count
```

To place no limit on the number of fragments allowed, use the `no ip max-frag-count` command.

**Parameters**

- `count` Enter a number for the number of fragments allowed for re-assembly. The range is from 2 to 256.

**Defaults**

No limit is set on number of fragments allowed.

**Command Modes**

</tr>
<tr>
<td>7.6.1.0</td>
<td>Introduced on the S-Series.</td>
</tr>
</tbody>
</table>
**Usage Information**

To avoid denial of service (DOS) attacks, keep the number of fragments allowed for re-assembly low.

---

**ip max-routes**

Enables you to configure the maximum number of protocol routes per VRF that are allowed for IPv4.

**Syntax**

```
ip max-routes [vrf vrf-name] max-number
```

**Parameters**

- `vrf vrf-name` Enter the keyword `vrf` and then the name of the VRF for which you want to configure maximum number of protocol routes that IPv4 allows.
- `max-number` Enter the maximum number of protocol routes that a VRF RTM can hold. The range is from 0 to 7500.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tr>
<tr>
<td>9.4.(0.0)</td>
<td>Introduced on the S4810 and S4820T.</td>
</tr>
</tbody>
</table>

**Usage Information**

Use this command to specify the maximum number of protocol routes that the Route Table Manager can hold for a specific VRF. This command does not apply to the management VRFs.

**Related Commands**

- `show ip route` — view the switch routing table.
- `show ipv6 route` — display the IPv6 routes.

---

**ip mtu**

Set the IP MTU (frame size) of the packet the RPM transmits for the line card interface. If the packet must be fragmented, Dell EMC Networking OS sets the size of the fragmented packets to the size specified in this command.

**Syntax**

```
ip mtu value
```
To return to the default IP MTU value, use the `no ip mtu` command.

**Parameters**

- **value**: Enter the maximum MTU size if the IP packet is fragmented. The range is from 576 to 9234. The default is 1500 bytes.

**Defaults**

- 1500 bytes

**Command Modes**

- INTERFACE (Gigabit Ethernet and 10-Gigabit Ethernet interfaces)

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

<table>
<thead>
<tr>

<tr>
<td>8.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
<tr>
<td>6.1.1.0</td>
<td>Introduced on the E-Series.</td>
</tr>
</tbody>
</table>

**Usage Information**

When you enter the `no mtu` command, Dell EMC Networking OS reduces the `ip mtu` value to 1536 bytes. To return the IP MTU value to the default, use the `no ip mtu` command.

Starting with Dell EMC Networking OS Release 9.2(0.2), the `ip mtu` command is not supported to configure the IP MTU value that is used when the IP packet is fragmented. Instead of having to configure the IP MTU value, this value is automatically computed by the software when you configure an interface. As a result, the `ip mtu` command is not available for configuration. However, you can continue to specify the link MTU value by using the `mtu` command.

Compensate for Layer 2 header when configuring link MTU on an Ethernet interface or Dell EMC Networking OS may not fragment packets. If the packet includes a Layer 2 header, the difference between the link MTU and IP MTU (the `ip mtu` command) must be enough bytes to include for the Layer 2 header.

Link MTU and IP MTU considerations for Port Channels and VLANs are as follows:

**Port Channels:**

- All members must have the same link MTU value and the same IP MTU value.
- The Port Channel link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the channel members. For example, if the members have a link MTU of 2100 and an IP MTU of 2000, the Port Channel's MTU values cannot be higher than 2100 for link MTU or 2000 bytes for IP MTU.

**VLANs:**

- All members of a VLAN must have same IP MTU value.
- Members can have different Link MTU values. Tagged members must have a link MTU 4 bytes higher than untagged members to account for the packet tag.
- The VLAN link MTU and IP MTU must be less than or equal to the link MTU and IP MTU values configured on the VLAN members. For example, the VLAN contains tagged members with Link MTU of 1522 and IP MTU of 1500 and untagged members with Link MTU of 1518 and IP MTU of 1500. The VLAN's Link MTU cannot be higher than 1518 bytes and its IP MTU cannot be higher than 1500 bytes.
Packet handling during MTU mismatch

When you configure the MTU size on an interface, ensure that the MTU size of both ingress and egress interfaces are set to the same value for IPv4 traffic to work correctly. If there is an MTU mismatch between the ingress and egress interface, there may be a high CPU usage. If egress interface MTU size is smaller than the ingress interface, packets may get fragmented.

The following describes the difference between Link MTU and IP MTU.

<table>
<thead>
<tr>
<th>Layer 2 Overhead</th>
<th>Difference between Link MTU and IP MTU</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet (untagged)</td>
<td>18 bytes</td>
</tr>
<tr>
<td>VLAN Tag</td>
<td>Tag 22 bytes</td>
</tr>
<tr>
<td>Untagged Packet with VLAN-Stack Header</td>
<td>22 bytes</td>
</tr>
<tr>
<td>Tagged Packet with VLAN-Stack Header</td>
<td>26 bytes</td>
</tr>
</tbody>
</table>

Related Commands

- **mtu** — set the link MTU for an Ethernet interface.

ip name-server

Enter up to six IPv4 addresses of name servers. The order you enter the addresses determines the order of their use.

**Syntax**

