About your system

This document familiarizes you with the functions of the Dell Storage MD1280 enclosure. The document is organized according to the tasks that you must complete after receiving your storage enclosure.

⚠️ **CAUTION**: See the Safety, Environmental, and Regulatory Information document for important safety information before following any procedures listed in this document

Overview

A Dell EMC Storage MD1280 enclosure holds the physical disk drive storage. The interface between the controller I/O cards and the enclosure is referred to as back-end connectivity.

Hardware

The Dell EMC Storage MD1280 is a 5U SAS enclosure and supports up to 84 hard drives in 3.5-inch carriers, which are installed in a two-drawer, three-row, and 14-column configuration. The Dell EMC Storage MD1280 enclosure ships with two redundant power supply units (PSUs), five redundant cooling fan modules, and two redundant 6 Gbps SAS I/O modules.

Monitoring Dell EMC Storage MD1280 enclosure

The Storage Enclosure Management software enables you to manage, update, and monitor the Dell EMC Storage MD1280 enclosure. The Dell EMC Storage MD1280 enclosure uses LED indicators to indicate an issue with the enclosure.

⚠️ **NOTE**: Dell EMC OpenManage Server Administrator is not available for the Dell EMC Storage MD1280 enclosure.

Front-panel features and indicators

The front panel displays the status of the enclosure and the status of power to the enclosure.

- **Module Fault**: Amber when there is a hardware fault. Also, an LED may glow on a PSU, hard drive, DDIC, fan module, or EMM indicating a faulty device.  

- **Logical Status**: Amber when there is a change of status or when devices other than the enclosure fail.  

- **Drive drawer 1 Fault**: Amber when a hard drive, cable, or sideplane fails in drive drawer 1.

**Physical disk installation guidelines**

**Prerequisites**

- Maximum of 84 physical disks can be installed in the storage enclosure.
- Of the 84 physical disks, there can only be 28 SSDs and rest are HDDs.
- A minimum of 28 physical disks must be installed. These 28 physical disks can be:
  - 28 HDDs only.
  - 28 SSDs only.
  - Combination of HDDs and SSDs adding to minimum of 28 physical disks.

**About this task**

To maintain proper airflow, install physicals disks from left to right and front to back in each drawer. The following image and table lists the slot numbers of the physical disks and the order in which the disks need to be installed.
Drive installation rules

About this task
Drives ordered after point of sale, as customer kits, must be added in increments of 14.
Steps

1. Each row with drives installed must be filled entirely (14 drives).
2. Top and bottom drawers must have rows filled evenly; within a count of 1. Refer to Installation order of physical disk groups table listed in Physical disk installation guidelines.
3. All spinning drives in the same row must be the same rotational speed.
4. An individual row can have spinning drives with a different rotational speed than another row.
5. Spinning drives and SSDs can be mixed within a row.
6. Drive capacities can be mixed within a row of 14 drives for both spinning drives and SSDs.

DDIC indicator

The Disk Drive In Carrier (DDIC) includes one status indicator.

When a hard drive fails, the fault LED of the hard drive drawer that contains the hard drive blinks. However, when an enclosure fails, the fault LEDs of all hard drives and both drive drawers blink. |
Installing and removing system components

This section describes the tasks to replace field replaceable units (FRUs) inside the Dell Storage MD1280 enclosure. Here, it is assumed that the user has already received the appropriate replacement device and is ready to install the device in the enclosure.

Recommended tools

You must have the below listed tools to install system components:

- T10 Torx screwdriver
- Wrist grounding strap connected to ground

Topics:

- Safety precautions
- Pre-replacement tasks
- Replacing PSUs
- Replacing fan modules
- Replacing hard drives
- Replacing I/O EMM modules
- Replacing chassis
- Replacing rack rails
- Post-replacement tasks

Safety precautions

To avoid injury and damage to the enclosure, always follow these safety precautions.

⚠️ WARNING: See the safety and regulatory information that shipped with your system. Warranty information may be included within this document or as a separate document.

Electrical safety precautions

To avoid injury and damage to the enclosure, always follow electrical safety precautions.

⚠️ WARNING: Disconnect power from the enclosure when removing or installing components that are not hot-swappable. When disconnecting power, first turn off the EMMs and enclosure. Remove the power cords from all the PSUs in the enclosure.

- Know the locations of the following in your system environment: power switch of the equipment, emergency power button, switch to turn off power, and electrical outlet of the system.
- Do not work alone when working with high-voltage components.
- Do not use mats designed to decrease electrostatic discharge as protection from electrical shock. Instead, use rubber mats that are designed as electrical insulators.
- The PSU cord must include a grounding prong and must be plugged into a grounded electrical outlet.
General safety precautions

To avoid injury and damage to an enclosure, always follow general safety precautions.

