## Battery health

Battery health indicates the amount of charge that is available to a system. In general, a battery’s health decreases over time at a rate that depends on how often the battery is used and the conditions under which it is used.

Battery health is indicated using the heart icon followed by a set of four circular icons. The number of circular icons that are filled indicates the battery health.

**NOTE:** Health information is available only if the Dell batteries are attached to your system.

## Battery settings

Dell Power Manager enables users to select a Battery Setting that is optimized for specific system usage patterns. For example, some settings focus on extending battery life, while others provide fast charge times.

**NOTE:** Battery settings can be modified only if Dell batteries are attached to your system.

Available settings may be limited depending on the battery. Possible battery settings include:

- **Standard** — Fully charges the battery at a moderate rate. This setting provides a balanced approach to extending battery life while still providing a reasonably fast charging time. Recommended for users who frequently switch between battery and external power sources.

- **ExpressCharge™** — Quickly charges the battery using Dell fast-charge technology. Recommended for users who need the battery to charge quickly. If the system is powered off, then the battery typically charges to 80 percent within one hour and 100 percent in two hours. Charge time may be longer if the system is powered on.

  **NOTE:** The ExpressCharge™ setting may cause battery health to diminish more quickly than other settings.

- **Primarily AC** — Extends battery life by lowering the charge threshold, so that the battery never charges to 100 percent capacity. Recommended for users who primarily operate the system while plugged into an external power source.

- **Adaptive** — Automatically optimizes battery settings based on the user’s typical patterns. Recommended for users who want to “set it and forget it.”

- **Custom** — User selects when the battery starts and stops charging. Recommended for advanced users.

## Select battery setting

1. On the **Battery Information** page, click the battery that you want to change (such as Battery #1 or Battery #2).

   **NOTE:** If Advanced charge is enabled, you can only access battery setting through the advanced charge screen.

2. Click **Settings**.

3. Select a pre-configured battery setting, or select **Custom** to define your own settings.

   **NOTE:** Available settings may be limited depending on the battery.

4. Click **OK** to save your changes, or click **CANCEL** to discard them.

## Create custom battery setting

The **Custom** battery setting enables users to define when a battery starts and stops charging. This setting is recommended for advanced users who are familiar with battery charging cycles.
NOTE: There should be a minimum difference between the Start Charging and Stop Charging values specified in your system's BIOS.

1. Go to the Battery Setting page, and then click Custom.
2. Under Start Charging, move the slider to the percentage threshold at which the battery begins charging, or enter a number in the text box.
   For example, entering 60 causes the battery to start charging when it depletes to 60 percent of the total available charge.
3. Under Stop Charging, move the slider to the percentage threshold at which the battery stops charging, or enter a number in the text box.
   For example, entering 90 causes the battery to stop charging when it reaches 90 percent of the total available charge.
4. Click OK to apply your settings, or click CANCEL to discard your changes and return to the Battery Information page.

Battery charge status

View a battery’s charge status quickly by referring to the battery charge status indicator codes displayed beside the battery number on the Battery Information screen. For precise information on the percentage charged as well as the battery’s charging and AC connection status, see the Charge Status information displayed below the battery number and directly below the battery graphic.

NOTE: Charge Status is available only if Dell batteries are attached to your system.
Advanced charge

Advanced charge is an optional feature that prolongs the usable life of a system’s batteries by charging them to full capacity only once per day, prior to the Start of day you establish when you Enable advanced charge. For the remainder of the day, advanced charge keeps batteries in a lower charge state that is better for storage, even when the system is plugged into a direct power source.

1. **NOTE:** If you have not enabled advanced charge for a particular day, that day will not display on the Time Settings page, and you will not be able to set the advanced charge schedule for that day. Go back to the main Advanced Charge page and enable advanced charge for that particular day.

Enable advanced charge

Advanced charge is not enabled by default. When advanced charge is enabled, the feature applies to all batteries in the system, and individual battery configuration is disabled.

1. Click the Advanced Charge tab in the left pane.
   
   1. **NOTE:** Hover your cursor over the icon if you want to see further information on advanced charge.