```
ip name-server ipv4-address [ipv4-address2...ipv4-address6]
```

To remove a name server, use the `no ip name-server ip-address` command.

**Parameters**

- **ipv4-address**
  - Enter the IPv4 address, in dotted decimal format, of the name server to be used.
- **ipv4-address2...ipv4-address6**
  - (OPTIONAL) Enter up five more IPv4 addresses, in dotted decimal format, of name servers to be used. Separate the addresses with a space.

**Defaults**

No name servers are configured.

**Command Modes**

CONFIGURATION

8.1.1.0               Introduced on the E-Series.
7.6.1.0               Introduced on the S-Series.
7.5.1.0               Introduced on the C-Series.
pre-6.1.1.0           Introduced on the E-Series.

Usage Information  Dell EMC Networking OS does not support sending DNS queries over a VLAN. DNS queries are sent out on all other interfaces, including the Management port.

You can separately configure both IPv4 and IPv6 domain name servers.

In a dual stack setup, the system sends both A (request for IPv4 — RFC 1035) and AAAA (request for IPv6 — RFC 3596) record requests to a DNS server even if only the ip name-server command is configured.

**ip proxy-arp**

Enable proxy ARP on an interface.

**Syntax**

```
ip proxy-arp
```

To disable proxy ARP, use the `no ip proxy-arp` command.

**Defaults**

Enabled.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.
### Version Description
9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100-ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100-ON.
9.8(0.0P5) Introduced on the S4048-ON.
9.8(0.0P2) Introduced on the S3048-ON.
9.7(0.0) Introduced on the S6000-ON.
9.2(1.0) Introduced on the Z9500.
9.0.2.0 Introduced on the S6000.
8.3.19.0 Introduced on the S4820T.
8.3.11.1 Introduced on the Z9000.
8.3.7.0 Introduced on the S4810.
8.1.1.0 Introduced on the E-Series.
7.6.1.0 Introduced on the S-Series.
7.5.1.0 Introduced on the C-Series.
pre-6.1.1.0 Introduced on the E-Series.

### Related Commands
- `show ip interface` — display the interface routing status and configuration.

### ip route
Assign a static route to the switch.

**Syntax**
```
ip route [vrf vrf-name] ip-address mask [ip-address | interface [ip-address]] [distance] [permanent] [tag tag-value] [vrf vrf-name] [weight weight-value]
```

To delete a specific static route, use the `no ip route destination mask` command.

To delete all routes matching a certain route, use the `no ip route destination mask` command.

**Parameters**
- `vrf vrf-name` (Optional) Enter the keyword `vrf` and then the name of the VRF to configure a static route corresponding to that VRF. Use this VRF option after the `ip route` keyword to configure a static route on that particular VRF.
- `destination` Enter the IP address in dotted decimal format of the destination device.
- `mask` Enter the mask in the slash prefix format (/x) of the destination IP address.
**ip-address**
Enter the IP address of the forwarding router in dotted decimal format.

**interface**
Enter one of the following keyword followed by the interface information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.

If you configure a static IPv6 route using an egress interface and enter the ping command to reach the destination IPv6 address, the ping operation may not work. Configure the IPv6 route using a next-hop IPv6 address in order for the ping command to detect the destination address.

**interface ip-address**
Enter the keyword `interface` then the IP address.

**distance**
(Optional) Enter the value of the distance metric assigned to the route. The range is from 1 to 255.

**permanent**
(Optional) Enter the keyword `permanent` to specify that the route must not be removed even if the interface assigned to that route goes down. The route must be currently active to be installed in the routing table. If you disable the interface, the route is removed from the routing table.

**tag tag-value**
(Optional) Enter the keyword `tag` then a number to assign to the route. The range is from 1 to 4294967295.

**vrf vrf-name**
Enter the keyword `vrf` followed by the name of the VRF. Use this VRF option after the next hop to specify which VRF the next hop belongs to. This setting is used in route leaking cases. See “R”oute Leaking VRFs” in the Virtual Routing and Forwarding (VRF) section of the Configuration guide.

**weight weight-value**
Enter the keyword `weight` followed by a weight value. The range is from 0 to 255.

**NOTE:** Weight for a static route can be added only for the destination address and not for the route pointing to destination a interface.

**Defaults**
Not configured.

**Command Modes**
CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

</tbody>
</table>

**Usage Information**

Using the following example of a static route: `ip route 33.33.33.0 /24 tengigabitethernet 1/1 172.31.5.43`

- The software installs a next hop that is not on the directly connected subnet but which recursively resolves to a next hop on the interface’s configured subnet. In the example, if tengigabitethernet 1/1 has an ip address on subnet 2.2.2.0 and if 172.31.5.43 recursively resolves to 2.2.2.0, Dell EMC Networking OS installs the static route.
- When the interface goes down, Dell EMC Networking OS withdraws the route.
- When the interface comes up, Dell EMC Networking OS re-installs the route.
- When recursive resolution is “broken,” Dell EMC Networking OS withdraws the route.
- When recursive resolution is satisfied, Dell EMC Networking OS re-installs the route.

You can specify a weight for an IPv4 or IPv6 static route. If the weight value of a path is 0, then that path is not used for forwarding when weighted ECMP is in effect. Also, if a path corresponding to a static route (destination) has a non-zero weight assigned to it and other paths do not have any weight configured, then regular ECMP is used for forwarding.

You can specify the weight value only to destination address and not on the egress port.

A route is considered for weighted ECMP calculations only if each paths corresponding to that route is configured with a weight.
You cannot use the VRF attribute of this command to configure routes in a management VRF. When a specific VRF is deleted, all the configured static routes corresponding to that VRF are automatically removed.

**Example**

