## Audience

The information provided in this guide is intended for storage or network administrators and deployment personnel.

## Contacting Dell

Dell provides several online and telephone-based support and service options. Availability varies by country and product, and some services might not be available in your area.

To contact Dell for sales, technical support, or customer service issues, go to [Dell.com/support](http://Dell.com/support).

- For customized support, type your system service tag on the support page and click **Submit**.
- For general support, browse the product list on the support page and select your product.

## Related Publications

About the SCv3000 and SCv3020 Storage System

The SCv3000 and SCv3020 storage system provides the central processing capabilities for the Storage Center Operating System (OS), application software, and management of RAID storage.

The SCv3000 and SCv3020 storage system holds the physical drives that provide storage for the Storage Center. If additional storage is needed, the SCv3000 and SCv3020 supports SCv300 and SCv320 and SCv360 expansion enclosures.

Topics:
- Storage Center Hardware Components
- Storage Center Communication
- SCv3000 and SCv3020 Storage System Hardware

Storage Center Hardware Components

The Storage Center described in this document consists of an SCv3000 and SCv3020 storage system, expansion enclosures, and enterprise-class switches.

To allow for storage expansion, the SCv3000 and SCv3020 storage system supports multiple SCv300 and SCv320 and SCv360 expansion enclosures.

NOTE: The cabling between the storage system, switches, and host servers is referred to as front-end connectivity. The cabling between the storage system and expansion enclosures is referred to as back-end connectivity.

SCv3000 and SCv3020 Storage System

The SCv3000 and SCv3020 storage systems contain two redundant power supply/cooling fan modules, and two storage controllers with multiple I/O ports. The I/O ports provide communication with host servers and expansion enclosures. The SCv3000 storage system contains up to 16 3.5-inch drives and the SCv3020 storage system contains up to 30 2.5-inch drives.

The SCv3000 Series Storage Center supports up to 222 drives per Storage Center system. This total includes the drives in the storage system chassis and the drives in the expansion enclosures. The SCv3000 and SCv3020 require a minimum of seven hard disk drives (HDDs) or four sold-state drives (SSDs) installed in the storage system chassis or an expansion enclosure.

</tr>
</tbody>
</table>

Expansion Enclosures

Expansion enclosures allow the data storage capabilities of the SCv3000 and SCv3020 storage system to be expanded beyond the 16 or 30 drives in the storage system chassis.

The SCv3000 and SCv3020 support up to 16 SCv300 expansion enclosures, up to eight SCv320 expansion enclosures, and up to three SCv360 expansion enclosures.
Switches

Dell offers enterprise-class switches as part of the total Storage Center solution.

The SCv3000 and SCv3020 storage system supports Fibre Channel (FC) and Ethernet switches, which provide robust connectivity to servers and allow for the use of redundant transport paths. Fibre Channel (FC) or Ethernet switches can provide connectivity to a remote Storage Center to allow for replication of data. In addition, Ethernet switches provide connectivity to a management network to allow configuration, administration, and management of the Storage Center.

Storage Center Communication

A Storage Center uses multiple types of communication for both data transfer and administrative functions.

Storage Center communication is classified into three types: front end, back end, and system administration.

Front-End Connectivity

Front-end connectivity provides I/O paths from servers to a storage system and replication paths from one Storage Center to another Storage Center. The SCv3000 and SCv3020 storage system provides the following types of front-end connectivity:

- Fibre Channel – Hosts, servers, or network-attached storage (NAS) appliances access storage by connecting to the storage system Fibre Channel ports through one or more Fibre Channel switches. Connecting host servers directly to the storage system, without using Fibre Channel switches, is not supported.
- iSCSI – Hosts, servers, or network-attached storage (NAS) appliances access storage by connecting to the storage system iSCSI ports through one or more Ethernet switches. Connecting host servers directly to the storage system, without using Ethernet switches, is not supported.

When replication is licensed, the SCv3000 and SCv3020 storage system can use the front-end Fibre Channel or iSCSI ports to replicate data to another Storage Center.

Fault Domains for SCv3000 Series Storage Systems

The Storage Center handles all fault domain creation and modification on SCv3000 series storage systems. Depending on the hardware configuration, the following fault domains are automatically created on SCv3000 series storage systems:

- For SCv3000 series storage systems with Fibre Channel HBAs, two fault domains are created for the Fibre Channel ports.
- For SCv3000 series storage systems with iSCSI HBAs, two fault domains are created for the iSCSI ports.
- For SCv3000 series storage systems with SAS HBAs, four fault domains are created for the SAS ports.
- For SCv3000 series storage systems with iSCSI mezzanine cards, two fault domains are created for the iSCSI ports.
- For SCv3000 series storage systems with iSCSI mezzanine cards and iSCSI HBAs, four fault domains are created for iSCSI ports.

NOTE: Additional front-end fault domains cannot be created on SCv3000 series storage systems. In addition, existing fault domains cannot be modified or deleted on SCv3000 series storage systems.
SCv3000 and SCv3020 Storage System With Fibre Channel Front-End Connectivity

A storage system with Fibre Channel front-end connectivity can communicate with the following components of a Storage Center system.

Using SFP+ Transceiver Modules

You can connect to the front-end port of a storage controller using a direct-attached SFP+ cable or an SFP+ transceiver module. An SCv3000 and SCv3020 storage system with 16 Gb Fibre Channel or 10 GbE iSCSI storage controllers uses short-range small-form-factor pluggable (SFP+) transceiver modules.

Figure 4. SFP+ Transceiver Module With a Bail Clasp Latch

The SFP+ transceiver modules are installed into the front-end ports of a storage controller.

Guidelines for Using SFP+ Transceiver Modules

Before installing SFP+ transceiver modules and fiber-optic cables, read the following guidelines.

CAUTION: When handling static-sensitive devices, take precautions to avoid damaging the product from static electricity.

- Use only Dell-supported SFP+ transceiver modules with the Storage Center. Other generic SFP+ transceiver modules are not supported and might not work with the Storage Center.
- The SFP+ transceiver module housing has an integral guide key that is designed to prevent you from inserting the transceiver module incorrectly.
- Use minimal pressure when inserting an SFP+ transceiver module into a Fibre Channel port. Forcing the SFP+ transceiver module into a port could damage the transceiver module or the port.
- The SFP+ transceiver module must be installed into a port before you connect the fiber-optic cable.
- The fiber-optic cable must be removed from the SFP+ transceiver module before you remove the transceiver module from the port.

Install an SFP+ Transceiver Module

Use the following procedure to install an SFP+ transceiver module into a storage controller.

About this task

Read the following cautions and information before installing an SFP+ transceiver module.

NOTE: To reduce the risk of injury from laser radiation or damage to the equipment, take the following precautions:

- Do not open any panels, operate controls, make adjustments, or perform procedures to a laser device other than those specified in this document.
- Do not stare into the laser beam.

CAUTION: Transceiver modules can be damaged by electrostatic discharge (ESD). To prevent ESD damage to the transceiver module, take the following precautions:

- Wear an antistatic discharge strap while handling transceiver modules.
- Place transceiver modules in antistatic packing material when transporting or storing them.

Steps

1. Position the transceiver module so that the key is oriented correctly to the port in the storage controller.
Figure 5. Install the SFP+ Transceiver Module

1. SFP+ transceiver module
2. Fiber-optic cable connector

2. Insert the transceiver module into the port until it is firmly seated and the latching mechanism clicks.
   The transceiver modules are keyed so that they can be inserted only with the correct orientation. If a transceiver module does not slide in easily, ensure that it is correctly oriented.
   ▲ **CAUTION:** To reduce the risk of damage to the equipment, do not use excessive force when inserting the transceiver module.

3. Position the fiber-optic cable so that the key (the ridge on one side of the cable connector) is aligned with the slot in the transceiver module.
   ▲ **CAUTION:** Touching the end of a fiber-optic cable damages the cable. Whenever a fiber-optic cable is not connected, replace the protective covers on the ends of the cable.

4. Insert the fiber-optic cable into the transceiver module until the latching mechanism clicks.

Remove an SFP+ Transceiver Module

Complete the following steps to remove an SFP+ transceiver module from a storage controller.

**Prerequisites**

Use failover testing to make sure that the connection between host servers and the Storage Center remains up if the port is disconnected.

**About this task**

Read the following cautions and information before beginning the removal and replacement procedures.

**NOTE:** To reduce the risk of injury from laser radiation or damage to the equipment, take the following precautions:
- Do not open any panels, operate controls, make adjustments, or perform procedures to a laser device other than those specified in this document.
- Do not stare into the laser beam.

▲ **CAUTION:** Transceiver modules can be damaged by electrostatic discharge (ESD). To prevent ESD damage to the transceiver module, take the following precautions:
- Wear an antistatic discharge strap while handling modules.
- Place modules in antistatic packing material when transporting or storing them.

**Steps**

1. Remove the fiber-optic cable that is inserted into the transceiver.
   a) Make sure the fiber-optic cable is labeled before removing it.
   b) Press the release clip on the bottom of the cable connector to remove the fiber-optic cable from the transceiver.
   ▲ **CAUTION:** Touching the end of a fiber-optic cable damages the cable. Whenever a fiber-optic cable is not connected, replace the protective covers on the ends of the cables.
2. Open the transceiver module latching mechanism.
3. Grasp the bail clasp latch on the transceiver module and pull the latch out and down to eject the transceiver module from the socket.
4. Slide the transceiver module out of the port.

![Image of transceiver module](image)

**Figure 6. Remove the SFP+ Transceiver Module**

a. SFP+ transceiver module
b. Fiber-optic cable connector

---

**Back-End Connectivity**

Back-end connectivity is strictly between the storage system and expansion enclosures.

The SCv3000 and SCv3020 storage system supports back-end connectivity to multiple SCv300, SCv320, and SCv360 expansion enclosures.

---

**System Administration**

To perform system administration, the Storage Center communicates with computers using the Ethernet management (MGMT) port on the storage controllers.

The Ethernet management port is used for Storage Center configuration, administration, and management.

---

**Storage Center Replication**

Storage Center sites can be collocated or remotely connected and data can be replicated between sites. Storage Center replication can duplicate volume data to another site in support of a disaster recovery plan or to provide local access to a remote data volume. Typically, data is replicated remotely as part of an overall disaster avoidance or recovery plan.

The SCv3000 and SCv3020 storage system supports replication to the storage systems listed below. However, a Storage Manager Data Collector must be used to replicate data between the storage systems. For more information about installing and managing the Data Collector and setting up replications, see the Storage Manager Installation Guide.

---

**SCv3000 and SCv3020 Storage System Hardware**

The SCv3000 and SCv3020 storage system ships with Dell Enterprise Plus Value drives, two redundant power supply/cooling fan modules, and two redundant storage controllers.

Each storage controller contains the front-end, back-end, and management communication ports of the storage system.
SCv3000 and SCv3020 Storage System Front-Panel View

The front panel of the storage system contains power and status indicators, and a system identification button. In addition, the hard drives are installed and removed through the front of the storage system chassis.

SCv3000 and SCv3020 Storage System Drives

The SCv3000 and SCv3020 storage system supports Dell Enterprise Plus Value drives.

The drives in an SCv3000 storage system are installed horizontally. The drives in an SCv3020 storage system are installed vertically. The indicators on the drives provide status and activity information.
**Figure 8. SCv300 and SCv320 Expansion Enclosure Drive Indicators**

</tr>
</tbody>
</table>

**SCv3000 and SCv3020 Storage System Drive Numbering**

The storage system holds up to 16 or 30 drives, which are numbered from left to right in rows starting from 0 at the top-left drive. Drive numbers increment from left to right, and then top to bottom such that the first row of drives is numbered from 0 to 4 from left to right, and the second row of drives is numbered from 5 to 9 from left to right.

Storage Manager identifies drives as **XX-YY**, where **XX** is the number of the unit ID of the storage system and **YY** is the drive position inside the storage system.

**Figure 9. SCv3000 Storage System Drive Numbering**

</table>
Power Supply and Cooling Fan Modules
The SCv3000 and SCv3020 storage system supports two hot-swappable power supply/cooling fan modules. The cooling fans and the power supplies are integrated into the power supply/cooling fan module and cannot be replaced separately. If one power supply/cooling fan module fails, the second module continues to provide power to the storage system.

**NOTE:** When a power supply/cooling fan module fails, the cooling fan speed in the remaining module increases significantly to provide adequate cooling. The cooling fan speed decreases gradually when a new power supply/cooling fan module is installed.

**CAUTION:** A single power supply/cooling fan module can be removed from a powered on storage system for no more than 90 seconds. If a power supply/cooling fan module is removed for longer than 90 seconds, the storage system might shut down automatically to prevent damage.

SCv3000 and SCv3020 Storage Controller Features and Indicators
The SCv3000 and SCv3020 storage system includes two storage controllers in two interface slots.

SCv3000 and SCv3020 Storage Controller

  • Steady amber, left LED – Link (degraded speed)  
  • Blinking green, right LED – Activity  

  **NOTE:** The mezzanine card does not support DCB.

---

**Expansion Enclosure Overview**

Expansion enclosures allow the data storage capabilities of the SCv3000 and SCv3020 storage system to be expanded beyond the 30 internal drives in the storage system chassis.

- The SCv300 is a 2U expansion enclosure that supports up to 12 3.5-inch hard drives installed in a four-column, three-row configuration.
- The SCv320 is a 2U expansion enclosure that supports up to 24 2.5-inch hard drives installed vertically side by side.
- The SCv360 is a 4U expansion enclosure that supports up to 60 3.5-inch hard drives installed in a twelve-column, five-row configuration.

**SCv300 and SCv320 Expansion Enclosure Front-Panel Features and Indicators**

The front panel shows the expansion enclosure status and power supply status.

Install the Storage Center Hardware

This section describes how to unpack the Storage Center equipment, prepare for the installation, mount the equipment in a rack, and install the drives.

Topics:
- Unpacking Storage Center Equipment
- Safety Precautions
- Prepare the Installation Environment
- Install the Storage System in a Rack

Unpacking Storage Center Equipment

Unpack the storage system and identify the items in your shipment.