⚠️ WARNING: Do not lift the enclosure without any assistance. If installed above the lower 20U of a rack, a customer-provided mechanical lift must be used to avoid injury.

- Keep the area clean and free of clutter around the chassis.
- While working on the enclosure, do not wear loose clothing, such as neckties and unbuttoned shirt sleeves, which can come into contact with electrical circuits or be pulled into a cooling fan.
- Remove any jewelry or metal objects from your body because they are excellent electricity conductors that can create short circuits and harm you if they come into contact with printed circuit boards (PCBs) or areas where power is available.

⚠️ CAUTION: If the enclosure system operates for too long (depending on altitude) with drive drawers open, the enclosure can overheat, causing power failure and data loss. Such use may invalidate the warranty.

Electrostatic discharge precautions

To avoid injury and damage to the enclosure, always follow electrostatic discharge (ESD) precautions.

ESD is generated by two objects with different electrical charges coming into contact with each other. The resulting electrical discharge can damage electronic components and PCBs.

- Dell EMC recommends to always use an antistatic mat and antistatic wrist or ankle strap while working on components in the interior of an enclosure.
- Observe all conventional ESD precautions when handling plug-in modules and components.
- Avoid contact with backplane components and module connectors.
- When you are not using the components and PCBs, keep them in their antistatic bags.

Pre-replacement tasks

If the FRU is not hot-swappable, the EMMs and enclosure must be turned off.

Turning off the EMMs and enclosure

About this task
To turn off the EMMs and enclosure, complete the following tasks:

Steps
1. Before turning off the EMMs and enclosure, identify the failed devices.
2. Stop I/O to the storage enclosure.
3. Turn off the EMMs and PSUs in the enclosure using the power switches located on the corresponding devices.
4. Disconnect power from the enclosure by removing the power cords from all the PSUs in the enclosure.

Replacing PSUs

The Dell EMC Storage MD1280 enclosure supports two 2.8kW AC hot-swappable PSUs. If one PSU stops functioning, the second PSU continues to supply power to the enclosure.
Identifying the failed PSU

To identify a non-functioning PSU, use the secli component of the Storage Enclosure Management Software or visually verify which PSU is not functioning.

Replacing a PSU

About this task
To replace failed PSUs, complete the following tasks:

Steps
1. Turn off the PSU switch.
2. Remove the power cord from the securing clip and then remove the power cord from the PSU.
3. Push the red release tab to right and hold it, and then slide the PSU out of the chassis by using the PSU handle.

⚠️ CAUTION: The PSUs are heavy. To avoid injury, use both hands while removing the module.

Figure 8. Removing a PSU

1. Release tab
2. PSU

4. Slide the replacement PSU module into the chassis until it is fully seated and the release tab clicks into place.
5. Connect the power cord to the PSU and ensure that the power cord is inserted into a power outlet.
6. Secure the power cord by using the clip.
Figure 9. Securing the power cord

1. Power cable securing clip

7. Turn on the PSU switch.

**NOTE:** Allow the enclosure to identify the PSU and determine its status. If the PSU is functioning properly, the PSU’s Power OK LED glows green and the PSU fault LED and AC fault LED are off.

## Replacing fan modules

The Dell EMC Storage MD1280 enclosure supports five fan modules. If one fan module fails, the remaining modules continue to cool the enclosure.

**NOTE:** When a fan module fails, the fan speed in the remaining modules increases significantly to provide adequate cooling. The fan speed decreases gradually when a new fan module is installed.

### Identifying the failed fan module

To identify the failed fan module, use the secli component of the Storage Enclosure Management Software or visually verify which fan module is not functioning properly.

### Replacing a fan module

**About this task**

To replace a failed fan module, complete the following tasks:

**Steps**

1. Press the red release tab and pull the fan module out of the chassis by using the handle.

**CAUTION:** The fan modules are heavy. To avoid injury, use both hands while removing the module.
Replacing hard drives

The Dell EMC Storage MD1280 enclosure supports hot-swappable hard drives and supports up to 84 hard drives in 3.5-inch carriers, which are installed in a two-drawer, three-row, 14-column configuration. Hard drives are connected to a backplane by using Disk Drive in Carrier (DDIC) hard drive carriers.

Numbering hard drive

Hard drives are numbered in the secli, starting with 0. Dell EMC Storage MD1280 DDIC slots are numbered 1–42 in drive drawer 0, from front to back and left to right, and 43–84 in drive drawer 1.