```bash
DellEMC(conf)# ip route 1.1.1.0/24 4.4.4.2 weight 100
DellEMC(conf)# ip route 1.1.1.0/24 6.6.6.2 weight 200
DellEMC(conf)# do show running-config | grep route
ip route 1.1.1.0/24 4.4.4.2 weight 100
ip route 1.1.1.0/24 6.6.6.2 weight 200
DellEMC(conf)# ip route vrf test 1.1.1.0/24 4.4.4.2 weight 100
DellEMC(conf)# ip route vrf test 1.1.1.0/24 6.6.6.2 weight 200
DellEMC(conf)# do show running-config | grep route vrf test
ip route vrf test 1.1.1.0/24 4.4.4.2 weight 100 ip route vrf test 1.1.1.0/24 6.6.6.2 weight 200
```

**Related Commands**

- `show ip route` — view the switch routing table.

**ip source-route**

Enable Dell EMC Networking OS to forward IP packets with source route information in the header.

**Syntax**

`ip source-route`

To drop packets with source route information, use the `no ip route-source` command.

**Defaults**

Enabled.

**Command Modes**

CONFIGURATION

### ip unreachables

Enable the generation of internet control message protocol (ICMP) unreachable messages.

**Syntax**

```
ip unreachables
```

To disable the generation of ICMP messages, use the `no ip unreachables` command.

**Defaults**

Disabled.

load-balance

By default, for C-Series and S-Series, Dell EMC Networking OS uses an IP 4-tuple (IP SA, IP DA, Source Port, and Destination Port) to distribute IP traffic over members of a Port Channel as well as equal-cost paths. To designate another method to balance traffic over Port Channel members, use the `load-balance` command.

**Syntax**

```plaintext
load-balance {ip-selection [dest-ip | source-ip]} | {mac [dest-mac | source-dest-mac | source-mac]} | {tcp-udp | ingress-port [enable]}
```

To return to the default setting (IP 4-tuple), use the `no load-balance {ip-selection [dest-ip | source-ip]} | {mac [dest-mac | source-dest-mac | source-mac]} | {tcp-udp | ingress-port [enable]}` command.

**Parameters**

- **ip-selection (dest-ip | source-ip)**
  - Enter the keywords to distribute IP traffic based on the following criteria:
    - `dest-ip` — Uses destination IP address and destination port fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.
    - `source-ip` — Uses source IP address and source port fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.

- **mac (dest-mac | source-dest-mac | source-mac)**
  - Enter the keywords to distribute MAC traffic based on the following criteria:
    - `dest-mac` — Uses the destination MAC address, VLAN, Ethertype, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.
    - `source-dest-mac` — Uses the destination and source MAC address, VLAN, Ethertype, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.
    - `source-mac` — Uses the source MAC address, VLAN, Ethertype, source module ID and source port ID fields to hash. The hashing mechanism returns a 3-bit index indicating which port the packet should be forwarded.

- **tcp-udp enable**
  - Enter the keywords to distribute traffic based on the following:
    - `enable` — Takes the TCP/UDP source and destination ports into consideration when doing hash computations. This option is enabled by default.

- **ingress-port enable**
  - Enter the keywords to distribute traffic based on the following:
    - `enable` — Takes the source port into consideration when doing hash computations. This option is disabled by default.

**Defaults**

IP 4-tuple (IP SA, IP DA, Source Port, Destination Port)

Usage Information

By default, Dell EMC Networking OS distributes incoming traffic based on a hash algorithm using the following criteria:

- IP source address
- IP destination address
- TCP/UDP source port
- TCP/UDP destination port

load-balance hg

Choose the traffic flow parameters the hash calculation uses while distributing the traffic across internal higig links.

Syntax