Figure 26. SCv3000 and SCv3020 Storage System Components

1. Documentation
2. Storage system
3. Rack rails
4. USB cables (2)
5. Power cables (2)
6. Front bezel

Safety Precautions

Always follow these safety precautions to avoid injury and damage to Storage Center equipment.

If equipment described in this section is used in a manner not specified by Dell, the protection provided by the equipment could be impaired. For your safety and protection, observe the rules described in the following sections.

NOTE: See the safety and regulatory information that shipped with each Storage Center component. Warranty information is included within this document or as a separate document.

Installation Safety Precautions

Follow these safety precautions:
Del recommends that only individuals with rack-mounting experience install the storage system in a rack.

- Make sure the storage system is always fully grounded to prevent damage from electrostatic discharge.
- When handling the storage system hardware, use an electrostatic wrist guard (not included) or a similar form of protection.

The chassis must be mounted in a rack. The following safety requirements must be considered when the chassis is being mounted:

- The rack construction must be capable of supporting the total weight of the installed chassis. The design should incorporate stabilizing features suitable to prevent the rack from tipping or being pushed over during installation or in normal use.
- When loading a rack with a chassis, fill from the bottom up; empty from the top down.
- To avoid danger of the rack toppling over, slide only one chassis out of the rack at a time.

**Electrical Safety Precautions**

Always follow electrical safety precautions to avoid injury and damage to Storage Center equipment.

**NOTE:** Disconnect power from the storage system when removing or installing components that are not hot-swappable. When disconnecting power, first power down the storage system using the Storage Manager and then unplug the power cords from all the power supplies in the storage system.

- Provide a suitable power source with electrical overload protection. All Storage Center components must be grounded before applying power. Make sure that a safe electrical earth connection can be made to power supply cords. Check the grounding before applying power.
- The plugs on the power supply cords are used as the main disconnect device. Make sure that the socket outlets are located near the equipment and are easily accessible.
- Know the locations of the equipment power switches and the room's emergency power-off switch, disconnection switch, or electrical outlet.
- Do not work alone when working with high-voltage components.
- Do not remove covers from the power supply unit. Disconnect the power connection before removing a power supply from the storage system.
- Do not remove a faulty power supply unless you have a replacement model of the correct type ready for insertion. A faulty power supply must be replaced with a fully operational module power supply within 24 hours.
- Unplug the storage system chassis before you move it or if you think it has become damaged in any way. When powered by multiple AC sources, disconnect all power sources for complete isolation.

**Electrostatic Discharge Precautions**

Always follow electrostatic discharge (ESD) precautions to avoid injury and damage to Storage Center equipment.

Electrostatic discharge (ESD) is generated by two objects with different electrical charges coming into contact with each other. The resulting electrical discharge can damage electronic components and printed circuit boards. Follow these guidelines to protect your equipment from ESD:

- Dell recommends that you always use a static mat and static strap while working on components in the interior of the chassis.
- Observe all conventional ESD precautions when handling plug-in modules and components.
- Use a suitable ESD wrist or ankle strap.
- Avoid contact with backplane components and module connectors.
- Keep all components and printed circuit boards (PCBs) in their antistatic bags until ready for use.

**General Safety Precautions**

Always follow general safety precautions to avoid injury and damage to Storage Center equipment.

- Keep the area around the storage system chassis clean and free of clutter.
- Place any system components that have been removed away from the storage system chassis or on a table so that they are not in the way of other people.
- While working on the storage system chassis, do not wear loose clothing such as neckties and unbuttoned shirt sleeves. These items can come into contact with electrical circuits or be pulled into a cooling fan.
- Remove any jewelry or metal objects from your body. These items are excellent metal conductors that can create short circuits and harm you if they come into contact with printed circuit boards or areas where power is present.
- Do not lift the storage system chassis by the handles of the power supply units (PSUs). They are not designed to hold the weight of the entire chassis, and the chassis cover could become bent.
• Before moving the storage system chassis, remove the PSUs to minimize weight.
• Do not remove drives until you are ready to replace them.

**NOTE:** To ensure proper storage system cooling, hard drive blanks must be installed in any hard drive slot that is not occupied.

### Prepare the Installation Environment

Make sure that the environment is ready for installing the Storage Center.

- **Rack Space** — The rack must have enough space to accommodate the storage system chassis, expansion enclosures, and switches.
- **Power** — Power must be available in the rack, and the power delivery system must meet the requirements of the Storage Center. AC input to the power supply is 200–240 V.
- **Connectivity** — The rack must be wired for connectivity to the management network and any networks that carry front-end I/O from the Storage Center to servers.

### Install the Storage System in a Rack

Install the storage system and other Storage Center system components in a rack.

**About this task**

Mount the storage system and expansion enclosures in a manner that allows for expansion in the rack and prevents the rack from becoming top-heavy.

The SCv3000 and SCv3020 storage system ships with a ReadyRails II kit. The rails come in two different styles: tool-less and tooled. Follow the detailed installation instructions located in the rail kit box for your particular style of rails.

**NOTE:** Dell recommends using two people to install the rails, one at the front of the rack and one at the back.

**Steps**

1. Position the left and right rail end pieces labeled FRONT facing inward.
2. Align each end piece with the top and bottom holes of the appropriate U space.

![Figure 27. Attach the Rails to the Rack](image)

3. Engage the back end of the rail until it fully seats and the latch locks into place.
4. Engage the front end of the rail until it fully seats and the latch locks into place.
5. Align the system with the rails and slide the storage system into the rack.
6. Lift the latches on each side of the front panel and tighten the screws to the rack.

**Figure 28. Slide the Storage System Onto the Rails**

**Figure 29. Tighten the Screws**

**Results**

If the Storage Center system includes expansion enclosures, mount the expansion enclosures in the rack. See the instructions included with the expansion enclosure for detailed steps.
Connect the Front-End Cabling

Front-end cabling refers to the connections between the storage system and external devices such as host servers or another Storage Center.

Dell recommends connecting the storage system to host servers using the most redundant option available. Also, ensure that the speed of the HBAs in the storage controller matches the speed of the host server.

- For a list of supported HBAs and detailed host adapter settings, see the Dell EMC Storage Compatibility Matrix.
- For detailed switch configurations, see the Switch Configuration Guides for SC Series.

**Topics:**

- Types of Redundancy for Front-End Connections
- Connecting to Host Servers with Fibre Channel HBAs
- Connecting to Host Servers with iSCSI HBAs or Network Adapters
- Connecting to Host Servers with SAS HBAs
- Attach Host Servers (Fibre Channel)
- Attach the Host Servers (iSCSI)
- Attach the Host Servers (SAS)
- Connect the Management Ports to the Management Network

**Types of Redundancy for Front-End Connections**

Front-end redundancy is achieved by eliminating single points of failure that could cause a server to lose connectivity to the Storage Center.

Depending on how the Storage Center is cabled and configured, the following types of redundancy are available.

**Port Redundancy**

If a port becomes unavailable because it is disconnected or a hardware failure has occurred, the port moves over to another port in the same fault domain.

**Storage Controller Redundancy**

To allow for storage controller redundancy, a front-end port on each storage controller must be connected to the same switch or server. If a storage controller becomes unavailable, the front-end ports on the offline storage controller move over to the ports (in the same fault domain) on the available storage controller.

**Multipath I/O (MPIO)**

MPIO allows a server to use multiple paths for I/O if they are available.

MPIO software offers redundancy at the path level. MPIO typically operates in a round-robin manner by sending packets first down one path and then the other. If a path becomes unavailable, MPIO software continues to send packets down the functioning path.

**NOTE:** MPIO is operating-system specific, and it loads as a driver on the server or it is part of the server operating system.

**MPIO Behavior**

The server must have at least two FC or iSCSI ports to use MPIO.

When MPIO is configured, a server can send I/O to multiple ports on the same storage controller.
MPIO Configuration Instructions for Host Servers

If a Storage Manager wizard is used to configure host server access to the Storage Center, the Storage Manager attempts to automatically configure MPIO with best practices.

NOTE: Compare the host server settings applied by the Storage Manager wizard against the latest Storage Center Best Practices documents (listed in the following table) on the Dell TechCenter site (http://en.community.dell.com/techcenter/storage/).

Connecting to Host Servers with Fibre Channel HBAs

A storage system with Fibre Channel front-end ports connects to one or more FC switches, which connect to one or more host servers with Fibre Channel HBAs.

Fibre Channel Zoning

When using Fibre Channel for front-end connectivity, zones must be established to ensure that storage is visible to the servers. Use the zoning concepts discussed in this section to plan the front-end connectivity before starting to cable the storage system.

Dell recommends creating zones using a single initiator host port and multiple Storage Center ports.

WWN Zoning Guidelines

When WWN zoning is configured, a device may reside on any port, or change physical ports and still be visible, because the switch is seeking a WWN.

List of guidelines for WWN zoning.

- Include all Storage Center virtual World Wide Port Names (WWPNs) in a single zone.
- Include all Storage Center physical World Wide Port Names (WWPNs) in a single zone.
- For each host server HBA port, create a zone that includes the HBA port WWPN and multiple Storage Center virtual WWPNs on the same switch.
- For Fibre Channel replication from Storage Center system A to Storage Center system B:
  - Include all Storage Center physical WWPNs from system A and system B in a single zone.
  - Include all Storage Center physical WWPNs of system A and the virtual WWPNs of system B on the particular fabric.
  - Include all Storage Center physical WWPNs of system B and the virtual WWPNs of system A on the particular fabric.

NOTE: Some ports may not be used or dedicated for replication, however ports that are used must be in these zones.

Fibre Channel Replication

Storage Center System A (Virtual Port Mode) to Storage Center System B (Virtual Port Mode)

- Include all Storage Center physical WWPNs from system A and system B in a single zone.
- Include all Storage Center physical WWPNs of system A and the virtual WWPNs of system B on the particular fabric.
- Include all Storage Center physical WWPNs of system B and the virtual WWPNs of system A on the particular fabric.
Some ports may not be used or dedicated for replication, however ports that are used must be in these zones.

Cable the Storage System with 2-Port Fibre Channel IO Cards

Connect the Fibre Channel ports on the storage controllers to host servers with Fibre Channel HBAs. The Fibre Channel ports of the storage controllers connect to the host servers through the Fibre Channel switches in the SAN.

About this task

Steps

1. Connect each host server to both Fibre Channel fabrics.
2. Connect Storage Center fault domain 1 (shown in orange) to fabric 1.
   - Connect port 1 of the Fibre Channel HBA in the top storage controller to switch 1.
   - Connect port 1 of the Fibre Channel HBA in the bottom storage controller to switch 1.
3. Connect Storage Center fault domain 2 (shown in blue) to fabric 2.
   - Connect port 2 of the Fibre Channel HBA in the top storage controller to switch 2.
   - Connect port 2 of the Fibre Channel HBA in the bottom storage controller to switch 2.
Cable the Storage System with 4-Port Fibre Channel IO Cards

Connect the Fibre Channel ports on the storage controllers to host servers with Fibre Channel HBAs. The Fibre Channel ports of the storage controllers connect to the host servers through the Fibre Channel switches in the SAN.

About this task

![Diagram showing the connection of host servers, Fibre Channel switches, and storage systems]

**Figure 31. Connect the Storage System to Fibre Channel Host Servers**

1. Host server
2. Host server
3. Fibre Channel switch 1 (member of fault domain 1)
4. Fibre Channel switch 2 (member of fault domain 2)
5. SCv3000 and SCv3020 storage system

**Steps**

1. Connect each host server to both Fibre Channel fabrics.
2. Connect fault domain 1 (shown in orange) to fabric 1.
   - Connect port 1 of the Fibre Channel HBA in the top storage controller to switch 1.
   - Connect port 3 of the Fibre Channel HBA in the top storage controller to switch 1.
   - Connect port 1 of the Fibre Channel HBA in the bottom storage controller to switch 1.
   - Connect port 3 of the Fibre Channel HBA in the bottom storage controller to switch 1.
3. Connect fault domain 2 (shown in blue) to fabric 2.
   - Connect port 2 of the Fibre Channel HBA in the top storage controller to switch 2.
   - Connect port 4 of the Fibre Channel HBA in the top storage controller to switch 2.
   - Connect port 2 of the Fibre Channel HBA in the bottom storage controller to switch 2.
   - Connect port 4 of the Fibre Channel HBA in the bottom storage controller to switch 2.

**Labeling the Front-End Cables**

Label the front-end cables to indicate the storage controller and port to which they are connected.

**Prerequisites**

Locate the front-end cable labels that shipped with the storage system.
About this task

Apply cable labels to both ends of each cable that connects a storage controller to a front-end fabric or network, or directly to host servers.

Steps

1. Starting with the top edge of the label, attach the label to the cable near the connector.

![Figure 32. Attach Label to Cable](image)

2. Wrap the label around the cable until it fully encircles the cable. The bottom of each label is clear so that it does not obscure the text.

![Figure 33. Wrap Label Around Cable](image)

3. Apply a matching label to the other end of the cable.
Connecting to Host Servers with iSCSI HBAs or Network Adapters

A storage system with iSCSI front-end ports connects to one or more Ethernet switches, which connect to one or more host servers with iSCSI HBAs or network adapters.

Cable the Storage System with 2–Port iSCSI IO Cards

Connect the iSCSI ports on the storage controllers to host servers with iSCSI HBAs. The iSCSI ports of the storage controllers connect to the host servers through the Ethernet switches in the SAN.

About this task

Figure 34. Connect the Storage System to Host Servers with iSCSI HBAs

Steps

1. Connect each host server to both iSCSI networks.
2. Connect fault domain 1 (shown in orange) to iSCSI network 1.
   - Connect port 1 of the iSCSI HBA in the top storage controller to switch 1.
   - Connect port 1 of the iSCSI HBA in the bottom storage controller to switch 1.
3. Connect iSCSI fault domain 2 (shown in blue) to iSCSI network 2.
   - Connect port 2 of the iSCSI HBA in the top storage controller to switch 2.
   - Connect port 2 of the iSCSI HBA in the bottom storage controller to switch 2.
Cable the Storage System with 4-Port iSCSI IO Cards

Connect the iSCSI ports on the storage controllers to host servers with iSCSI HBAs. The iSCSI ports of the storage controllers connect to the host servers through the Ethernet switches in the SAN.