NOTE: The enumeration of hard drives in the secli software is zero-based. The physical enclosure enumerates hard drives starting from 1.
Identifying the failed hard drive

To identify the failed hard drive, use the secli component of the Storage Enclosure Management Software or visually verify the failed hard drive.

Replacing hard drives

About this task
Hard drives can be replaced one at a time without turning off the enclosure. To replace failed hard drives, complete the following tasks:

Steps
1. Find the Dell EMC Storage MD1280 enclosure and the drive drawer containing the failed hard drive. The fault drive drawer LED glows.
Figure 12. Opening DDIC

1  Drive drawer latches (2 per drawer)  2  Drive drawer

⚠️ CAUTION: Before opening a drive drawer, ensure that the system is not indicating a temperature warning. This issue must be rectified first to avoid potential hard drive failure and data loss.

2  Push and hold both red drive drawer latches toward the center of the drive drawer and pull out the drive drawer.

⚠️ CAUTION: If the Dell EMC Storage MD1280 enclosure operates for too long (depending on altitude) with drive drawers open, the enclosure can overheat, causing potential hard drive failure and data loss. Such use may invalidate the warranty.

3  Find the failed DDIC by the glowing LED.
4  Press the release button to unlatch the DDIC.
5  Wait for 10 seconds for the hard drive to spin down.
6  Slide the DDIC up and out until it is free of the DDIC slot.
Slide the replacement DDIC into the slot, push and hold the DDIC down while sliding it toward the back of the enclosure until the DDIC latches to the backplane.

⚠️ **CAUTION:** If the DDIC fails to latch, do not use it and request a replacement. If a faulty DDIC unlatches within a closed drive drawer, then you cannot open the drive drawer.

⚠️ **CAUTION:** To maintain proper airflow, the drive drawers must be populated with hard drives in whole rows at a time (there are three rows of 14 hard drives per drawer). The minimum number of hard drives in an enclosure is 28 (one full, front row in the top drive drawer), the number of populated rows between drive drawers must not differ by more than one. The rows should be populated from the front to the rear of the enclosure.
Figure 14. Closing drive drawer

1. Drive drawer
2. Open-drawer lock

8. Close the drive drawer.
   a. Pull and hold both drive drawer releases, and push the drive drawer inside slightly.
   b. Release and push the drive drawer until it clicks into a place.

⚠️ **WARNING:** After releasing the open-drawer locks, move hands away from the slides to avoid injury while pushing the drive drawer inside.

⚠️ **NOTE:** Allow the enclosure to identify the hard drive and determine its status. If the hard drive is functioning properly, DDIC LED is off.

---

### Replacing I/O EMM modules

The Dell EMC Storage MD1280 enclosure supports redundant hot-swappable I/O Enclosure Management Modules (EMMs).

EMMs provide the following data path and enclosure management functions for the enclosure:

- Monitoring and controlling enclosure environment elements such as temperature, fan, PSUs, and enclosure LEDs
- Controlling access to hard drives
- Communicating enclosure attributes and states to the host

---

### Identifying the failed EMM

To identify the failed EMM, use the secli component of the Storage Enclosure Management Software or visually verify the EMM that is not functioning.
Replacing an EMM

About this task
EMMs can be replaced one at a time without turning off the enclosure. To replace failed EMMs, complete the following tasks:

Steps
1. Remove all cables from the EMM. Ensure all the cables are labeled.
2. Push the release tab to right and pull the release lever away from the chassis.
3. Grasp the release lever and pull the EMM away from the chassis.

4. Insert the replacement EMM into the bay until it is fully seated.
5. Push the release lever toward the chassis until it clicks into place.
6. Connect all the cables to the EMM.

Replacing chassis

Replacing the chassis is required when non-FRU devices must be replaced. Replacing a chassis requires a scheduled maintenance window when the system is unavailable. The replacement chassis ships without any FRUs, and therefore all cards and DDICs must be transferred to the new chassis.

About this task
To replace a chassis, complete the following tasks:

Steps
1. Remove the Hold Down Brackets (HDBs).
   a. Remove the fixing screws from the rear of the enclosure.
b Remove the HDBs from the rear of the rack.
2 Remove all DDICs from the enclosure and place on a static free mat or bench. Note the slot position of each DDIC as you remove it, the DDICs must be reinstalled in the same slot position as in the original chassis.
3 Remove the enclosure from the rack rails.