```
```

Parameters

- **ip-selection**
- **ipv6-selection**

To use IPv4 key fields in hash computation, enter the keyword ip-selection then one of the parameters. To use IPv6 key fields in hash computation, enter the keyword ipv6-selection then one of the parameters.

- source-ip — Use IPv4 src-ip field in hash calculation.

**Defaults**
IP selection 5-tuples (source-ip dest-ip vlan protocol L4-source-port L4-dest-port).

**Command Modes**
CONFIGURATION

**Command History**
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

**Version** | **Description**
--- | ---
9.10(0.1) | Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) | Introduced on the S3148.
9.10(0.0) | Introduced on the S6100–ON.
9.8(2.0) | Introduced on the S3100 series.
9.8(1.0) | Introduced on the Z9100–ON.
9.8(0.0P5) | Introduced on the S4048-ON.
9.8(0.0P2) | Introduced on the S3048-ON.
management route

Configure a static route that points to the Management interface or a forwarding router.

Syntax

```
management route {ip-address mask | ipv6-address 1.1.1.1prefix-length} 
{forwarding-router-address | managementethernet | fortyGigE | vlan | 
tengigabitethernet }
```

To remove a static route, use the `no management route` command.

Parameters

- **ip-address mask**: Enter an IP address (dotted decimal format) and mask (/prefix format) of the destination subnet.
- **ipv6-address prefix-length**: Enter an IPv6 address (x:x:x:x format) and mask (/prefix format) of the destination subnet. Enter the IPv6 address in the x:x:x:x format followed by the prefix length in the /x format.
  The range is from /0 to /128.

  **NOTE**: The :: notation specifies successive hexadecimal fields of zeros.
- **forwarding-router-address**: Enter an IP address (dotted decimal format) or an IPv6 address (x:x:x:x format) of a forwarding router.
- **managementethernet**: Enter the keyword `managementethernet` for the Management interface on the Primary RPM.
- **fortyGigE**: Enter the keyword `fortyGigE` to specify a forty Gigabit Ethernet interface.
- **vlan**: Enter the keyword `vlan` to specify a vlan interface.
- **tengigabitethernet**: Enter the keyword `tengigabitethernet` to specify a ten Gigabit Ethernet interface.

Defaults

Not configured.

</tr>
</tbody>
</table>

**Usage Information**

When a static route (or a protocol route) overlaps with Management static route, the static route (or a protocol route) is preferred over the Management Static route. Also, Management static routes and the Management Connected prefix are not reflected in the hardware routing tables. Separate routing tables are maintained for IPv4 and IPv6 management routes. This command manages both tables.

**Related Commands**

- `interface ManagementEthernet` — configure the Management port on the system (either the Primary or Standby RPM).
- `speed (Management interface)` — set the speed for the Management interface.

**show arp**

Display the ARP table.

**Syntax**