2. To enable advanced charge, click the toggle at the top of the page to the On position.

3. Click the toggle for each day of the week to enable or disable advanced charge for each day.
   
   If you enable the advanced charge feature, you must configure the feature for at least one day.

4. To set the times of day when advanced charge is active and inactive, click Settings.
   
   1. **NOTE:** You can select times in 15-minute increments—for example, you can enter 11:15 AM or 9:30 PM.

   The circular slider represents a 24-hour period. To use the circular slider:
   
   a. Slide the Start of day thumb control to the start time of a typical workday.
   b. Slide the End of day thumb control to the end time of a typical workday.

   1. **NOTE:** The segment of time displayed in blue represents the work period, or when the system is active.

   Alternatively, you can use the drop-down menus to set the times:
   
   a. Select a time for Start of day.
   b. Select a time for End of day.

5. In the Time Settings screen, click a day of the week. In the main portion of the page, you can use either the circular slider or the drop-down menus to set the time.

6. Select the Copy the same settings to multiple days check box. In the left pane, select the days to which these settings apply.

7. Click OK to save your settings, or click CANCEL to discard them.
Peak shift

Peak shift is an optional feature that reduces power consumption by automatically switching the system to battery power during certain times of the day, even if the system is plugged into a direct power source. After peak shift begins, the system will run on battery power until the combined charge level of all batteries reaches a minimum threshold. See Enabling peak shift for instructions on how to change these settings. Then, if the system is plugged in, it is powered by the direct power source; however, the battery will not charge until the peak shift ends.

Users can program the start and end times at which the peak shift feature is active and inactive each day.

NOTE: 如果为“峰值偏移”和“高级充电”分配的小时数重叠，则以“峰值偏移”优先。在“峰值偏移”期间电池将不会充电。

Enable peak shift

1. Click the Peak Shift tab in the left pane.

   NOTE: Hover your cursor over the icon if you want to see further information on peak shift.

2. To enable peak shift, click the toggle at the top of the page to the On position.

   Your system BIOS already has a minimum threshold setting below which the system always draws AC power if it is available; this BIOS setting always takes precedence over any setting you enter here.

3. To select the percentage at which the system will Restore AC power if available system charge falls below, move the slider.

   For example, selecting 15 percent causes the system to switch from battery to AC power during peak shift if the power remaining falls below 15 percent.

   While the system runs as normal on AC (direct) power, the battery does not charge until peak shift ends.

4. To enable or disable peak shift for a specific day, click the toggle next to each day of the week.

   NOTE: If you have not enabled peak shift for a particular day, that day will not display on the Time Settings page, and you will not be able to set an peak shift schedule for that day. Go back to the main peak shift page and enable peak shift for that particular day.

5. To set the time of day when peak shift is active, click Settings.

6. On the Time Settings screen, click a day of the week. Using either the circular slider or the drop-down menus:

   NOTE: You can select times in 15-minute increments—for example, you can enter 11:15 AM or 9:30 PM.

   NOTE: The circular slider represents a 24-hour period.

   • Activate peak shift: Select the time you want peak shift to begin.

     NOTE: If you enable Operate only on AC, then the time between starting peak shift and operating on AC power is indicated in blue, and the time between starting to operate on AC power and ending peak shift is indicated in yellow. Green indicates the period of operation on AC power without charging the battery.

   • Set a time at which the system begins to operate only on AC power without charging the battery: Select the Operate on AC power without charging battery check box, then select the time that you want the system to start operating on AC power without charging the battery.

   • End peak shift: Select the time you want peak shift to end.

   NOTE: The Copy the same settings to multiple days check box is automatically cleared once you leave the page.

7. Select Copy the same settings to multiple days. Then, in the left pane, select the days to which these settings apply.
To save your changes, click **OK** or to discard them, click **CANCEL**.
Dell Power Manager allows you to manage your system’s processor and cooling fan settings so that you can manage performance, system surface temperature, and fan noise. Each option represents a different balance of these three elements. Choose the configuration that best suits the way you use your system.

**CAUTION:** If a fan has failed, the Thermal Management feature is disabled.