About this task

Steps

1. Connect each host server to both iSCSI networks.
2. Connect fault domain 1 (shown in orange) to iSCSI network 1.
   - Connect port 1 of the iSCSI HBA in the top storage controller to switch 1.
   - Connect port 3 of the iSCSI HBA in the top storage controller to switch 1.
   - Connect port 1 of the iSCSI HBA in the bottom storage controller to switch 1.
   - Connect port 3 of the iSCSI HBA in the bottom storage controller to switch 1.
3. Connect iSCSI fault domain 2 (shown in blue) to iSCSI network 2.
   - Connect port 2 of the iSCSI HBA in the top storage controller to switch 2.
   - Connect port 4 of the iSCSI HBA in the top storage controller to switch 2.
   - Connect port 2 of the iSCSI HBA in the bottom storage controller to switch 2.
   - Connect port 4 of the iSCSI HBA in the bottom storage controller to switch 2.

Results
Connect a Storage System to a Host Server Using an iSCSI Mezzanine Card

Connect the iSCSI ports on the mezzanine card to host servers with iSCSI HBAs. The iSCSI ports on the mezzanine card connect to the iSCSI host servers through the Ethernet switches in the SAN.

About this task

NOTE: The ports on the mezzanine cards are numbered 1 to 4 from left to right.

To connect the iSCSI host server to iSCSI networks:

Steps

1. Connect each iSCSI host server to both iSCSI networks.
2. Connect fault domain 1 (shown in orange) to iSCSI network 1.
   - Connect port 1 of the mezzanine card in the top storage controller to switch 1.
   - Connect port 3 of the mezzanine card in the top storage controller to switch 1.
   - Connect port 1 of the mezzanine card in the bottom storage controller to switch 1.
   - Connect port 3 of the mezzanine card in the bottom storage controller to switch 1.
3. Connect block access fault domain 2 (shown in blue) to iSCSI network 2.
   - Connect port 2 in the mezzanine card in the top storage controller to switch 2.
   - Connect port 4 in the mezzanine card in the top storage controller to switch 2.
   - Connect port 2 in the mezzanine card in the bottom storage controller to switch 2.
   - Connect port 4 in the mezzanine card in the bottom storage controller to switch 2.
Labeling the Front-End Cables

Label the front-end cables to indicate the storage controller and port to which they are connected.

Prerequisites

Locate the pre-made front-end cable labels that shipped with the storage system.

About this task

Apply cable labels to both ends of each cable that connects a storage controller to a front-end fabric or network, or directly to host servers.

Steps

1. Starting with the top edge of the label, attach the label to the cable near the connector.

   ![Figure 37. Attach Label to Cable](image)

2. Wrap the label around the cable until it fully encircles the cable. The bottom of each label is clear so that it does not obscure the text.

   ![Figure 38. Wrap Label Around Cable](image)

3. Apply a matching label to the other end of the cable.
Connecting to Host Servers with SAS HBAs

An SCv3000 and SCv3020 storage system with front-end SAS ports connects directly to host servers with SAS HBAs.

Cable the Storage System with 4-Port SAS HBAs to Host Servers using One SAS HBA per Server

A storage system with four front-end SAS ports on each storage controller can connect to up to four host servers, if each host server has one SAS HBA with two ports.

About this task

This configuration includes four fault domains spread across both storage controllers. The storage controllers are connected to each host server using two SAS connections.

If a storage controller becomes unavailable, all of the standby paths on the other storage controller become active.

![Figure 39. Storage System with Two 4-Port SAS Storage Controllers](image)

Steps

1. Connect fault domain 1 (shown in orange) to host server 1.
   a) Connect a SAS cable from storage controller 1: port 1 to the SAS HBA on host server 1.
   b) Connect a SAS cable from storage controller 2: port 1 to the SAS HBA on host server 1.
2. Connect fault domain 2 (shown in blue) to host server 2.
   a) Connect a SAS cable from storage controller 1: port 2 to the SAS HBA on host server 2.
   b) Connect a SAS cable from storage controller 2: port 2 to the SAS HBA on host server 2.
3. Connect fault domain 3 (shown in gray) to host server 3.
   a) Connect a SAS cable from storage controller 1: port 3 to the SAS HBA on host server 3.
   b) Connect a SAS cable from storage controller 2: port 3 to the SAS HBA on host server 3.
4. Connect fault domain 4 (shown in red) to host server 4.
   a) Connect a SAS cable from storage controller 1: port 4 to the SAS HBA on host server 4.
   b) Connect a SAS cable from storage controller 2: port 4 to the SAS HBA on host server 4.
Next steps

Install or enable MPIO on the host servers.

NOTE: For the latest best practices, see the Dell Storage Center Best Practices document on the Dell TechCenter site (http://en.community.dell.com/techcenter/storage/).

Labeling the Front-End Cables

Label the front-end cables to indicate the storage controller and port to which they are connected.

Prerequisites

Locate the pre-made front-end cable labels that shipped with the storage system.

About this task

Apply cable labels to both ends of each cable that connects a storage controller to a front-end fabric or network, or directly to host servers.

Steps

1. Starting with the top edge of the label, attach the label to the cable near the connector.

   ![Figure 40. Attach Label to Cable](image)

2. Wrap the label around the cable until it fully encircles the cable. The bottom of each label is clear so that it does not obscure the text.

   ![Figure 41. Wrap Label Around Cable](image)

3. Apply a matching label to the other end of the cable.
**Attach Host Servers (Fibre Channel)**

Install the Fibre Channel host bus adapters (HBAs), install the drivers, and make sure that the latest supported firmware is installed.

**About this task**

See the [Dell EMC Storage Compatibility Matrix](#) for a list of supported Fibre Channel HBAs and recommended host adapter settings.

**Steps**

1. Install Fibre Channel HBAs in the host servers.  
   - **NOTE:** Do not install Fibre Channel HBAs from different vendors in the same server.
2. Install supported drivers for the HBAs and make sure that the HBAs have the latest supported firmware.
3. Use the Fibre Channel cabling diagrams to cable the host servers to the switches. Connecting host servers directly to the storage system without using Fibre Channel switches is not supported.

**Attach the Host Servers (iSCSI)**

Install the iSCSI host bus adapters (HBAs) or iSCSI network adapters, install the drivers, and make sure that the latest supported firmware is installed.

**About this task**

See the [Dell EMC Storage Compatibility Matrix](#) for a list of supported iSCSI HBAs and recommended host adapter settings.

**Steps**

- If the host server is a Windows or Linux host:
  a) Install the iSCSI HBAs or network adapters dedicated for iSCSI traffic in the host servers.  
   - **NOTE:** Do not install iSCSI HBAs or network adapters from different vendors in the same server.
  b) Install supported drivers for the HBAs or network adapters and make sure that the HBAs or network adapter have the latest supported firmware.
  c) Use the host operating system to assign IP addresses for each iSCSI port. The IP addresses must match the subnets for each fault domain.  
   - **CAUTION:** Correctly assign IP addresses to the HBAs or network adapters. Assigning IP addresses to the wrong ports can cause connectivity issues.
   - **NOTE:** If using jumbo frames, they must be enabled and configured on all devices in the data path, adapter ports, switches, and storage system.
  d) Use the iSCSI cabling diagrams to cable the host servers to the switches. Connecting host servers directly to the storage system without using Ethernet switches is not supported.
- If the host server is a vSphere host:
  a) Install the iSCSI HBAs or network adapters dedicated for iSCSI traffic in the host servers.
  b) Install supported drivers for the HBAs or network adapters and make sure that the HBAs or network adapter have the latest supported firmware.
  c) If the host uses network adapters for iSCSI traffic, create a VMkernel port for each network adapter (1 VMkernel per vSwitch).
  d) Use the host operating system to assign IP addresses for each iSCSI port. The IP addresses must match the subnets for each fault domain.  
   - **CAUTION:** Correctly assign IP addresses to the HBAs or network adapters. Assigning IP addresses to the wrong ports can cause connectivity issues.
   - **NOTE:** If using jumbo frames, they must be enabled and configured on all devices in the data path, adapter ports, switches, and storage system.
  e) If the host uses network adapters for iSCSI traffic, add the VMkernel ports to the iSCSI software initiator.
  f) Use the iSCSI cabling diagrams to cable the host servers to the switches. Connecting host servers directly to the storage system without using Ethernet switches is not supported.
Attach the Host Servers (SAS)

On each host server, install the SAS host bus adapters (HBAs), install the drivers, and make sure that the latest supported firmware is installed.

About this task

See the Dell EMC Storage Compatibility Matrix for a list of supported SAS HBAs and recommended host adapter settings.

Steps

1. Install the SAS HBAs in the host servers.
   
   **NOTE:** Do not install HBAs from different vendors in the same server.

2. Install supported drivers for the HBAs and make sure that the HBAs have the latest supported firmware installed.

3. Use the SAS cabling diagram to cable the host servers directly to the storage system.

Connect the Management Ports to the Management Network

Connect the management port on each storage controller to the management network.

About this task

![Diagram of connecting the management ports to the management network](image)

**Figure 42. Connect the Management Ports to the Management Network**

1. Management network
2. Ethernet switch
3. SCv3000 and SCv3020 storage system

Steps

1. Connect the Ethernet switch to the management network.

2. Connect the management ports to the Ethernet switch.
   - Connect the management port on the top storage controller to the Ethernet switch.
   - Connect the management port on the bottom storage controller to the Ethernet switch.

Labeling the Ethernet Management Cables

Label the Ethernet management cables that connect each storage controller to an Ethernet switch.

Prerequisites

Locate the Ethernet management cable labels that shipped with the SCv3000 and SCv3020 storage system.
About this task

Apply cable labels to both ends of each Ethernet management cable.

Steps

1. Starting with the top edge of the label, attach the label to the cable near the connector.

   ![Figure 43. Attach Label to Cable](image)

2. Wrap the label around the cable until it fully encircles the cable. The bottom of each label is clear so that it does not obscure the text.

   ![Figure 44. Wrap Label Around Cable](image)

3. Apply a matching label to the other end of the cable.
Connect the Back-End Cabling

Back-end cabling refers to the connections between the storage system and expansion enclosures. An SCv3000 and SCv3020 storage system can be deployed with or without expansion enclosures.

**NOTE:** When expansion enclosures are not used, there is no need to interconnect the SAS port of a storage controller.

Topics:
- Expansion Enclosure Cabling Guidelines
- Back-End Connections to Expansion Enclosures
- Label the Back-End Cables
- Attach the Serial Cable

Expansion Enclosure Cabling Guidelines

The connection between a storage system and expansion enclosures is referred to as a SAS chain. A SAS chain is made up of two paths, which are referred to as the A side and B side. Each side of the SAS chain starts at a SAS port on one storage controller and ends at a SAS port on the other storage controller.

You can connect multiple expansion enclosures to an SCv3000 and SCv3020 by cabling the expansion enclosures in series. However, the SCv3000 and SCv3020 do not support the cabling of SCv300 and SCv320 expansion enclosures on the same SAS chain as SCv360 expansion enclosures.

You can connect multiple expansion enclosures to an SCv3000 and SCv3020 by cabling the expansion enclosures in series. However, the SCv3000 and SCv3020 do not support the cabling of SCv300 and SCv320 Expansion Enclosures on the same SAS chain as SCv360 expansion enclosures.

Back-End SAS Redundancy

Use redundant SAS cabling to make sure that an unavailable I/O port or storage controller does not cause a Storage Center outage. If an I/O port or storage controller becomes unavailable, the Storage Center I/O continues on the redundant path.

Back-End Connections to Expansion Enclosures

The SCv3000 and SCv3020 supports up to 16 SCv300 expansion enclosures, up to eight SCv320 expansion enclosures, and up to three SCv360 expansion enclosures per SAS chain.

The following sections show common cabling between the SCv3000 and SCv3020 and expansion enclosures. Locate the scenario that most closely matches the Storage Center that you are configuring and follow the instructions, modifying them as necessary.
SCv3000 and SCv3020 and One SCv300 and SCv320 Expansion Enclosure

This figure shows an SCv3000 and SCv3020 storage system cabled to one SCv300 and SCv320 expansion enclosure.

**Label the Back-End Cables**

Label the back-end cables that interconnect the storage controllers or label the back-end cables that connect the storage system to the expansion enclosures.

**Prerequisites**

Locate the cable labels provided with the expansion enclosures.

**About this task**

Apply cable labels to both ends of each SAS cable to indicate the chain number and side (A or B).
Steps

1. Starting with the top edge of the label, attach the label to the cable near the connector.

   Figure 50. Attach Label to Cable

2. Wrap the label around the cable until it fully encircles the cable. The bottom of each label is clear so that it does not obscure the text.

   Figure 51. Wrap Label Around Cable

3. Apply a matching label to the other end of the cable.

Attach the Serial Cable

The Storage Center ships with a serial cable that is used for service only. To ensure that the cable remains with the system, bundle the serial cable and secure it to the rack near the Storage Center using a cable tie.
Deploy the Storage Center

Storage Center can be deployed using different methods, including the web-based Unisphere or the Storage Manager Client.

Topics:
- Preparing for Deployment
- Deploying the Storage Center Using Unisphere
- Unisphere Discovery Utility
- Deploying the Storage Center Using Storage Manager Client

Preparing for Deployment

Before starting the Storage Center deployment, review the IPv address information below, cable and power on the system, and collect the required information.

IPv Addresses

The configuration process uses DHCP to obtain IPv4 and IPv6 addresses from the data center network.

If DHCP is not available:
- Configure the IPv4 address on the system running the Storage Manager client on the target subnet, and
- Enable IPv6 addressing.

This allows the discovery and initial configuration to occur over the IPv6 link local address and then transition to the IPv4 address when the controller IP addresses are configured.

If IPv6 is not allowed or is blocked, configure the Storage Manager client's NIC with two IPv4 IP addresses:
- One IPv4 address configured on the target subnet
- A second IPv4 address on the link local subnet, such as 169.254.10.10

This allows the discovery and initial configuration to occur over the IPv4 link local address and then transition to the IPv4 address when the controller IP addresses are configured.

Connect Power Cables and Turn On the Storage System

Connect power cables to the storage system components and turn on the hardware.