```
show arp [vrf vrf-name] [interface interface | ip ip-address [mask] | macaddress mac-address [mac-address mask]] [retries] [static | dynamic] [inspection {database | statistics}[summary]
```

**Parameters**

- `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` and then the name of the VRF.

**NOTE:** Use this attribute to start a BGP instance for either a specific address family corresponding to the default VRF or an IPv4 address family corresponding to a non-default VRF.
interface interface  (OPTIONAL) Enter the following keywords and the interface information:
  • For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  • For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.
  • For the Management interface on the stack-unit, enter the keyword ManagementEthernet then the slot/port information.
  • For a port channel interface, enter the keywords port-channel then a number.
  • For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

ip ip-address mask  (OPTIONAL) Enter the keyword ip then an IP address in the dotted decimal format. Enter the optional IP address mask in the slash prefix format (/x).

inspection  Enter the keyword inspection with one of the following keywords to view ARP entries:
  • database — view a list of ARP entries learned using DAI
  • statistics — view DAI statistics

macaddress mac-address mask  (OPTIONAL) Enter the keyword macaddress then a MAC address in nn:nn:nn:nn:nn:nn format. Enter the optional MAC address mask in nn:nn:nn:nn:nn format also.

static  (OPTIONAL) Enter the keyword static to view entries entered manually.

retries  (OPTIONAL) Enter the keyword retries to show the number of ARP retries before a 20-second back off.

dynamic  (OPTIONAL) Enter the keyword dynamic to view dynamic entries.

summary  (OPTIONAL) Enter the keyword summary to view a summary of ARP entries.

Command Modes  EXEC Privilege

Command History  This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Usage Information

The following example shows two VLANs that are associated with a private VLAN (PVLAN) (refer to Private VLAN (PVLAN)).

If you have entered the clear arp-cache command to remove a large number of ARP entries and the command is still being processed in the background, an error message display if you attempt to enter the show arp command:

Clear arp in-progress. Please try after sometime!

The following describes the show arp command shown in the following example.

**Description**

Protocol | Displays the protocol type.
Address | Displays the IP address of the ARP entry.
Age(min) | Displays the age (in minutes) of the ARP entry.
Hardware Address | Displays the MAC address associated with the ARP entry.
Interface | Displays the first two letters of the interfaces type and the slot/port associated with the ARP entry.
VLAN | Displays the VLAN ID, if any, associated with the ARP entry.
CPU | Lists which CPU the entries are stored on.

**Example**

