Notes, cautions, and warnings

NOTE: A NOTE indicates important information that helps you make better use of your product.

CAUTION: A CAUTION indicates either potential damage to hardware or loss of data and tells you how to avoid the problem.

WARNING: A WARNING indicates a potential for property damage, personal injury, or death.

Dell Wyse Management Suite is the next generation management solution that lets you centrally configure, monitor, manage, and optimize your Dell Wyse thin clients. The new Suite makes it easier to deploy and manage thin clients with high functionality and performance, and ease of use. It also offers advanced feature options such as cloud versus on-premises deployment, remote management by using a mobile application, BIOS configuration and port lockdown. Other features include device discovery and registration, asset and inventory management, configuration management, operating system and applications deployment, real-time commands, monitoring, alerts reporting, and troubleshooting of endpoints.

This document provides a deployment strategy of Wyse Management Suite in a single virtual machine or server on a private cloud to support management of up to 120,000 devices.
## Hardware requirements

The following table lists the hardware requirements:

<table>
<thead>
<tr>
<th>Description</th>
<th>10000 devices or less</th>
<th>50,000 devices or less</th>
<th>120,000 devices or less</th>
<th>Wyse Management Suite – Software repository</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operating system</td>
<td>Microsoft Windows Server 2012 R2 or Microsoft Windows Server 2016 Supported language pack—English, French, Italian, German, Spanish, Japanese and Chinese (preview release).</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Minimum disk space</td>
<td>40 GB</td>
<td>120 GB</td>
<td>200 GB</td>
<td>120 GB</td>
</tr>
<tr>
<td>Minimum memory (RAM)</td>
<td>8 GB</td>
<td>16 GB</td>
<td>32 GB</td>
<td>16 GB</td>
</tr>
<tr>
<td>Minimum CPU requirements</td>
<td>4</td>
<td>4</td>
<td>16</td>
<td>4</td>
</tr>
<tr>
<td>Network Communication Ports</td>
<td>The Wyse Management Suite installer adds TCP ports 443 and 1883 to the firewall exception list. The ports are added to access the Wyse Management Suite console, and to send the push notifications to the thin clients.</td>
<td>The Wyse Management Suite repository installer adds TCP port 443 to the firewall exception list. The port is added to access the operating system images and application images that are managed by Wyse Management Suite.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>· TCP 443—HTTPS communication</td>

<td>Firefox version 52.0 and later</td>
<td>Edge browser on Windows—English only</td>
</tr>
</tbody>
</table>

**NOTE:**

Wyse Management Suite can be installed on a physical or a virtual machine.

The software repository and the Wyse Management Suite server must have the same operating system.
Wyse Management Suite deployment architecture

The following are the Wyse Management Suite installer components to deploy at the work place:

- WMS Web Application—Application Server that hosts Wyse Management Suite.
- Memcached—Used to Cache data for performance and scalability.
- MQTT—Used to push notifications to thin clients.
- MongoDB—Relational database for structured data and normalization.
- MariaDB—SQL database for performance and scalability.
- EMSDK—SDK to manage Teradici devices.

Figure 1. Wyse Management Suite architecture
Deployment details

This chapter contains the deployment architecture details for Wyse Management Suite.

The Wyse Management Suite supports up to 120,000 connected devices.

Single server deployment is easier to maintain, however, you have an option to deploy Wyse Management Suite on multiple servers as per your preference.

Deployment on a single server to support 50,000 thin client devices

The minimum hardware requirement on a single server for 50,000 devices is:

Table 2. Hardware specification

<table>
<thead>
<tr>
<th>Application</th>
<th>Hardware specification</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td></td>
<td>• 200 GB HDD</td>
</tr>
</tbody>
</table>

The following diagram explains deployment of Wyse Management Suite on a single server:
Deployment details to support Teradici devices

EMSDK software component must be installed with Wyse Management Suite, to support Teradici devices. EMSDK components are included in WMS.exe installer, however the installation is optional.

EMSDK can be installed locally on Wyse Management Suite server or on a separate VM or server. Wyse Management Suite deployment can have multiple instances of EMSDK, however each instance must run on a separate server, and each instance can support up to 5000 Teradici devices.