About this task
- If the storage system is installed without expansion enclosures, connect power cables to the storage system chassis and turn on the storage system.
- If the storage system is installed with expansion enclosures, connect power cables to the expansion enclosure chassis. Make sure you power on each expansion enclosure before turning on the storage system.

NOTE: When powering on expansion enclosures with spinning hard drives, wait approximately three minutes for the drives to spin up before powering on the storage system.

Steps
1. Make sure that the power switches are in the OFF position before connecting the power cables.
2. Connect the power cables securely to both power supply/cooling fan modules in the storage system chassis.
3. Connect the power cables plugged into the left power supply to one power distribution unit (PDU).
4. Connect the power cables plugged into the right power supply to a second power distribution unit (PDU).
5. Turn on the storage system by pressing the power switches on both power supply/cooling fan modules to the ON position.

**CAUTION:** Do not power off the storage system until it is discovered by Storage Manager. During the initial power up, the storage system might take up to twenty minutes to boot completely.

### Figure 52. Connect the Power Cables

### Figure 53. Turn On the Storage System

**NOTE:**
- If the LEDs on a storage controller do not turn on, the storage controller might not be fully seated in the storage system chassis. If this issue occurs, press both power buttons to turn off the storage system. Reseat the storage controller, and then press both power buttons again to turn on the storage system.
- If the power supply units do not power on, confirm that the power source is 200 to 240 volts (V). The 200 to 240 V power supply units do not display any LED indications if they are plugged into a 110 V outlet.

### Locate Your Service Tag

Your storage system is identified by a unique service tag and Express Service Code.

The Service Tag and Express Service Code are found on the front of the system by pulling out the information tag. Alternatively, the information might be on a sticker on the back of the storage system chassis. This information is used by Dell to route support calls to the appropriate personnel. This information is used by the manufacturer to route support calls to the appropriate personnel.

**NOTE:** The Quick Resource Locator (QRL) code on the information tag is unique to your system. Scan the QRL to get immediate access to your system information using your smart phone or tablet.
Record System Information

Use the worksheet found in the appendix of this guide to record the information you will need to install the SCv3000 and SCv3020 system.

Deploying the Storage Center Using Unisphere

Use the Initialize Storage Center wizard in Unisphere to discover and configure Storage Centers.

If you do not have access to Unisphere, use the Unisphere Discovery Utility to discover and configure Storage Centers.

Open the Initialize Storage Center Wizard

Perform the following steps to open the Initialize Storage Center wizard:

Steps

• To access the Initialize Storage Center wizard from the Data Collector:
  a) Open a web browser.
  b) Type the address of the Data Collector in the browser using the following format:
     https://Data Collector host name or IP address:3033/

  [NOTE: The computer accessing the Data Collector must be on the same subnet as the Data Collector.]
  c) Type the user name and password of a Data Collector user in the User Name and Password fields.
  d) Click Log In.
     The web browser connects to the Data Collector and displays the Storage Manager Home page.
  e) From the Unisphere Home page, click + (New), and select Initialize Storage Center.
     The Initialize Storage Center wizard opens and the Introduction page is displayed.

• If the Storage Center is installed on a network with DHCP enabled, you can access the Initialize Storage Center wizard by connecting directly to a Storage Center.
  a) Open a web browser.
  b) Type the service tag or IP address of the Storage Center in the browser using the following format:
     https://Storage Center service tag or IP address/

  c) Type Admin in the User Name field.
  d) Type mmm in the Password field.
  e) Click Log In.
     The web browser connects to the Storage Center and the Change Password dialog box is displayed in the Unisphere interface.
  f) Type mmm in the Current Password field.
  g) Type a new password for the Admin user in the New Password and Confirm New Password fields.
  h) Click OK.
     The Initialize Storage Center wizard opens and the Welcome page is displayed.

• If you do not have access to a Data Collector and you are unable to connect directly to a Storage Center, use the Unisphere Discovery Utility to discover and initialize a Storage Center.

Install Tab

Use the Install tab to configure the management network and security settings on a Storage Center.

Introduction to Storage Center Initial Configuration

The Storage Center Initial Configuration page provides a list of prerequisite actions that must be performed and information that is required to configure a Storage Center.

Steps

1. Make sure the prerequisites that are listed on the Storage Center Initial Configuration page are met.
2. Make sure the information that is required to configure the Storage Center is gathered.
3. Click Next. The Discover Storage Centers page is displayed and it lists the unconfigured Storage Centers.
NOTE: If the wizard does not discover the Storage Center that you want to configure, perform the following actions:

- Make sure that the Storage Center hardware is physically attached to all necessary networks.
- Click \(\text{C} (\text{Refresh})\) to rediscover the unconfigured Storage Centers.

Welcome to the Storage Center
Use the Welcome page to specify a name for the Storage Center and view the End User License Agreement.

Steps
1. Type a name for the Storage Center in the **Name** field.
2. Verify that the service tag or serial number that are displayed on the Welcome page match the Storage Center to initialize.
3. Select the language of the End User License Agreement to view from the drop-down menu, and click **Terms of Use** to open the agreement.
4. Click **Next**.

Discover Storage Centers
Use the Discover Storage Centers page to select the Storage Center to initialize. This page appears only when you are connected to a Data Collector.

Steps
1. (Optional) To refresh the list of unconfigured Storage Centers, click \(\text{C} (\text{Refresh})\).
2. Select the Storage Center to initialize.
3. (Optional) To blink the indicator light on the front of the selected Storage Center, click **Enable Indicator Light**.
   You can use the indicator light to visually verify that you have selected the correct Storage Center.
4. To view the drives detected by the selected Storage Center, click **View Disks**.
5. If the selected Storage Center is partially initialized and security is enabled:
   a) Click **Provide Password**.
      The **Provide Password** dialog box opens.
   b) Type the password for the Storage Center Admin user in the **Password** field.

| NOTE: The default password for the Storage Center Admin user is \(\text{mmm}\). |
6. Click **Next**.

Configure the Management Network Settings
Use the Management Network page to configure the management network settings for the Storage Center.

Steps
1. Select how to configure the management network from the **Network Configuration Source** drop-down menu.
   - **DHCP IPv4 Only** – IP addresses are dynamically assigned.
   - **Static** – IP addresses must be specified manually.
2. If the network configuration source is set to Static, specify the management network settings in the following fields:
   **Management IPv4 Settings**
   a) Type the IPv4 management address for the Storage Center in the **Virtual Address** field.
      The IPv4 management address is the IP address that is used to manage the Storage Center and it is different than the IPv4 management address of the storage controllers.
   b) Type a IPv4 management address for each storage controller in the associated fields.
   c) Type the IPv4 subnet mask of the management network in the **Subnet Mask** field.
   d) Type the IPv4 gateway address of the management network in the **Gateway Address** field.
   (Optional) **Management IPv6 Settings**
   a) Type the IPv6 management address for the Storage Center in the **Virtual Address** field.
      The IPv6 management address is the IP address that is used to manage the Storage Center and it is different than the IPv6 management address of the storage controllers.
b) Type an IPv6 management address for each storage controller in the associated fields.

c) Type the IPv6 address prefix in the Prefix field.

d) Type the IPv6 gateway address in the Gateway Address field.

Network Settings

a) Type the domain name of the management network in the Domain Name field.

b) Type the DNS server addresses of the management network in the DNS Server and Secondary DNS Server fields.

c) (Optional) Type a secondary DNS server addresses of the management network in the Secondary DNS Server fields.

3. To proceed:

   • If you are connected to a Data Collector, click Next. The Security page opens.
   • If you are connected directly to a Storage Center, click Finish. The Configure tab opens.

Set the Password and Finish the Installation

If you are connected to a Data Collector, the Security tab opens after configuring the network settings.

Prerequisites

This section applies only if you are connected to a Data Collector.

Steps

1. Type a password for the Storage Center Admin user in the New Password field.

2. Retype the password for the Storage Center Admin user in the Confirm Password field.

3. Click Next.

   The Storage Center Summary page opens.

4. Verify that the Storage Center settings are correct.

5. If the configuration information is correct, click Next.

   If the configuration information is incorrect, click Back and provide the correct information.

   **NOTE:** After you click the Next button, the configuration cannot be changed until after the Storage Center is fully deployed.

   The Installation Complete page opens.

6. Click Finish.

   The Configure tab of the Initialize Storage Center wizard is displayed.

Configure Tab

Use the Configure tab to deploy the Storage Center and configure additional Storage Center settings.

Deploy the Storage Center

The Initialize Storage Center wizard performs system deployment tasks.

Steps

1. Wait until all of the Storage Center deployment tasks are complete.

2. Click Next.

Enter Key Management Server Settings

Specify key management server settings, such as hostname and port.

Steps

1. In the Hostname field, type the host name or IP address of the key management server.

2. In the Port field, type the number of a port with open communication with the key management server.

3. In the Timeout field, type the amount of time in seconds after which the Storage Center should stop attempting to reconnect to the key management server after a failure.
4. To add alternate key management servers, type the host name or IP address of another key management server in the *Alternate Hostnames* area, and then click *Add*.

5. If the key management server requires a user name to validate the Storage Center certificate, enter the name in the *Username* field.

6. If the key management server requires a password to validate the Storage Center certificate, enter the password in the *Password* field.

7. Click *Browse* next to the *Root CA Certificate*. Navigate to the location of the root CA certificate on your computer and select it.

8. Click *Browse* next to the certificate fields for the storage systems. Navigate to the location of the storage system certificates on your computer and select them.

9. Click *Next*.

### Create a Storage Type

Use the New Storage Type page to create a storage type for the Storage Center.

**Steps**

1. (Optional) To create the storage type after the initial configuration, clear the *Create a storage type* checkbox.
2. Select the redundancy level for the storage type.
3. Select the page size for the storage type from the *Page Size* drop-down menu.
4. Select the redundancy level for each tier from the *Tier* drop-down menus.

   **NOTE:** Dual redundancy may be forced for a tier based on the drive sizes occupying the tier.

5. Click *Next*.

### Select the Types of Ports to Configure

Use the Fault Tolerance page to select the types of ports to configure on the Storage Center.

**Steps**

1. Select the checkboxes of the types of ports to configure.
2. Click *Next*.

### Review Fibre Channel Fault Domains

Use the Fibre Channel - Fault Domain Review page to view the automatically generated fault domains.

**Steps**

1. If the wizard displays an error message about Fibre Channel port cabling, correct the issue with the cabling and click *C (Regenerate)* to regenerate the Fibre Channel fault domains.
2. Click *Next*.
   The *Fibre Channel - Fault Domain Summary* page is displayed.
3. Use the software from your switch vendor to create zones for each Fibre Channel fault domain.
4. Click *Next*.

### Review iSCSI Fault Domains

Use the iSCSI - Fault Domain Review page to view the automatically generated fault domain configurations.

**Steps**

1. If the wizard displays an error message about iSCSI port cabling, correct the issue with the cabling and click *C (Regenerate)* to regenerate the iSCSI fault domains.
2. Select the fault domain on which to specify IP addresses for the target and controller ports.
3. Click *Set IPv4 Addresses for Fault Domain*.
   The *Set IPv4 Addresses for Fault Domain* dialog box opens.
4. Type the target address for the iSCSI control port in the *Target IPv4 Address* field.
5. Type the subnet mask of the iSCSI network in the *Subnet Mask* field.
6. Type the IP address of the iSCSI network default gateway in the *Gateway IPv4 Address* field.
7. To set IP addresses for the iSCSI ports:
   a) Select a port to edit.
   b) Click (Edit).
   c) Type the IP address for the port in the IP4 Address field.
   d) Click Set.

   Repeat the previous steps to add additional ports to the fault domain.

8. Click OK.
   Repeat the previous steps for the other fault domains.

9. Click Next.

10. View the iSCSI fault domains that have been created, and click Next.

**Configure SAS Ports**

Perform the following steps to create fault domains for SAS ports:

**Prerequisites**
- One port from each controller within the same fault domain must be cabled.
- The ports for each fault domain must be cabled to the same server.

**Steps**
1. Review the information on the SAS - Cable Ports page. If the Storage Center is not cabled correctly to create fault domains, fix the cabling and click Refresh.
2. Click Next.
   View the fault domains that have been created.
3. Click Next.

**Configure Time Settings**

Configure an NTP server to set the time automatically, or set the time and date manually.

**Steps**
1. From the Region and Time Zone drop-down menus, select the region and time zone used to set the time.
2. Select Use NTP Server and type the host name or IPv4 address of the NTP server, or select Set Current Time and set the time and date manually.
3. Click Next.

**Configure SMTP Server Settings**

If you have an SMTP server, configure the SMTP email settings to receive information from the Storage Center about errors, warnings, and events.

**Steps**
1. By default, the Enable SMTP Email checkbox is selected and enabled. If you do not have an SMTP server you can disable SMTP email by clearing the Enable SMTP Email checkbox.
2. Alternatively, if you have an SMTP server, configure the SMTP server settings.
   a) In the Recipient Email Address field, enter the email address where the information will be sent.
   b) In the SMTP Mail Server field, enter the IP address or fully qualified domain name of the SMTP mail server. Click Test Server to verify connectivity to the SMTP server.
   c) (Optional) In the Backup SMTP Mail Server field, enter the IP address or fully qualified domain name of a backup SMTP mail server. Click Test Server to verify connectivity to the backup SMTP server.
   d) If the SMTP server requires emails to contain a MAIL FROM address, specify an email address in the Sender Email Address field.
   e) (Optional) In the Common Subject Line field, enter a subject line to use for all emails sent by the Storage Center.
Connect Tab
Use the Connect tab to configure SupportAssist and update the Storage Center software.

Accept the SupportAssist Collection Agreement
Use the Accept SupportAssist Collection Agreement page to accept to the terms of the agreement and enable SupportAssist.

Steps
1. To allow SupportAssist to collect diagnostic data and send this information to technical support, select the By checking this box, you accept the above terms and turn on SupportAssist checkbox.
2. Click Next.

   NOTE: If you chose to clear the By checking this box, you accept the above terms and turn on SupportAssist checkbox, a SupportAssist Recommended dialog box opens.
   • To return to the Accept SupportAssist Collection Agreement page, click No.
   • To opt out of SupportAssist, click Yes.