```
DellEMC> show arp
  Protocol   Address   Age(min)   Hardware Address   Interface   VLAN   CPU
  Internet   192.2.1.254 1  00:00:c0:02:01:02   Te 2/13   -     CP
  Internet   192.2.1.253 1  00:00:c0:02:01:02   Te 2/13   -     CP
  Internet   192.2.1.252 1  00:00:c0:02:01:02   Te 2/13   -     CP
  Internet   192.2.1.251 1  00:00:c0:02:01:02   Te 2/13   -     CP
  Internet   192.2.1.250 1  00:00:c0:02:01:02   Te 2/13   -     CP
  Internet   192.2.1.249 1  00:00:c0:02:01:02   Te 2/13   -     CP
  Internet   192.2.1.248 1  00:00:c0:02:01:02   Te 2/13   -     CP
  Internet   192.2.1.247 1  00:00:c0:02:01:02   Te 2/13   -     CP
```
Example (Private VLAN)

NOTE: In this example, Line 1 shows community VLAN 200 (in primary VLAN 10) in a PVLAN. Line 2 shows primary VLAN 10.

DellEMC# show arp

Internet 133.33.33.4   1  00:01:e8:d5:9e:e2  Ma 1/1 -            CP

Usage Information

The following describes the show arp summary command shown in the following example.

Description
Total Entries               Lists the total number of ARP entries in the ARP table.
Static Entries             Lists the total number of configured or static ARP entries.
Dynamic Entries            Lists the total number of learned or dynamic ARP entries.
CPU                        Lists which CPU the entries are stored on.

Example (Summary)          DellEMC# show arp summary

Total Entries Static Entries Dynamic Entries CPU
--------------------------------------------------
83             0               83           CP

Related Commands
- ip local-proxy-arp — enable/disable Layer 3 communication in secondary VLANs.
- switchport mode private-vlan — set PVLAN mode of the selected port.

show arp retries

Display the configured number of ARP retries.

Syntax

show arp retries

Command Modes
- EXEC
- EXEC Privilege

### Version | Description
--- | ---
9.8(0.0P2) | Introduced on the S3048-ON.
9.7(0.0) | Introduced on the S6000-ON.
9.2(1.0) | Introduced on the Z9500.
9.0.2.0 | Introduced on the S6000.
9.0.0.0 | Added support for IPv6 addresses.
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.1.1.0 | Introduced on the E-Series.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
pred-6.1.1.0 | Introduced on the E-Series.

### Usage Information
The following describes the `show hosts` command in the following example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default domain...</strong></td>
<td>Displays the domain name (if configured).</td>
</tr>
</tbody>
</table>
| **Name/address lookup...** | States if DNS is enabled on the system.  
- If DNS is enabled, the Name/Address lookup is domain service.  
- If DNS is not enabled, the Name/Address lookup is static mapping |
| **Name servers are...** | Lists the name servers, if configured. |
| **Host** | Displays the host name assigned to the IP address. |
| **Flags** | Classifies the entry as one of the following:  
- perm — the entry was manually configured and will not time out  
- temp — the entry was learned and will time out after 72 hours of inactivity.  
Also included in the flag is an indication of the validity of the route:  
- ok — the entry is valid.  
- ex — the entry expired.  
- ?? — the entry is suspect. |
| **TTL** | Displays the amount of time until the entry ages out of the cache. For dynamically learned entries only. |
| **Type** | Displays IP as the type of entry. |
| **Address** | Displays the IP addresses assigned to the host. |

### Example
```
DellEMC# show hosts
Default domain is not set
Name/address lookup uses static mappings
Name servers are not set
Host     Flags     TTL   Type   Address
-------- -----     ----  ----   -------
ks      (perm, OK) -     IP     2.2.2.2
4200-1  (perm, OK) -     IP     192.68.69.2
```
### Related Commands
- `traceroute` — view the DNS resolution.
- `ip host` — configure a host.

## show ip cam stack-unit

Display CAM entries for a port-pipe of a stack-unit on a S-Series or Z-Series switch.

### Syntax
```
show ip cam stack-unit {stack-unit-number} [port-set {pipe-number}] | vrf vrf-name {ip-address mask [longer-prefixes [ecmp-group detail]]} | ecmp-group {detail | member-info [detail [group-index index-number]]} | summary
```

### Parameters
- **stack-unit-number**
  - Enter the stack-unit ID. The unit ID range is from 1 to 6.
- **port-set pipe-number**
  - Enter the keyword `port-set` then the number of the stack unit's port-pipe. The unit ID range is from 0 to 0.
- **vrf vrf-name**
  - Enter the keyword `vrf` followed by the name of the VRF to display CAM entries corresponding to that VRF.
- **network mask**
  - (OPTIONAL) Enter the IP address and mask of a route to CAM entries for that route only.
  - You can enter one of the following keywords to filter results.
    - Enter the keyword `longer-prefixes` to view routes with a common prefix.
    - Enter the keyword `ecmp-group detail` to view the ECMP group index.
- **ecmp-group (detail | member-info [detail [group-index index-number]]))**
  - (OPTIONAL) Enter the keyword `ecmp-group` then one of the following keywords to filter results.
    - Enter the keyword `detail` to view the ECMP group index.
    - Enter the keyword `member-info` to view the member information for the ECMP group.
    - Enter the keyword `member-info detail` to view detailed ECMP membership and n-hop information.
    - Enter the keyword `group-index` then the index number to show ECMP membership per group. The range is from 0 to 1022.
- **summary**
  - (OPTIONAL) Enter the keyword `summary` to view a table listing route prefixes and the total number routes which can be entered in to CAM.

### Command Modes
- EXEC
- EXEC Privilege

### Command History
This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

2.1.1.0/24  0  1    0 00:00:00:00:00:00      CP  -
DellEMC#
```
show ip fib stack-unit

View all Forwarding Information Base (FIB) entries of a specific stack-unit.

Syntax

show ip fib stack-unit stack-unit-number vrf vrf-name [ip-address [mask] [longer-prefixes] | summary]

Parameters

stack-unit-number Enter the stack unit ID.

vrf vrf-name Enter the keyword vrf followed by the name of the VRF to view FIB entries corresponding to that VRF.

ip-address mask (OPTIONAL) Enter the IP address of the network destination to view only information on that destination. Enter the IP address in dotted decimal format (A.B.C.D). Enter the mask in slash prefix format (/X).

longer-prefixes (OPTIONAL) Enter the keywords longer-prefixes to view all routes with a common prefix.

summary (OPTIONAL) Enter the keyword summary to view the total number of prefixes in the FIB.

Command Modes

- EXEC
- EXEC Privilege

Command History

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

Version Description

9.10(0.1) Introduced on the S6010-ON and S4048T-ON.
9.10(0.0) Introduced on the S3148.
9.10(0.0) Introduced on the S6100–ON.
9.8(2.0) Introduced on the S3100 series.
9.8(1.0) Introduced on the Z9100–ON.
9.8(0.0P6) Introduced on the S4048-ON.
9.8(0.0P2)Introduced on the S3048-ON.
### Version Description
- **9.7(0.0)** Introduced on the S6000-ON.
- **9.4(0.0)** Added support for VRF.
- **9.2(1.0)** Introduced on the Z9500.
- **9.0.2.0** Introduced on the S6000.
- **8.3.19.0** Introduced on the Z9000.
- **8.3.7.0** Introduced on the S4810.
- **7.7.1.0** Added support for up to seven stack members.
- **7.6.1.0** Introduced on the S-Series.