Deployment on a single server to support 5000 Teradici devices

The following diagram explains deployment architecture of Wyse Management Suite on a single VM with remote EMSDK:
Figure 3. Wyse Management Suite on a single VM with remote EMSDK
(supports up to 5000 Teradici devices)

The following diagram explains deployment architecture of Wyse Management Suite with EMSDK on a single VM:
Deployment Architecture of Wyse Management Suite with EMSDK on a single VM (supports up to 5000 Teradici devices)

**Figure 4. Wyse Management Suite with EMSDK on a single VM**

**Deployment to support more than 5000 Teradici devices**

The following diagram explains deployment architecture of Wyse Management Suite on a single VM with multiple remote EMSDKs:
This section explains the deployment architecture of Wyse Management Suite on a separate database server. MongoDB and MariaDB may be on the same server or on separate servers.

The following diagram depicts the deployment architecture of Wyse Management Suite on a separate database server.
Deployment Architecture of Wyse Management Suite on a single VM with Remote Database

Figure 6. Wyse Management Suite on a separate database server
Custom port configurations

Wyse Management Suite uses the following port as the default port for the applications that are installed:

- Apache Tomcat: 443
- MariaDB database: 3306
- Mongo database: 27017
- MQTT Broker: 1883
- Memcached: 11211
- EMSDK: 5172, 49159—optional to manage Teradici devices

To use a nondefault port for one or more of the above services, use Custom install option during Wyse Management Suite installation, the option listed in the following screen allows you to use the local database for MongoDB and MariaDB or use the remotely installed database.

Topics:

- Change the Tomcat service port
- Change the MQTT port
- Change the MariaDB port
- Change the MongoDB database port
- Remote repository

Change the Tomcat service port

This section explains how to change the port after installing Wyse Management Suite. You must reinstall using Custom installation mode to change ports. If reinstalling is not an option, the following sections explains the procedure to change the ports manually.

To change the Tomcat service port, do the following:

1. Stop the Tomcat service. The Tomcat service is identified by Dell WMS: Tomcat Service entry.
2. Edit the file `<INSTALLDIR>\Tomcat-8\conf\server.xml` in a text editor.
3. Find and replace all occurrences of port entry 443 with the port number you need to use. It is optional to change the references to port 8443.
4. Save the `server.xml` file and exit.
5. Start the Tomcat service.
6. Enter the port number in the URL (default port 443 can be omitted from the URL). For example, `https://xyz.wysemanagementsuite.com:553/ccm-web`. The port specified in the URL must be used for both portal access and for device registration.

**NOTE:** The Memcached port can be changed during Wyse Management Suite installation. Dell recommends not to change the Memcached port detail after installation

Change the MQTT port

1. Stop the Tomcat and MQTT services.
2. Perform the following steps to configure Mosquitto:
   a. Edit the file `<INSTALLDIR>\Mosquitto\mosquitto.conf` in a text editor.
   b. Note the following entries:
      # Port to use for the default listener
Uncomment the port 1883 entry and change the port number to your preferred port. For example, port 2883.

d  Save the file, and start the MQTT service.

e  Check the following entry to confirm that the MQTT service is running on the new port:

```bash
ps> get-nettcpconnection -LocalPort 2883
```

To configure Tomcat, do the following:

a  Open a command prompt session, and navigate to `cd C:\Program Files\DELL\WMS\MongoDB\bin`

b  Run the following command at the command prompt:

```bash
>mongo stratus -u stratus -p <mongodbPassword> -eval "db.bootstrapProperties.update({"name": "mqtt.server.url"}, {"name": "mqtt.server.url", "value": "tcp://xyz-pns.wysemanagementsuite.com:2883", "isActive": true, "committed": true}, {upsert:true})"
```

c  Start Tomcat Service identified in Local Services as Dell WMS: Tomcat Service and re-register all the devices, so that the MQTT URL is referring to the new port.

### Change the MariaDB port

1  Start the Tomcat service and stop the MariaDB service. To configure the MariaDB, do the following:

   a  Edit the file `<INSTALLDIR>\Database\SQL\my.ini` in a text editor.
   
   b  Change the port number for both mysqld and client to your preferred port. The port numbers should be of the same value. For example:

   ```ini
   [mysqld]
   datadir=C:/Program Files/DELL/WMS/Database/SQL
   port=3308
   
   [client]
   port=3308
   ```

   c  Save the file, and start the MariaDB service.

2  To configure Tomcat, do the following:

   a  Edit the file `<INSTALLDIR>\Tomcat-8\webapps\ccm-web\WEB-INF\classes\bootstrap.properties` in a text editor.
   
   b  Update the properties in the file with your preferred port number details. For example:

   ```java
   jpa.connection.url=jdbc:mysql://localhost:3308/stratus?useUnicode=true&characterEncoding=utf-8&useLegacyDatetimeCode=false&serverTimezone=America/Los_Angeles
   jpa.connection.port=3308
   ```

   c  Save the file, and start the Tomcat service. Verify that the services are running on the configured port. For example:

   ```bash
   ps>get-nettcpconnection -LocalPort 3308
   ```

### Change the MongoDB database port

1  Stop the Tomcat and MongoDB services.

2  To configure the MongoDB port entry, do the following:

   a  Edit the file `<INSTALLDIR>\MongoDB\mongod.cfg` in a text editor.
   
   b  Update the property in the file with your preferred port number. For example: `port=27027`.

   c  Save the file, and start the MongoDB service. Confirm that it is running on the new port.