Provide Contact Information
Specify the contact information to provide to SupportAssist and technical support.

Steps
1. Specify general contact information.
2. Specify contact preferences.
3. Click Next.

Provide Onsite Address Information
Provide an address to which to dispatch parts in the event of a failure.

Steps
1. Type a shipping address where replacement Storage Center parts can be sent.
2. Click Next.

Validate SupportAssist Connection
The Connect page displays a summary of the SupportAssist contact information and confirms that the Storage Center is able to connect to SupportAssist.

Steps
• Click Next.

Update the Storage Center
The Storage Center attempts to contact the SupportAssist Update Server to check for updates. If you are not using SupportAssist, you must use the Storage Center Update Utility to update the Storage Center operating system before continuing.

Steps
• If no update is available, the Storage Center Up to Date page appears. Click Next.
• If an update is available, the current and available Storage Center versions are listed.
  1. Click Install to update to the latest version.
  2. If the update fails, click Retry Update to try to update again.
  3. When the update is complete, click Next.
• If the SupportAssist Data Collection and Storage Agreement was not accepted, the Storage Center cannot check for updates.
  • To proceed without checking for an update, click Next.
• To perform updates using the Storage Center Update Utility, click **Use Update Utility**.

• To accept the SupportAssist agreement and check for an update:

  1. Click **Use SupportAssist Server** to review the agreement.
  2. Select the **By checking this box, you accept the above terms and turn on SupportAssist** check box.
  3. Click **Next**. The Storage Center attempts to contact the SupportAssist Update Server to check for updates.

• The **Setup SupportAssist Proxy Settings** dialog box appears if the Storage Center cannot connect to the SupportAssist Update Server. If the site does not have direct access to the Internet but uses a web proxy, configure the proxy settings:

  1. Select **Enabled**.
  2. Enter the proxy settings.
  3. Click **OK**. The Storage Center attempts to contact the SupportAssist Update Server to check for updates.

---

**Unisphere Discovery Utility**

Use the Unisphere Discovery Utility to find and configure uninitialized Storage Centers.

The Unisphere Discovery Utility is supported on 64-bit versions of the following operating systems:

- Oracle Linux 7.0
- Red Hat Enterprise Linux 7.1, 7.2, and 7.3
- SUSE Linux Enterprise 12
- Windows 8.1 and 10
- Windows Server 2012 R2, 2016, and 2019

The computer running the Unisphere Discovery Utility must meet the following requirements:

- The computer must be within the same broadcast domain as the unconfigured Storage Centers to discover.
- The firewall on the computer must be configured to allow outbound communication on UDP port 5353.
- DHCP or IPv6 must be enabled on the computer running the Unisphere Discovery Utility. If DHCP or IPv6 are not enabled, two IPv4 addresses must be configured on the computer:
  - An IP address on the target subnet of the Storage Centers to discover
  - A link local IP address in the 169.254.x.x subnet
- To run the Unisphere Discovery Utility on a Linux operating system, you must grant the execute permission to the Unisphere Discovery Utility file.

Before proceeding, make sure that the Storage Center hardware is physically attached to all networks and powered on.

---

**Introduction to Storage Center Initial Configuration**

The Storage Center Initial Configuration page provides a list of prerequisite actions that must be performed and information that is required to configure a Storage Center.

**Steps**

1. Make sure the prerequisites that are listed on the Storage Center Initial Configuration page are met.
2. Make sure the information that is required to configure the Storage Center is gathered.
3. Click **Next**. The Discover Storage Centers page is displayed and it lists the unconfigured Storage Centers.

**NOTE:** If the wizard does not discover the Storage Center that you want to configure, perform the following actions:

- Make sure that the Storage Center hardware is physically attached to all necessary networks.
- Click **C (Refresh)** to rediscover the unconfigured Storage Centers.

---

**Discover Storage Centers**

Use the Discover Storage Centers page to select the Storage Center to initialize. This page appears only when you are connected to a Data Collector.

**Steps**

1. (Optional) To refresh the list of unconfigured Storage Centers, click **C (Refresh)**.
2. Select the Storage Center to initialize.

3. (Optional) To blink the indicator light on the front of the selected Storage Center, click **Enable Indicator Light**. You can use the indicator light to visually verify that you have selected the correct Storage Center.

4. To view the drives detected by the selected Storage Center, click **View Disks**.

5. If the selected Storage Center is partially initialized and security is enabled:
   a) Click **Provide Password**. The **Provide Password** dialog box opens.
   
   b) Type the password for the Storage Center Admin user in the **Password** field.

   **NOTE:** The default password for the Storage Center Admin user is **mmm**.

6. Click **Next**.

## Welcome to the Storage Center

Use the Welcome page to specify a name for the Storage Center and view the End User License Agreement.

**Steps**

1. Type a name for the Storage Center in the **Name** field.

2. Verify that the service tag or serial number that are displayed on the Welcome page match the Storage Center to initialize.

3. Select the language of the End User License Agreement to view from the drop-down menu, and click **Terms of Use** to open the agreement.

4. Click **Next**.

## Configure the Management Network Settings

Use the Management Network page to configure the management network settings for the Storage Center.

**Steps**

1. Select how to configure the management network from the **Network Configuration Source** drop-down menu.
   
   - **DHCP IPv4 Only** – IP addresses are dynamically assigned.
   
   - **Static** – IP addresses must be specified manually.

2. If the network configuration source is set to Static, specify the management network settings in the following fields:

   **Management IPv4 Settings**
   
   a) Type the IPv4 management address for the Storage Center in the **Virtual Address** field.

   b) Type a IPv4 management address for each storage controller in the associated fields.

   c) Type the IPv4 subnet mask of the management network in the **Subnet Mask** field.

   d) Type the IPv4 gateway address of the management network in the **Gateway Address** field.

   **(Optional) Management IPv6 Settings**
   
   a) Type the IPv6 management address for the Storage Center in the **Virtual Address** field.

   b) Type a IPv6 management address for each storage controller in the associated fields.

   c) Type the IPv6 address prefix in the **Prefix** field.

   d) Type the IPv6 gateway address in the **Gateway Address** field.

   **Network Settings**
   
   a) Type the domain name of the management network in the **Domain Name** field.

   b) Type the DNS server addresses of the management network in the **DNS Server** and **Secondary DNS Server** fields.

   c) (Optional) Type a secondary DNS server addresses of the management network in the **Secondary DNS Server** fields.

3. To proceed:
   
   - If you are connected to a Data Collector, click **Next**. The **Security** page opens.

   - If you are connected directly to a Storage Center, click **Finish**. The **Configure** tab opens.
Set the Password and Finish the Installation

If you are connected to a Data Collector, the Security tab opens after configuring the network settings.

Prerequisites
This section applies only if you are connected to a Data Collector.

Steps
1. Type a password for the Storage Center Admin user in the New Password field.
2. Retype the password for the Storage Center Admin user in the Confirm Password field.
3. Click Next.
   The Storage Center Summary page opens.
4. Verify that the Storage Center settings are correct.
5. If the configuration information is correct, click Next.
   If the configuration information is incorrect, click Back and provide the correct information.
   **NOTE:** After you click the Next button, the configuration cannot be changed until after the Storage Center is fully deployed.
   The Installation Complete page opens.
6. Click Finish.
   The Configure tab of the Initialize Storage Center wizard is displayed.

Complete the Installation

Use the Installation Complete page to connect to the Storage Center after the settings on the Summary page are applied to the Storage Center.

Steps
1. Click Connect.
   The Unisphere interface opens in a web browser.
2. Log into Unisphere to continue Storage Center initialization:
   a) Type Admin in the User Name field.
   b) Type the password for the Storage Center Admin user in the Password field.
   c) Click Log In.
      The Configure tab of the Initialize Storage Center wizard is displayed.

Deploying the Storage Center Using Storage Manager Client

Setting up a Storage Center using the Discover and Configure Uninitialized Storage Centers wizard and the host setup wizards requires 64-bit versions of the following operating systems:

- Red Hat Enterprise Linux 6 or later
- SUSE Linux Enterprise 12 or later
- Windows Server 2008 R2 or later

Install and Use the Storage Manager Client

Start the Storage Manager Client as an Administrator to run the Discover and Configure Uninitialized Storage Centers wizard.

Steps
1. Install the Storage Manager Client on a host server.
   To discover and configure a Storage Center, the software must be installed on a host server that is on the same subnet as the storage system.
2. To start the Storage Manager Client on a Windows computer, right-click the Dell Storage Manager shortcut and select Run as administrator. To start the Storage Manager Client on a Linux computer, run the command ./Client from the var/lib/dell/bin directory.

3. Click Discover and Configure Uninitialized Storage Centers. The Discover and Configure Uninitialized Storage Centers wizard starts.

Introduction to Storage Center Initial Configuration

The Storage Center Initial Configuration page provides a list of prerequisite actions that must be performed and information that is required to initialize a Storage Center.

Prerequisites

- The host server, on which the Storage Manager software is installed, must be on the same subnet or VLAN as the Storage Center.
- Layer 2 multicast must be allowed on the network.
- Make sure that IGMP snooping is disabled on the switch ports connected to the Storage Center.

Steps

1. Make sure the prerequisites that are listed on the Storage Center Initial Configuration page are met.
2. Make sure the information that is required to initialize the Storage Center is gathered.
3. Click Next. The Select a Storage Center to Initialize page is displayed and it lists the uninitialized Storage Centers discovered by the wizard.

**NOTE:** If the wizard does not discover the Storage Center that you want to initialize, perform the following actions:

- Make sure that the Storage Center hardware is physically attached to all necessary networks.
- Temporarily disable any firewall on the host server that is running the Storage Manager software.
- Click Rediscover to rediscover the uninitialized Storage Centers.
- Follow the steps in Deploy the Storage Center Using the Direct Connect Method.

Select a Storage Center to Initialize

The next page of the Discover and Configure Uninitialized Storage Centers wizard provides a list of uninitialized Storage Centers discovered by the wizard.

Steps

1. Select the Storage Center to initialize.
2. (Optional) To blink the indicator light for the selected Storage Center, click Enable Storage Center Indicator. You can use the indicator light to verify that you have selected the correct Storage Center.
3. Click Next.
4. If the Storage Center is partially configured, the Storage Center login pane is displayed. Type the management IPv4 address and the password for the Storage Center Admin user, then click Next to continue.

Deploy the Storage Center Using the Direct Connect Method

Use the direct connect method to manually deploy the Storage Center when it is not discoverable.

Steps

1. Use an Ethernet cable to connect the computer running the Storage Manager Client to the management port of the top controller.
2. Cable the bottom controller to the management network switch.
3. Click Discover and Configure Uninitialized Storage Centers. The Discover and Configure Uninitialized Storage Centers wizard opens.
4. Fill out the information on the initial configuration pages and stop when the Confirm Configuration page is displayed.
5. At this point, recable the management port of the top controller to the management network.
6. Connect the computer to the same subnet or VLAN as the Storage Center.
   a) Click Next.
b) If the cable is not properly connected or the host cannot access the controller, an Error setting up connection message is displayed. Correct the connection, and click OK.

c) If the deployment wizard is closed, click Discover and Configure Uninitialized Storage Centers to relaunch the deployment wizard.

d) Type Admin in the User Name field, type the password entered on the Set Administrator Information page in the Password field, and click Next.

Welcome Page

Use the Welcome page to verify the Storage Center information, and optionally change the name of the Storage Center.

Steps
1. Verify that the Service Tag and serial number match the Storage Center to set up.
2. (Optional) Type a name for the Storage Center.
3. Click Next.

Customer Installation Authorization

If the storage system is running Storage Center 7.3 or later, customer authorization is required.

Steps
1. Type the customer name and title.
2. Click Next.

Set System Information

The Set System Information page allows you to enter Storage Center and storage controller configuration information to use when connecting to the Storage Center using Storage Manager.

Steps
1. Type a descriptive name for the Storage Center in the Storage Center Name field.
2. If the storage system is running Storage Center 7.3 or later, select the network configuration option from the Network Configuration Source drop-down menu.
   - DHCP IPv4 – Selected by default. IP addresses will be discovered and assigned.
   - Static – Enter static IP addresses manually.
3. If the network configuration source is set to Static:
   a) Type the system management IPv4 address for the Storage Center in the Virtual Management IPv4 Address field.
   b) Type an IPv4 address for the management port of each storage controller.
   c) Type the subnet mask of the management network in the Subnet Mask field.
   d) Type the gateway address of the management network in the Gateway IPv4 Address field.
   e) Type the domain name of the management network in the Domain Name field.
   f) Type the DNS server addresses of the management network in the DNS Server and Secondary DNS Server fields.
4. Click Next.
Set Administrator Information

The Set Administrator Information page allows you to set a new password and an email address for the Admin user.

Steps

1. Enter a new password for the default Storage Center administrator user in the **New Admin Password** and **Confirm Password** fields.
2. Enter the email address of the default Storage Center administrator user in the **Admin Email Address** field.
3. Click **Next**.
   - For a Fibre Channel or SAS storage system, the **Confirm Configuration** page appears.
   - For an iSCSI storage system, the **Configure iSCSI Fault Domains** page appears.

Confirm the Storage Center Configuration

Make sure that the configuration information shown on the Confirm Configuration page is correct before continuing. If you selected DHCP IPv4 as the network configuration source, the dynamically assigned IP addresses are displayed on this page.

Steps

1. Verify that the Storage Center settings are correct.
2. If the configuration information is correct, click **Apply Configuration**.
   - If the configuration information is incorrect, click **Back** and provide the correct information.

   **NOTE:** After you click the **Apply Configuration** button, the configuration cannot be changed until after the Storage Center is fully deployed.

Deploy the Storage Center

The Storage Center sets up the storage system using the information provided on the previous pages.

Steps

1. The Storage Center performs system setup tasks. The **Deploy Storage Center** page displays the status of these tasks.
   - To learn more about the initialization process, click **More information about Initialization**.
   - If one or more of the system setup tasks fails, click **Troubleshoot Initialization Error** to learn how to resolve the issue.
   - If the Configuring Disks task fails, click **View Disks** to see the status of the drives detected by the Storage Center.
   - If any of the Storage Center front-end ports are down, the **Storage Center Front-End Ports Down** dialog box opens. Select the ports that are not connected to the storage network, then click **OK**.
2. When all of the Storage Center setup tasks are complete, click **Next**.