### Field Description

#### Destination
Lists the destination IP address.

#### Gateway
Displays either the word "direct" and an interface for a directly connected route or the remote IP address used to forward the traffic.

#### First-Hop
Displays the first hop IP address.

#### Mac-Addr
Displays the MAC address.

#### Port
Displays the egress-port information.

#### VId
Displays the VLAN ID. If no VLAN is assigned, zero (0) is listed.

#### EC
Displays the number of ECMP paths.

If weighted ECMP is enabled, then the `show ip fib stack-unit` command display a new column named W-EC (Weighted ECMP). This column displays either a value of 1 or 0 depending on whether or not a route is assigned with a weight.

### Example

```
DellEMC# show ip fib stack-unit 1
Destination   Gateway                 First-Hop  Mac-Addr            Port       VId    EC
-------------------------------------------------------------------------------------------
1.1.1.2/32     via 1.1.1.2, Vl 1000    1.1.1.2    00:01:00:00:00:02   Te 3/42    1000   0
2.1.1.2/32     via 2.1.1.2, Vl 20      2.1.1.2    00:01:00:00:00:02   Po 10        20   0
0.0.0.0/0      Direct, Vl 1000        0.0.0.0    00:00:00:00:00:00   CP    0    0
1.1.1.1/32     via 127.0.0.1          127.0.0.1  00:00:00:00:00:00   CP    0    0

```

### Example (Show command output with Weighted ECMP Enabled)

```
DellEMC# show ip fib stack-unit 1
Destination   Gateway                 First-Hop  Mac-Addr            Port       VId    EC    RC    W
-------------------------------------------------------------------------------------------
0.0.0.0/0      Direct, Lo 0            0.0.0.0    00:00:00:00:00:00   CP    0    0    -    -
1.1.1.2/32     via 127.0.0.1            127.0.0.1  00:00:00:00:00:00   CP    0    0    -    -
```

### Related Commands
- `clear ip fib stack-unit` — clear FIB entries on a specified stack-unit.
show ip flow

Show how a Layer 3 packet is forwarded when it arrives at a particular interface.

Syntax

show ip flow interface {source-ip address destination-ip address} {protocol number [tcp | udp]} {src-port number destination-port number}

Parameters

- **interface**: Enter the keyword interface then one of the following interface keywords.
  - For a 10-Gigabit Ethernet interface, enter the keyword TenGigabitEthernet then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword fortyGigE then the slot/port information.

- **source-ip address**: Enter the keywords source-ip then the IP source address in IP address format.

- **destination-ip address**: Enter the keywords destination-ip then the IP destination address in IP address format.

- **protocol number [tcp | udp]**: Enter the keyword protocol then one of the protocol type keywords: tcp, udp, or protocol number. The protocol number range is from 0 to 255.

- **src-port number**: Enter the keywords src-port then the source port number.

- **destination-port number**: Enter the keywords destination-port then the destination port number.

Command Modes

EXEC Privilege

Version | Description
--- | ---
8.3.19.0 | Introduced on the S4820T.
8.3.11.1 | Introduced on the Z9000.
8.3.10.0 | Introduced on the S4810.
8.5.1.0 | Added support for 4-port 40G line cards on the E-Series.
8.1.1.0 | Introduced on the E-Series.
7.9.1.0 | Introduced VRF on the E-Series.
7.6.1.0 | Introduced on the S-Series.
7.5.1.0 | Introduced on the C-Series.
pre-6.1.1.0 | Introduced on the E-Series.

Usage Information

This command provides egress port information for a given IP flow. This information is useful in identifying which interface the packet follows in the case of Port-channel and Equal Cost Multi Paths. Use this command for routed packed only. For switched packets, use the `show port-channel-flow` command.

The `show ip flow` command does not compute the egress port information when `load-balance mac hashing` is also configured due to insufficient information (the egress MAC is not available).

S-Series produces the following error message: %Error: Unable to read IP route table.

Example

```
DellEMC# show ip flow interface te 2/42 20.1.1.1 100.1.1.2 protocol tcp
Flow: 20.1.1.1 100.1.1.2 6
  Ingress interface: Te 2/42
  Egress Interface: Te 2/43
DellEMC#
```

**show ip interface**

View IP-related information on all interfaces.