⚠️ WARNING: Do not attempt to lift the enclosure without any assistance. If installed above the lower 20U of a rack, a customer-provided mechanical lift must be used to avoid injury.
4 Install the replacement chassis in the rack.
5 Install the HDBs.
6 Move all the back-panel parts (EMMs, fans, and PSUs) from the original chassis to the racked replacement.
7 Move the front panel bezel from drive drawer 0 from the original chassis onto the racked replacement.
8 Install the DDICs into the replacement.
9 Turn on the enclosure as described in the Post-replacement tasks section in this document.
10 An update to the electronically stored product ID and Service Tag must be applied. Contact your service provider.
11 Swap the bezel on drive drawer 0 of the failed chassis with the bezel on drive drawer 0 of the new chassis before loading back into the rack.
12 A blank Service Tag is included in the replacement chassis Label Kit. Mark the new blank Service Tag with the old Service Tag information and adhere it to the replacement chassis.

Replacing rack rails

Rack rails are used to install the Dell EMC Storage MD1280 enclosure into a rack.

About this task
To replace rack rails, complete the following tasks:

⚠️ NOTE: This procedure contains high-level tasks. For more information about the instructions, see the Rack Installation Instructions document available at Dell.com/support.

Steps
1 Turn off the EMMs and enclosure as described in the Pre-replacement tasks section in this document.
2 Remove the HDBs.
   a Remove the fixing screws from the rear of the enclosure.
   b Remove the HDBs from the rear of the rack.
3 Remove the enclosure from the rack rails.

⚠️ WARNING: Do not attempt to lift the enclosure without any assistance. If installed above the lower 20U of a rack, a customer-provided mechanical lift must be used to avoid injury.

4 Remove the rack rails from the rack.
5 Install the replacement rack rails in the rack.
6 Install the enclosure in the rack rails.
7 Install the HDBs.
8 Turn on the EMMs and enclosure as described in the Post-replacement tasks section in this document.

Post-replacement tasks

After replacing an FRU in Dell EMC Storage MD1280, turn on the EMMs and enclosure, if they were turned off.

Turning on the EMMs and enclosure

About this task
If the servers and enclosure are turned off, turn on the servers by doing the following:
Steps
1. Insert the power cords.
2. Press the power button on the enclosures to turn on the power.
   ☢️ **NOTE:** Always turn on the enclosures before turning on the host.
3. Ensure that the host is turned on.
4. Use the secli component of the Storage Enclosure Management Software to verify that the replacement device is up and running.
5. Install all available firmware update by using secli.
Troubleshooting Dell Storage MD1280 components

This section contains basic troubleshooting tasks for components inside the Dell Storage MD1280 enclosure.

Topics:
- Troubleshooting fan modules
- Troubleshooting PSUs
- Troubleshooting DDICs
- Troubleshooting I/O EMMs

Troubleshooting fan modules

About this task
To troubleshoot fan modules, complete the following tasks:

Steps
1. Determine the status of the fan module LEDs.
   - If the fan fault LED glows, the fan module has failed.
2. Reseat the fan module by removing and reinstalling it.

   ☢️ **NOTE:** Allow the enclosure to identify the fan module and determine fan's status.

Troubleshooting PSUs

About this task
To troubleshoot PSUs, complete the following tasks:

Steps
1. Determine the status of the PSU LEDs.
   a. If the PSU fault LED glows, the PSU has failed.
   b. If the Power OK LED is not glowing, check the power cord and power source into which the PSU is inserted:
      1. Connect another device to the power source and check whether the device works.
      2. Insert power cord to a different power source.
      3. Replace the power cord.
   c. If the AC fault LED glows, this PSU is not supplying power, though the other PSU may still be supplying the power.
2. Reseat the PSU by removing and reinstalling it.

   ☢️ **NOTE:** Allow the enclosure to identify the PSU and determine PSU's status.

Troubleshooting DDICs

About this task
To troubleshoot DDICs, complete the following tasks:
Steps
1  Determine the status of DDIC LED.
   a  If the DDIC fault LED glows, the hard drive has failed.
   △ CAUTION: Confirmed that the particular hard drive contains no user data. The Fault LED alone is not an indication the hard drive can be safely removed.
   b  If the DDIC fault LED is not glowing, perform step 2.
2  Check the connectors and reseat the DDIC.
   △ CAUTION: This task should be only performed on unmanaged hard drives or after it is confirmed that the particular hard drive contains no user data. Mere glowing of Fault LED does not imply that the hard drive has failed (you can remove the hard drive even if the Fault LED is glowing).
   a  Remove the DDIC.
   b  Check the DDIC and the backplane to ensure that the connectors are not damaged.
   c  Reinstall the DDIC. Ensure the DDIC contacts the backplane.