Configure Key Management Server Settings

The Key Management Server Settings page opens if the Storage Center is licensed for SEDs. Use this page to specify the key management server network settings and select the SSL certificate files.

Steps

1. Specify the network settings for the key management server.
2. If the key management server is configured to verify client certificates against credentials, type the user name and password of the certificates.
3. Select the key manager server certificate files.
4. Click **Next**.
Create a Storage Type

Select the datapage size and redundancy level for the Storage Center.

**Steps**

1. Select a datapage size.
   - **Standard (2 MB Datapage Size):** Default datapage size, this selection is appropriate for most applications.
   - **High Performance (512 KB Datapage Size):** Appropriate for applications with high performance needs, or in environments in which snapshots are taken frequently under heavy I/O. Selecting this size increases overhead and reduces the maximum available space in the Storage Type. All-flash storage systems use 512 KB by default.
   - **High Density (4 MB Datapage Size):** Appropriate for systems that use a large amount of disk space and take snapshots infrequently.

2. Select a redundancy type.
   - **Redundant:** Protects against the loss of any one drive (if single redundant) or any two drives (if dual redundant).
   - **Non-Redundant:** Uses RAID 0 in all classes, in all tiers. Data is striped but provides no redundancy. If one drive fails, all data is lost.
     
     **NOTE:** Non-Redundant is not recommended because data is not protected against a drive failure. Do not use non-redundant storage for a volume unless the data has been backed up elsewhere.

3. For Redundant Storage Types, you must select a redundancy level for each tier unless the drive type or size requires a specific redundancy level.
   - **Single Redundant:** Single-redundant tiers can contain any of the following types of RAID storage:
     - RAID 10 (each drive is mirrored)
     - RAID 5-5 (striped across 5 drives)
     - RAID 5-9 (striped across 9 drives)
   - **Dual redundant:** Dual redundant is the recommended redundancy level for all tiers. It is enforced for 3 TB HDDs and higher and for 18 TB SSDs and higher. Dual-redundant tiers can contain any of the following types of RAID storage:
     - RAID 10 Dual-Mirror (data is written simultaneously to three separate drives)
     - RAID 6-6 (4 data segments, 2 parity segments for each stripe)
     - RAID 6-10 (8 data segments, 2 parity segments for each stripe)

4. **Drive Addition** is selected by default. Leave this option selected.
5. Click Next.

Fault Tolerance

Set up Fibre Channel, iSCSI and SAS ports with redundant paths for fault tolerance.

**Steps**

1. Select the checkbox of each type of port you want to configure. You must select at least one type to continue.
   
   **NOTE:** If a port type is grayed out, no ports of that type have been detected.
2. Click Next.

Configure Fibre Channel Ports

For a Storage Center with Fibre Channel front-end ports, the Review Fault Domains page displays information about the fault domains that were created by the Storage Center.

**Prerequisites**

One port from each controller within the same fault domain must be cabled.

**NOTE:** If the Storage Center is not cabled correctly to create fault domains, the Cable Ports page opens and explains the issue. Click Refresh after cabling more ports.

**Steps**

1. Review the fault domains that have been created.
2. (Optional) Click Copy to clipboard to copy the fault domain information.
3. (Optional) Review the information on the Zoning, Hardware, and Cabling Diagram tabs.
   1 | NOTE: The ports must already be zoned.
4. Click Next.

**Configure iSCSI Ports**

For a Storage Center with iSCSI front-end ports, verify iSCSI cabling and then enter network information for the fault domains and ports.

**Prerequisites**

One port from each controller within the same fault domain must be cabled.

**Steps**

1. Review the information on the iSCSI - Cable Ports page. If the Storage Center is not cabled correctly to create fault domains, fix the cabling and click Refresh.
2. Click Next. The Set IPv4 Addresses for iSCSI Fault Domain 1 page opens.
3. Enter network information for the fault domain and its ports.
   1 | NOTE: Make sure that all the IP addresses for iSCSI Fault Domain 1 are in the same subnet.
4. Click Next.
5. On the Set IPv4 Addresses for iSCSI Fault Domain 2 page, enter network information for the fault domain and its ports. Then click Next.
   1 | NOTE: Make sure that all the IP addresses for iSCSI Fault Domain 2 are in the same subnet.
6. Click Next.
7. Review the fault domain information.
8. (Optional) Click Copy to clipboard to copy the fault domain information.
9. (Optional) Review the information on the Hardware and Cabling Diagram tabs.
10. Click Next.

**Configure SAS Ports**

For a Storage Center with SAS front-end ports, the Review Fault Domains page displays information about the fault domains that were created by the Storage Center.

**Prerequisites**

- One port from each controller within the same fault domain must be cabled.
- The ports for each fault domain must be cabled to the same server.

**Steps**

1. Review the information on the SAS - Cable Ports page. If the Storage Center is not cabled correctly to create fault domains, fix the cabling and click Refresh.
3. Review the fault domains that have been created.
4. (Optional) Click Copy to clipboard to copy the fault domain information.
5. (Optional) Review the information on the Hardware and Cabling Diagram tabs.
6. Click Next.
Inherit Settings
Use the Inherit Settings page to copy settings from a Storage Center that is already configured.

Prerequisites
You must be connected through a Data Collector.

Steps
1. Select the Storage Center from which to copy settings.
2. Place a check next to each setting that you want to inherit, or click Select All to inherit all settings.
3. Click Next.
   If you chose to inherit time and SMTP settings from another Storage Center, the Time Settings and SMTP Server Settings pages are skipped in the wizard.

Configure Time Settings
Configure an NTP server to set the time automatically, or set the time and date manually.

Steps
1. From the Region and Time Zone drop-down menus, select the region and time zone used to set the time.
2. Select Use NTP Server and type the host name or IPv4 address of the NTP server, or select Set Current Time and set the time and date manually.
3. Click Next.

Configure SMTP Server Settings
If you have an SMTP server, configure the SMTP email settings to receive information from the Storage Center about errors, warnings, and events.

Steps
1. By default, the Enable SMTP Email checkbox is selected and enabled. If you do not have an SMTP server you can disable SMTP email by clearing the Enable SMTP Email checkbox.
2. Alternatively, if you have an SMTP server, configure the SMTP server settings.
   a) In the Recipient Email Address field, enter the email address where the information will be sent.
   b) In the SMTP Mail Server field, enter the IP address or fully qualified domain name of the SMTP mail server. Click Test Server to verify connectivity to the SMTP server.
   c) (Optional) In the Backup SMTP Mail Server field, enter the IP address or fully qualified domain name of a backup SMTP mail server. Click Test Server to verify connectivity to the backup SMTP server.
   d) If the SMTP server requires emails to contain a MAIL FROM address, specify an email address in the Sender Email Address field.
   e) (Optional) In the Common Subject Line field, enter a subject line to use for all emails sent by the Storage Center.
3. Click Next.

Set Up SupportAssist
If the storage system is running Storage Center 7.3 or later, the Set Up SupportAssist page opens.

About this task
Use the Set Up SupportAssist page to enable SupportAssist.

Steps
1. To allow SupportAssist to collect diagnostic data and send this information to technical support, select the Receive proactive notifications, notices, and other predictive support checkbox.
2. Click Next.
If you chose to clear the Receive proactive notifications, notices, and other predictive support checkbox and click Next, a SupportAssist Recommended dialog box opens.

- To return to the Set Up SupportAssist page, click No.
- To disable SupportAssist and proceed to the Update Storage Center page, click Yes.

Accept the SupportAssist Collection Agreement

Use the Accept SupportAssist Collection Agreement page to accept the terms of the agreement and enable SupportAssist.

Steps

1. To allow SupportAssist to collect diagnostic data and send this information to technical support, select the By checking this box, you accept the above terms and turn on SupportAssist checkbox.

2. Click Next.
   
   \[\text{NOTE:} \text{ If you chose to clear the By checking this box, you accept the above terms and turn on SupportAssist checkbox, a SupportAssist Recommended dialog box opens.}\]
   
   - To return to the Accept SupportAssist Collection Agreement page, click No.
   - To opt out of SupportAssist, click Yes.

Provide Contact Information

Specify contact information for technical support to use when sending support-related communications from SupportAssist.

Steps

1. Specify the contact information.

2. (Storage Center 7.2 or earlier) To receive SupportAssist email messages, select the Send me emails from SupportAssist when issues arise, including hardware failure notifications check box.

3. Select the preferred contact method, language, and available times.

4. (Storage Center 7.2 or earlier) Type a shipping address where replacement Storage Center components can be sent.

5. (Storage Center 7.2 or earlier) Click Finish.

6. (Storage Center 7.3 or later) Click Next.

Provide Site Contact Information

If the storage system is running Storage Center 7.3 or later, specify the site contact information.

Steps

1. Select the Enable Onsite Address checkbox.

2. Type a shipping address where replacement Storage Center components can be sent.

3. Click Next.
   
   The Confirm Enable SupportAssist dialog box opens.

4. Click Yes.

Validate the SupportAssist Connection

If the storage system is running Storage Center 7.3 or later, the Validate SupportAssist Connection page opens.

About this task

The Validate SupportAssist Connection page displays a summary of the SupportAssist contact information and confirms that the Storage Center is connected to SupportAssist.

Steps

- To complete the SupportAssist setup, click Finish.
Update Storage Center

The Storage Center attempts to contact the SupportAssist Update Server to check for updates. If you are not using SupportAssist, you must use the Storage Center Update Utility to update the Storage Center operating system before continuing.

Steps

- If no update is available, the Storage Center Up to Date page appears. Click Next.
- If an update is available, the current and available Storage Center versions are listed:
  1. Click Install to update to the latest version.
  2. If the update fails, click Retry Update to try to update again.
  3. When the update is complete, click Next.
- If the SupportAssist Data Collection and Storage Agreement was not accepted, the Storage Center cannot check for updates.
  1. To proceed without checking for an update, click Next.
  2. To accept the agreement and check for an update:
    1. Click Accept SupportAssist Data Collection and Storage Agreement to review the agreement.
    2. Select By checking this box you accept the above terms.
    3. Click Next. The Storage Center attempts to contact the SupportAssist Update Server to check for updates.
- The Setup SupportAssist Proxy Settings dialog box appears if the Storage Center cannot connect to the SupportAssist Update Server. If the site does not have direct access to the Internet but uses a web proxy, configure the proxy settings:
  1. Select Enabled.
  2. Enter the proxy settings.
  3. Click OK. The Storage Center attempts to contact the SupportAssist Update Server to check for updates.

Complete Configuration and Perform Next Steps

The Storage Center is now configured. The Configuration Complete page provides links to a Storage Manager Client tutorial and wizards to perform the next setup tasks.

Steps

1. (Optional) Click one of the Next Steps to configure a localhost, configure a VMware host, or create a volume.
2. Click Finish to exit the wizard.

Modify iDRAC Interface Settings for a Storage System

The iDRAC interface provides functions to help deploy, update, monitor and maintain the storage system.

About this task

⚠️ CAUTION: The iDRAC interface is intended for use by trained Dell Technical Support personnel for specific unique circumstances. Certain features and functionality of iDRAC for storage products differs from Dell server products.

iDRAC can be configured so it can be used to perform out-of-band system management.

Steps

1. When you reach the Configuration Complete page, scroll down to Advanced Steps.
2. Click Modify BMC Settings. The Edit BMC Settings dialog box opens.
3. Select how to assign an IP Address to the iDRAC from the Configure via drop-down menu.
   - To specify a static IP address for the iDRAC, select Static.
   - To allow a DHCP server to assign an IP address to the iDRAC, select DHCP.
4. If you selected to specify a static IP address, specify the iDRAC IP address for the bottom storage controller and the top storage controller.

⚠️ NOTE: Dell EMC recommends setting the iDRAC IP address to a non-routable address such as 0.0.0.0 unless otherwise directed by Technical Support.
a) In the **BMC IP Address** field, type an IP address for the iDRAC.
b) In the **BMC Net Mask** field, type the network mask.
c) In the **BMC Gateway IP Address** field, type the default route for the iDRAC.

5. Click **OK**.

6. Log in to the iDRAC and configure the iDRAC password. You will be prompted to change the iDRAC password when you log in. The default password is root/calvin.

1) **NOTE:** Any hardware errors reported in the iDRAC can be ignored. Storage Manager is the official interface to check hardware status.

### Unconfigure Unused I/O Ports

Unconfigure a port when it is disconnected and will not be used.

**Prerequisites**

- The Storage Center must be a SCv3000 and SCv3020 storage system.
- The I/O port must appear as down in Storage Manager.

**Steps**

1. Click the **Storage** view.
2. In the **Storage** pane, select a Storage Center.
3. Click the **Hardware** tab.
4. In the **Hardware** tab navigation pane, expand **Controllers > storage controller > IO Ports**.
5. Right-click on the down I/O port and select **Unconfigure Port.** Storage Manager unconfigures the port.
Perform Post-Setup Tasks

Perform connectivity and failover tests to make sure that the Storage Center deployment was successful.

**NOTE:** Before testing failover, use Storage Manager to place the storage system in Maintenance mode. When you are finished, use Storage Manager to place the storage system back into Production mode.

**Topics:**
- Update Storage Center Using Storage Manager
- Check the Status of the Update
- Change the Operation Mode of a Storage Center
- Verify Connectivity and Failover
- Send Diagnostic Data Using SupportAssist

### Update Storage Center Using Storage Manager

Use this procedure to update the Storage Center using Storage Manager.

**Steps**
1. If the Storage Manager Client is connected to a Data Collector, click **Storage** and select a Storage Center.
2. In the Summary tab, select **Actions** > **System** > **Check for Updates**.
3. Click **Install** to update to the latest version.
4. If the update fails, click **Retry Update** to try to update again.
   a) The **Setup SupportAssist Proxy Settings** dialog box opens if the Storage Center cannot connect to the SupportAssist Update Server. If the site does not have direct access to the Internet but uses a web proxy, configure the proxy settings:
      - Select **Enabled**
      - Specify the proxy settings.
      - Click **OK**. The Storage Center attempts to contact the SupportAssist Update Server to check for updates.
6. When the update is complete, click **Next**.