**Syntax**

```
show ip interface [interface | brief] [configured]
```

**Parameters**

- **interface**
  
  Enter the following keywords and the interface information:
  
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information.
  - For a port channel interface, enter the keywords `port-channel` then a number.
For a Null interface, enter the keyword null then the Null interface number.

For a VLAN interface, enter the keyword vlan then a number from 1 to 4094.

For a stack-unit interface, enter the keyword stack-unit then the stack unit number.

For a tunnel interface, enter the keyword tunnel then the tunnel interface number. The range is from 1 to 16383.

brief

(OPTIONAL) Enter the keyword brief to view a brief summary of the interfaces and whether an IP address is assigned.

configured

(Optional) Enter the keyword configured to display the physical interfaces with non-default configurations only.

**show ip management-route**

View the IP addresses assigned to the Management interface.

**Syntax**

```
show ip management-route [all | connected | summary | static]
```

**Parameters**

- **all** *(OPTIONAL)* Enter the keyword `all` to view all IP addresses assigned to all Management interfaces on the switch.
- **connected** *(OPTIONAL)* Enter the keyword `connected` to view only routes directly connected to the Management interface.
- **summary** *(OPTIONAL)* Enter the keyword `summary` to view a table listing the number of active and non-active routes and their sources.
- **static** *(OPTIONAL)* Enter the keyword `static` to view non-active routes also.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, see the relevant Dell EMC Networking OS Command Line Reference Guide.

show ipv6 management-route

Display the IPv6 static routes configured for the management interface.

Syntax

```
show ipv6 management-route [all | connected | summary | static]
```

Parameters

- `all` (OPTIONAL) Enter the keyword all to view all IP addresses assigned to all Management interfaces on the switch.
- `connected` (OPTIONAL) Enter the keyword connected to view only routes directly connected to the Management interface.
- `summary` (OPTIONAL) Enter the keyword summary to view a table listing the number of active and non-active routes and their sources.
- `static` (OPTIONAL) Enter the keyword static to view non-active routes also.

Command Modes

- EXEC Privilege

</table>
**show ip route**

View information, including how they were learned, about the IP routes on the switch.

**Syntax**

```
show ip route [vrf vrf-name] hostname | ip-address [mask] [longer-prefixes] | list prefix-list | protocol [process-id | routing-tag] | all | connected | static | summary]
```

**Parameters**

- **vrf vrf-name**  
  (OPTIONAL) Enter the keyword `vrf` and then the VRF name to list the routes in the route table of a specific VRF.

- **ip-address**  
  (OPTIONAL) Specify a name of a device or the IP address of the device to view more detailed information about the route.

- **mask**  
  (OPTIONAL) Specify the network mask of the route. Use this parameter with the IP address parameter.

- **longer-prefixes**  
  (OPTIONAL) Enter the keywords `longer-prefixes` to view all routes with a common prefix.

- **list prefix-list**  
  (OPTIONAL) Enter the keyword `list` and the name of a configured prefix list. For more information, refer to the `show ip route list` command.

- **protocol**  
  (OPTIONAL) Enter the name of a routing protocol (`bgp`, `isis`, `ospf`, `rip`) or the keywords connected or static.

**NOTE:** `bgp`, `isis`, `ospf`, and `rip`.

- If you enter `bgp`, you can include the BGP `as-number`.
- If you enter `isis`, you can include the ISIS `routing-tag`.
- If you enter `ospf`, you can include the OSPF `process-id`.

---

**Example**

```
DellEMC# show ip protocols
Routing Protocol is "bgp 1"
Cluster Id is set to 20.20.20.3
Router Id is set to 20.20.20.3
Fast-external-failover enabled
Regular expression evaluation optimization enabled
Capable of ROUTE_REFRESH
For Address Family IPv4 Unicast
BGP table version is 0, main routing table version 0
Distance: external 20 internal 200 local 200
Neighbor(s):
  Address : 20.20.20.2
  Filter-list in : foo
  Route-map in : foo
  Weight : 0
  Address : 5::6
  Weight : 0
DellEMC#
```
**process-id**  
(Optionalal) Specify that only OSPF routes with a certain process ID must be displayed.

**routing-tag**  
(Optionalal) Specify that only ISIS routes with a certain routing tag must be displayed.

**connected**  
(Optionalal) Enter the keyword connected to view only the directly connected routes.

**all**  
(Optionalal) Enter the keyword all to view both active and non-active routes.

**static**  
(Optionalal) Enter the keyword static to view only routes the ip route command configures.

**summary**  
(Optionalal) Enter the keyword summary. For more information, refer to the `show ip route summary` command.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**