Troubleshooting I/O EMMs

About this task
To troubleshoot I/O EMMs, complete the following tasks:

Steps
1  Check the pins, and reseat the EMM.
   a  Remove the EMM.
   b  Verify that the pins on the backplane and the EMM are not bent. If any pins are bent, do not attempt to correct them. Instead, contact Dell EMC technical support services for further instructions.
   c  Reinstall the EMM.
2  Determine the status of the EMM power and Fault LEDs. If the Fault LED glows, the EMM has failed.
3  Verify link status. If the link status LEDs are not glowing green, check the cables.
   a  Reseat the cables on the enclosure and the controller.
   b  Recheck the link status LEDs. If the link status LEDs are not glowing green, replace the cables.
4  Reseat the EMM by removing and reinstalling it.
   ☰ NOTE: Allow the enclosure to identify the EMM, and determine its status.

| Front panel | • One two-digit LCD indicator for Unit ID, error code, and unit location identifier  
• One two-color LED indicator for power status  
• One single-color LED indicator for module fault status (enclosure as a whole)  
• One single-color LED indicator for logical fault status (hard drive, HBA, RAID controller)  
• One single-color LED indicator for drive drawer 1 fault status  
• One single-color LED indicator for drive drawer 2 fault status |

| Disk Drive In Carrier (DDIC) | One single-color LED for hard drive fault status |

| 6 Gbps SAS I/O module | 14 one-color LED status indicators, four each for the three SAS ports, and two for the module status |

| Fan module | • One single-color LED indicator for module status  
• One single-color LED indicator for battery fault status (not currently used) |
Specifications

- One single-color LED indicator for fan fault status
- One single-color LED indicator for power status

PSU

- One single-color LED indicator for PSU fault status
- One single-color LED indicator for AC fault status
- One single-color LED indicator for power status

Power Supply Units (per PSU)

- Watt: 2.8 kW
- Voltage: 200–240 VAC (8.6 A–4.3 A)
- Heat dissipation: 191–147 W
- Maximum inrush current: Under typical line conditions and over the entire system ambient operating range, the inrush current may reach 55 A for each PSU for 10 ms or less.

Available Hard Drive Power (Per Slot)

- Supported hard drive power consumption (continuous): Up to 1.16 A at +5 V, Up to 1.6 A at +12 V

I/O Card Power (Per Slot)

- Maximum power consumed by I/O Card: 11 W at +12 V
- Maximum available power: 100 W at +12 V
- Maximum available power: 1 W at +5 V (standby)

Physical

- Height: 22.23 cm (8.75 inches)
- Width: 48.26 cm (19 inches)
- Depth (front mounting bracket to rear surface): 91.5 cm (36 inches)
- Depth (front surface to rear surface): 96 cm (38 inches)
- Full Weight (maximum configuration): 130.7 kg (287.5 lb)
- Shipping Weight (without hard drives): 62 kg (137 lb)

Environmental

**NOTE:** For more information about environmental measurements for specific system configurations, see Dell.com/environmental_datasheets.

- Storage: −40°C to 65°C (−40°F to 149°F) at a maximum altitude of 12,000 m (39,370 ft)

Contacting Dell EMC

Dell EMC provides several online and telephone based support and service options. If you do not have an active internet connection, you can find contact information about your purchase invoice, packing slip, bill, or Dell EMC product catalog. Availability varies by country and product, and some services may not be available in your area. To contact Dell EMC for sales, technical assistance, or customer service issues:

1 Go to Dell.com/support/home.
2 Select your country from the drop-down menu on the lower right corner of the page.
3 For customized support:
   a Enter your system Service Tag in the Enter your Service Tag field.
   b Click Submit.
      The support page that lists the various support categories is displayed.
4 For general support:
   a Select your product category.
   b Select your product segment.
   c Select your product.
      The support page that lists the various support categories is displayed.
5 For contact details of Dell EMC Global Technical Support:
   a Click Global Technical Support.
   b The Contact Technical Support page is displayed with details to call, chat, or e-mail the Dell EMC Global Technical Support team.

Locating service tag of your system

Your system is identified by a unique Express Service Code and Service Tag number. The Express Service Code and Service Tag are found on the chassis label. Alternatively, the information may be on a sticker on the chassis of the system. This information is used by Dell to route support calls to the appropriate personnel.

Documentation feedback

You can rate the documentation or write your feedback on any of our Dell EMC documentation pages and click Send Feedback to send your feedback.