### Check the Status of the Update

Return to Storage Manager to determine whether the update has completed.

**About this task**

**NOTE:** The update process should take between 60 and 90 minutes to complete. During the update, Storage Manager might disconnect from the Storage Center. You will be able to reconnect to the Storage Center after the update completes.

**Steps**
1. If Storage Manager is connected to a Data Collector, click **Storage**, and select a Storage Center.
2. In the **Summary** tab, select **Actions** > **System** > **Check for Updates**.
Change the Operation Mode of a Storage Center

Change the operation mode of a Storage Center before performing maintenance or installing software updates so that you can isolate alerts from those events.

About this task

**NOTE:** Do not change the mode of the Storage Center from Pre-production mode until setup and testing is complete.

Steps

1. In the **Summary** tab, click **Edit Settings**. The **Edit Storage Center Settings** dialog box opens.
2. Click the **General** tab.
3. In the **Operation Mode** field select **Maintenance**. Selecting Maintenance isolates alerts from those that would occur during normal operation.
4. Click **OK**.

Verify Connectivity and Failover

This section describes how to verify that the Storage Center is set up properly and performs failover correctly.

The process includes creating test volumes, copying data to verify connectivity, and shutting down a storage controller to verify failover and MPIO functionality.

Create Test Volumes

Connect a server to the Storage Center, create one or more test volumes, and map them to the server to prepare for connectivity and failover testing.

Prerequisites

**NOTE:** The localhost must have network connection to both the iSCSI connection and Data Collector host IP.

Steps

1. Configure a localhost to access the Storage Center using the **Set up localhost on Storage Center** wizard.
   a) In the Storage view, select a Storage Center.
   b) Click the Storage tab, then click **Servers > Create Server from Localhost**.
2. Connect to the Storage Center using the Dell Storage Manager.
3. Create two small test volumes (TestVol1 and TestVol2) on the server.
4. Map TestVol1 to storage controller 1 and TestVol2 to storage controller 2.
5. Partition and format the test volumes on the server.

Test Basic Connectivity

Verify basic connectivity by copying data to the test volumes.

Steps

1. Connect to the server to which the volumes are mapped.
2. Create a folder on the TestVol1 volume, copy at least 2 GB of data to the folder, and verify that the data copied successfully.
3. Create a folder on the TestVol2 volume, copy at least 2 GB of data to the folder, and verify that the data copied successfully.
Test Storage Controller Failover

Test the Storage Center to make sure that a storage controller failover does not interrupt I/O.

About this task

1. **NOTE:** Before restarting a storage controller, use Storage Manager to change the operation mode to Maintenance mode. When you are finished, use Storage Manager to place the storage system back to Production mode.

Steps

1. Connect to the server, create a Test folder on the server, and copy at least 2 GB of data into it.
2. Restart storage controller 1 while copying data to verify that the failover event does not interrupt I/O.
   a) Copy the Test folder to the TestVol1 volume.
   b) During the copy process, restart the storage controller (through which TestVol1 is mapped) by selecting it from the Hardware tab and clicking Shutdown/Restart Controller.
   c) Verify that the copy process continues while the storage controller restarts.
   d) Wait several minutes and verify that the storage controller has finished restarting.
3. Restart storage controller 2 while copying data to verify that the failover event does not interrupt I/O.
   a) Copy the Test folder to the TestVol2 volume.
   b) During the copy process, restart the storage controller (through which TestVol2 is mapped) by selecting it from the Hardware tab and clicking Shutdown/Restart Controller.
   c) Verify that the copy process continues while the storage controller restarts.
   d) Wait several minutes and verify that the storage controller has finished restarting.

Test MPIO

Perform the following tests for a Storage Center with Fibre Channel or iSCSI front-end connectivity if the network environment and servers are configured for MPIO.

Steps

1. Create a Test folder on the server and copy at least 2 GB of data into it.
2. Make sure that the server is configured to use load-balancing MPIO (round-robin).
3. Manually disconnect a path while copying data to TestVol1 to verify that MPIO is functioning correctly.
   a) Copy the Test folder to the TestVol1 volume.
   b) During the copy process, disconnect one of the paths and verify that the copy process continues.
   c) Reconnect the path.
4. Repeat the previous steps as necessary to test additional paths.
5. Restart the storage controller that contains the active path while I/O is being transferred and verify that the I/O process continues.
6. If the front-end connectivity of the Storage Center is Fibre Channel or iSCSI and the Storage Center is not in a production environment, restart the switch that contains the active path while I/O is being transferred, and verify that the I/O process continues.

Clean Up Test Volumes

After testing is complete, delete the volumes used for testing.

About this task

1. **NOTE:** During deployment, a Storage Type is created for each tier that defines the Redundancy Level. If you delete all test volumes, the Storage Type for each tier reverts to the default redundancy level. Creating new volumes will then require setting Storage Types to the desired redundancy level manually. It is recommended that before deleting any test volumes, you create at least one volume in each Storage Type required by the customer. If all volumes are deleted before creating new volumes, you will need to manually update the redundancy levels for each Storage Type.
Steps
1. Use Storage Manager to connect to the Storage Center.
2. Click the Storage tab.
3. From the Storage tab navigation pane, select the Volumes node.
4. Create new volumes for the customer in each tier as required by their application.
5. Select the test volumes to delete.
6. Right-click on the selected volumes and select Delete. The Delete dialog box opens.
7. Click OK.
8. In the Volumes view, expand the Recycle Bin.
9. In the right pane, click Empty Recycle Bin.
   The Empty Recycle Bin dialog box opens.
10. Click OK to confirm that you want to permanently delete all volumes in the Recycle Bin.

Send Diagnostic Data Using SupportAssist

After replacing components, use SupportAssist to send diagnostic data to technical support.

Steps
1. Use Storage Manager to connect to the Storage Center.
2. In the Summary tab, click Send SupportAssist Information Now, which is located under SupportAssist Actions in the Status pane. The Send SupportAssist Information Now dialog box opens.
3. Select Storage Center Configuration and Detailed Logs.
4. Click OK.
Adding or Removing Expansion Enclosures

This section describes how to add an expansion enclosure to a storage system and how to remove an expansion enclosure from a storage system.

Topics:
- Adding Expansion Enclosures to a Storage System Deployed Without Expansion Enclosures
- Adding a Single Expansion Enclosure to a Chain Currently in Service
- Removing an Expansion Enclosure from a Chain Currently in Service

Adding Expansion Enclosures to a Storage System Deployed Without Expansion Enclosures

Install the expansion enclosures in a rack, but do not connect the expansion enclosures to the storage system.

For more information, see the SCv300 and SCv320 Expansion Enclosure Getting Started Guide or the SCv360 Expansion Enclosure Getting Started Guide.

**NOTE:** To preserve the integrity of the existing data, use caution when adding expansion enclosures to a storage system.

Install New SCv300 and SCv320 Expansion Enclosures in a Rack

Prerequisites

Install the expansion enclosures in a rack, but do not connect the expansion enclosures to the storage system. For more information, see the SCv300 and SCv320 Expansion Enclosure Getting Started Guide.

Steps

1. Cable the expansion enclosures together to form a chain.
   a) Connect a SAS cable from expansion enclosure 1: top, port 2 to expansion enclosure 2: top, port 1.
   b) Connect a SAS cable from expansion enclosure 1: bottom, port 2 to expansion enclosure 2: bottom, port 1.
   c) Repeat the previous steps to connect additional expansion enclosures to the chain.
Add the SCv300 and SCv320 Expansion Enclosures to the A-Side of the Chain

Connect the expansion enclosures to one side of the chain at a time to maintain drive availability.

Steps
1. Cable the expansion enclosures to the A-side of the chain.
   a) Connect a SAS cable from storage controller 1: port 1 to the first expansion enclosure in the chain, top EMM, port 1.
b) Connect a SAS cable from storage controller 2: port 2 to the last expansion enclosure in the chain, top EMM, port 2.

Figure 55. Connect the A-Side Cables to the Expansion Enclosures

1. Storage system
2. Storage controller 1
3. Storage controller 2
4. Expansion enclosure 1
5. Expansion enclosure 2

2. Label the back-end cables.

Add the SCv300 and SCv320 Expansion Enclosures to the B-Side of the Chain

Connect the expansion enclosures to one side of the chain at a time to maintain drive availability.

Steps

1. Cable the expansion enclosures to the B-side of the chain.
   a) Connect a SAS cable from storage controller 1: port 2 to expansion enclosure 2: bottom EMM, port 2.
   b) Connect a SAS cable from storage controller 2: port 1 to expansion enclosure 1: bottom EMM, port 1.
Install New SCv360 Expansion Enclosures in a Rack

Install the expansion enclosures in a rack, but do not connect the expansion enclosures to the storage system. For more information, see the SCv360 Expansion Enclosure Getting Started Guide

About this task

Steps

1. Cable the expansion enclosures together to form a chain.
   a) Connect a SAS cable from expansion enclosure 1: left, port 3 to expansion enclosure 2: left, port 1.
   b) Connect a SAS cable from expansion enclosure 1: right, port 3 to expansion enclosure 2: right, port 1.
   c) Repeat the previous steps to connect additional expansion enclosures to the chain.
Figure 57. Cable the Expansion Enclosures Together

1. Expansion enclosure 1
2. Expansion enclosure 2

2. Connect to the Storage Center using the Storage Manager Client.

3. Check the drive count of the Storage Center system before adding the expansion enclosure. Make sure the number of drives installed plus the drives in the new expansion enclosure does not exceed 500 drives.
   a) Select the Storage tab.
   b) In the Storage tab navigation pane, select the Disks node.
   c) On the Disks tab, record the number of drives that are accessible by the Storage Center.
      Compare this value to the number of drives accessible by the Storage Center after adding expansion enclosures to the storage system.

4. Click the Hardware tab and select the Enclosures node in the Hardware tab navigation pane.

5. Click Add Enclosure. The Add New Enclosure wizard starts.
   a) Click Next to validate the existing cabling.
   b) Select the expansion enclosure type and click Next.
   c) If the drives are not installed, install the drives in the expansion enclosures.
   d) Turn on the expansion enclosure. When the drives spin up, make sure that the front panel and power status LEDs show normal operation.
   e) Click Next.
   f) Add the expansion enclosure to the A-side chain. Click Next to validate the cabling.
   g) Add the expansion enclosure to the B-side chain. Click Next to validate the cabling.
   h) Click Finish.

6. To manually manage new unassigned drives:
   a) Click the Storage tab.
   b) In the Storage tab navigation pane, select the Disks node.
   c) Click Manage Unassigned Disks.
      The Manage Unassigned Disks dialog box opens.
   d) From the Disk Folder drop-down menu, select the drive folder for the unassigned drives.
   e) Select Perform RAID rebalance immediately.
   f) Click OK.

7. Label the back-end cables.

Add the SCv360 Expansion Enclosures to the A-Side of the Chain

Connect the expansion enclosures to one side of the chain at a time to maintain drive availability.

Steps

1. Cable the expansion enclosures to the A-side of the chain.
a) Connect a SAS cable from storage controller 1: port 1 to the first expansion enclosure in the chain, left EMM, port 1.
b) Connect a SAS cable from storage controller 2: port 2 to the last expansion enclosure in the chain, left EMM, port 3.

![Figure 58. Connect the A-Side Cables to the Expansion Enclosures](image)

1. Storage system
2. Storage controller 1
3. Storage controller 2
4. Expansion enclosure 1
5. Expansion enclosure 2

2. Label the back-end cables.

**Add an SCv360 Expansion Enclosure to the B-Side of the Chain**

Connect the expansion enclosure to one side of the chain at a time to maintain drive availability.

**Steps**

1. Disconnect the B-side cable (shown in blue) from the expansion enclosure: right EMM, port 3. The A-side cables continue to carry I/O while the B-side is disconnected.
Figure 59. Disconnect B-Side Cable from the Existing Expansion Enclosure

1. Storage system
2. Storage controller 1
3. Storage controller 2
4. Expansion enclosure 1
5. New expansion enclosure (2)

2. Use a new SAS cable to connect expansion enclosure 1: right EMM, port 3 to the new expansion enclosure (2): right EMM, port 1.
3. Connect the B-side cable that was disconnected in step 1 to the new expansion enclosure (2): right EMM, port 3.

Figure 60. Connect B-Side Cables to the New Expansion Enclosure

2. Storage controller 1
3. Storage controller 2
4. Expansion enclosure 1
5. New expansion enclosure (2)
Adding a Single Expansion Enclosure to a Chain Currently in Service

To preserve the integrity of the existing data, use caution when adding an expansion enclosure to a live Storage Center system.

Prerequisites

Install the expansion enclosure in a rack, but do not connect the expansion enclosure to the storage system. For more information, see the SCv300 and SCv320 Expansion Enclosure Getting Started Guide or the SCv360 Expansion Enclosure Getting Started Guide.

To add an expansion enclosure to an existing chain, connect the expansion enclosure to the end of the chain.

Steps

1. Connect to the Storage Center using the Dell Storage Manager.
2. Check the drive count of the Storage Center system before adding the expansion enclosure.
3. Click the Hardware tab and select Enclosures in the Hardware tab navigation pane.
4. Click Add Enclosure. The Add New Enclosure wizard starts.
   a) Confirm the details of your current installation and click Next to validate the existing cabling.
   b) Turn on the expansion enclosure. When the drives spin up, make sure that the front panel and power status LEDs show normal operation.
   c) Click Next.
   d) Add the expansion enclosure to the A-side chain. Click Next to validate the cabling.
   e) Add the expansion enclosure to the B-side chain. Click Next to validate the cabling.
   f) Click Finish.
5. To manually manage new unassigned drives:
   a) Click the Storage tab.
   b) In the Storage tab navigation pane, select the Disks node.
   c) Click Manage Unassigned Disks.
      The Manage Unassigned Disks dialog box opens.
   d) From the Disk Folder drop-down menu, select the drive folder for the unassigned drives.
   e) Select Perform RAID rebalance immediately.
   f) Click OK.
6. Label the new back-end cables.