3  To configure Tomcat, do the following:

   a  Edit the file `<INSTALLDIR>\Tomcat-8\webapps\ccm-web\WEB-INF\classes\bootstrap.properties` in a text editor.
   
   b  Update the properties in the file with your preferred port number. For example: `mongodb.seedList=localhost:27027`.

   c  Save the file, and start the Tomcat service. Verify that the service is running on the required port. For example:

   ```bash
   ps>get-nettcpconnection -LocalPort 27027
   ```
Remote repository

Wyse Management Suite allows you to have local and remote repositories for applications, operating system images and so on. If the user accounts are distributed across geographies, it would be efficient to have a separate local repository for each of the distributed user account so the devices can download images from its local repository. This flexibility is provided with WMS_Repo.exe software. The WMS_Repo.exe is a Wyse Management Suite file repository software that helps to create distributed remote repositories which can be registered with Wyse Management Suite. The WMS_Repo.exe is available only for Pro license subscribers only.

The server requirements to install Wyse Management Suite repository software are:

- Windows 2012 R2 or Windows 2016 Server
- 4 CPU
- 8 GB RAM
- 40 GB storage space

Do the following to install WMS-Repo software:

1. Download WMS_Repo.exe file from Dell Digital Locker.
2. Log in as Administrator, and install WMS_Repo.exe on the repository server.
3. Click Next and follow the instructions on the screen to complete the installation.

![Figure 7. Welcome screen](image-url)
4 Click **Launch** to launch the **WMS Repository registration** screen on the web browser.
5. Click **Register** to start the registration. Select the **Register to public WMS Management Portal** if you are registering on the public cloud.
Enter the following details, and click **Register**:

- Wyse Management Suite server URL
- **NOTE:** Unless you register with Wyse Management Suite v1.0, you cannot use MQTT Server URL.
- WMS Repository URL (update the URL with the domain name)
- Wyse Management Suite administrator login username information
- Wyse Management Suite administrator login password information
- Repository path information

If the registration is successful, the **Registration** window is displayed:
The following screen on the Wyse Management Suite portal confirms the successful registration of the remote repository:

HTTPS is by default enabled with \texttt{WMS\_Repo.exe}, and is installed with the self-signed certificate. To install your own domain-specific certificate, scroll down the registration page to upload the SSL certificates.
Figure 14. Certificate upload

10 The server restarts, and the uploaded certificate is displayed.
If the Wyse Management Suite is enabled with self-signed or a private domain certificate, you can upload the certificate on the Wyse Management Suite repository server to validate the Wyse Management Suite CA credentials.

Navigate to the C:\wmsrepo location that you entered during registration, and you can view the folders where all the repository files are saved and managed.
Manage Wyse Management Suite repository service

Wyse Management Suite repository is displayed as **Dell WMS Repository: Tomcat Service** in the Windows Local Services window and is configured to start automatically when the server restarts as shown:
This chapter describes how to take a backup of the database.

## Database backup

Stop Tomcat Service before taking a backup of the database. Tomcat Service is identified as “Dell WMS: Tomcat Service” and must be stopped from Local Services.

To dump the contents of the MongoDB, run the following command:

```
mongodump --host `<mongodb_host>` -u `stratus` -p `<db_password>` --authenticationDatabase admin --db `stratus` --out `.`
```

To dump the contents of the MarioDB, run the following command:

```
mysqldump --routine --h `<mariadb_host>` -u `stratus` -p `<db_password>` `stratus` > `.`
```

## Database restore

Stop Tomcat Service before restoring the database. Tomcat Service is identified as “Dell WMS: Tomcat Service” and can be stopped from Local Services.

You must run the following command from the `wmsmongodump` directory — parent directory of stratus database, to restore MongoDB.

```
echo "db.dropDatabase();" | mongo -u `stratus` -p `<db_password>` --authenticationDatabase admin --host `<db_host>` `stratus`
```

You must run the following command to restore the MarioDB:

```
mongorestore --host `<db_host>` -u `stratus` -p `<db_password>` --authenticationDatabase admin --db `stratus` "`stratus`"
```
