Introduction

**NOTE:** Unlike previous versions of Windows Server, Microsoft Windows Server 2019 does not support the conversion from Windows Server Core to Server with Desktop Experience and vice versa. For more information, see Installation options for Windows Server 2019.
Set up preinstalled Microsoft Windows Server 2019 operating system

This section provides instructions for completing the setup of the Microsoft Windows Server 2019 Operating System (OS) that is preinstalled on your system.

NOTE: Before you begin, see the documentation that is shipped with the operating system for important product information. For more information about completing the installation, see the documentation included with your software.

NOTE: Before using your system, read the software license agreements that are included with each product that you have ordered.

To set up Windows Server 2019 OS for Datacenter, Standard, and the Essentials edition:

1. Connect the keyboard, monitor, mouse, network cable, power cable, and other required peripherals to your system.
2. Turn on your system.
3. Select the language in which you want to configure the preinstalled OS, and then click Next.

NOTE: This screen is not displayed for the Simplified or Traditional Chinese operating system.

4. Select country or region, app language, keyboard layout, and then click Next.

5. Read the license terms, and then click Accept if you agree to the license terms.

NOTE: If you do not accept the license agreement, you cannot proceed with OS installation.
6. Enter administrator password, reenter to confirm the password, and then click Finished.

**NOTE:** The password must conform to the password complexity rules. For more information about password complexity rules, see Password Policy.

7. In the **Select OS Partition Size** window, move the slider to set an appropriate OS partition size, and then click **Ok**.  
The minimum partition size recommended:
  - 40 GB—for primary partitions
  - 60 GB—for the Essentials edition
Select OS Partition Size

Select an appropriate OS partition size based on your requirements

- Amount of physical memory in this server: 16 GB
- Minimum possible OS partition size: 19 GB
- Maximum possible OS partition size: 1020 GB

Best Practices for choosing an OS partition size:
- OS partition size should be based on the Page file size and memory requirement at peak load.
- It is recommended that you use 1.5 size of the memory as a Page file, but this is not mandatory, especially when you have large system memory.
- Consider splitting the page file on two different drives on the server for better disk I/O performance.
- Dell recommends having a minimum 50GB OS partition for Windows Server 2008 R2 and beyond.
- For more information for determining the Page file size, refer Microsoft KB article KB2938680.

Select your choice of OS partition size

| Min | 19 GB | Max | 1020 GB |

Selected OS partition size = 60 GB

Drive partitioning enables you to divide a hard drive disk space into multiple Virtual Drives (VDs). Each VD is called a partition. There are two types of partition schemes:

- Master Boot Record scheme
- GUID Partition Table scheme

The main considerations for selecting between the partition schemes are:

- Hard drive disk space
- Operating system version
- Software installed or to be installed in the operating system

Topics:

- Master boot record scheme
- GUID partition table scheme

**Master boot record scheme**

Most of the operating systems use the Master Boot Record (MBR) legacy partition scheme. The total data storage space of a computer hard drive is divided into a maximum of four primary partitions.

The MBR partition scheme is used across older versions of the Microsoft operating systems. MBR partitioning scheme supports a volume size lesser than 2 TB.

For more information about partitions and volumes, see the Partitions and Volumes section at www.technet.microsoft.com.

**GUID partition table scheme**

GUID Partition Table (GPT) scheme is a new standard for the layout of the partition table on a hard drive. It is part of the extensible firmware interface (EFI) standard, which is a replacement for the system BIOS.

**NOTE:** It is recommended that you use the GPT partition scheme as it is more flexible, supports larger hard drive sizes, and has some features and recovery mechanisms that are not available in the MBR partition scheme.

For more information about partitions and volumes, see the Partitions and Volumes section at www.technet.microsoft.com. For information about GPT, see the Windows and GPT FAQ section at www.microsoft.com.

Identifying the series of your Dell EMC PowerEdge servers

The PowerEdge series of servers form Dell EMC are divided into different categories on the basis of their configuration. For easier reference, they are referred to as YX2X, YX3X, YX4X, YX4XX, or YX5XX series of servers. The structure of the naming convention is described below:

The letter Y denotes the alphabets in the server model number. The alphabets denote the form factor of the server. The form factors are described below:
- Cloud (C)
- Flexible (F)
- Modular (M or MX)
- Rack (R)
- Tower (T)

The letter X denotes the numbers in the server model number. The numbers denote multiple items about the server.
- The first digit (denoted by X) denotes the value stream or class of the server.
  - 1-5—iDRAC basic
  - 6-9—iDRAC Express
- The second digit denotes the series of the server. It is retained in the server naming convention and not replaced by the letter X.
  - 0—series 10
  - 1—series 11
  - 2—series 12
  - 3—series 13
  - 4—series 14
  - 5—series 15
- The third digit (denoted by X) denotes the number of processor sockets a series of server supports. This is applicable only from series 14 of PowerEdge servers.
  - 1—one socket server
  - 2—two socket server
- The last digit (denoted by X) always denotes the make of the processor as described below:
  - 0—Intel
  - 5—AMD