Check the Drive Count

Determine the number of drives that are currently accessible to the Storage Center.

Steps

1. Use Storage Manager to connect to the Storage Center.
2. Select the Storage tab.
3. In the Storage tab navigation pane, select the Disks node.
4. On the Disks tab, record the number of drives that are accessible by the Storage Center.
   Compare this value to the number of drives accessible by the Storage Center after adding an expansion enclosure to the storage system.
Add an SCv300 and SCv320 Expansion Enclosure to the A-Side of the Chain

Connect the expansion enclosure to one side of the chain at a time to maintain drive availability.

Steps

1. Turn on the expansion enclosure being added. When the drives spin up, make sure that the front panel and power status LEDs show normal operation.

2. Disconnect the A-side cable (shown in orange) from the expansion enclosure: top EMM, port 2. The B-side cables continue to carry I/O while the A-side is disconnected.

3. Use a new SAS cable to connect expansion enclosure 1: top EMM, port 2 to the new expansion enclosure (2): top EMM, port 1.

4. Connect the A-side cable that was disconnected in step 2 to the new expansion enclosure (2): top EMM, port 2.
5. Label the back-end cables.

Add an SCv300 and SCv320 Expansion Enclosure to the B-Side of the Chain

Connect the expansion enclosure to one side of the chain at a time to maintain drive availability.

Steps

1. Disconnect the B-side cable (shown in blue) from the expansion enclosure: bottom EMM, port B. The A-side cables continue to carry I/O while the B-side is disconnected.

![Figure 63. Disconnect B-Side Cable from the Existing Expansion Enclosure](image)

2. Use a new SAS cable to connect expansion enclosure 1: bottom EMM, port 2 to the new expansion enclosure (2): bottom EMM, port 1.

3. Connect the B-side cable that was disconnected in step 1 to the new expansion enclosure (2): bottom EMM, port 2.
Add an SCv360 Expansion Enclosure to the A-Side of the Chain

Connect the expansion enclosure to one side of the chain at a time to maintain drive availability.

Steps
1. Turn on the expansion enclosure being added. When the drives spin up, make sure that the front panel and power status LEDs show normal operation.
2. Disconnect the A-side cable (shown in orange) from the expansion enclosure: left EMM, port 3. The B-side cables continue to carry I/O while the A-side is disconnected.

3. Use a new SAS cable to connect expansion enclosure 1: left EMM, port 3 to the new expansion enclosure (2): left EMM, port 1.
4. Connect the A-side cable that was disconnected in step 2 to the new expansion enclosure (2): left EMM, port 3.

Figure 66. Connect A-Side Cables to the New Expansion Enclosure

1. Storage system
2. Storage controller 1
3. Storage controller 2
4. Expansion enclosure 1
5. New expansion enclosure (2)
6. Label the back-end cables.

Add an SCv360 Expansion Enclosure to the B-Side of the Chain

Connect the expansion enclosure to one side of the chain at a time to maintain drive availability.

Steps
1. Disconnect the B-side cable (shown in blue) from the expansion enclosure: right EMM, port 3. The A-side cables continue to carry I/O while the B-side is disconnected.
Figure 67. Disconnect B-Side Cable from the Existing Expansion Enclosure

1. Storage system
2. Storage controller 1
3. Storage controller 2
4. Expansion enclosure 1
5. New expansion enclosure (2)

2. Use a new SAS cable to connect expansion enclosure 1: right EMM, port 3 to the new expansion enclosure (2): right EMM, port 1.

3. Connect the B-side cable that was disconnected in step 1 to the new expansion enclosure (2): right EMM, port 3.

Figure 68. Connect B-Side Cables to the New Expansion Enclosure

2. Storage controller 1
3. Storage controller 2
4. Expansion enclosure 1
5. New expansion enclosure (2)
Removing an Expansion Enclosure from a Chain Currently in Service

To remove an expansion enclosure, you disconnect the expansion enclosure from one side of the chain at a time.

About this task

During this process, one side of the chain is disconnected. The Storage Center directs all I/O to the other side of the chain, which remains connected.

⚠️ CAUTION: Make sure that your data is backed up before removing an expansion enclosure.

Before physically removing an expansion enclosure, make sure that none of the drives in the expansion enclosure are managed by the Storage Center software.

Steps

1. Use Storage Manager to connect to the Storage Center.
2. Use Storage Manager to release the drives in the expansion enclosure.
3. Select the expansion enclosure to remove and click Remove Enclosure. The Remove Enclosure wizard starts.
4. Confirm the details of your current installation and click Next to validate the cabling.
5. Locate the expansion enclosure in the rack. Click Next.
6. Disconnect the A-side chain.
   a) Disconnect the A-side cables that connect the expansion enclosure to the storage system. Click Next.
   b) Reconnect the A-side cables to exclude the expansion enclosure from the chain. Click Next to validate the cabling.
7. Disconnect the B-side chain.
   a) Disconnect the B-side cables that connect the expansion enclosure to the storage system. Click Next.
   b) Reconnect the B-side cables to exclude the expansion enclosure from the chain. Click Next to validate the cabling.
8. Click Finish.

Release the Drives in the Expansion Enclosure

Release the drives in an expansion enclosure before removing the expansion enclosure.

About this task

Because releasing drives causes all of the data to move off the drives, this procedure might take some time.

⚠️ NOTE: Do not release drives unless the remaining drives have enough free space for the restriped data.

Steps

1. Use Storage Manager to connect to the Storage Center.
2. Click the Hardware tab.
3. In the Hardware tab navigation pane, expand the expansion enclosure to remove.
4. Select the Disks node.
5. Select all of the drives in the expansion enclosure.
7. Select Perform RAID rebalance immediately.
8. Click OK.

Results

When all of the drives in the expansion enclosure are in the Unassigned drive folder, the expansion enclosure is safe to remove.
Disconnect the SCv300 and SCv320 Expansion Enclosure from the A-Side of the Chain

Disconnect the A-side cables from the expansion enclosure that you want to remove.

Steps

1. Disconnect the A-side cable (shown in orange) from expansion enclosure 1: top EMM, port 1. The B-side cables continue to carry I/O while the A-side is disconnected.

2. Remove the A-side cable between expansion enclosure 1: top EMM, port 2 and expansion enclosure 2: top EMM, port 1.

3. Connect the A-side cable to expansion enclosure 2: top EMM, port 1.

Troubleshooting Storage Center Deployment

This section contains troubleshooting steps for common Storage Center deployment issues.

Topics:

- Troubleshooting Storage Controllers
- Troubleshooting Hard Drives
- Troubleshooting Expansion Enclosures

Troubleshooting Storage Controllers

To troubleshoot storage controllers:

Steps

1. Check the status of the storage controller using Storage Manager.
2. Check the position of the storage controllers.
3. Check the pins and reseat the storage controller.
   a) Remove the storage controller.
   b) Verify that the pins on the storage system backplane and the storage controller are not bent.
   c) Reinstall the storage controller.
4. Determine the status of the storage controller link status indicators. If the indicators are not green, check the cables.
   a) Shut down the storage controller.
   b) Reseat the cables on the storage controller.
   c) Restart the storage controller.
   d) Recheck the link status indicators. If the link status indicators are not green, replace the cables.

Troubleshooting Hard Drives

To troubleshoot hard drives:

Steps

1. Check the status of the hard drive using Storage Manager.
2. Determine the status of the hard drive indicators.
   • If the hard drive status indicator blinks amber ON for two seconds and OFF for one second, the hard drive has failed.
   • If the hard drive status indicator is not lit, proceed to the next step.
3. Check the connectors and reseat the hard drive.

**CAUTION:** Perform this step only on unmanaged drives or after you confirm that the particular drive contains no user data. The Fault LED alone is not an indication that you can safely remove the drive.

   a) Remove the hard drive.
   b) Check the hard drive and the backplane to ensure that the connectors are not damaged.
   c) Reinstall the hard drive. Make sure the hard drive makes contact with the backplane.
Troubleshooting Expansion Enclosures

To troubleshoot expansion enclosures:

Steps

1. Check the status of the expansion enclosure using Storage Manager.
2. If an expansion enclosure and/or drives are missing from the Storage Manager, you might need to check for and install Storage Center updates to use the expansion enclosure and/or drives.
3. If an expansion enclosure firmware update fails, check the back-end cabling and ensure that redundant connections are used.
Set Up a Local Host or VMware Host

After configuring a Storage Center, you can run the Storage Manager Client on a Windows or Linux host to set up block level storage. In addition, you can set up block-level storage for a VMware ESXi host, or multiple VMware ESXi hosts in a vSphere cluster.

Topics:
- Set Up a Local Host from Initial Setup
- Set Up a VMware ESXi Host from Initial Setup
- Set Up Multiple VMware ESXi Hosts in a VMware vSphere Cluster

Set Up a Local Host from Initial Setup

Configure the local host from Initial Setup to access block-level storage on the Storage Center.

Prerequisites
- The Storage Manager Client must be running on a system with a 64-bit operating system.
- You must be logged into the Storage Manager Client using a Storage Manager user with the Administrator privilege.
- On a Storage Center with Fibre Channel I/O ports, configure Fibre Channel zoning before starting this procedure.

Steps
1. On the Configuration Complete page of the Discover and Configure Storage Center wizard, click Set up block level storage for this host.
   The Set up localhost for Storage Center wizard opens.
   - If the Storage Center has iSCSI ports and the host is not connected to any interface, the Log into Storage Center via iSCSI page opens. Select the target fault domains, and then click Log in.
   - In all other cases, the Verify localhost Information page opens. Proceed to the next step.
2. On the Verify localhost Information page, verify that the information is correct. Then click Create Server.
   The server definition is created on the Storage Center for the connected and partially connected initiators.
3. The Host Setup Successful page displays the best practices that were set by the wizard and best practices that were not set. Make a note of any best practices that were not set. It is recommended that these updates be applied manually before starting I/O to the Storage Center.
4. (Optional) Select Create a Volume for this host to create a volume after finishing host setup.
5. Click Finish.

Set Up a VMware ESXi Host from Initial Setup

Configure a VMware ESXi host to access block-level storage on the Storage Center.

Prerequisites
- The Storage Manager Client must be running on a system with a 64-bit operating system.
- You must be logged into the Storage Manager Client using a Storage Manager user with the Administrator privilege.
- On a Storage Center with Fibre Channel I/O ports, configure Fibre Channel zoning before starting this procedure.

Steps
1. On the Configuration Complete page of the Discover and Configure Storage Center wizard, click Configure VMware vSpheres to access a Storage Center.
   The Set up VMware Host on Storage Center wizard opens.
2. Type the vCenter or ESXi IP address or host name, user name, and password. Then click Next.
• If the Storage Center has iSCSI ports and the host is not connected to any interface, the Log into Storage Center via iSCSI page opens. Select the target fault domains, and then click Log In.
• In all other cases, the Verify vSpheres Information page opens. Proceed to the next step.

3. Select an available port, and then click Create Server.
   The server definition is created on the Storage Center.

4. The Host Setup Successful page displays the best practices that were set by the wizard and best practices that were not set. Make a note of any best practices that were not set by the wizard. It is recommended that these updates be applied manually before starting I/O to the Storage Center.

5. (Optional) Select Create a Volume for this host to create a volume after finishing host setup.

6. Click Finish.

Set Up Multiple VMware ESXi Hosts in a VMware vSphere Cluster

Configure multiple VMware ESXi hosts that are part of the vSphere cluster from initial setup to access block-level storage on the Storage Center.

Prerequisites
• The Storage Manager Client must be running on a system with a 64-bit operating system.
• You must be logged into the Storage Manager Client using a Storage Manager user with the Administrator privilege.
• On a Storage Center with Fibre Channel I/O ports, configure Fibre Channel zoning before starting this procedure.

Steps
1. On the Configuration Complete page of the Discover and Configure Storage Center wizard, click Configure VMware vSphere to access a Storage Center.
   The Set up VMware Host on Storage Center wizard opens.
2. Type the vCenter IP address or host name, user name, and password. Then click Next.
   • If the Storage Center has iSCSI ports and the host is not connected to any interface, the Log into Storage Center via iSCSI page opens. Select the hosts and target fault domains, and then click Log In.
   • In all other cases, the Verify vSpheres Information page appears. Proceed to the next step.
3. Select an available port, and then click Create Servers.
   The server definition is created on the Storage Center for each of the connected or partially connected hosts.
4. The Host Setup Successful page displays the best practices that were set by the wizard and best practices that were not set. Make a note of any best practices that were not set. It is recommended that these updates be applied manually before starting I/O to the Storage Center.
5. (Optional) Select Create a Volume for this host to create a volume after finishing host setup.
6. Click Finish.
Worksheet to Record System Information

Use the following worksheet to record the information that is needed to install the SCv3000 and SCv3020 storage system.

Storage Center Information

Record the following information about the Storage Center network and the administrator user.

Table 7. Storage Center Network and Administrator

<table>
<thead>
<tr>
<th>Storage Center Network</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Tag</td>
<td></td>
</tr>
<tr>
<td>Management IPv4 address</td>

<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Password for the default Storage Center Admin user</td>
<td></td>
</tr>
<tr>
<td>Email address of the default Storage Center Admin user</td>
<td></td>
</tr>
</tbody>
</table>

iSCSI Fault Domain Information

For a storage system with iSCSI front-end ports, record network information for the iSCSI fault domains. This information is needed to complete the Discover and Configure Uninitialized Storage Centers wizard.

NOTE: For a storage system deployed with two Ethernet switches, Dell recommends setting up each fault domain on a separate subnet.

Table 8. iSCSI Fault Domains

<table>
<thead>
<tr>

</tbody>
</table>

**Fibre Channel Zoning Information**

For a storage system with Fibre Channel front-end ports, record the physical and virtual WWNs of the Fibre Channel ports in Fault Domain 1 and Fault Domain 2. This information is displayed on the Review Front-End page of the Discover and Configure Uninitialized Storage Centers wizard. Use this information to configure zoning on each Fibre Channel switch.

**Table 10. Fault Domain WWNs**

**Physical WWNs in Fault Domain 1**

Physical WWN of storage controller 1: port 1

Physical WWN of storage controller 2: port 1
